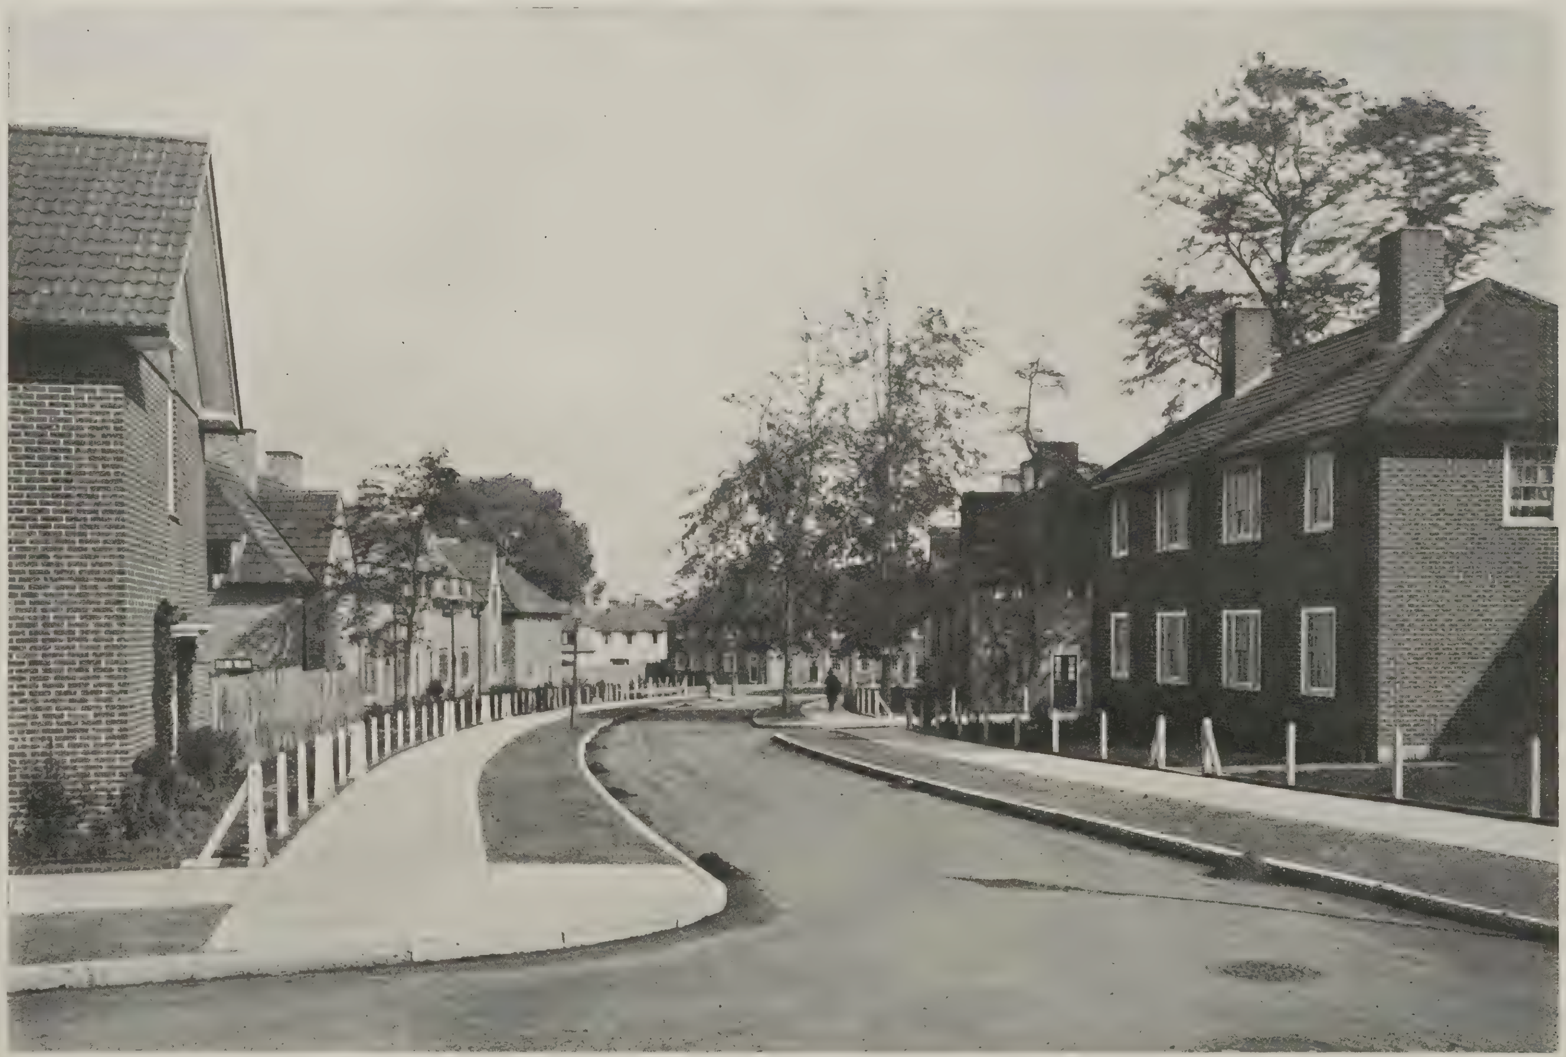
# The Roehampton Housing Scheme of the London County Council: North End of Swinburne Road

G. Topham Forrest, F.R.I.B.A., Architect to the Council



Roehampton is one of the most delightful housing schemes in the country. Much skill has been employed in the creation of the estate, not only in the design of the individual houses, which are charming examples of domestic architecture, but in their grouping on the lay-out, which provides a succession of picturesque *coups d'œil*.

THE
ARCHITECTS' JOURNAL
27-29 Tothill Street, Westminster, S.W.1.

**Wednesday, January 3, 1923** **Volume LVII. No. 1461**

# Housing: A Retrospect and a Forecast

THE subject of housing still quite properly figures prominently in Parliamentary question time; indeed, during the debate on the address subsequent to the opening of the session many pertinent questions were asked by members of every political party. This is a good omen. The physical health and the mental disposition of the nation are more dependent upon good housing than upon any other single condition, and until housing is made to transcend party politics, and to take its place in national affairs in the same unfettered way as, for example, matters affecting the post office, the whole subject will be at the mercy of intrigue and opportunism.

The late Government's housing programme terminated, according to the terms of the 1919 Act, at the end of June of this year. Actually, owing to circumstances that are now well known, the closing down began exactly a year previously, when the majority of the Housing Commissioners' staffs were served with notices to terminate their appointments at the end of September. What is the result of the three years' work under the Act? In the opinion of some extraordinary people it is negligible. Yet it has been such as to have excited the admiration of other countries, who, it would seem, are more generously disposed than the average Englishman, whose prerogative it still remains to abuse every enterprise which his Government undertakes without first pausing to consider the obstacles that may have been encountered or to view the result from more than a single aspect.

Considered numerically, it may with some justification be said that the results are disappointing. The amount of energy, enthusiasm, and hard work which went to forward the cause of housing might appear to be incommensurably recompensed by the comparatively small number of houses produced. The estimated need in 1919 was half a million houses. The actual number of houses completed by the end of October this year, under both the 1919 Acts, was 184,916. In addition, 3,056 dwellings have been provided by conversions of huts and large houses, and 30,229 more houses are passed for erection, of which the majority are in actual course of construction, making a total of 218,201 dwellings. Even the result thus baldly contained in a bare statistical statement represents no mean achievement when the enormous difficulties to be encountered are considered. It is doubtful if any other Government has ever carried out such a programme, or has made so rich a contribution to the immediate needs of the community. To make good a shortage of eight years (1914–1922) in three, even in times of industrial prosperity, in a country long undisturbed by war and rumours of war, would be a feat of surprising magnitude; but when such an attempt is made by a nation, weary, worn, stressed, and utterly shaken by four years' conflict of unprecedented violence, complete success is scarcely within the bounds of possibility. However, to view the matter on a mere statistical basis is to ignore the deeper significance of the three years' work.

The really important things are that standards in housing have been immensely raised; that the whole nation has had its interest in housing quickened as never before, so that there is scarcely a parish in the whole of Great Britain that has not a committee of men and women considering the question of housing with keenness and intelligence. The results of thus turning the nation's thought to matters pertaining to housing have spread out in countless ramifications. To them may be attributed much of the experimental work which has been carried out in new systems of construction. Various methods for the use of concrete as a house-building material have been devised, which have been important factors in reducing costs. To them may be attributed the enormous improvement in labour-saving devices and household equipment which are lessening the drudgery in thousands of homes. To them also may be attributed the efforts and determination to combat the smoke evil which desecrates the countryside, wastes millions of pounds annually in uneconomical fuel consumption, in unnecessary laundry work, and in disintegrating buildings, and which condemns the majority of the nation to live in a permanently sunless and unhealthy atmosphere. Yet more than all these things is the quickening and reviving of civic consciousness, without which our towns must always remain dirty, chaotic, and ugly, and the eyes, ears, and nose be subjected to continual offence until the very senses themselves atrophy and cease to serve us.

In this issue will be found illustrations and descriptions of a number of schemes which have been undertaken in different parts of the country. They are typical of others. A most superficial inspection is sufficient to show how immensely superior these houses are to a similar class of house of an earlier pre-war date; superior in the comforts and amenities of life which they provide, and superior in their general grouping and in their relation to each other. Their efficiency, their "home-worthiness," insure their being art in the fullest and richest connotation of that much-abused word, even though they are not consciously "artistic," which quality has often in the past consisted in marring simplicity with meretricious applied ornament. These plans show conclusively the wisdom of having insisted upon proper ventilation and sunshine, convenient planning, and low density. These are lessons that have been so thoroughly inculcated that whoever provides houses in the future will be compelled, if he wishes to market his goods, to abide by them. Local authorities, too, will be compelled to maintain these new standards, and many of them are determined to continue with the provision of houses, even though they will receive no financial assistance from the State. Thirty-five authorities have actually undertaken to provide houses on these lines, and another sixty have schemes under consideration.

The material result of the late Government's work of nearly a quarter of a million dwellings is, under the circumstances, no mean achievement, and its absolute result of a changed mental attitude towards housing conditions and standards, and a changed spiritual attitude towards civics, marks an advancement in national life which none but the purblind can ignore.

Housing must go on immediately, and architects are rightly determined to be associated with it. Mr. Stanley Hamp and other distinguished architects have taken up the matter with commendable enthusiasm, and we look forward to the early establishment of some new basis of co-operation between architects and house-builders.

# Architectural Character and the Government Housing Scheme

## By Professor S. D. ADSHEAD, M.A, F.R.I.B.A.

IN architecture the expression of character has ever been regarded as a first essential of design. Variance in view and of opinion has been, not as to the need for character, but as to the way in which character should be expressed.

The "Garden City" movement, which has had so important an influence in shaping the Ministry schemes, was essentially a revolt against villadom, against the endless repetition of those mean streets and monotonous houses which the industrial conditions of a century of town building had produced.

Those responsible for the lay-out and design of our first garden cities and garden suburbs may be said to have adopted the "Casemented" or "Jacobean" style of cottage, in preference to the "Georgian sash," and this to avoid all suspicion of a relationship with the ugly plate-glass windows of the nineteenth-century villa, or anything that had a hung sash.

But a more mature view made it clear that the real difference between the character of a cottage and that of a villa lay in an appreciation of niceties, less obvious and more subtle than mere distinctions between types of windows. It was seen that the so-called nineteenth-century villa, notwithstanding its sash windows, was a very different proposition from the simple and carefully-proportioned sashed cottages of the Georgian era.

It came to be realized that, whilst both casements and sashes were suitable for cottages and capable of producing cottage character, both could also very easily adapt themselves to villadom, it being all a question of detail of proportions and of the treatment of every feature that contributes to architectural design.

But the type of window, important as it is in deciding the character of the architecture, is not alone responsible for setting the style. Perhaps even more important than the window is the pitch of the roof and the treatment of the eaves. In the early days roofs were pitched high in accordance with early models, but latterly there has been a tendency to flatten the roofs, and this to so gentle a pitch as 30 deg. Cottages of this type assimilate to what is known as the style of the Greek revival of the early part of last century, and many good cottages modelled on these early-nineteenth-century houses form a part of those carried out in the Ministry schemes. But, perhaps, the thing that is most striking in these Ministry houses, as compared with previous houses erected for the working classes, is the material which composes their roofs. Probably two-thirds of the houses have been roofed in with tiles, and whilst there is nothing to be said against good slates used with discrimination and a nice sense of colour, there is no doubt that for homeliness and a comfortable appearance nothing is so attractive as the cottage that is tiled.

In the early days of Ministry housing, it was generally felt that repetition and standardization were to be avoided at all costs, and whilst the designers of housing schemes were for reasons of economy and in order to be able to carry out rapidly large numbers of houses, limited as regards the number of different types, it was felt that as far as possible the picturesque village of the English countryside, in which every cottage was a piece of individual history, was the model upon which the Ministry housing scheme was to be based. However, the hopelessness of producing even a lifeless imitation of an English village very soon became apparent, and it was seen that a group of from 50 to 500 houses, erected from a limited number of types, must depend upon other interests than those which belong to the historic town and village, which have grown up in quite a different way.

It was seen that quite new opportunities were offered the designer of Ministry houses—opportunities of producing compositions on a scale in this kind of building hitherto unknown.

In many of the best schemes, street compositions and the planning of squares and forecourts have introduced quite a new interest, and one which is eminently characteristic of the full communal existence which the tenants of these new housing schemes may enjoy.

It is regrettable that in the numerous lay-outs that are dotted all over the country, dull repetition has taken the place of composition, and very few have made their compositions the expression of real communal needs.

There are very few, moreover, who in the design of their houses have preserved that simplicity and breadth which is so essential to the cottage character, and who have escaped getting entangled in a conflict of faddist requirements that are so irritating to the general effect.

Amongst the more successful, and those which have not been marred by over many constructional and hygienic stunts, may be mentioned the charming cottages at Swanpool by Messrs. Hennell and James. These architects have shown that the casemented cottage, which is used there, can be as artistic and practical as the sash-windowed type, which they have also used with such good results elsewhere in their other schemes. An example from Welwyn is particularly worthy of attention.

Mr. Houfton, who at a very early date in the new movement gave us those delightful cottages at Woodlands, is still a believer in the casement, which he knows how to proportion so well.

Amongst those who have contributed to the distinctly Georgian type of cottage we would pick out at random the work of Messrs. Clayton and Black, who have carried out some of the houses in the Moulescombe Estate at Brighton, and whose fanlight doorways are so distinctive.

Another scheme which has been carried out with extremely picturesque character and on a distinctly picturesque site, is one by Messrs. Culpin and Bowers at Folkestone. There is something about this scheme which strikes one as being very free. The living-room windows remind one of those transomed windows which we associate with the rather more ambitious dwellings of the Elizabethan and Jacobean period, but they are used so well and are obviously so practical, that there is every excuse for this rather ambitious feature in cottage design.

Amongst designs that are worthy of mention on account of their good Georgian character may be mentioned the cottages of Mr. Waring, of Norwich; Messrs. Harvey and Wicks at West Bromwich, and Mr. Soutar at Kensington. Of rural cottages few are more charming than those which have been erected from the designs of Mr. Skipper of Norwich.

# Economy of Cost in House Building

TO an architect the problem of economy in building costs has elements of complexity which can seldom be taken account of in the utilitarian calculations of the engineers and sanitary experts who may be called upon to devote their attention to housing. The question to which he must address himself is not only how a house of given accommodation can be erected with the least expenditure of money, but how far such economy can be achieved without the sacrifice of that quality which marks the distinction between architecture and mere building. Of course, there are several only too obvious ways of cheapening the cost of houses. Cut the porch off the doorway, reduce your factors of safety by employing the smallest scantlings possible, eschew all cornices and other mouldings, leave out the felt under the slates, use two coats of paint instead of three, and so on. I do not propose to examine expedients such as these, but shall confine myself to a consideration of the means whereby a legitimate economy can be attained without forgoing either good construction or architectural effect.

Everybody must be familiar with countless designs which would actually have been improved if less money had been spent upon decorative features, and there is no need to insist upon the platitude that an embellishment badly handled may be worse than no embellishment at all. By the elimination of false ornament and of other meretricious features the cost of building can be reduced, and there are also arrangements of plan and of the grouping of houses which will tend to cheapness of construction. But although it is true that Mr. Bernard Shaw's dictum "The love of economy is the root of all virtue" expresses a truth which is as valid for architecture as for life in general, the term "economy" must here be construed as economy of means to a desired artistic end, and the need for economy should not be made an excuse for poverty of conception.

Even from the narrowest financial point of view the chief desideratum is not cheapness of construction, but rather an adequate return for money invested. In many instances a very small extra expenditure will so enhance the appearance and social status of a house that an addition in rent quite out of proportion to the additional capital sum invested in the improvement will readily be paid by the prospective tenant. Sometimes an appeal is made to an uneducated taste, such as that which demands a bay window or a gable to each subdivision in a row of cottages, and it is to be hoped that a better architectural ideal in cottage building will presently prevail. But whether the public taste be good or bad, it does not alter the fact that the degree of financial economy in building is not dependent merely upon cost of construction, but upon the relation of cost of construction to rent. And the client has a right to demand from the architect a house which, although it may not be the cheapest possible house of stated accommodation (for this might not be architecture at all), will yet have the greatest architectural value which can be supplied at a moderate cost.

With regard to the plan there are several obvious considerations which must be borne in mind. The perfect plan, however, does not exist, for in planning every virtue is liable to have its own characteristic defect. For instance, architectural students are often warned by their instructors to be sparing of passages wasteful of space, and to aim at the utmost compactness in the arrangement of rooms. Yet there can be too severe an economy in passages. Nobody wants to live in a house where several people happening simultaneously to emerge from the rooms on an exiguous landing must necessarily head for a collision. Nor is it to be forgotten that a passage is often a convenient place for cupboards, shelves, bookcases, which otherwise might cumber the rooms, and, in fact, a passage so employed cannot justly be described as waste space, for a house must be designed to accommodate not only persons but their effects. Economical planning is partly a matter of providing space for a certain quantity of furniture without this furniture appearing to be in the way. In this connection it may be noted that a doorway at the extreme edge of a wall is always unfortunate, as at least 4 ft. of the adjoining wall-space ought to be kept free from furniture in order that the door may open. An interval of 2 ft. or 18 in. between corner of wall and door is all that is needed to obviate this difficulty.

Of rectangular rooms, the most economical is the square, for this has the greatest area of floor-space per lineal yard of wall. It is sometimes hastily concluded, however, that a square or nearly square over-all plan must necessarily be the cheapest. But this is not the case, for the arrangement of the internal walls must be taken into account as well, and an elongated rectangle or even a T- or L-shaped house, of which the constituent chambers all approximated to the square form (even including the staircase hall) might easily be more economical of wallage than a square house of equal area subdivided into the same number of long and narrow apartments. Yet in comparing the respective cheapness of the two types, allowance must be made for the fact that external walls are more costly than internal ones, and the greater this difference in cost the more important will it be to adopt a simple form for the over-all plan. It is not to be assumed, however, that a house 30 ft. by 50 ft. will be cheaper than one of 25 ft. by 60 ft., although these houses are of the same area, and the former more nearly approximates to the square shape. Although the perimeter of the first house is 160 ft. as against 170 ft. in the second, it is probable that the extra cost of the larger roof timbers required for the 30 ft. span will neutralize the advantage of the shorter length of wallage, while the additional height of chimney-flues and party-walls, if any, will still further increase the comparative cost of the narrower-fronted house.

The nature of the roof construction has an important bearing upon costs. Obviously it is more economical to use slates at quarter pitch than either slates or tiles at a pitch of 50 or 60 degrees. For a low-pitched roof a hip is generally cheaper than a gable, but for a steep roof the gabled treatment has the advantage, assuming that the simplest form of construction be adopted in each case. The natural place of the gable, however, is either at the ends of the house or at the end of any projecting portion of it, and it is always an extravagance to place it as a decorative adjunct in the middle of the façade. In this latter case a gable is a quite gratuitous expense, for it entails additional roof truss, valleys, and brickwork, and it is highly questionable whether the resultant artistic effect is a praiseworthy one. Of course, if the gable has a window giving light to a room inside the roof, its use may be justifiable. The custom of placing rooms in a roof, however, although it reduces the cubical contents of a house, and may thus appear to be a cheap treatment, has many disadvantages. Dormers are always costly, and they generally fail to give adequate ventilation to the rooms. The practice of having steep roofs and dormers is really far more often due to a sentimental admiration of the mediæval cottage than to a desire for economy. For, granted that the mediæval cottage was cheap, the standard of bedroom accommodation has since undergone an important change, and people are no longer content to sleep in lofts. The type of client who wants airy rectangular bedrooms cannot be provided for more cheaply than by building up the walls to the ceiling of the topmost story of a house, and by surmounting them by a low-pitched roof.

One of the most lamentable results of the fluctuations in prices since the war is that lead has now become so costly that its use as a building material must be severely restricted.

This has had a most unfortunate effect upon design inasmuch as architects can now seldom venture to solve a difficulty of roofing by putting lead flats over small projections or irregularities of plan. Also, and this is more important still, the parapet wall, which was treated with such success in the eighteenth and early nineteenth centuries, has now become somewhat of a luxury. Where in domestic architecture an urban character is desired, a parapet will do more than any other feature to impart dignity to a façade and to effect that subtle distinction between a "house" and a "cottage." If an inventor could supply a cheap and serviceable substitute for lead to be used for gutters behind parapet walls, he would earn the gratitude of architects. The flat roof has practical advantages over any other kind, and it is a matter of urgent importance that the constructional problem it presents should have an economical solution. At present the architect is constantly being hampered in his planning by difficulties in connection with the roof, but with flat-roofed buildings he would more easily be able to indulge in those terminal projections and formal modulations which are necessary if houses are not to be characterized by a tiresome simplicity. "They look just like barns," is a popular criticism of many of the cottages recently erected. This comment is a just one, and the fault is partly due to the limitations of design imposed by the present necessity to adopt a form of roof which is apt to be uneconomical unless it is applied to a building shaped like a barn. On the other hand, gables, dormers, and half-timbered work are costly and unsatisfactory devices for mitigating the crudeness of these designs. If a simplicity of unit is to be insisted upon, by far the cheapest method of obtaining a good architectural effect is by large group formations of houses, which can be arranged in terraces, quadrangles, or other dispositions. By this means the repetition of the unit of the house, which is an important factor in economy, will no longer lead to monotony, because the eye will find satisfaction in the variety of the larger formations themselves and in the occasional emphasis at special points of the long façades. And it is scarcely necessary to point out that a house in a large block is cheaper than one detached or semi-detached. There is an obvious saving in external walls and in the drains, gas, water, and other services. The advocacy of continuous building, with as much repetition of the unit as may be necessary to the attainment of rhythm and orderly composition, does not imply an acceptance of the ideal expressed in the words "standard house." The "standard house" is an architectural abortion; it is conceived in ignorance of the fact that each individual building should have a relation to its environment. Moreover, common humanity is insulted at the suggestion that the homes of men should be cast in a single pattern, as if we had now reached the stage at which industrialism had obliterated distinctions of personality. Standard joinery may occasionally be tolerated, and, of course, standard sizes for bricks and timber scantlings, for slates and tiles, are extremely useful and tend to economy of building costs. But there are strict limits to the possibility of standardizing the design of a house or of any feature of a house.

A word may here be added with regard to the many systems of "special construction" which have been tried during the last few years. Exhaustive experiments have been made with concrete slabs and other artificial materials for walls, with excellent results. Bricks and mortar, however, can still hold their own.

There can be no doubt that, as far as methods of building construction are concerned, a state of great efficiency has been reached, and a large number of highly economical plans are being produced by architects. If houses are still too expensive for many people who would like to build or rent them, this state of things is not the fault of the architect or constructor, but it is due to the general financial situation.

---

# House Planning

## By MANNING ROBERTSON, A.R.I.B.A., late Deputy Chief Architect, Ministry of Health (Housing Department)

THE average layman is under the belief that there is nothing so easy in this world as to design a small house, and this illusion too often leads him to attempt the performance, with results on a par with doing eighteen holes in 126 strokes, the unfortunate difference being that, in the case of the house, each stroke over bogey costs some five pounds. Every avoidable bit of passage, each undigested corner adds its quota to the price, and the layman, delighted at having "done it himself" and saved architect's fees, not only pays more than those fees but also lives in less comfortable circumstances than he need, merely on account of his ignorance of planning.

It is not proposed in this article to deal with the desirability of any particular accommodation, nor does space permit of a discussion on the arrangement of rooms. One can only outline the broader aspects of the subject and consider the developments that should be aimed at in the future.

Before dealing with the actual planning of small houses it is necessary to emphasize certain conditions that must be fulfilled if satisfactory planning is to be possible. Practically all our troubles in the past have arisen from attempts to design houses on too narrow a front, and it cannot be too clearly understood that any such attempt can only end in failure. A net frontage of 19 ft. for a non-parlour house and 21 ft. for a parlour house is about the lowest on which a well-planned house can be built and, even so, too many houses of these dimensions would result in monotony. These figures refer to houses with rooms of the standard sizes laid down by the Ministry of Health. There have been two main reasons for the habitual overcrowding of buildings on a site: first, the excessive cost of land, usually due to "corners" created by landlord speculators; secondly, by-laws and other elaborate requirements as to the width and substance of residential roads, the cost of such roads being so great that as many houses as possible were squeezed along the frontage in an attempt to recoup this extravagant outlay. When these two obstacles are finally removed we shall find that the tendency to plan houses on narrow frontages will disappear, and with the passing of the cramped front will go the scullery pushed outside the main building into the back extension. Fig. 1 is a typical plan of the narrow-fronted Victorian house, a monstrosity that, even at the risk of wearisome repetition, must be illustrated in any discussion on house planning.

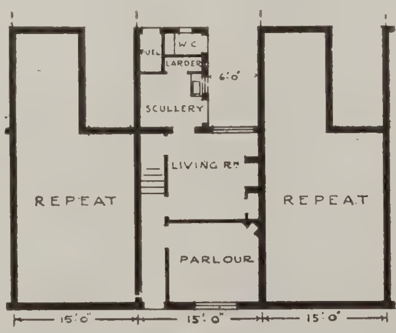


FIG. 1.

Illustrating the bad lighting and ventilation resulting from planning on too narrow a frontage.

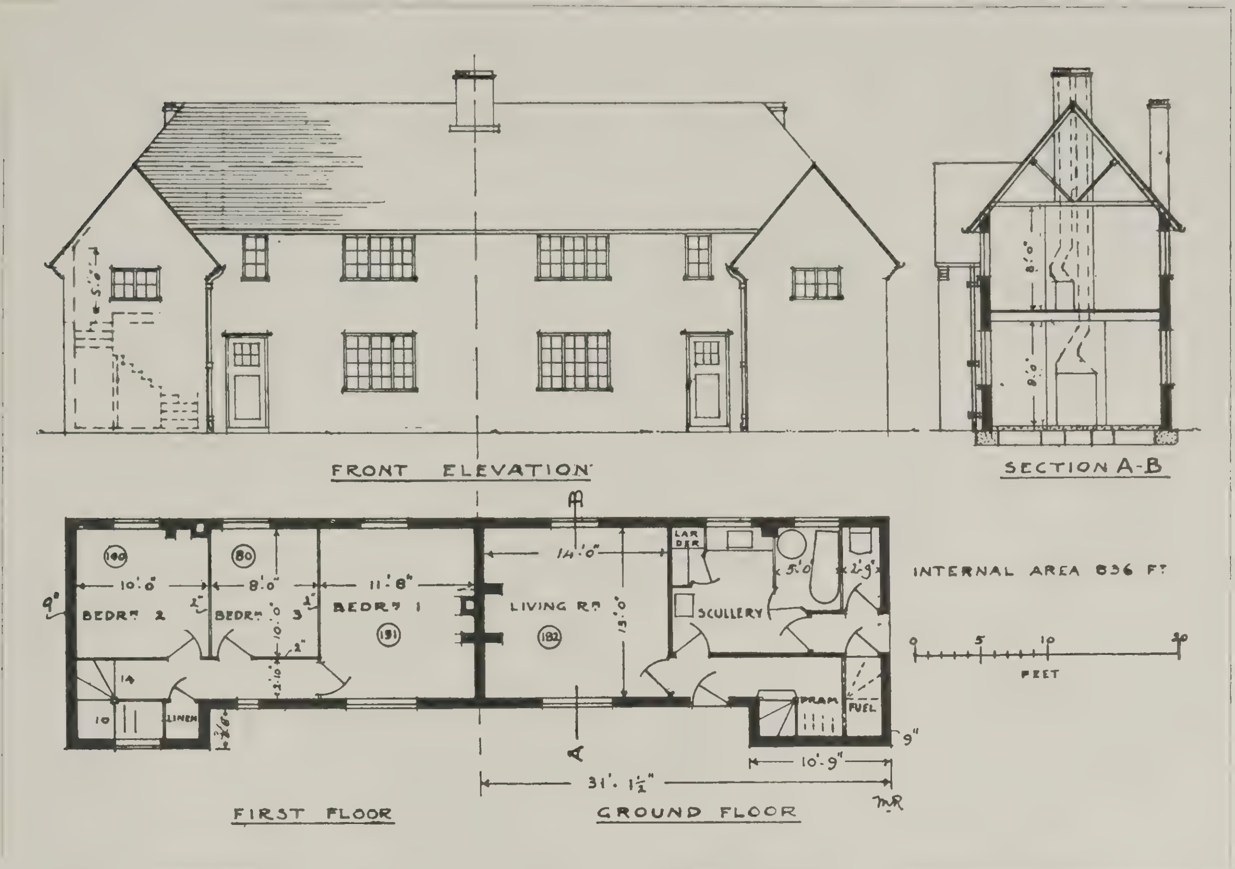

FIG. 2. THE "SUSSEX" TYPE. THE NARROW SPAN ECONOMIZES TILING.

When the frontage is so narrow that it becomes necessary to place the scullery in a back extension, we automatically prevent the sun from entering the main back window of the house, we convert the living-room into a passage looking out into a passage, and, in trying to plan adequately a row or terrace of such houses, we are attempting to solve a problem that would baffle Sir Christopher Wren if he were called up from the dead for that especial purpose.

To leave impossibilities out of account we must assume a sufficient width of frontage. There is probably no subject which has, in recent years, received such widespread and concentrated attention as the planning of small houses, more even than is indicated by the 176,000 houses built under the Government scheme, and one can therefore only summarize the results of recent experience. The two main points to be considered are clearly efficiency and economy, and, at the outset, we are faced with the difficulty that these vary with the locality in which the house is to be built. There is no definite house plan or form of construction that represents an absolute standard of cheapness, and while it is easy to grasp why local materials are cheaper than those requiring transport, it is not at first sight so clear why one type of plan should be cheaper in the Midlands and another in the South-East. We may well be thankful that this "relativity" exists, otherwise there would be a natural tendency to build the one absolutely cheap and efficient house throughout the country. The difference arises mainly on account of the prevailing local roofing material. If it be common tiles, a pitch of at least 45 deg. is necessary, and it is advantageous to utilize the space in the roof to the fullest extent if by this means roof space and outside walling can be economized. Plans of this type necessitate a considerable length of frontage, and often irregularity of outline, and we should therefore expect to find them in rural parts of Sussex and the neighbouring counties where land is reasonably cheap and where tiles are the local roofing material. The experience of the Ministry of Health confirmed this expectation, and houses of the type shown in Fig. 2 were usually found to be the cheapest to build in the circumstances mentioned. People whose experience lies only in other parts of the country are frequently inclined to be sceptical, but they may be reminded that builders will build most cheaply the type of house to which they are accustomed, and there still exists, fortunately, a large body of men who are accustomed to houses of what we may call the "Sussex" type, and who have brought the erection of such houses to a degree of nicety as regards economy that would be impossible to the man whose experience lies in the "square box" house.

Turning now to the Midlands and the North of England, where slates at 30 deg. pitch is the recognized roofing material, we find naturally enough that the "square box" is the cheapest house to build. With a pitch of 45 deg. or more the "square box" means a great roof area and consequent waste of roof space, and while a narrow span is therefore the characteristic of the Sussex house a wide span is more economical with the "square box," because when dealing with slates at 30 deg. the roof area is smaller and the waste of roof space is immaterial in comparison with the saving effected by keeping an unbroken roof. As a consequence of this we see that the "back extension" type of house, with its irregular outline and cut-up roof, is not only ugly and unhealthy, but actually more expensive to build than the same house built within a rectangle and slated in the usual way. The price of land and the cost of roads must have this extra charge debited to their account.

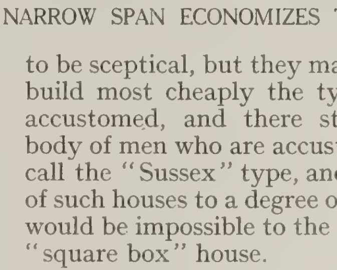

FIG. 3.

The "Square Box" Type. Compare the lighting and ventilation with that obtained on the fifteen foot frontage in Fig. 1, and note the increased economy in this plain roof and rectangular walling.

Fig. 3 illustrates a typical "square box" type of house, and the freedom it enjoys can best be appreciated by comparing it with Fig. 1. While it would be absurd to pretend that Fig. 3 illustrates all that could be desired, the type does probably represent all we can hope to obtain for real "working-class" houses in urban conditions. The double-fronted house, with a through living-room, requires a frontage of from 25 ft. to 30 ft. (Fig. 4), but the increased amenity it affords must mean a slight increase in rent, and our problem at present is to find the cheapest house that can be built consistent with efficiency and regard to the moral and physical welfare of the inmates. If the "working man" is to pay an economic rent out of wages bearing any resemblance to those he now receives, nothing but the lowest possible rent will do.

Locality has another important bearing upon the design of the house; the miner's requirements are entirely different to those of the Londoner, and the agricultural labourer has his own ideas which are by no means identical throughout the country; and we need not therefore be afraid of too great a degree of standardization. We must depend upon these divergencies of requirements and material to produce typical local architecture, an architecture which should arise not from the promiscuous bandying about of one individual plan or blue print (of which we have seen ten times more than enough already), but from an architectural grouping and lay-out of those plans that are found most suitable for the district in question.

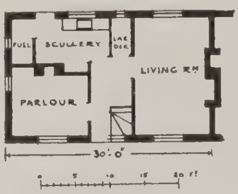

FIG. 4.

The "Double Fronted" type. (Taken from the Ministry of Health's Book of Type Plans.)

"Aspect" has been so thoroughly thrashed out that in embarking upon it one is afraid of "teaching one's grandmother to suck eggs." Seeing, however, that most old ladies would require instruction in this art, the risk must be run. It has been suggested that the Ministry of Health, in issuing the book of type plans, should have provided for a greater selection of aspects than merely north and south, but the truth is that each site should have separate consideration. The aspect is not all; the thoroughfares, the surrounding country, the prevailing winds, and numerous other factors should be taken into account when a plan is selected, and in a general collection of type plans little can be said beyond labelling a house "north" if the larder faces the front and the living-room behind, and "south" if positions are reversed. As a general guide this is all that can usefully be done without providing an enormous number of plans. The main reason for disregard of aspect in the past has, of course, been that the houses (Fig. 1) had no aspect at the back, it was therefore immaterial whether the dingy passage faced north, south, east or west.

Finally it may be said that no cottage plan has ever been produced that is not open to criticism. The planning in a really economical house is so compact that some of the minor amenities must be allowed to look after themselves; the important point is to realize which are minor and which are major, and this will to a great extent depend upon the site and prospective tenants of the cottage in question.

No model type plans, however efficient, can take the place of the individual designer. The lack of personal attention and an acceptance of impossible conditions have in the past led to a complete absence of design, to unhealthy homes, and an amazingly stereotyped monotony. It is to be hoped that the present renaissance in cottage architecture will result in the architect and the builder joining hands, first to insist on a fair field in which to work, and then jointly to produce results creditable to themselves and to the country.

# London County Council Housing Schemes

## G. TOPHAM FORREST, F.R.I.B.A., Architect to the Council

ROEHAMPTON and Bellingham are two of the L.C.C.'s most important housing estates. The first section of the former has been completed, and comprises 624 cottages and maisonnettes. The Bellingham Estate will be completed by the end of January, 1923. It is the second largest of the Council's estates, the total number of cottages and flats on the estate being 2,089.

As in the case of all the other L.C.C. estates, the lay-outs and houses have been designed by the architect to the Council, Mr. G. Topham Forrest, F.R.I.B.A., F.R.S.E., F.G.S., and, as the accompanying illustrations show, he has obtained exceptionally pleasing and satisfactory results, and this notwithstanding all the difficulties at first experienced in obtaining suitable materials.

The Roehampton Estate is one of the most charming of the municipal housing estates in the country. The combination of the different coloured materials in the houses, the grouping of the blocks, the width of the roads, and the sense of openness about the estate, give in the result all that is looked for in the lay-out of a garden city.

Since Mr. Topham Forrest's appointment the L.C.C. has let contracts for 7,420 houses and 323 tenements (block dwellings). Of these over 6,000 houses and about 200 tenements have actually been completed, a remarkable achievement when we remember that Mr. Topham Forrest has been architect to the Council for only three years. He has already earned the thanks of London architects for the helpful way in which he administers the various Building Acts, and now he is to be further congratulated on the excellent results he has achieved as an architect in the design and lay-out of the Council's housing estates and in the design of new educational buildings for the same authority.

### ROEHAMPTON ESTATE

This estate is 147 acres in extent, and was purchased in October, 1919, for £120,000. It lies to the west of Putney Park Lane, between the Upper Richmond Road and Putney Heath, and rises from north to south.

The northern portion of the site, to the extent of about 94 acres, has been reserved for development by the Council for the housing of the working classes.

This reservation is distributed as follows :—

| | Acres. |
|---|---|
| Housing site | 52 |
| Schools, shops, etc. | 8 |
| Roads, allotments, and open spaces | 34 |
| | 94 |

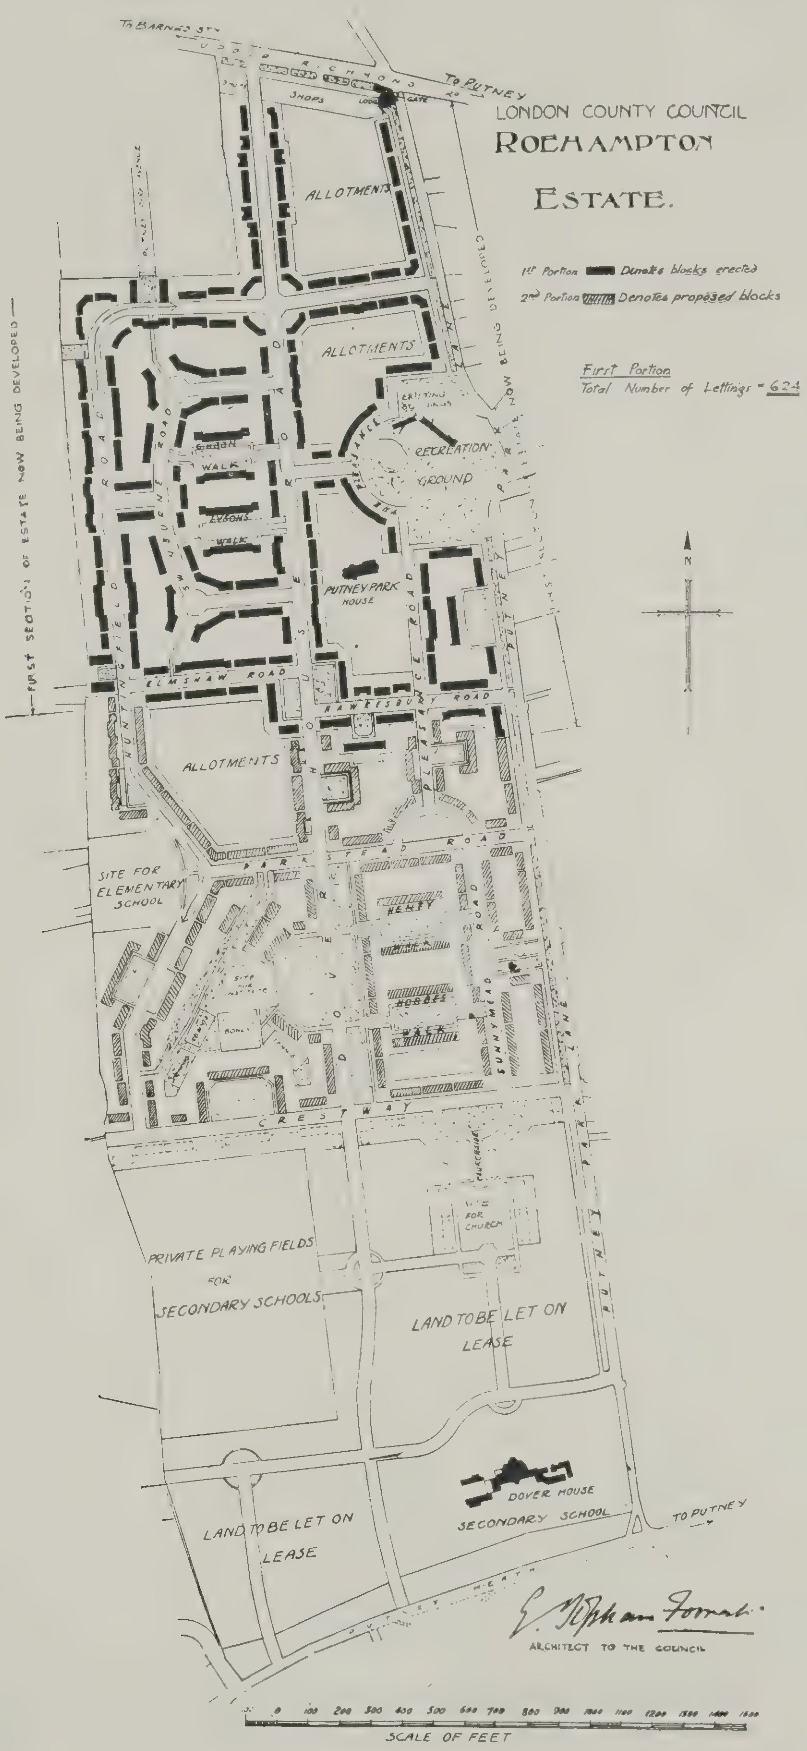
Distribution of remaining land :—

| | Acres. |
|---|---|
| Area reserved for houses other than working class | 34 |
| Secondary school | 5 |
| Church site | 1 |
| Roads and open spaces | 13 |
| | 53 |

*Accommodation.*

The portion of the estate developed comprises 624 cottages and maisonnettes as under :—

| | | |
|---|---|---|
| Three-room cottages | (living-room and two bedrooms) | 37 |
| Four-room ,, | (living-room and three bedrooms) | 222 |
| Five-room ,, | (living-room, parlour, and three bedrooms) | 271 |
| Two-room maisonnettes | (living-room and one bedroom) | 66 |
| Three-room ,, | (living-room and two bedrooms) | 28 |
| | | 624 |



LAY-OUT OF THE ROEHAMPTON (L.C.C.) HOUSING ESTATE.

G. TOPHAM FORREST, F.R.I.B.A., ARCHITECT TO THE COUNCIL.

*Rent, Rates, and Taxes* (*November*, 1922).

| | Rent. | | Rates and Taxes. | | Total. | |
|---|---|---|---|---|---|---|
| | s. | d. | s. | d. | s. | d. |
| Five-room house .. .. | 18 | 6 | 7 | 4 | 25 | 10 |
| Four-room ,, .. .. | 15 | 6 | 6 | 4 | 21 | 10 |
| Three-room ,, .. .. | 14 | 6 | 5 | 10 | 20 | 4 |
| Three-room flat .. .. | 12 | 6 | 5 | 0 | 17 | 6 |
| Two-room ,, .. .. | 11 | 0 | 4 | 2 | 15 | 2 |

*Schools.*

There will be one elementary school for 996 places, divided as follows :—

312 places for boys.
312 ,, ,, girls.
372 ,, ,, infants.

996

The junior portion is already built, and accommodation is temporarily provided there for 384 junior mixed pupils and infants. There will be one secondary school, for which a site of 5 acres has been reserved.

In framing the lay-out and designing the cottages, special regard has been paid to the preservation of the amenities of the neighbourhood, and natural features, including the finer trees, have been retained and absorbed into the scheme as far as possible.

In order to secure the maximum amount of sunlight in the principal rooms, particular attention has been directed to the grouping and aspects of the various blocks.

Among features of interest are turfed open spaces at the more important road crossings, and open greens bounded by subsidiary roads.

A scheme of seclusion is created by the judicious use of feature blocks as closing vistas, and this will be enhanced as the shrubs and trees included in the general scheme mature.

The scheme for the whole estate provides for the erection of approximately 1,200 houses, comprising two- and three-room maisonnettes, and three-, four-, and five-room cottages.

As will be seen from the plans, each house erected on the first portion of the estate has a separate bathroom (with lavatory basin, except in the case of the three-room cottage) and w.c., a hot-water system, supplying bathroom and scullery, and space for a perambulator or cycle.

Messrs. Leslie & Co., Ltd., and Mr. F. G. Minter were the general contractors for Roehampton. The sub-contractors were as follows :—*Tiling and slating :* Messrs. A. W. Allard & Co., Ltd., Clapham Junction. *Fencing :* Messrs. W. Turner, Riley & Co., Ltd., Putney Bridge Road; Messrs. John Stenning and Son, Ltd., East Grinstead. *Tar paving :* Messrs. Josiah Smart and Son, Gray's Inn Road. *Metal casements :* Messrs. The Crittall Manufacturing Co., Ltd.

## BELLINGHAM ESTATE

The estate at Bellingham is one of the largest State-aided schemes approved by the Minister of Health. The site, of about 250 acres, was purchased by the Council, the price being about £200 per acre. It is situated in the Metropolitan Borough of Lewisham, about nine miles from Charing Cross.

Comprising an area of about 175 acres, the estate is, roughly, a triangle enclosed on the west by the Mid-Kent branch of the S.E. & C. Railway, on the east by the Catford loop-line of the S.E. & C. Railway, and on the south by Southend Lane.

The area is served by three stations, of which Bellingham is the most central. Trams and omnibuses pass close by along the Bromley Road. Following are some interesting particulars :—

| | Acres. |
|---|---|
| Housing site .. .. .. .. .. .. | 176·5 |
| Area reserved for houses other than working class .. | 52·0 |
| Market gardens, etc. .. .. .. .. .. | 23·5 |
| | 252·0 |

The housing site includes :—

| | |
|---|---|
| Allotments .. .. .. .. .. | 20·40 |
| Recreation ground .. .. .. .. | 9·50 |
| Site for two schools .. .. .. | 4·79 |
| Site for churches, shops, etc. .. .. | 4·58 |

*Accommodation.*

399 five-room houses.
1,103 four-room ,, without parlours.
111 four-room ,, with parlours.
188 three-room ,,
156 three-room flats.
132 two-room ,,

2,089

An estate office and workshop in Randlesdown Road.

*Rent, Rates, and Taxes* (*November*, 1922).

| | Rent. | | Rates and Taxes. | | Total. | | |
|---|---|---|---|---|---|---|---|
| | s. | d. | s. | d. | £ | s. | d. |

| Two-room ,, .. .. | 10 | 0 | 3 | 0 | | 13 | 0 |

*Schools.*

There will be two elementary schools.

*The N. School :* 1,024 places.

384 places have been provided for infants.

320 additional places will be ready early this year.

320 further places will be ready in February, 1923.

*The S. School :* 1,024 places.

It is expected the erection of this school will be started early this year.

*Construction.*

The construction of the houses is as follows :—

External walls : 11 in. hollow walls faced with various bricks.

Internal walls : largely coke breeze.

Wood floors.

Roofs covered with Courtrai, Marseilles, Van Eght, Home tiles, and Welsh slates.

A point of interest about the blocks which have been erected on rising ground is that they have been designed with the floors stepped, and at the same time unsightly breaks in the horizontal lines of the roofs have been avoided.

Sir Robert McAlpine and Sons were the general contractors for the Bellingham Estate, and the following were sub-contractors :—*Plasterers :* Messrs. H. and F. Badcock, Peckham; Messrs. Jefferyes & Co., London; Mr. H. Hitchings, Balham. *Glaziers :* Messrs. Brooks, Phillips & Co., Paddington Green; Mr. A. Goldstein, Gillingham, Kent; Messrs. Smith and Owen, Beckenham; Messrs. W. Weller and Sons, Catford. *Tilers :* Messrs. Roberts, Adlard & Co., Bermondsey; Messrs. Nethercot & Co., Stratford Market. *Painting :* Messrs. J. and R. Anderson, Glasgow. *Road surfacing and garden paths :* Messrs. Constable, Hart & Co., London. *Asphalt :* Messrs. The Limmer and Trinidad Lake Asphalte Co., Ltd., London; Messrs. The Ragusa Asphalte Co., Ltd., London. *Fencing :* Messrs. The Vectis Stone and Fencing Co., Ltd., Hay, Herefordshire; Messrs. The Fernden Fencing Co., Guildford; Messrs. Turner, Riley & Co., Putney; Messrs. The Merton Abbey Joinery Works, Merton Abbey.

# Welwyn Garden City, Herts

C. MURRAY HENNELL F.S.I., and C. H. JAMES, A.R.I.B.A., Architects

THE houses shown in the accompanying plans and photographs form part of a "middle class" housing scheme embarked on by a "Public Utility Society," known as "Labour Saving Houses, Ltd.," which received Government financial assistance under the 1919 Housing Act. It will be appreciated, therefore, that the architects were strictly limited as to cost.

The building of the first twenty-eight houses, in Brockswood Lane and the northern part of Dellcott Close, illustrated by the photographs taken from points Q, T, and U, was started in 1920, when good facing bricks were practically unobtainable except at prohibitive prices and in uncertain quantities. Rough-cast was, therefore, resorted to, but in the later houses, at the end of Dellcott Close (see photographs taken from points X and Z), also at the corners of Valley Road and Ayot Road, the availability of bricks facilitated a Georgian treatment of the elevations, mixed red and Luton grey facings being used.

The siting of these houses, as shown on the plot plan, was more or less dictated by the General Town Planning of Welwyn Garden City, the levels of the land (severe and difficult falls being encountered throughout), and the fact that the Society required for the most part semi-detached houses. The accommodation in the houses ranges from living-room, scullery, and two bedrooms (generally known as Type A2), to living-room, dining-room, kitchen, scullery, and four bedrooms (Type B4), and some of the houses have a living-room, dining-room, with a working scullery recess, and two or three bedrooms. In every house there is a bathroom and one separate w.c., and in the larger types a second w.c. is provided.

With an unlevel site and such small units as semi-detached houses, it was extremely difficult to obtain any continuity of line, but the linking-up of the houses by high square trellis fencing and gates, which was the most that could be afforded, has obviated the usual draughty-looking opening between such buildings, and when Nature has had her way in the form of ramblers, shrubs, and trees, many of which had yet to be planted when the photographs were taken, a restful and harmonious result is likely to be achieved.

The quadrangle at the southern end of Dellcott Close, flanked by a block of four houses on each side and terminated by two pairs, gave the architects a much better chance, but here again the severe fall across the site did not readily lend itself to such a treatment. However, this has been overcome in such a way that, unless the observer's attention is drawn to the difference of levels, he will come away with the impression that the site is practically a flat one.

# Housing Schemes at Totnes (Devonshire), and Ham (Surrey)

### ADSHEAD and RAMSEY, FF.R.I.B.A., Architects

THE original scheme at Totnes provided for forty houses, provision being made for the addition of future houses from time to time, as required. Of this scheme twenty-four houses have been built along the main road.

The site is a comparatively flat one, and the interest of the lay-out centres around the small square.

The houses are built of concrete blocks covered with cement plaster, finished off with a wood float and coloured a light cream. The roofs are covered with slates from the Delabole Slate Quarries in Cornwall.

The Ham scheme consists of twenty houses, built with London stock bricks and roofed with double Roman tiles of bright orange-red. The windows are all sash.

Architectural character has been obtained by a careful disposition of windows and wall spacing. The doorways have evidently been designed with great care. (Mr. E. J. Partridge, Architect to the Dysart Estate, was associated with Messrs. Adshead and Ramsey in this scheme.)

# Hatfield Housing Scheme

C. M. CRICKMER, F.R.I.B.A., and ALLEN FOXLEY, M.A., Architects

THIS scheme consists of seventy-two houses on four different sites, three of which are here illustrated. The house plans show various methods of meeting the requirements of the Ministry of Health on sites with various aspects. The architectural treatment is simple and effective, and the different groups make charmingly picturesque compositions. At Ground Lane there are thirty-six houses (Messrs. Miskin and Sons, of St. Albans, builders); at Welham Green twenty houses (Mr. J. Naden, of Hatfield, builder); and at Stanborough eight houses (also built by Mr. J. Naden). The steel windows are by Messrs. Henry Hope and Sons.

# Housing Scheme, The Durlocks, Folkestone

For Sir PHILIP SASSOON, Bart., M.P.

CULPIN and BOWERS, Architects

EVERY circumstance conspired to render the buildings at Folkestone, here illustrated, immune from the charge of monotony so frequently levelled at State-aided housing schemes. Perched high on the East Cliff, and overlooking the familiar harbour, the site is roughly rectangular, and is bounded on the east and south by existing roads and on the west by a public right of way adjoining the railway. A reference to the block plan on this page shows at a glance the lay-out adopted, which in itself calls for no particular comment until it is pointed out that from N.E. to S.W. the ground falls 36 ft. In order to obtain the requisite balance between the buildings flanking the new cul-de-sac, those on the right were planned as cottages with their first floors entirely in the roof, while those opposite consist of blocks of similar overall sizes and with their roofs at the same level, but with both stories entirely below the level of the eaves.

The scheme is a small one, comprising thirty-three dwellings, none having parlours; it includes a number of flats with only two bedrooms—at the time these were rather an innovation, but have since proved very successful, as has also the endeavour to make the most of the necessarily restricted space by forming the bathrooms as annexes to the sculleries, with folding doors standing back against the walls except when the bath is in use.

All the living-rooms have "Registroven" combination stoves with hot-water circulation to sink and bath. Gas-cookers and electric light are installed throughout.

The main interest of the scheme lies in the front block, which is illustrated in some detail. It involved the demolition of some old property at the south-west corner of the site, and was not finally embarked upon until the remainder of the scheme had been completed.

THE COVERED WAY.

It consists of twelve dwellings which, owing to the necessarily stepped levels, are rather complicated, both as regards planning and the manner in which they fit together. The most exceptional case is that of the lowest dwelling of all, which is entered on the left of the lower covered way. The front door gives access to a landing with one bedroom and w.c. at this level, and the stairs lead down to another bedroom and the garden door, and up to the main floor with the largest bedroom, combined scullery and bathroom, and the living-room, this last being built over the covered way, which is the only position in which a southern aspect could be secured. The manner in which the other dwellings—some flats, some two-story cottages—are interlocked is almost equally unconventional, and can best be gathered from the plans and the longitudinal section.

Externally it was endeavoured to carry on the traditions of the old fishing town, with a central innovation in the shape of a Dutch gable, somewhat similar in form to those built by Mr. Herbert Baker at Lympne, and here introduced at the wish of Sir Philip Sassoon. The walls are of cavity brickwork, part faced with smooth white plaster and part hung with tarred weather boarding. Owing to the exposed situation the roofs are boarded, felted, counter-battened and tiled, old tiles being used as far as practicable. The casement windows are of wood with wood bars generally, but leaded glazing in plain rectangles where they occur in weather-boarded surfaces. Casements not easily accessible from the outside are hung on Parkes hinges to facilitate cleaning. All external joinery and ironwork is painted black.

The lower passage-way has oak beams, mainly salvage from the old buildings, that on the face being trussed up with heavy-framed oak brackets—seen in one of the photographs. The floor over the beams in this case, and wherever one occurs between two separate dwellings, is of concrete reinforced with "Self-Sentering."

One of the more normal blocks is illustrated on page 36. This is the one on the left of the cul-de-sac, and comprises

a central two-story cottage with two small flats at either end, the upper flat in each case being approached by an independent stairway on the flank. Owing to an accentuation of the slope of the ground at this point it was necessary to form small storage basements along the back of this block, and the story of these basements is one likely to interest most architects. When the work was approaching completion Sir Philip Sassoon, realizing that such abundant storage was hardly necessary, instructed the architects to see what could be done to utilize the space to better advantage. The basement flat shown on the plans was the result. It was inexpensive, and is reasonably convenient, but its tremendous length and shallow depth probably render its plan unique in the annals of housing.

Much of the success of the project was due to the keen personal interest of Sir Philip Sassoon, not only in the foundation of the public utility society formed to promote the scheme, but in every detail of the actual work, while Mr. O. Marx, of Folkestone, proved an ideal contractor.

The work was carried out under Messrs. Ewart G. Culpin and R. S. Bowers, architects, of Bush Lane, E.C., and Mr. F. W. Charles Barker, surveyor, of the same address; while Mr. Wm. Beeston, M.S.A., of Dover, held a watching brief for the architects.

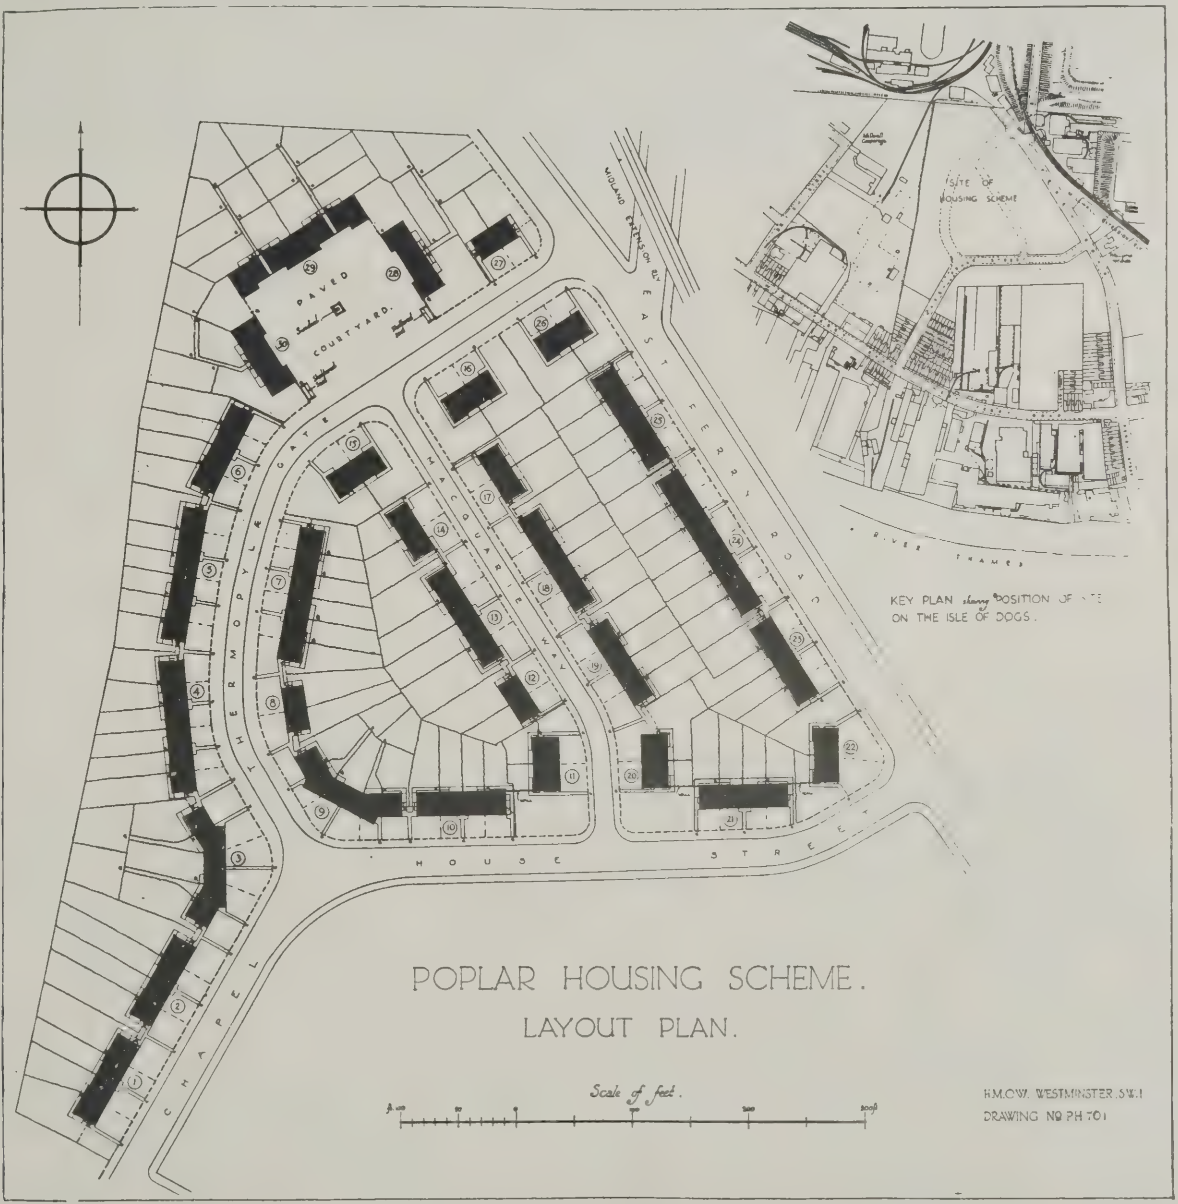
# Poplar Housing Scheme

## By H.M. OFFICE OF WORKS

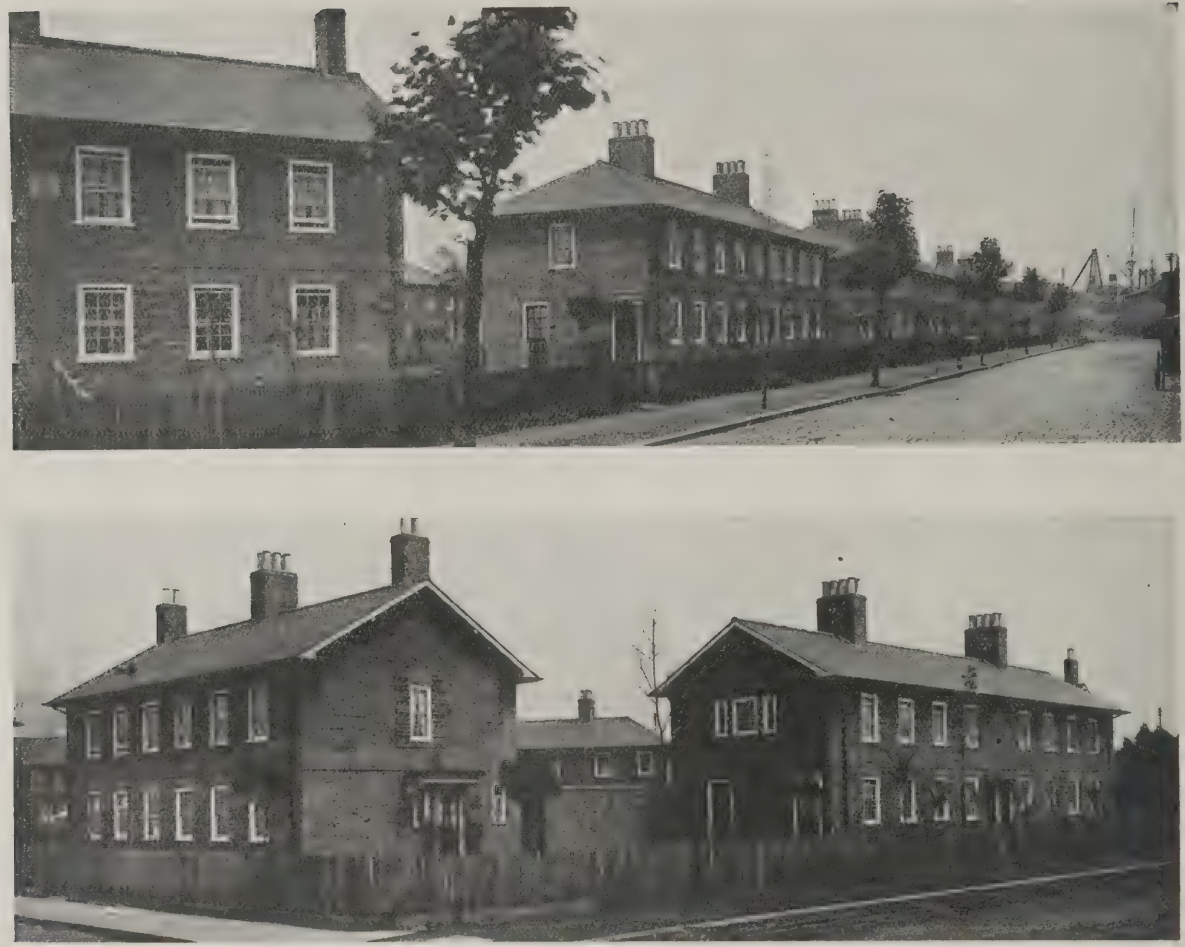
THIS scheme, a comparatively small one compared with others carried out by H.M. Office of Works, is situated between Chapel House Street and East Ferry Road in Cubitt Town, Isle of Dogs, and occupies about 7½ acres. It is interesting in showing what can be done with what appeared at first to be an unpromising site in an unattractive factory area.

The scheme was prepared by the Housing Section of H.M. Office of Works for the accommodation of 120 families, and approved by the Ministry of Health, a lay-out having been prepared by Mr. Harley Heckford, M.I.C.E., Borough Engineer and Surveyor to the Metropolitan Borough of Poplar, and approved by the Housing Board.

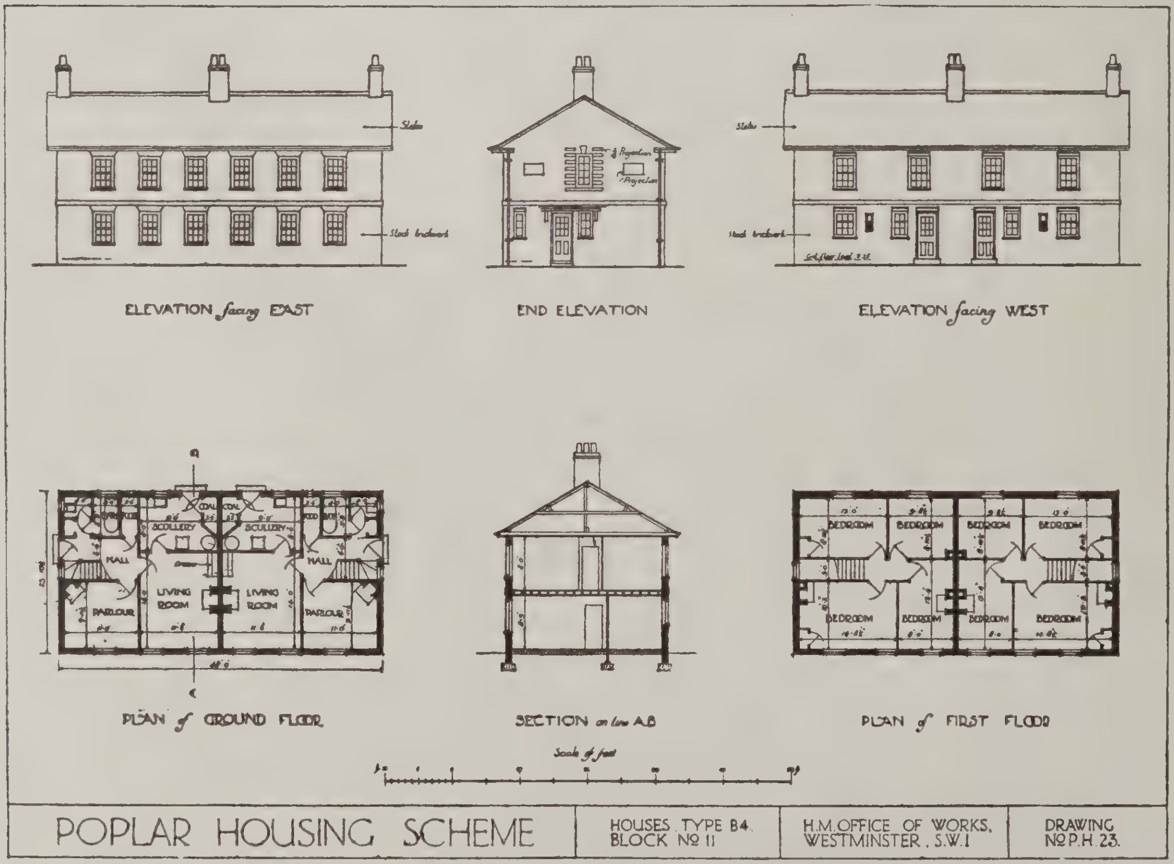
The dwellings comprise sixty "A" type houses, with living-room, scullery, three bedrooms, bathroom, and the usual offices; thirty "B" type houses which have a parlour in addition to the foregoing; six "B4" houses with living-room, parlour, scullery, four bedrooms, and bathroom; and



THE LAY-OUT.



GENERAL VIEWS.



POPLAR HOUSING SCHEME. DESIGNED BY H.M. OFFICE OF WORKS.

twenty-four "A2" type flats with living-room, scullery, two bedrooms, bathroom, etc. The houses are of two stories, and the flats of three; the latter, erected round three sides of a paved quadrangle, have mansard roofs. The dwellings, including the flats, are sixteen to the acre. The walls are of London stock bricks, and the roofs slated. Electric lighting is provided in each of the 120 tenements by the Poplar Borough Council's electricity undertaking, and gas-cookers by the Commercial Gas Company. In addition to cookers, gas-heating stoves are provided in the parlours of thirty houses.

The roads, sewers, and drainage connections under the roads were constructed by the Works Department of the Poplar Borough Council, and the houses by Messrs. Griggs and Sons, Builders, Manchester Road, E.C.4. Scheme started January, 1920; completed January, 1921.

# Camberwell Housing Scheme

## By H.M. OFFICE OF WORKS

THIS scheme was carried out by the Housing Section, H.M. Office of Works, by direct labour for the Borough Council of Camberwell. The scheme comprises three sites, namely, Red Post Hill, Hawkeslade Road, and Lanbury Road, the two latter sites being situated in the Nunhead district.

Red Post Hill site is hilly and well wooded, and in laying out the schemes trees have been preserved wherever possible, and a beautiful area has been allotted to recreation at the lower end of the site.

The houses, which average twelve to the acre, number 292 on Red Post Hill site, comprising fifty type "A," 202 type "B," and forty flats. On the Hawkeslade Road site there are eighty-four dwellings, namely, twenty-four type "A," fifty-two type "B," and eight flats, and at Lanbury Road there are fifty-two houses, sixteen type "A," thirty-six type "B," making a total on the three sites of 428 dwellings.

Some of the houses on the Red Post Hill site are constructed of stock bricks and slates, and some of Fletton bricks, rough cast on the exterior, and with tiled roofs at 40 degrees pitch, and casement windows.

On the two other sites stock bricks are used throughout for the walls, the roofs being slated at a 30 degrees pitch. The houses have sash windows.

The scheme was commenced in April, 1920, but Hawkeslade Road and Lanbury Road schemes have been completed for some time. Only very few houses on the Red Post Hill site now remain to be handed over to the local authorities.

# Banbury Housing Scheme

## T. LAWRENCE DALE, F.R.I.B.A., Architect

THE rural district of Banbury lies at the extreme north of Oxfordshire, and rests almost entirely on a surface bed of ironstone. The architectural character of the district is that of the Cotswolds, but thatch is more common than stone slates. The new houses were designed to harmonize with the character of the villages in which they are situated.

The scheme consists of 170 houses built in groups, varying from four to twenty-six, in all the parishes in the district. The houses at Wroxton lie on the main Stratford-on-Avon road, and are built of the local ironstone and covered with grey-green Westmorland slates. The mansard roof, besides producing the low proportion characteristic of the old thatched cottages in the village, reduces the amount of stone-walling, and adds to the thickness of the wall to the first floor area. The water supply is by a well situated in the centre of the group. Care has been taken to preserve the old trees. The site at Hook Norton presented many difficulties by reason of the levels and the fact that old quarries and patches of made ground were encountered. The whole of the stone for this scheme was quarried from the site. The roofs are covered with Dutch pantiles.

Generally the sanitation is by earth closets, which have proved entirely satisfactory, the slop water being taken to septic tanks. The ground floors are covered with "Ebnerite" flooring, steel sashes having been supplied by Messrs. Gibbons, of Wolverhampton.

The general contractors for the greater number of houses were Messrs. Henry Boot and Sons (London), Ltd., other contractors being Messrs. Wheeler Bros., Reading; The Harpenden Building Company; Messrs. Hopcraft, of Deddington; and Messrs. Poulton, of Sibford Gower.

# Housing Schemes at Lemington and Throckley, Northumberland

### HARVEY & WICKS, and ADSHEAD & RAMSEY, Architects

ORIGINALLY the Newburn-on-Tyne Urban District Council decided to develop two sites, one at Throckley and one at Lemington, situated about two miles apart, and to build 500 houses on each. Owing to the curtailment of the housing scheme programme, however, only 500 of these houses have been built altogether, viz., 250 at Throckley and 250 at Lemington.

*Lemington.*—The building site at Lemington is on the side of the hill approached by a short communication road on the main Newburn to Newcastle Road. The chief feature of the lay-out is the horseshoe centre with site for school on the lower part.

Very careful consideration has been given to the various widths of roads, and to the treatment of grass margins and tree-lined avenues.

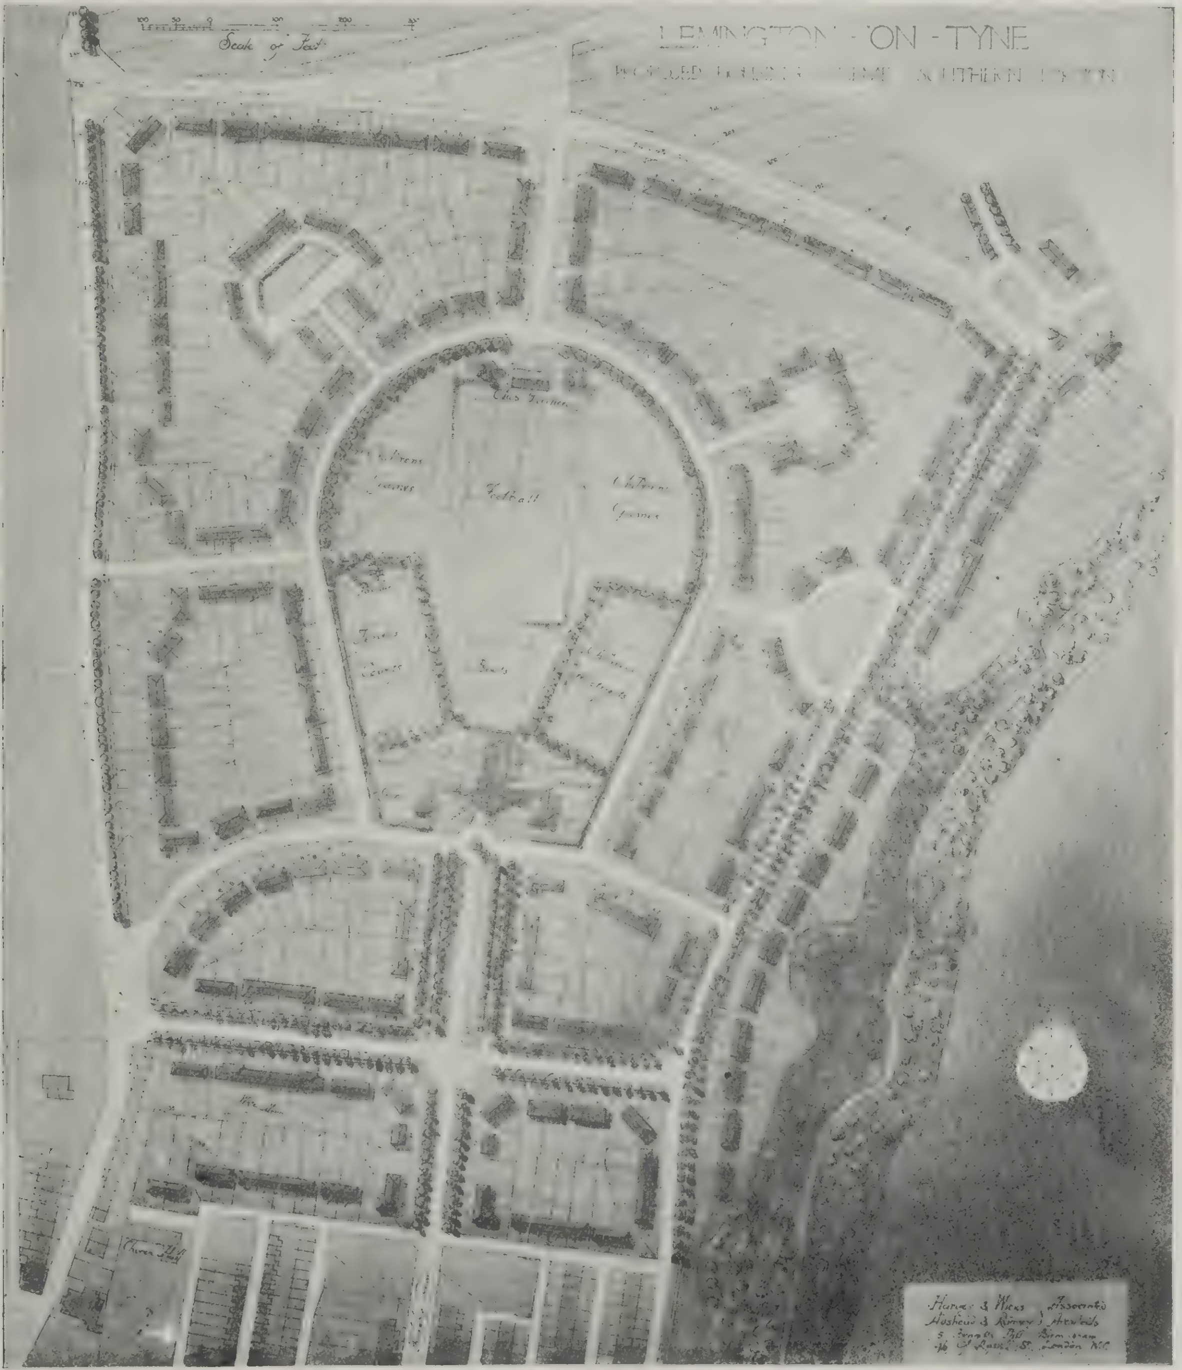
*Throckley.*—As at Lemington, the Throckley site is also on the side of a hill bounded by the public road on the west side, with a deep dene or ravine on the east.

On the western road, at the southern entrance to the estate, arrangements have been made for a small shopping centre.

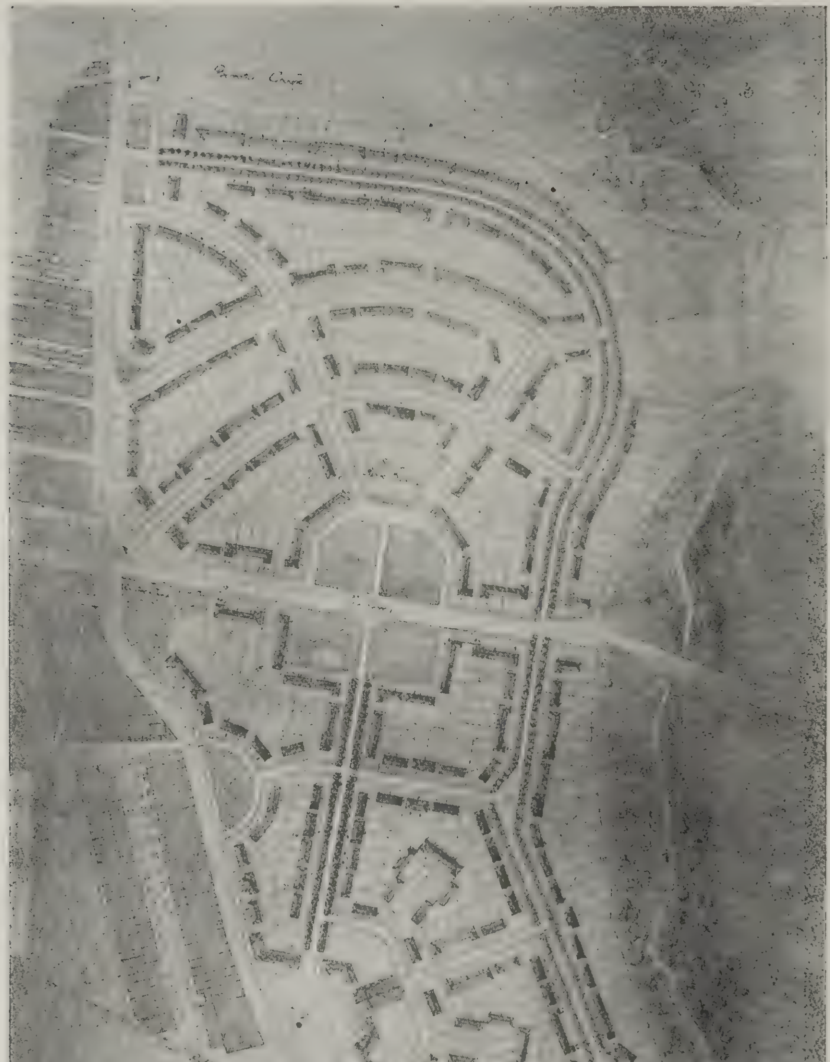
One of the chief points to be considered in this lay-out was the necessity for communication between the lower end of the western road and the main Newcastle Road which runs along the northern extremity of the site.

It is interesting to note that the old Roman wall which

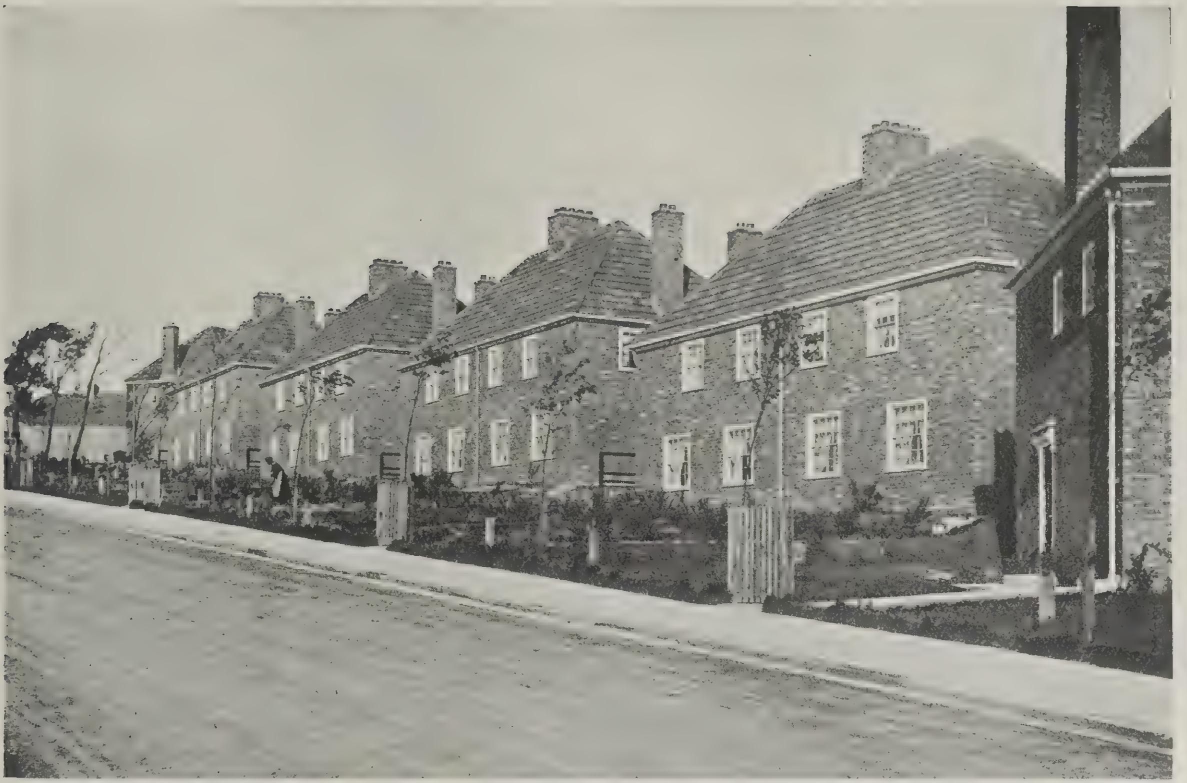
(*Continued on page* 48).

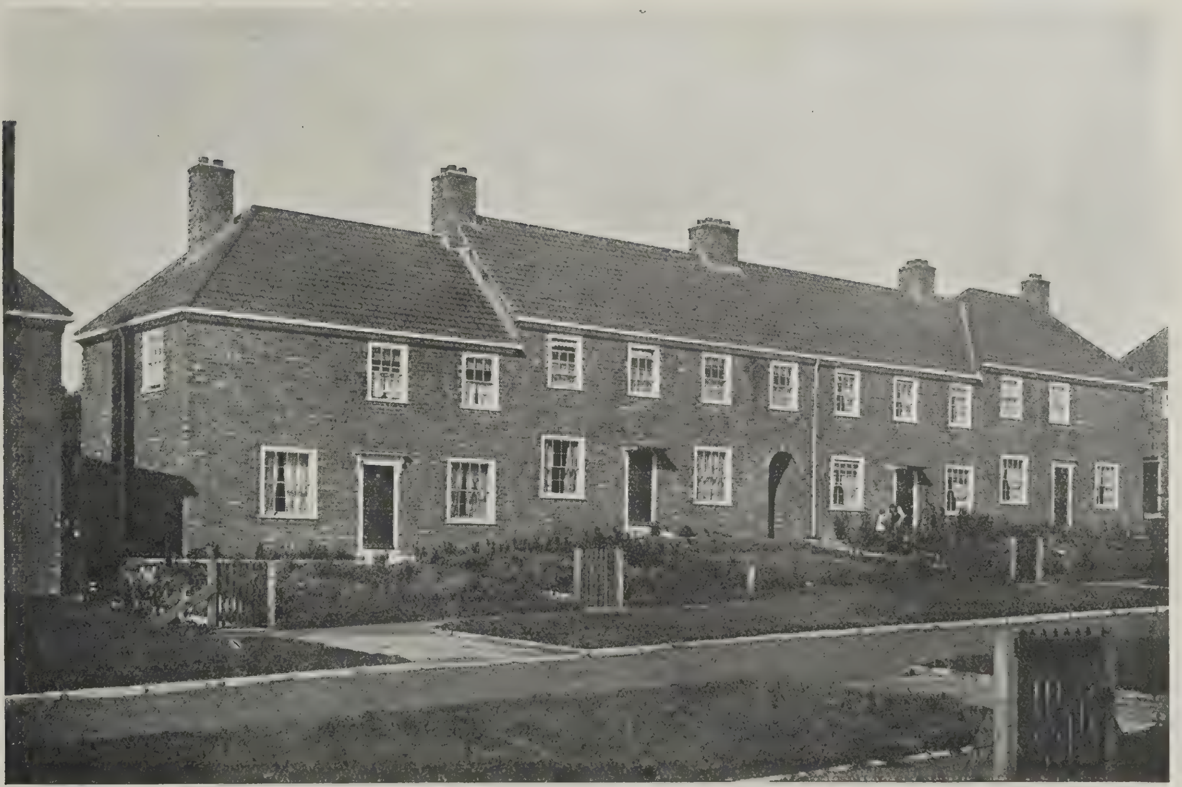


LAY-OUT OF LEMINGTON-ON-TYNE HOUSING SCHEME.



LAY-OUT OF THROCKLEY HOUSING SCHEME.





NEWBURN-ON-TYNE HOUSING SCHEMES: SOME TYPICAL VIEWS.
HARVEY & WICKS AND ADSHEAD & RAMSEY, ARCHITECTS.

(*Continued from page* 45.)

originally ran right across England, and was built to keep out the Picts and Scots (immediately to the south of the Newcastle Road), practically forms the northern boundary of the scheme. Portions of this wall were discovered during the progress of building operations.

The houses both at Lemington and Throckley are built of a local reddish brown coloured brick of rather rough texture, and the roofs are covered with Major's patent double Roman tiles.

The majority of the houses have sash windows, but in some cases where a gabled roof has been used, casements have been employed on the first-floor windows, in conjunction with sash windows on the ground floor, an interesting example of sash and casement treatment which is frequently found in old cottages, and, in particular, in many parts of Suffolk and Norfolk. In all probability the original cottages had all the windows of the casement type, but afterwards when sash windows came into general use, windows of this type were introduced into the principal ground-floor rooms.

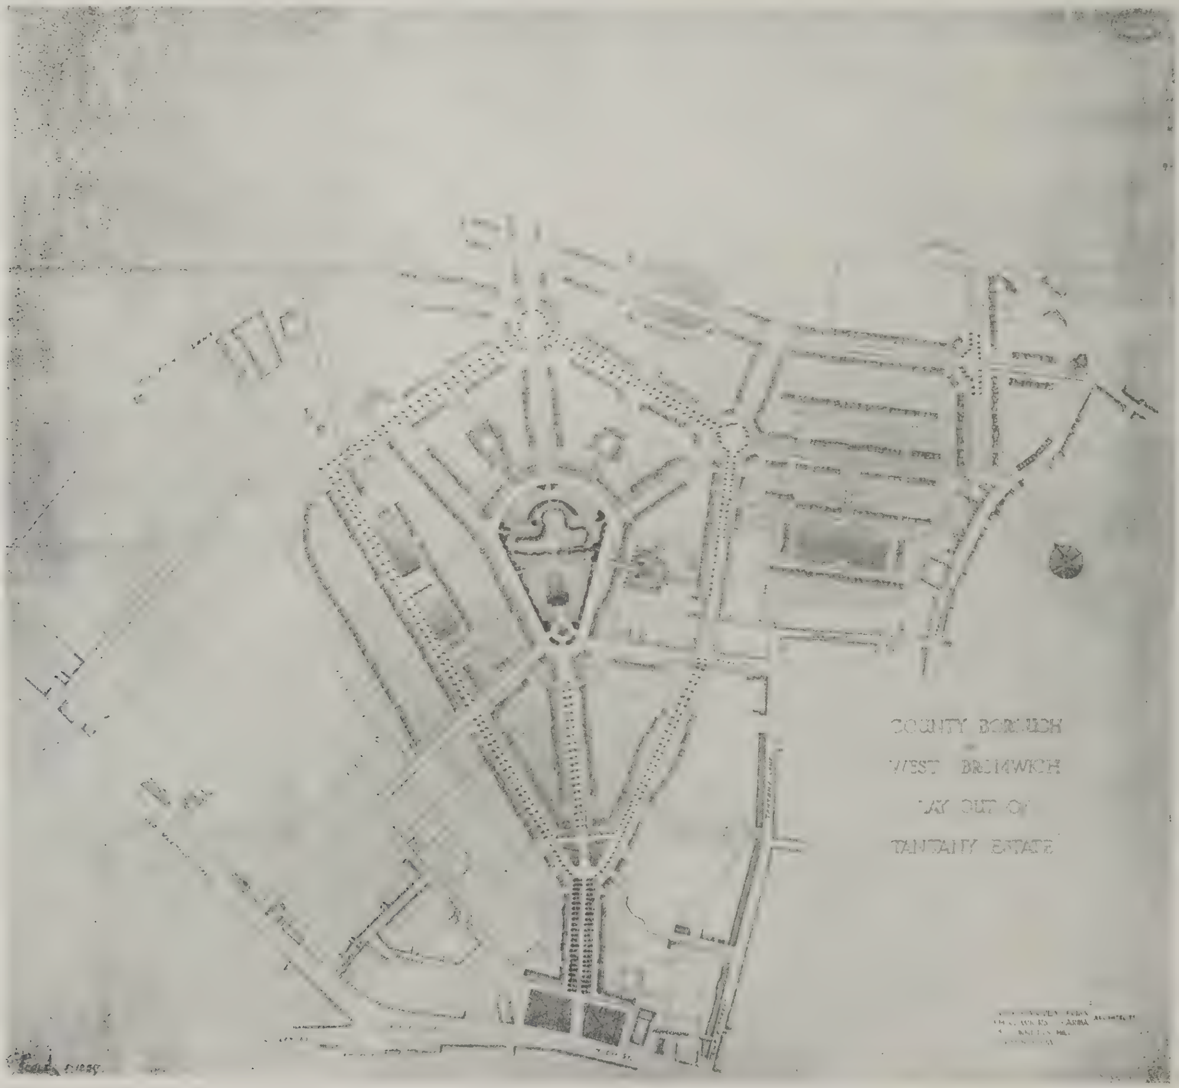
Both at Lemington and Throckley every effort was made to introduce variety into the schemes by the use of different types, in pairs and in groups of fours, and special attention was given to the treatment of the entrance doors. Many otherwise excellent schemes have been, to some extent, spoilt by a monotonous use of the same type of entrance door throughout.

# The Tantany Estate, West Bromwich

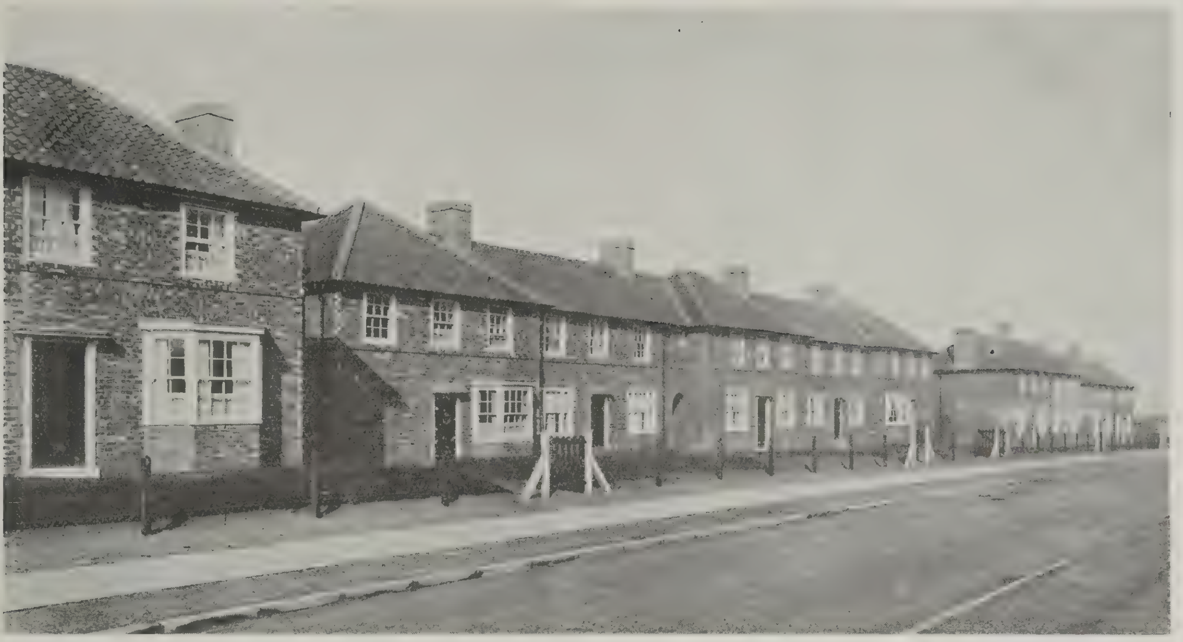
## W. ALEXANDER HARVEY and H. GRAHAM WICKS, F. and A.R.I.B.A., Architects

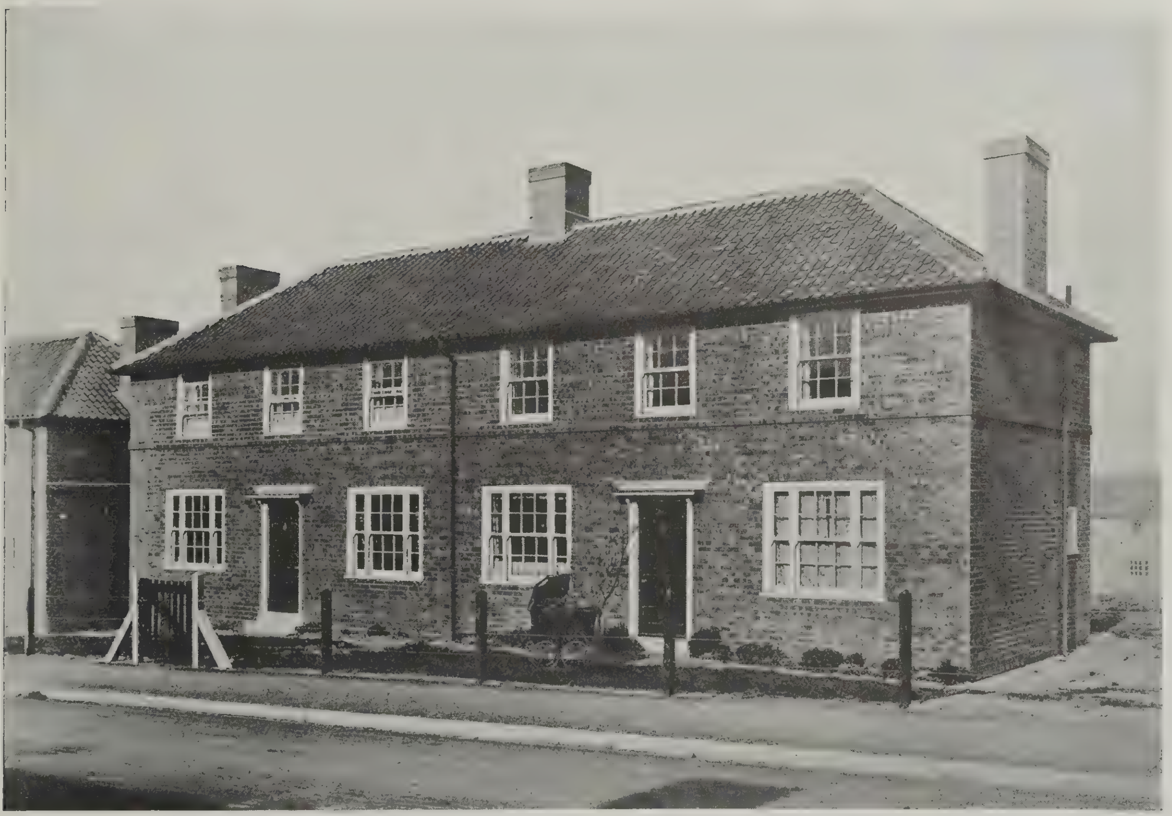
THE area of the Tantany Estate, West Bromwich, is approximately 95 acres. The site is typical of the Black Country, and is very undulating. The lay-out was largely governed by the existence of two large pit mounds and certain existing roads. Sites have been reserved for shops and public buildings. The large open space in the centre of the estate is a pit mound, and will be laid out and planted in due course; 605 houses have been erected by Messrs. H. Boot and Sons, Ltd., of Sheffield and London, and 112 houses of the Dorman Long type by Messrs. Whitehouse and Sons, Birmingham.

The houses are charming examples of domestic design, based on the "Georgian" model. They have sash windows and tiled roofs, and in some of the groups (as shown in the upper photograph on page 49) effective use is made of bay windows.



LAY-OUT OF THE TANTANY ESTATE, WEST BROMWICH





THE TANTANY ESTATE, WEST BROMWICH: SOME TYPICAL HOUSES.
HARVEY AND WICKS, ARCHITECTS.

# The Mile Cross Estate, Norwich

## STANLEY J. WEARING, A.R.I.B.A., Architect

THERE is an abundance of good early-nineteenth-century work in Norwich, a style which lends itself to a simple and dignified treatment for work of this nature, hence its adoption in this scheme. The bricks used are local red ones, those for facing varying considerably in colour. The roofs are covered with red pantiles, and all external woodwork is painted white. As houses face in different directions, it was necessary to adopt different type plans, which also gave slight variation in elevation without destroying the general harmony.

Only the houses on one side of the sweep in the lay-out and perspective shown have been erected. Tenders were obtained to complete the other side a few months back, but owing to the cost coming out at £500 each they were not proceeded with.

Professor S. D. Adshead, M.A., F.R.I.B.A., is the consultant architect to the Corporation.

# Rhiwbina Garden Village

## T. ALWYN LLOYD, F.R.I.B.A., Architect

THIS garden village has been built by the Cardiff Workers' Co-operative Garden Village Society, Ltd. The site is 3½ miles from Cardiff, beautifully placed under the foot-hills, and well wooded. For a Welsh site, it is conveniently flat, and there is a pleasant stream preserved as a feature, with bridges giving access to ten houses.

Building was commenced in 1913—seventy houses being completed as a first section. Building was taken up again after the war, and in August 1920 a contract for the erection of ninety-three houses, with the necessary roads and sewers, was let, and such good progress was made that all the houses were occupied by the early part of 1922. A contract for a further section of twenty-six houses in Lon-Isa was let by the society in May last.

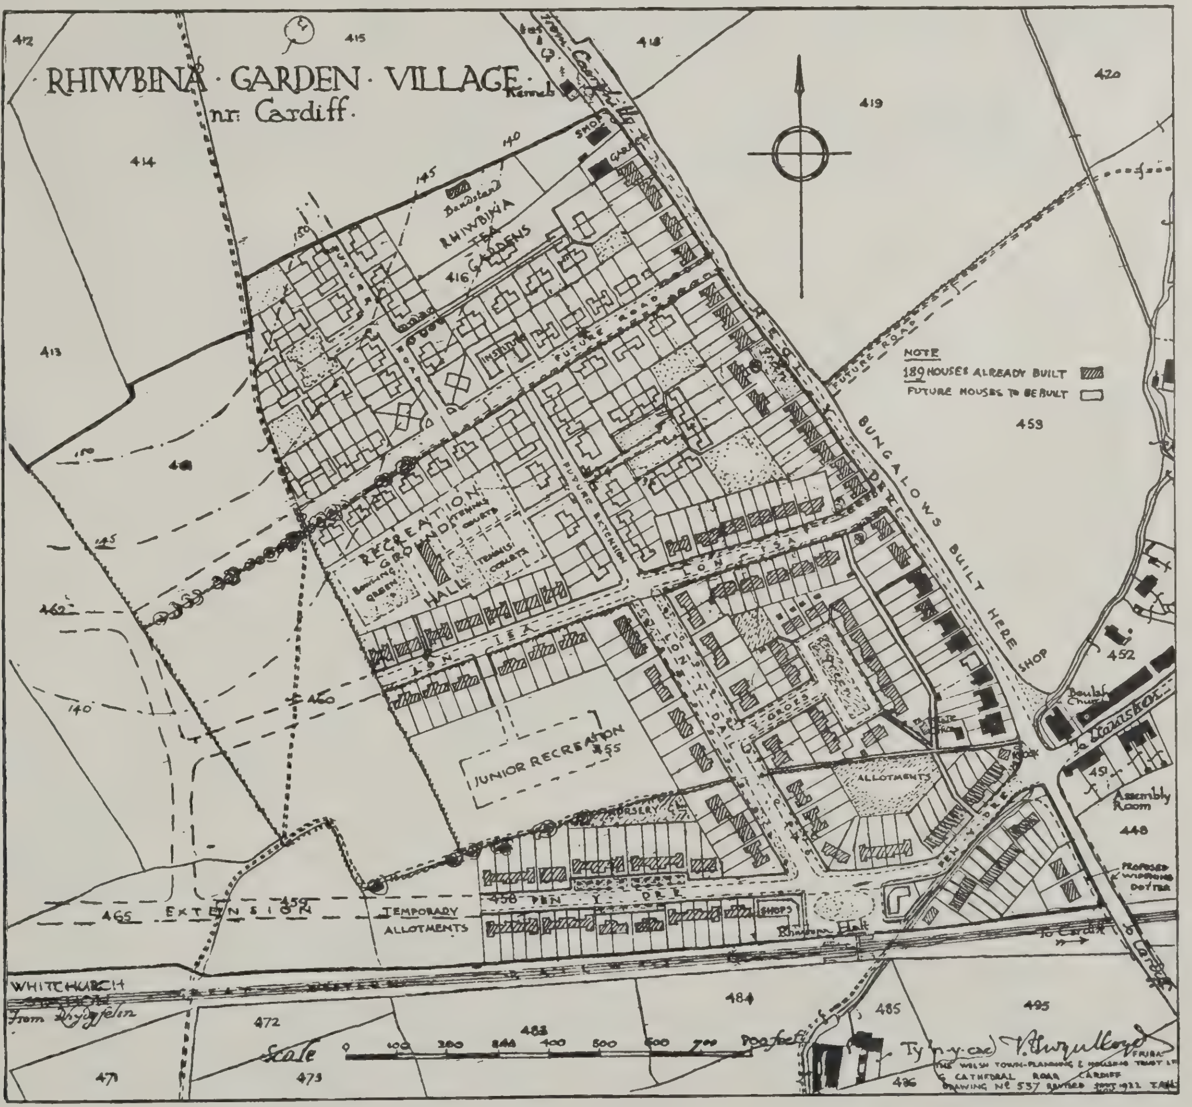
The whole estate consists of over 100 acres, part of which at present forms the Whitchurch golf course; but the portion which it is hoped to develop during the next few years provides for the building of an additional 150 houses. There is a long frontage to the main road, of which advantage has been taken in view of the high cost of road-making in 1920. "Pen-y-dre," a new road on which thirty-four houses have been built, will ultimately form part of a "through" relief road from Llanishen to Coryton under the Cardiff Corporation town-planning scheme. The railway forms the southern boundary of the property, and ample space has been left in the lay-out outside the Rhiwbina Halt for the provision of shopping sites and a formal station approach.

There is a large recreation ground on the village; eight tennis courts have been laid out, together with bowling green and croquet lawn. A new recreation hall has been recently built by the club, giving accommodation for an audience of 300 for concerts and other entertainments, besides changing rooms, etc. At one end of the estate refreshment rooms have been erected with well laid out tea gardens adjoining, where open-air concerts are given.

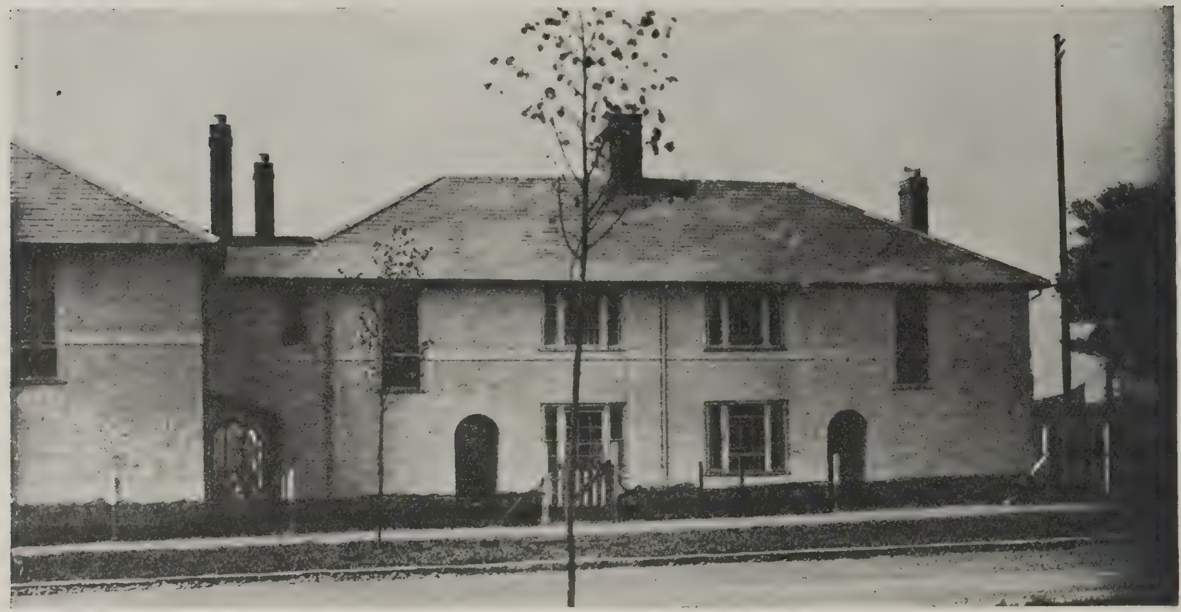
The houses recently built are of nine types, all with parlours, mostly with three bedrooms, but some have four. The materials used in construction are 11 in. hollow external walls, covered with fine cement, cast and colour-washed, with blue brindled bricks for chimneys and porches. A few groups are built with Cattybrook brindled facings with light joints. The latter groups are covered with thick green Arvon slates, and the whitewashed groups have blue and purple slates of uneven colours. The windows throughout are double-hung sashes; the internal doors being mainly "Woco" Columbia pine, stained and polished. The floors of living-rooms and parlours are of wood-blocks, the halls and sculleries being paved with quarry tiles.

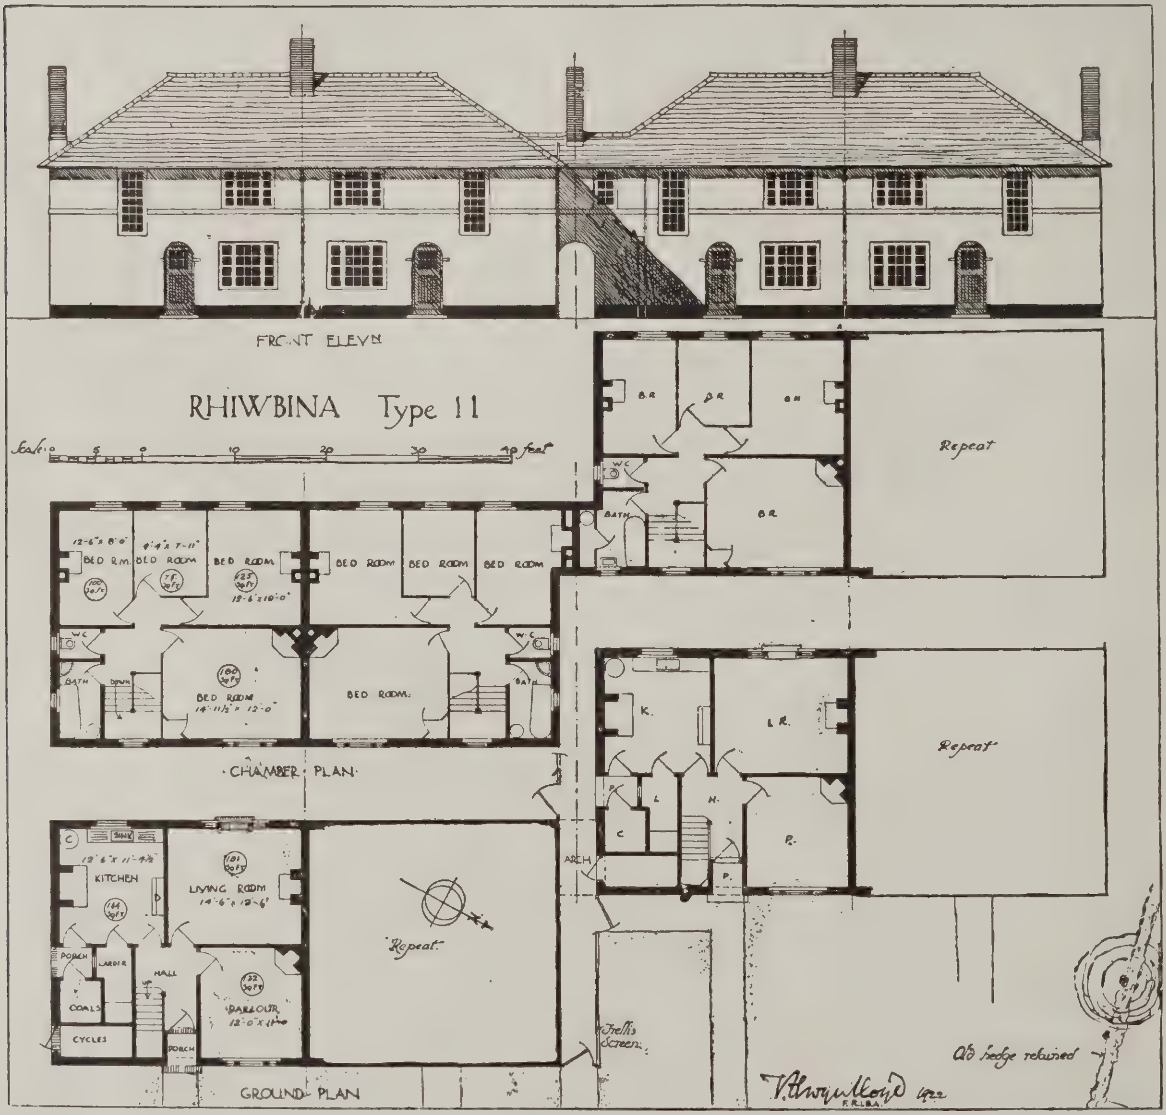
The general contractors for the ninety-three houses and roads were Messrs. Rogers and Davies, Ltd., of Cardiff.

(*Continued on page* 56.)

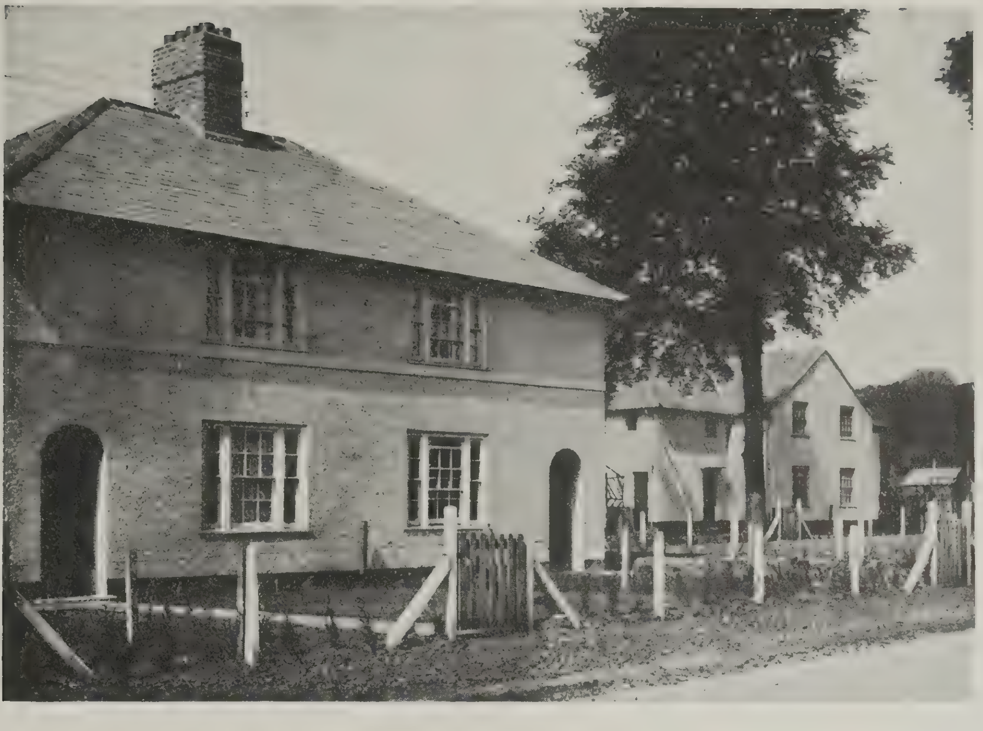


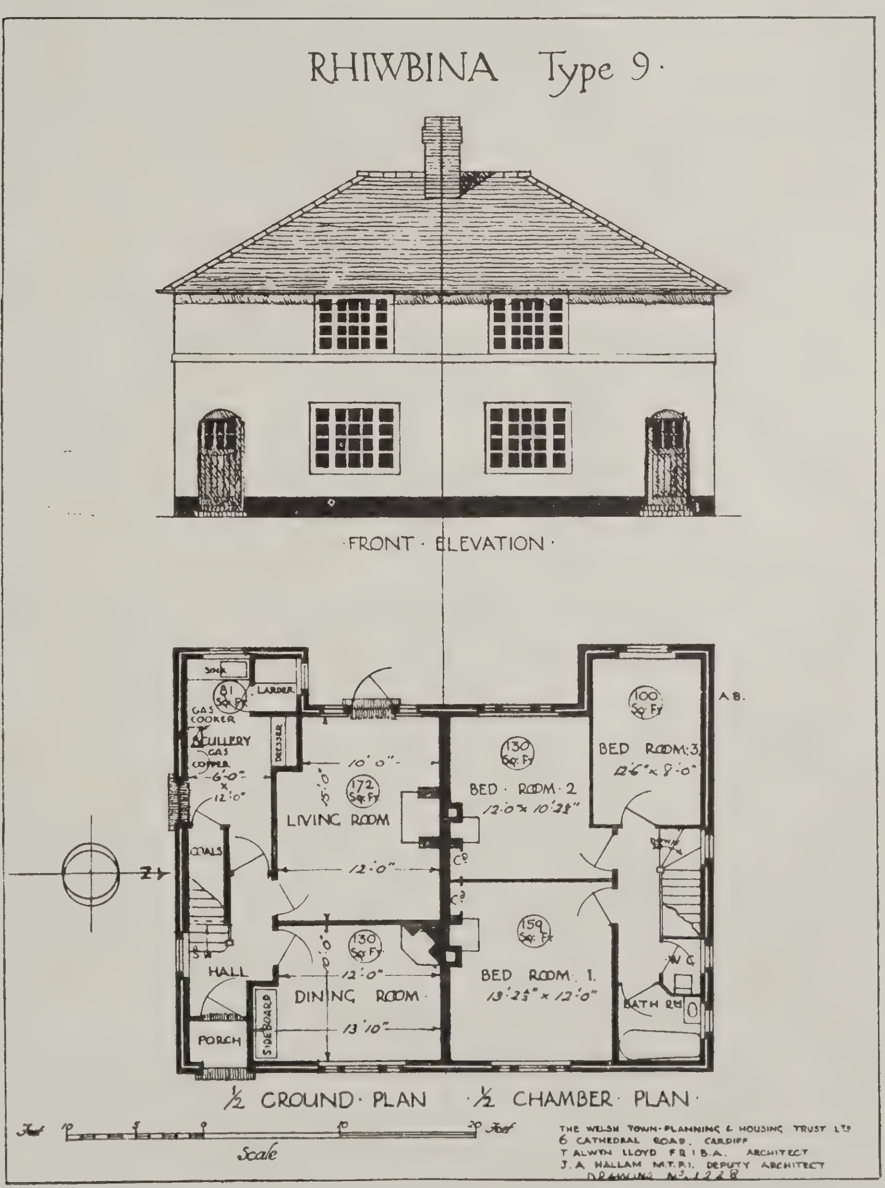
THE LAY-OUT.





RHIWBINA GARDEN VILLAGE: A GROUP OF FOUR HOUSES.
T. ALWYN LLOYD, F.R.I.B.A., ARCHITECT.





RHIWBINA GARDEN VILLAGE: A PAIR OF HOUSES.

T. ALWYN LLOYD, F.R.I.B.A., ARCHITECT

(*Continued from page* 53.)

Sub-contracts were carried out as follows: Joinery supplied by Messrs. Gibbon and Sons, Ltd., Cardiff; grates and ironmongery by Messrs. Williams and Borgars, Ltd., and D. Morgan and Sons, Ltd., Cardiff; plumbing, B. Williams; painting and decorating, G. H. Thompson, Cardiff. Messrs. Rogers and Davies, Ltd., were also the contractors for the recreation hall.

The contractors for the twenty-six houses and road now in course of construction are the National Building Guild, Ltd., timber and joinery are by Messrs. Newart Works, Ltd., Cardiff; and grates and sanitary goods by Williams and Borgars.

The architect is Mr. T. Alwyn Lloyd, F.R.I.B.A., M.T.P.I., of the Welsh Town-Planning and Housing Trust, Ltd., Cardiff, who has been assisted by Mr. J. A. Hallam, M.T.P.I., the deputy architect of the Trust.

# The Moulsecoombe Estate, Brighton

THIS estate has been carried out from the designs of four firms of Brighton architects, viz., Messrs. Clayton and Black, Messrs. Garrett and Son, Mr. Wallis Long, and Mr. W. T. Overton. The lay-out was designed by Messrs. Adshead and Ramsey; 480 houses have been erected, those illustrated being the work of Messrs. Clayton and Black and Wallis Long.

The following sizes of the rooms in one of the type A houses may be quoted as typical of the accommodation provided: Living room, 17 ft. by 11 ft.; scullery, 12 ft. by 7 ft.; parlour, 12 ft. by 10 ft.; three bedrooms, 13 ft. 9 in. by 8 ft. 6 in., 11 ft. 3 in. by 11 ft. 3 in., 9 ft. 10 in. by 12 ft. 3 in. The bathroom (with a lavatory basin and hot and cold water) is within easy access of the bedrooms; there are cupboards in every bedroom, drawers in all kitchens, and deep sinks are provided in all sculleries, with plugs and hot and cold water, so that they can be used for washing purposes as well as for washing-up. Gas cookers can be installed if desired, a point having been run into each house for that purpose, and there is electric light throughout.

The scheme owed much in its early stages to the zeal of Major Clements, Housing Surveyor for Brighton, whose duties, after he left to join the Ministry of Transport, were carried on by Mr. H. Tillstone, the present Borough Surveyor. The Ministry of Health authorities associated with the undertaking included Mr. Walker Smith, Director of Housing; Mr. Stephen Easten, Director of Production; and Mr. C. H. Eyles, the District Commissioner.

# Aylesbury Housing Scheme

MURRELL and PIGOTT, AA.R.I.B.A., R. G. MUIR, F.R.I.B.A., and C. H. B. QUENNELL, F.R.I.B.A., Architects

THIS scheme was carried out by a panel of architects nominated by the R.I.B.A., Mr. C. H. B. Quennell, F.R.I.B.A., being responsible for the general lay-out and road planning, and Mr. R. G. Muir, F.R.I.B.A., of Raymond Buildings, and Messrs. Murrell and Pigott, AA.R.I.B.A., of Bedford Row, for the houses.

A large level site was purchased on the south side of the town and adjacent to the station, a special railway siding being run to the boundary of the site. Owing to the extent of the ground available, an open type of lay-out was possible, and the great majority of the houses were planned as semi-detached.

A large number of types were adopted, giving considerable variety, and special types were designed for quadrants and similar positions.

The facings generally are in lime rough-cast, bricks being introduced as available. All the roofs are of Broseley tiles, sand-faced tiles not being obtainable at the time the scheme was in progress.

Artificial stone window frames the full thickness of the wall, and artificial stone mullions with metal casements, give an added interest to the houses, this method being found as economical in execution as any type of window finishing, and more economical for maintenance.

At the present moment about 120 houses have been completed, the scheme as originally designed comprising 400 houses.

The success of the scheme has been largely due to the care and interest taken by the Housing Committee of the Borough Council under the chairmanship of Councillor R. Eaton.

# Sedgley (Staffordshire) Housing Scheme

## T. ALWYN LLOYD, F.R.I.B.A., Architect

ONE of the largest housing schemes to be carried out in the area of a single local authority is nearing completion at Sedgley, Staffordshire. In addition to the prevailing shortage of new houses, Sedgley has its special local problems connected with slum clearances. Hundreds of houses inhabited by working-class people able to pay a reasonable rent are under closing orders for demolition, and these will be drastically dealt with as soon as the new houses are finished. Already several sections of insanitary property have been demolished, and their sites will be utilized under reconstruction or for road improvements.

The area of the Sedgley Council is rather widely scattered, and for this reason the 800 new houses have been built on three sites, as follows: Beacon Hill, 408; Clarence Street, Upper Gornal, 156; and Lower Gornal, 236. The Council were fortunate in obtaining fine open sites adjacent to thickly populated districts in the Black Country. The Beacon is the most pleasing, the houses being placed on the slopes of Beacon Hill, which attains an altitude of 770 ft. Out of an area of 45 acres, some 5¼ acres have been allocated to open spaces—allotments, recreation, children's playground, and estate nursery. In addition to these, there are private greens on to which squares and crescents of houses face. The wide road known as "Greenway" has been taken through the centre of the site, which will ultimately be carried through northwards and open up an undeveloped portion in the Council's town-planning scheme. On each site the existing hedges and trees dictated the positions of the roads, and have been preserved as features where possible.

The 800 houses comprise several types of accommodation, about 60 per cent. being class A, and 40 per cent. class B (parlour houses). The external walls are mainly 11 in. Black Country multi-coloured facings, with light joints, but variety has been obtained by building some of the blocks in 9 in. brickwork covered with rough-cast. The roofs are mainly covered with blue, purple, and green slates, but in selected groups facing culs-de-sac or greens there are hand-made tile roofs. All houses have double-hung sash windows, primed and painted three coats inside and out.

The general contractors for the 800 houses and for the roads and sewers on the three sites are Messrs. Wilson Lovatt and Sons, Ltd., of Wolverhampton; sub-contracts having been carried out as follows: Plumbing and painting, Messrs. Manley and Regulus, Wolverhampton; slating and tiling, Messrs. Ellis, Partridge & Co., Ltd., Leicester; tar macadam roads and footways, Messrs. Tarslag, Ltd., Stockton-on-Tees; grates and ranges, Messrs. S. Smith and Sons, Ltd., Smethwick, and Messrs. Williams and Borgars, Ltd., Cardiff; ironmongery, Messrs. J. Moreton & Co., Ltd., Wolverhampton; sanitary goods, Messrs. Cannon Iron Foundries, Bilston, and Messrs. Twyfords, Ltd.

Building was commenced in the autumn of 1920, and it is expected that the whole scheme will be completed early this year.

The architect is Mr. T. Alwyn Lloyd, F.R.I.B.A., M.T.P.I., of Cardiff and Lincoln's Inn Fields, W.C.2; and Mr. R. E. Jones is the Council's Building Superintendent on the works.

# Boythorpe Housing Scheme, Chesterfield

By VINCENT SMITH, Borough Surveyor, PERCY B. HOUFTON, and a Panel of Architects

THIS scheme is the largest of several carried out by the Council under the National Housing Scheme, and, where it is yet incomplete, sanctions to build have been given by the Ministry of Health.

The site is an elevated one to the south of the town, and forms part of an area scheduled for a town-planning scheme. The lay-out has been considered with a view to the roads of the estate linking up eventually with future developments. There are 326 houses, divided into fifty-three type A (three bedrooms), 243 type B, and thirty type B4.

The scheme has been carried out by a panel of seven local architects acting in conjunction with a consulting architect and the borough officials. The lay-out was prepared by the consulting architect, Mr. Percy B. Houfton, in consultation with the Borough Surveyor, Major Vincent Smith, O.B.E., who carried out all the roads and sewers on the estate. The panel of architects engaged includes all the practising members of the profession in the town, as follows: Mr. W. M. Ashmore, Mr. Bailey Deeping, Mr. W. A. Derbyshire, Mr. W. Cecil Jackson, Messrs. Rollinson and Sons, Messrs. W. H. Wagstaff and Sons, and Messrs. Wilcockson and Cutts.

The plans illustrated are type plans prepared by the consulting architect. In work, these have been modified in detail by the panel architects to suit various aspects and to produce satisfactory grouping. A measure of agreement as to elevations was arrived at by fixing a uniform pitch of roof, height of windows, doors, and eaves, etc. From this stage the elevations were prepared by the architects concerned. The effect is to give a certain appearance of unity to the scheme as a whole, with a considerable amount of variety in details. By arrangement with the contractors these small variations were not regarded as extras.

The greater part of the work was carried out by the Chesterfield Federated Builders on the following prices agreed in June 1920: A type houses £872, B type £962, and B4 £1,052. The figures were inclusive of the highest rate of wages for an A grade town. Subsequently contracts were placed on tenders submitted in competition at lower figures as prices declined.

The contractors engaged were as follows: Messrs. G. F. Kirk, Ltd., W. Tomlinson, A. Heath, G. Webber, S. Wheatcroft, J. Collis and Sons, and E. Revill, all of Chesterfield; and Messrs. Thompson and Dickson, Doncaster; W. T. Kemp, Skegby; Moses Simpson, Sheffield; C. Higton and Sons, Sheffield; Swift Bros. and Haslam, Doncaster; and R. Lehane & Co., Ltd., Darley Dale.

The contractor for the roads and sewers was Mr. Herbert Ashley, of Mansfield.

Mr. W. M. Simmons had entire charge of the scheme as clerk of works, and he is also responsible for the photographs reproduced.

The Housing Committee of the Council have had the benefit of the wide building experience of their chairman, Alderman William Rhodes, J.P.

BOYTHORPE HOUSING SCHEME, CHESTERFIELD: SOME GENERAL VIEWS.

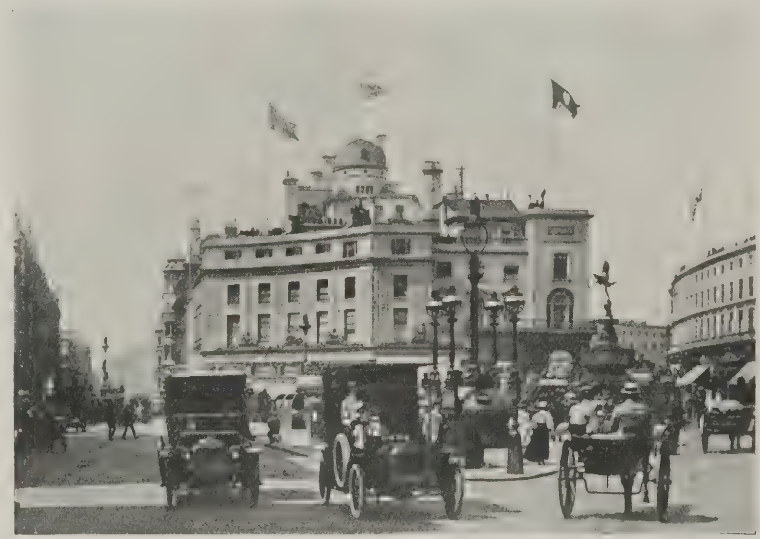
# The Rebuilding of Regent Street

THE rebuilding of Regent Street began tentatively about thirty years ago, since when it has been proceeding slowly and spasmodically. Within the past few months, however, the process of reconstruction has been considerably accelerated, and to-day a dozen or more large sections are in the hands of the housebreaker.

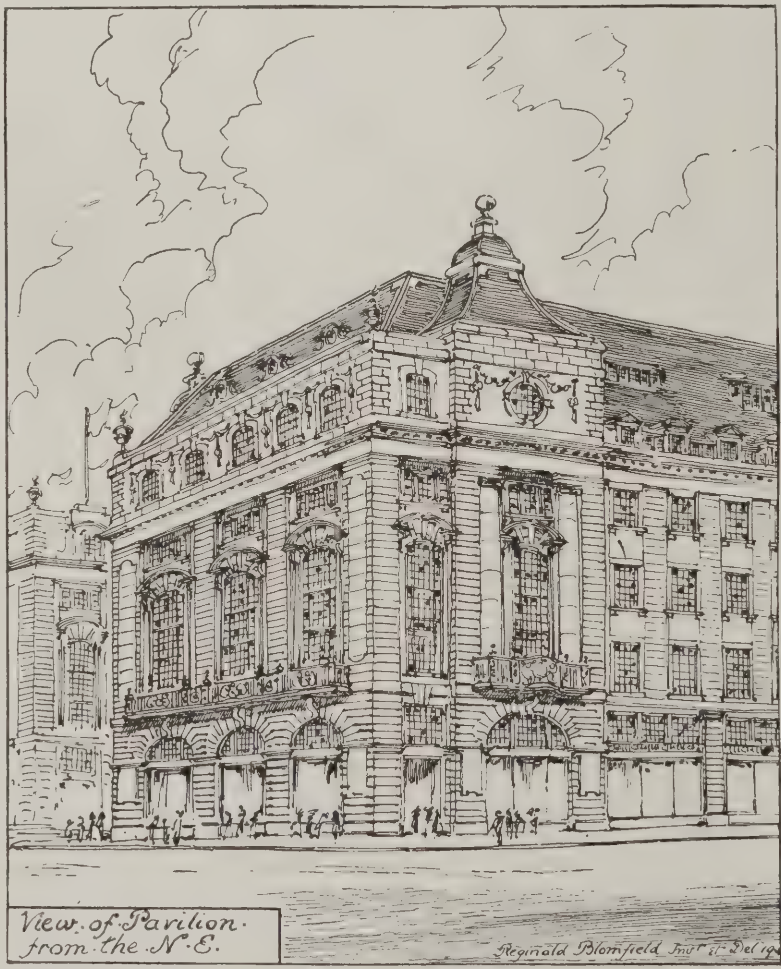
The whole street is doomed. Nothing is to be allowed to survive. To obtain any idea of the character of this most remarkable scheme of civic development—the finest thing of its kind that London has ever had—future generations will be entirely dependent upon photographs, measured drawings (where they exist), and old prints. The destruction is utterly deplorable; but it is difficult to see how it could possibly have been avoided.

Some there are who contend that there is no need to rebuild Regent Street; that Nash's small-scale buildings are well enough adapted to modern requirements. But those who think thus are surely a very small minority. Nash's Regent Street was built to suit the needs of the small shopkeeper of a century ago, a man who lived with his wife and family over the shop.

To-day conditions are entirely different. The small tradesman, where he still exists, no longer wishes to live over his shop, even if there were room; but mostly he has been displaced by the huge department store. Every floor of a building is now wanted for the storage and display of goods. Ground rents have gone up enormously, and to pay them it is necessary to get the utmost value out of a site. This can only be done by providing more floor space above or below, or in both directions. It will be generally admitted that Nash's buildings are incapable of being added to, either structurally or architecturally, so the only alternative is to rebuild. It is a regrettable necessity of the times that cannot be evaded. On this point we think there can be no two opinions.



AS IT IS.



View of Pavilion from the N.E.
Reginald Blomfield Invt et Del 19

AS IT WILL BE

SWAN AND EDGAR'S CORNER, PICCADILLY CIRCUS.

The method of rebuilding is open to question. But first let us put in a good word for the Office of Woods and Forests, the ground landlords, who have been subjected to much adverse and sometimes unjust criticism.

The Crown has always been amenable to the representations of architects. Some years ago, when a big section of the Quadrant had to come down to make room for the Piccadilly Hotel, architects at once pointed out that it was necessary to preserve the unity of the Quadrant, and that an elevational design for the whole sweep should be prepared and made compulsory for all subsequent reconstructions. The result was Mr. Norman Shaw's scheme, which was adopted for the Piccadilly Hotel. Then followed the outcry of the shopkeepers against Mr. Shaw's huge piers and small window areas, which, they said (with some justification, let it be admitted), were a hindrance to trade. Unreasonable demands for vast expanses of plate glass were firmly resisted by the Office of Woods and Forests, who, however, took counsel with a distinguished trio of architects—Sir Aston Webb, Sir Reginald Blomfield, and the late Mr. Ernest Newton—with the result that Mr. Shaw's design was greatly modified. (The design now adopted for the rebuilding of the Quadrant and Piccadilly Circus is shown in the illustrations on this page and opposite.)

Then, for the treatment of Oxford Circus, a competition was held about ten years ago, the successful architects being Messrs. Henry Tanner, whose scheme has already been carried out with respect to three sections, the third (Messrs. Jay's building) now being in course of erection. Thus complete architectural uniformity has been secured at Oxford Circus.

At Piccadilly Circus there are difficulties in the way of a uniform

THE QUADRANT, SHOWING NORMAN SHAW'S PICCADILLY HOTEL.

treatment, the ground landlords for the north side being the London County Council, who, it is hoped, will see the wisdom of conforming to the scheme prepared by the Office of Woods and Forests.

Then for the rebuilding of Waterloo Place, a design by Sir William Emerson was adopted many years ago. This is now nearing completion by the erection of a building for Cox's Bank, the architect being Mr. E. Keynes Purchase.

It will be seen, therefore, that the need for uniformity has been entirely realized by the Crown, and that architectural opinion has not been ignored or flouted as many people seem to imagine. Whether or not it would have been better to hold a great national competition for the rebuilding of the whole street is another question. Supervision and control are, however, being exercised throughout the entire reconstruction, and building owners speedily find that they cannot do as they like in the new Regent Street.

Good as may be the practical and economic reasons for the destruction of the work of the Regency, one cannot but lament its passing: for Nash contributed a valuable and extremely interesting quota to the development of monumental architecture in this country. He was without his peer in the composition of façades of great length in infinite variety—façades, moreover, which, when placed in juxtaposition, produced a complete unity of effect. He brought the art of street-designing up to a pitch of excellence that it had never reached before, and from which it has since sadly fallen, as nearly all our modern thoroughfares make us only too painfully aware.

Regent Street, it may be recalled, was designed and carried out between the years 1813–16; thus its term of useful service only just exceeds the century. The total cost of the entire scheme was, approximately, a million and a half sterling, which shows how economically building work could be carried out in the days of George IV. To-day it would probably cost almost as much to build, in permanent materials, only one of Nash's monumental blocks!

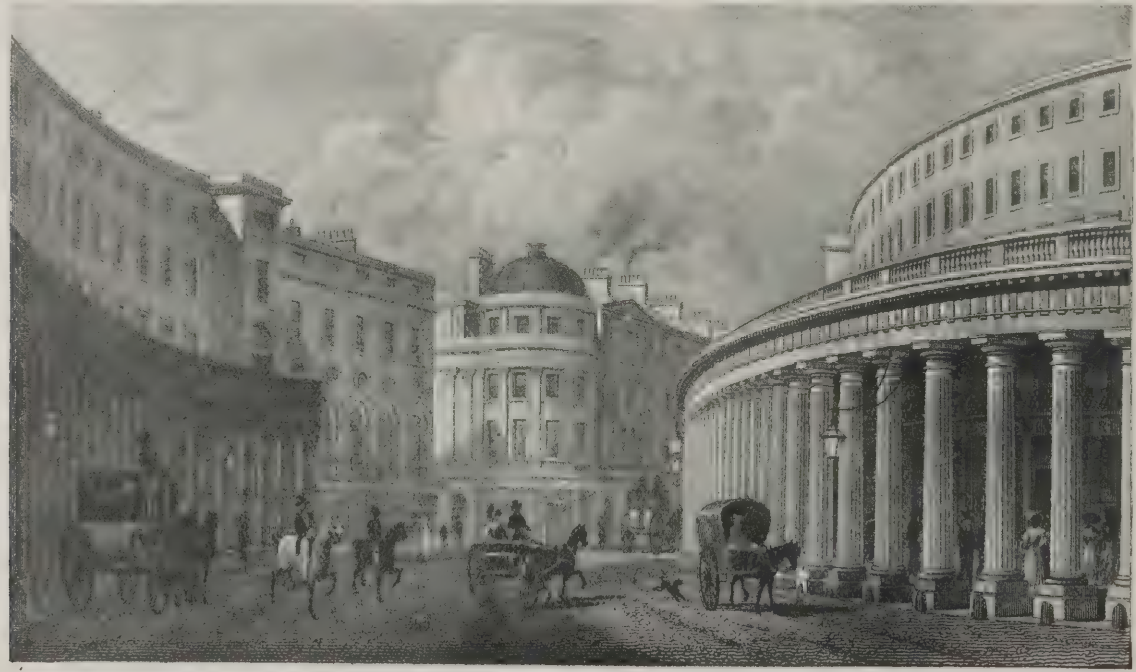
In the rebuilding of Regent Street, in order to maintain as much as possible a uniformity in the façades, each block of premises is to form one unit, irrespective of the number of leases contained therein, and designs have been prepared in many cases so that the positions of the existing party walls are not altered, thus allowing the several premises to be rebuilt at such times as the old leases run out.

In this issue we illustrate some of the more recently completed buildings, as well as others either in course of erection or immediately projected.

### 189–191 *Regent Street.*

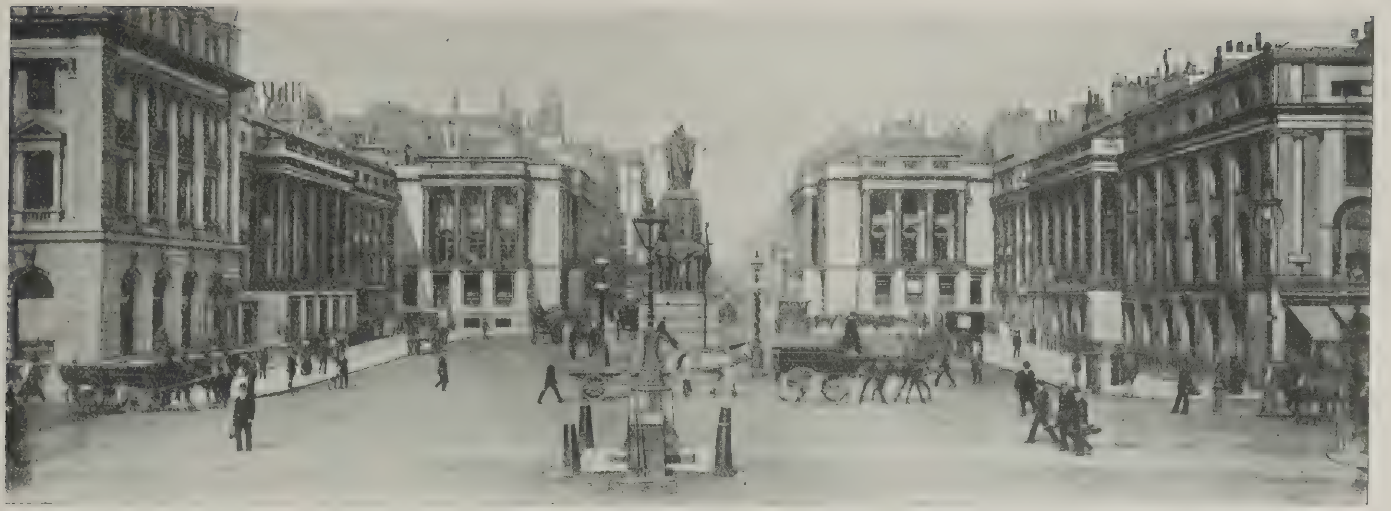
These premises, at present under reconstruction, form part of the block Nos. 169 to 201 Regent Street. St. George's House, which was erected and designed by Mr. Frank Verity some years ago, forms an important feature of the frontage, and an attempt has been made in designing the remainder of the block to harmonize with Mr. Verity's buildings.

The prevailing conditions dictated a simple architectural treatment, and a restrained design by Messrs. Yates, Cook, and Darbyshire, of Great Marlborough Street, W.1, for these premises and the remainder of the block has been approved by the Crown authorities. The builders are Messrs. W. F. Blay, Ltd. (See page 76.)



THE QUADRANT WITH ITS COLONNADES, AS ORIGINALLY DESIGNED BY JOHN NASH.

(*From an early-nineteenth-century print.*)



WATERLOO PLACE, AS IT WAS.

*223 Regent Street.*

These premises form one corner of the block comprising Nos. 223 to 227 Regent Street. This is one of the smallest blocks in the street, and there will be but three tenants in the whole of the premises when rebuilt.

Messrs. Yates, Cook, and Darbyshire are the architects, and Messrs. D. G. Somerville & Co., Ltd., the contractors.

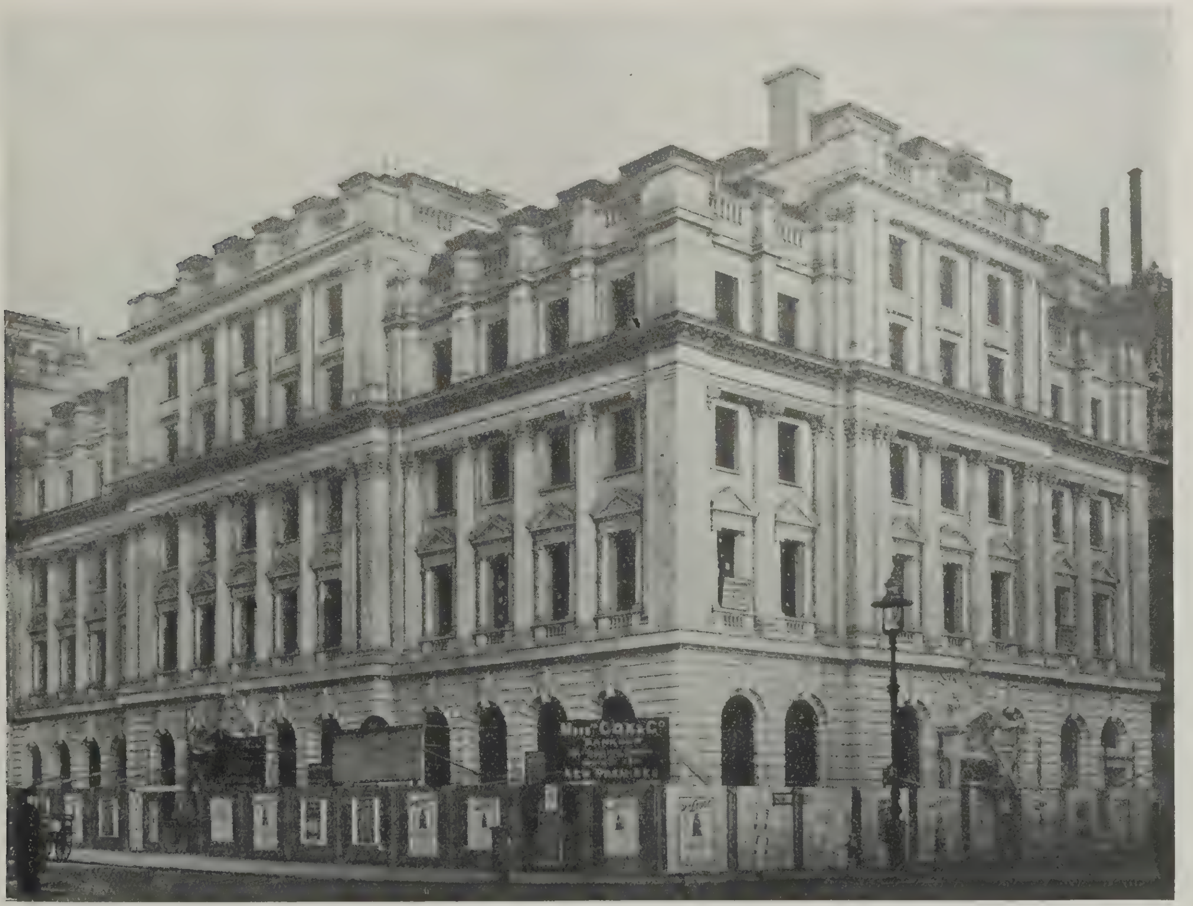
No. 225 forms the centre feature of the new design. The architect for this portion is Mr. Gordon Jeeves, M.S.A., of George Street, Hanover Square, the elevational drawings being supplied by Messrs. Yates, Cook, and Darbyshire, whose design for the whole façade was accepted by the Commissioner of H.M. Office of Woods and Forests.

*Messrs. Jay's New Building.*

The reconstruction of Messrs. Jay's premises will complete the new buildings of Oxford Circus (Messrs. Henry Tanner, architects). The new premises, together with a branch of the London County Westminster and Parr's Bank, Ltd., absorbs the whole block down to Princes Street, Messrs. Jay's occupying the whole of the building over the bank.

There will be eight floors, including basement and ground floor, and as the height from the street to the ridge is some 85 ft., dividing walls are introduced to keep within the cubical limit of the Building Act, part of the top story to the extent of 5 ft. being above the height now permitted for shop and store buildings of this character.

There will be five different cubes divided by walls, and fire-resisting steel doors and lobbies, rolling shutters, or ordinary fire folding-doors. Sprinklers and automatic fire-alarms will be provided, together with the usual hydrant and



THE NEW BUILDING FOR MESSRS. COX'S BANK, ON THE LOWER RIGHT-HAND CORNER OF WATERLOO PLACE
E. KEYNES PURCHASE, F.R.I.B.A., ARCHITECT. SIR WILLIAM EMERSON, ARCHITECT FOR THE GENERAL SCHEME.

hand apparatus. The construction will be steel framed, the facing of Portland stone and the floors fire-resisting, and either of hollow tiles or of concrete where the latter is required by the Fire Office Committee. The window frames will be of steel.

There will be four electric lifts, one running the whole height of the building, a service lift, and a goods lift (hydraulic); warming will generally be by radiators with accelerated flow; a vacuum cleaning apparatus will be installed, and lighting will be by electricity.

The ground, first, and part of the second floors will be used for show purposes. The shop windows will be of mahogany on a granite base.

It is intended to use the basement for counting-house, stock, and other purposes, the top (sixth) floor for a canteen, and the remainder for workrooms. There are two isolated staircases of artificial stone to insure the safe escape of the occupants in case of fire, while the back of the main portion will be protected by fire-resisting glazing.

The bank will occupy the ground floor and basement of the southern part next Princes Street. The banking room will be plastered in "Stuc" with fibrous ceiling and marble skirtings. The finishings will be of mahogany, and the window-frames of gunmetal.

The builders for Messrs. Jay's are Messrs. Hall, Beddall & Co., Ltd., and for the bank Messrs. Holliday and Greenwood, Ltd. Messrs. Moreland, Hayne & Co. are erecting the steel framing for both buildings.

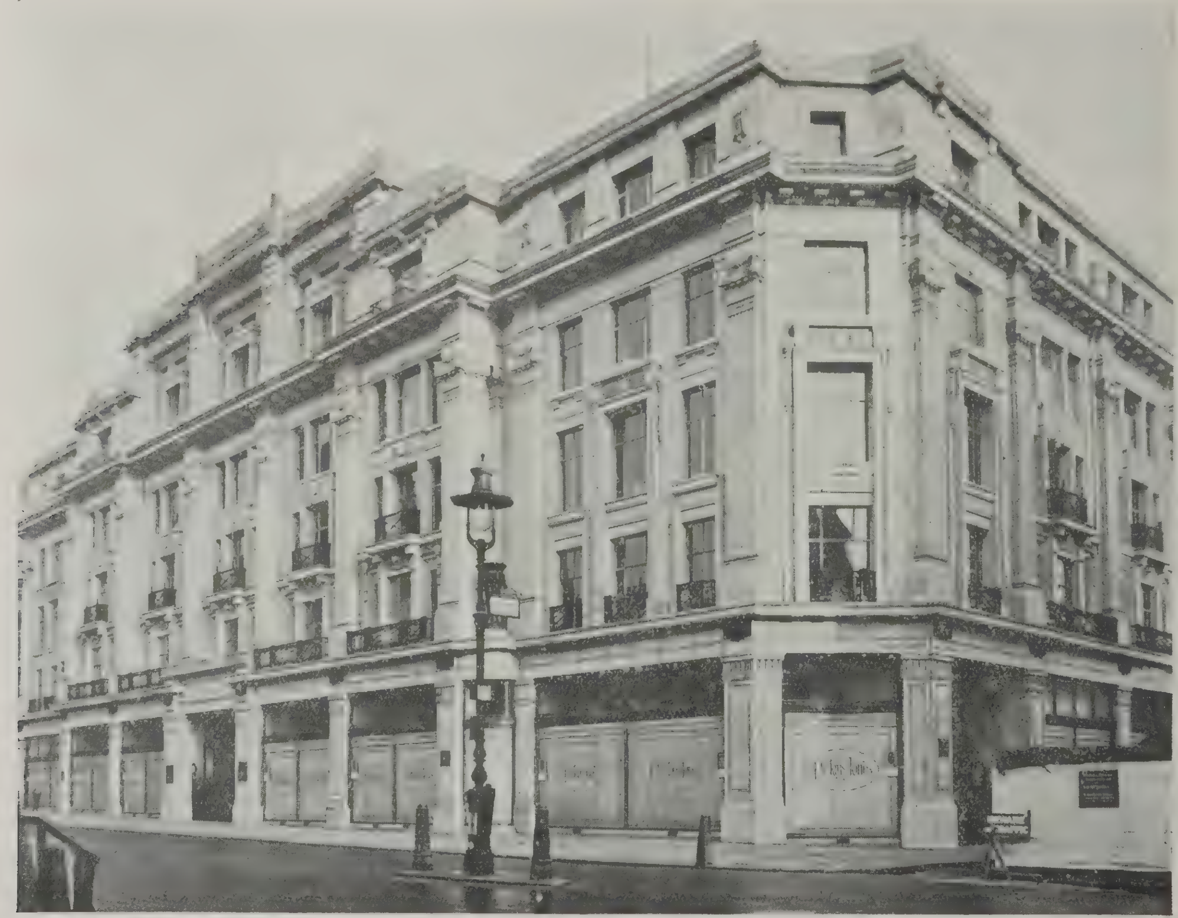
DICKINS AND JONES'S OLD BUILDING.

*Messrs. Dickins and Jones's.*

The new building for Messrs. Dickins and Jones is situated on the east side of Regent Street between Argyll Place and Little Argyll Street, and occupies an area of approximately one acre. It constitutes one of the most important sections so far rebuilt, and is from the designs of Messrs. Henry Tanner. The construction is of steel framing, with brick or concrete filling, and is generally of a fire-resisting nature, as required under the Building Act Regulations for buildings having excess cubic capacity. The main stairs are of reinforced concrete, others of Victoria stone.

Messrs. Higgs and Hill, Ltd., were the general contractors, and sub-contracts were carried out by the following firms :—

Thomas Faldo & Co., Ltd. (asphalting); Moreland, Hayne & Co., Ltd. (steelwork); Kleine Flooring Syndicate, Ltd. (part of fireproofing); Luxfer Prism Syndicate, Ltd., and Crittall & Co. (casements and fittings); Wotton and Sons, Croydon (patent glazing); Dent and Hellyer, Ltd. (sanitary ware and fittings); Diespeker and Art Pavements Co., Ltd. (mosaic flooring); Drake and Gorham, Ltd. (electric wiring); General Electric Co., Ltd., and Strode & Co., Ltd. (electric lighting and fittings); A. W. Elwood (art metal work); Waygood-Otis, Ltd. (lifts); J. Jeffreys & Co., Ltd. (heating and ventilating);



DICKINS AND JONES'S NEW BUILDING IN REGENT STREET. MESSRS. HENRY TANNER, ARCHITECTS.

*(From an early-nineteenth-century print.)*

Stirling Telephone Co., Ltd. (telephones); Sage & Co., Ltd. (shop fittings); Milner & Co., Ltd. (safes); Benham and Sons, Ltd. (cooking and laundry machines).

### *Hedges and Butler's Building.*

The new building for Messrs. Hedges and Butler forms part of a new block which has been partly built from the designs of Messrs. Henry Tanner. The style is Renaissance in character, to harmonize with the general scheme for the rebuilding of Regent Street.

Messrs. Holland, Hannen and Cubitts were the general contractors, and the following firms carried out sub-contracts :—

The Stourbridge Glazed Brick Co., Ltd. (glazed bricks); F. J. Barnes, Ltd. (stone); Drew, Bear, Perks & Co., Ltd. (steelwork); The Kleine Flooring Syndicate, Ltd. (fireproof floors); Cranham Hollow Partition Blocks (walling, etc.); Robert Adlard & Co., Ltd. (slates); The Luxfer Co. (casements and fittings); Wotton and Sons, Croydon (patent glazing); Ames and Finnis, and Dent and Hellyer, Ltd. (sanitary ware and fittings); Hollis Bros. & Co., Ltd., and Turpins Parquet Flooring Co., Ltd. (wood block and parquet flooring); Higgins and Griffiths, Ltd. (electric wiring and fittings); Clark and Fenn (plaster work); Carter and Aynesley, Ltd. (door furniture); Chas. Smith, Sons & Co., Ltd., and Strode & Co., Ltd. (railings); Patent Victoria Stone Co., Ltd. (stair-treads); Waygood-Otis, Ltd., and George Johnson (lifts); Colley, Meikle & Co., Ltd. (heating apparatus); The Reliance Telephone Co., Ltd. (telephones); Ideal Radiator Co. (boilers); Strode & Co., Ltd. (shop fronts, blinds, and shutters); James Gray & Co. (lightning conductors); Arthur L. Gibson, Twickenham, and Haywards, Ltd. (fireproof shutters and doors).

# Town-Planning: What it Means

By G. L. PEPLER, F.S.I., Past-President Town-Planning Institute

IN every profession the practitioner who means to keep pace with his subject is always eager to learn. More than this is, however, required of the town-planner, since the A B C of his subject has not yet been completely evolved, and therefore all sorts of initial research work remains to be done.

Town-planners, therefore, welcome the help of the technical Press, which by publishing articles on the subject facilitates exchange of experience, and by illustrating and giving particulars of existing plans and conditions or of work done or projected, provides material for study.

The practical application of town-planning to-day is, by the exercise of foresight, to provide that all land shall in future be put to the use to which it is best fitted in a scheme that provides for the most efficient and pleasant development of the whole plan. As all our life and work take place on land (even an aeroplane is of the earth and to earth must descend!) it is clear that the question of its use is fundamental and affects every living person, although it is extraordinary how in the past this simple fact has been forgotten. Because the entire population, particularly the part that lives in and around towns, is affected by town-planning, a clear duty is placed on the town-planner to take the public into his confidence, study its varying needs, and see that the public understands his aims and approves of them. He now need have no fear of exploitation, as, once land is in a town-planning area, that is impossible.

I rather dwell on this question of publicity because the fact has to be faced that town-planning, as we now understand it, is a comparatively new idea, and has, therefore, to be explained. One is glad to know of several prominent municipal engineers and others who are putting the matter before their constituents by lecture and talk, through such agencies as local Chambers of Commerce and various clubs and societies. Here again the technical Press can, and does, do a great deal to help.

As to the present position of town-planning under the Town-Planning Acts: by November 1, 1922, 291 schemes had been commenced by 178 local authorities, covering an area of 781,672 acres. Of these schemes twelve had been approved, and twenty-six preliminary statements had been prepared, of which eight had been approved.

The approved schemes deal with such matters as: Laying down the lines of main roads (including in some cases wide boulevards); providing for their ultimate construction and the allocation of their cost between the owner and the local authority; settling the predominant character of the building development that may take place in each part of the area, i.e., either for residence, factory or shop, etc.; providing that adjoining estates shall be developed in harmony, and that the estate development roads shall be on sites to be approved by the local authority; allowing certain residential roads to be of less than by-law width, so that through traffic shall be kept to main roads properly planned out and of adequate width, and that the residential roads shall be designed to keep free of this traffic and, therefore, be more pleasant to live in; controlling the number of houses allowed per acre; providing for the reservation of public and private open spaces; defining building lines and restricting the proportion of a building plot that may be covered by a house; etc.

The Ministry of Health are about to publish a set of model clauses so that the time and energy spent in the past in constructing the machine for each scheme will be released in future for concentration on perfecting the objects of the scheme.

By keeping schemes simple and on broad lines the well-worth-risking dangers of prophecy are greatly diminished, and the working out of the details later is not jeopardized, as the local authority will still be in control.

Local authority boundaries often bear little relation to surface utilization, and, therefore, to town-planning. Co-operation between authorities is therefore essential so that each region of common interest may be planned as a unit. This is being increasingly recognized, and already twelve joint Town-Planning Committees have been established, representing 176 local authorities, comprising some 1,175,000 acres and £32,127,000 rateable value.

It will be seen, therefore, that town-planning is forging ahead, which is hardly to be wondered at in these days when economy is so essential, for one of the principal objects of town-planning is the prevention of waste in all its forms.

# The City and County Borough of Bradford Town-Planning Scheme

By F. MARSDEN, City Engineer and Surveyor

THE Bradford Corporation have been very active in regard to the town-planning of the city. The area of the city is 22,879 acres, and this area has been divided into nine schemes for departmental purposes, excluding the central built-up area. The Corporation have passed the first resolution defining the areas of, and deciding to prepare, the schemes. Their combined acreage is 21,120 acres, of which 108 acres (to be reserved as a public open space) are situated without the city. The densely built-up portion not included within the town-planning schemes has an area of 1,867 acres.

The Town-Planning (General Interim Development) Order, 1922, issued by the Minister of Health, is applicable to the whole of the area covered by seven of the schemes, and this Order enables the Corporation to permit the development of land and building operations to proceed pending the preparation and approval of the Preliminary Statement.

The City Council passed the necessary resolution authorizing the preparation of the draft maps for schemes Nos. 3 to 9 inclusive, in March 1920. These maps have been prepared and approved by the City Council. The work is proceeding apace, and it is intended within the next few months to submit Preliminary Statements relating to schemes Nos. 3 to 9 inclusive.

The advantages gained by urging this work forward and having the proposals so far advanced become more manifest every day when the question of development is being

BRADFORD TOWN-PLANNING SCHEMES.

F. MARSDEN, CITY ENGINEER AND SURVEYOR.

raised in several parts of the city, and the Corporation are now able to permit and require such development to be in conformity with the general lines of roads and building lines and other amenities which are governed by the Development Order.

As an illustration, the power which the Corporation have obtained in the relaxation of the building regulations governing the lay-out of new streets, enables the Corporation to obtain the land required for the widening of the main roads and the observance of deep building lines and the general development of the area, the landowner getting his advantage in modified requirements for the width of roads which are purely for the development of his own estate.

Under this Order the number of houses per acre is not to exceed twelve on the average, and not more than twenty in any one acre.

The illustrations on page 79 are reproductions of the maps relating particularly to Town-planning Schemes Nos. 1 and 2, and these are dealt with separately because they are the schemes for which the Preliminary Statement has been approved by the Ministry of Health. The reference has been adapted to a black and white reproduction.

The Preliminary Statement defines the meaning in the usual way of "The Corporation," "The Map," "The Building Regulations," "Various Classes of Buildings," etc.

1. Area of Scheme.—Is defined by reference to the map.

2. (*a*) New Streets.—The principal new streets to be made are numbered and shown upon the map. In respect of any of the said new streets to be constructed of a greater width than 60 ft. (the Corporation having power under their Building Regulations to require a street to be constructed of a width of 60 ft.), adjoining owners will not be required to bear any greater expense in the execution of street works than they would be required to bear if the street were constructed of the width of 60 ft.

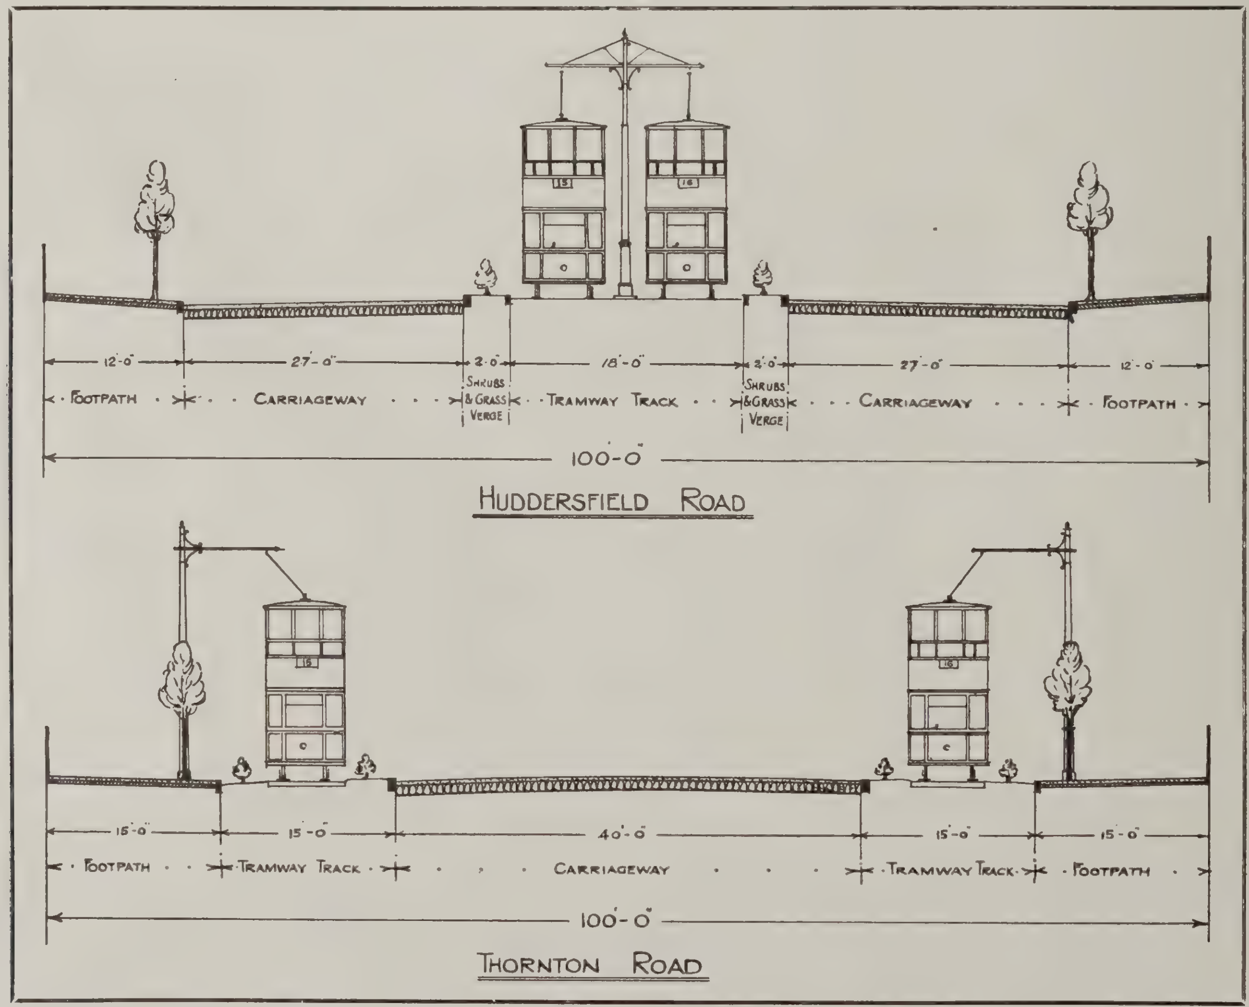
Widening of Existing Streets.—The existing streets to be widened are numbered and shown on the map, and the widenings are to take place at such time or times as the Corporation may determine.

(*b*) Space about Buildings.—No building or erection other than boundary walls or fences shall be permitted to be erected or set up on such space.

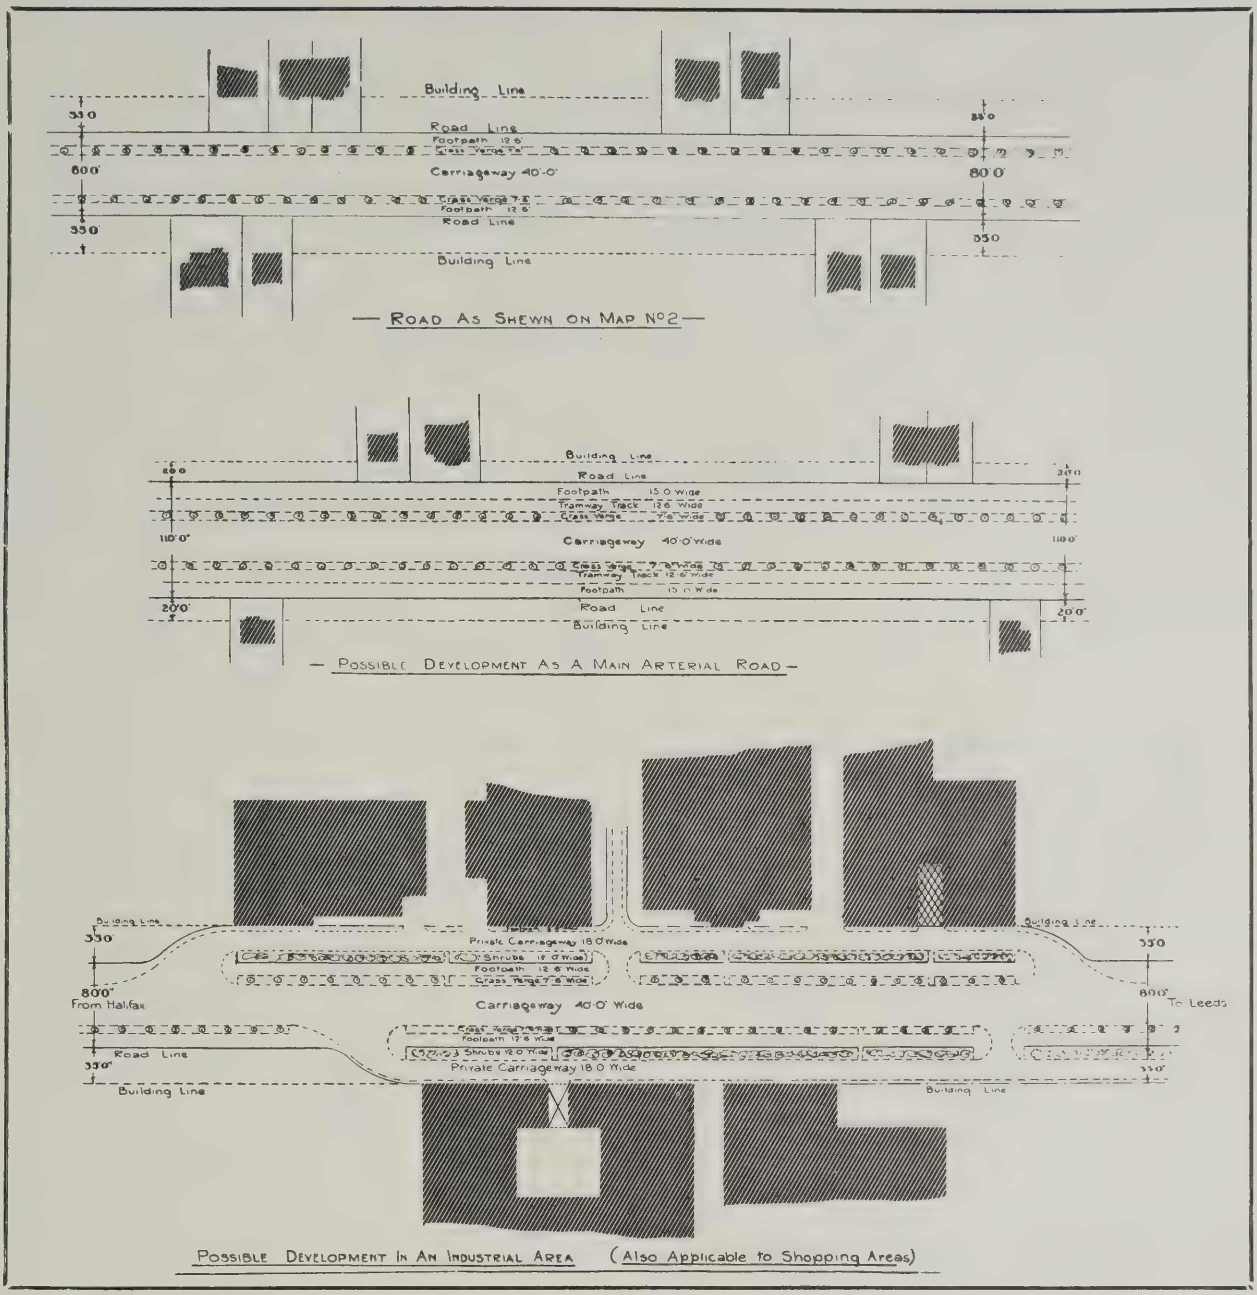
3. Roads, Streets or Ways which it is Proposed to Stop up or Divert.—These are numbered and shown on the map, and they shall as from, but not until, the respective dates on which the appropriate new streets or widenings shall have been constructed and opened for public traffic, be deemed to be stopped up, and all public rights thereover shall cease from such respective dates.

4. (*a*) Restrictions Proposed, and the Areas to which the several Restrictions are to Apply.—Under this heading are set out the various restrictions as to classes of buildings on certain areas shown by distinctive colours on the map, and these restrictions must be adhered to save with the consent of the Corporation and upon such conditions as they impose (subject to appeal to the Minister of Health against any withholding of consent or any conditions imposed).

(*b*) Density of Buildings.—This deals with the proposed restrictions on the number of houses to be erected in the various areas. In scheme No. 1 several restrictions are put on different areas so as to preserve the amenities of the districts, which have already been formed varying on the average from four houses to twelve to the acre. The Corporation, to prevent undue hardship, are permitted to exceed the maximum in certain places where land partially built on under old schemes of development are contiguous to the undeveloped land.



CITY OF BRADFORD TOWN-PLANNING: CROSS-SECTIONS OF ARTERIAL ROADS IN COURSE OF CONSTRUCTION.
F. MARSDEN, CITY ENGINEER AND SURVEYOR.



CITY OF BRADFORD TOWN-PLANNING SCHEME, SHOWING POSSIBILITIES OF ROADS WITH DEEP BUILDING LINES.

F. MARSDEN, CITY ENGINEER AND SURVEYOR.

In determining the "acre" it shall be taken to include, in addition to the plot of land to be used for building purposes, open spaces to be dedicated by the owner, and the half of any street which abuts.

The restriction of the proportion of land to be built upon within the curtilage of a building not being a dwelling-house shall not exceed three-fifths of the whole area of the curtilage, and in the case of a dwelling-house shall not exceed one-third of the whole area of the curtilage, with provision for exceptions in cases of extensions to buildings, existing prior to the dates of the resolutions of the Corporation applying for authority to prepare these two schemes.

(*c*) Heights of Buildings.—The height of buildings is restricted, the maximum in any case, not being a public building or a building of the warehouse class, being 60 ft.

5. Open Spaces.—The land proposed to be reserved for public open spaces is shown upon the map.

Generally speaking, the various proposals of the town-planning schemes have been favourably received. The lines adopted have been to inform the public as far as possible of the proposals, and with this object in view public advertisements and illustrated articles have appeared periodically in the local newspapers, and in addition, public posters have been shown on hoardings and in the tramcars, and an order has been given for the issuing of the advertisements at least once every three months, in which any prospective purchaser of land is advised to apply to the City Engineer and Surveyor as to the requirements relating to that piece of land. This has been largely taken advantage of, and over 900 people availed themselves of the opportunity of inspecting the maps during the last twelve months. In one district the City Engineer and Surveyor was present at a public meeting which was attended by some 300 people, the maps were displayed, and the whole scheme explained to the audience at considerable length, the time afterwards being devoted to questions from members of the audience.

Suggestions were received and carefully considered later. Landowners have received the proposals favourably, and in the development of estates by builders, modern ideas of development have been adopted. One pleasing feature, so far, has been the way in which deep building lines have been adopted for the improvement of main roads. In this connection, seeing that the proportion of the plot of land which can be covered by buildings is restricted to one-third or three-fifths as the case may be, the obtaining of a deep building line is facilitated at the front rather than having a very large area of land at the back. The advantage of this deep building line on heavy traffic roads is becoming more realized daily, and this is no small advantage to the property owner when one remembers the number of complaints received about the vibration caused by modern road traffic to buildings on the roadside. The illustration on page 81 is of an industrial and trading centre and shows the advantage of a building line and how the space in front of such premises can be utilized for loading and unloading goods without any loss of time to the proprietor and no inconvenience to the general public or the ordinary traffic along the road, also how a space in front of the buildings can be adapted to a future widening of the road when traffic warrants it.

One of the greatest advantages of having the schemes so well in advance is that building plans can be submitted and approved in accordance with the general requirements of the town-planning schemes as governed by the Development Order and Preliminary Statement. The Corporation are now in a much stronger position properly to regulate the development of the city than they would be if the owners were required to endorse their plans under Section 58 (2) of the Housing, Town-Planning, etc., Act, 1909, which clause is intended to protect the Corporation from having to pay compensation in cases of development of land not in accordance with the final approved town-planning scheme.

This section of the 1909 Act has undoubtedly the effect of retarding building operations. The Town-Planning (General Interim Development) Order, 1922, and the advanced state of the schemes has removed this difficulty in Bradford, and there are at the present time distinct signs of the revival of building operations.

For those who do not know the configuration of Bradford it may help to say that the altitudes vary from below 200 to 1,200 above ordnance datum, hence the great difficulty of obtaining roads of ordinary gradients not to exceed one in sixteen or eighteen, which is only secured on the hillsides by detours and very careful detailed planning.

---

# Town Planning on a Great Scale

## The work of the Manchester and District Joint Town-Planning Advisory Committee

THE above-named Joint Committee has been set up under and by virtue of the powers contained in Section 54 of the Housing, Town-Planning, etc., Act, 1909, as amended and extended by Section 42 of the Housing, Town-Planning, etc., Act, 1919. The various local authorities represented on the Joint Committee have by resolution concurred in appointing out of their respective bodies the Joint Committee, the functions of which are as follows :—

(*a*) To advise in the promotion, co-ordination, and linking-up of town-planning schemes within the area.

(*b*) If considered necessary by the committee, to prepare on broad outline a regional plan for the area.

(*c*) To consider and make suggestions or recommendations on any matter relating to the effective town or regional planning or development of the area, or upon any other co-essential matter which may be referred to it.

(*d*) To make suggestions and recommendations to any Government department or local authority on any matter coming within the scope of the committee's activity.

The agreed representation on the Joint Committee is for each county borough and borough to appoint two representatives, and each urban district council and rural district council one representative on the Joint Committee. On the invitation of the committee non-voting representatives are also appointed from the county councils of Cheshire, Derbyshire, Lancashire, and Yorkshire (West Riding); the Garden Cities and Town Planning Association (North Western Branch); the Manchester Society of Architects; the Manchester Chamber of Commerce; the Ministry of Health and Ministry of Transport. In addition the chief officials of the local authorities constituting the Joint Committee may attend the meetings of the committee in an advisory capacity.

The committee, which meets at least quarterly, has delegated to sub-committees, which are composed of members and officials of the various bodies associated with the Joint Committee, various duties, and it is chiefly through the sub-committees that the Joint Committee functions. Matters requiring detailed consideration are referred to the appropriate sub-committee, whose proceedings are in turn submitted to the Joint Committee for approval or otherwise.

The activity of the Joint Committee is practically limited to the area within a line drawn at a radius of 15 miles from the centre of St. Anne's Square, Manchester. Within this area (about 707 square miles) there is, approximately, 108 separate local authorities (either totally or in part), including the four county councils of Lancashire, Cheshire, Derbyshire, and Yorkshire (West Riding).

Of these 108 local authorities, 77 are represented on the Joint Committee, the remainder of the authorities having refused to associate themselves with the Joint Committee.

Following is an analysis of the authorities :—

| Authority. | Represented on Joint Committee. | Not Represented on Joint Committee. | Totals. |
|---|---|---|---|
| County Boroughs | 8 | — | 8 |
| Boroughs .. | 14 | 3 | 17 |
| Urban District Councils. | 43 | 24 | 67 |
| Rural District Councils. | 8 | 4 | 12 |
| County Councils | 4 | — | 4 |
| Totals . | 77 | 31 | 108 |

Taken on acreage and/or rateable value, the local authorities not yet associated with the Joint Committee form a minor portion of the whole area.

The Joint Committee was formed by mutual consent nearly two years ago, its main functions being to advise and assist in the promotion and co-ordination of town-planning schemes within the area.

As indicating the position to date with regard to town planning in the area, forty-two separate local authorities are now preparing, or considering, the preparation of schemes, and as a result of the requirements of the Town-Planning Act of 1919, whereby all authorities with a population of 20,000 persons or more, according to the last census, are obliged to prepare town-planning schemes, another twelve authorities will in the near future be actively engaged in town-planning their respective districts. It will thus be seen how important it is to have some representative authority co-ordinating the various proposals of these fifty-four local authorities, especially so when consideration is given to the highly industrialized nature of the area of the committee's activity.

Owing to the geographical position of the areas for which the fifty-four town-planning schemes are being prepared, or are to be prepared, many other local authorities will be obliged to undertake the preparation of schemes, the probable result being that in the course of a few years practically the whole region of the committee will come under the provisions of the Town-Planning Acts.

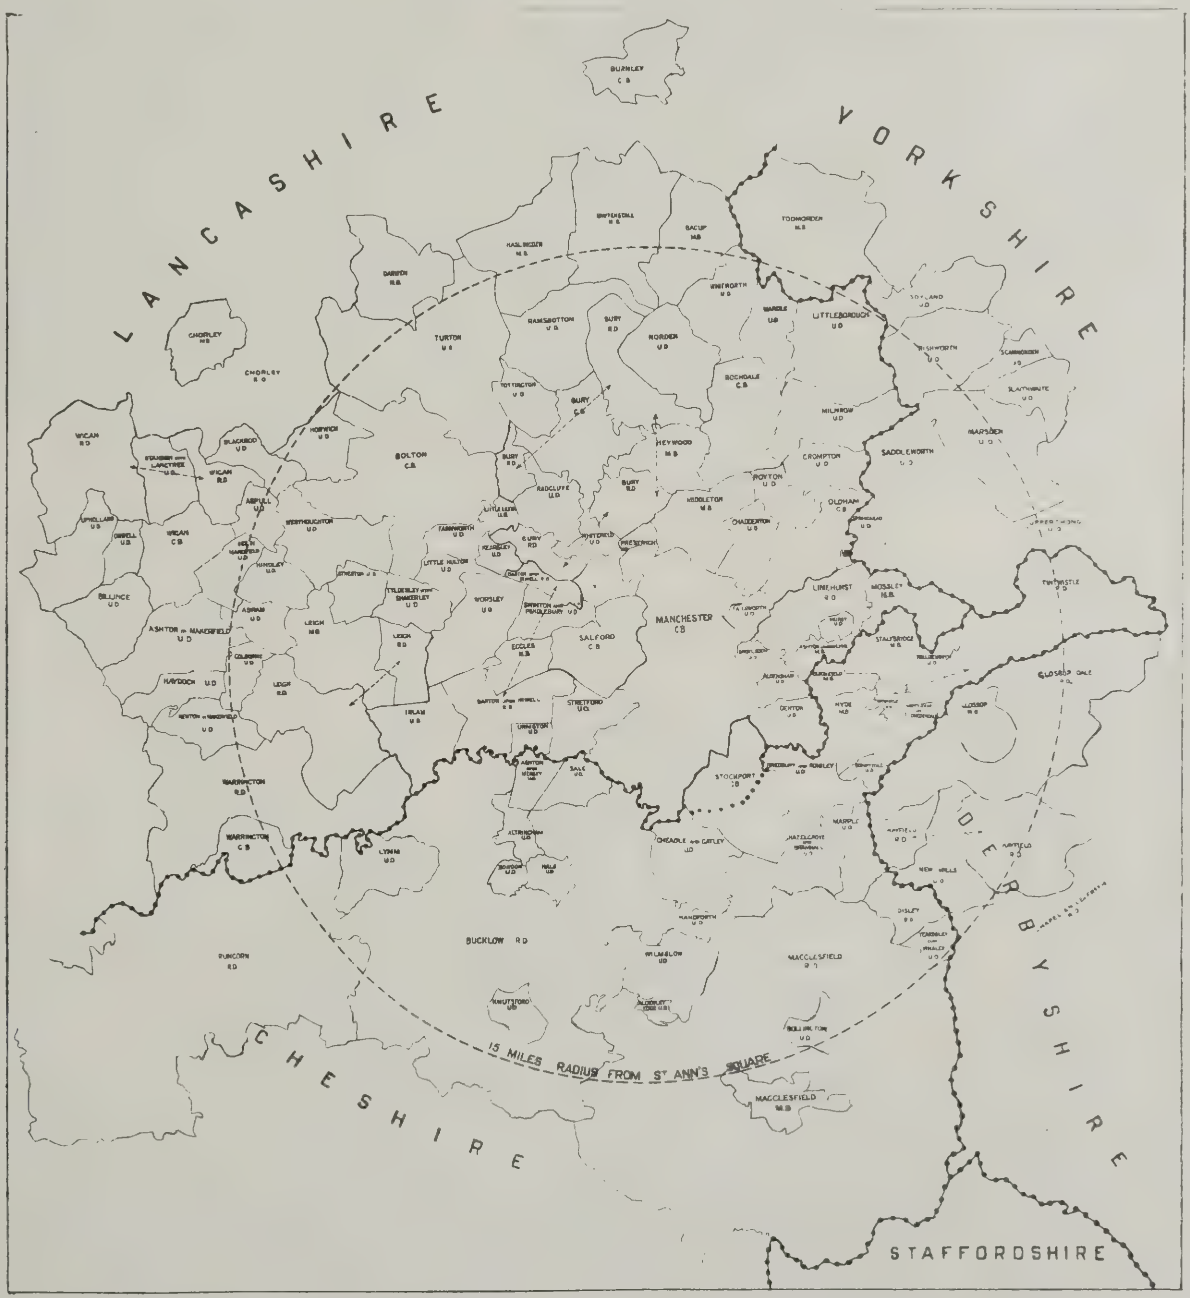
In order that guidance may be available for the various authorities in the preparation of their individual schemes, a sub-committee of the Joint Committee is endeavouring to set down the principles to be adopted in relation to building operations, such as density of houses per acre for urban and rural areas, proportion of site area to be built upon, provision of parks and open spaces, classes of commercial and industrial buildings, spaces between and about buildings, building lines, etc. Another sub-committee is engaged in considering the desirable minimum widths for both existing first-class and second-class roads and proposed roads, and from the answers received to a questionnaire recently addressed to the surveyors of all authorities represented on the Joint Committee, this sub-committee is about to consider in detail numerous proposals for the widening and improvement of existing roads, and the positions and widths of proposed new roads.

A sub-committee is also dealing with the preparation of a civic and regional survey of the area. Much information has already been obtained by this sub-committee, and a very fine series of maps are being prepared relative to the area.

In addition, the Joint Committee is being of some assistance, especially to the smaller local authorities, in giving advice on the various questions which arise in the promotion and preparation of schemes. It is considered that the Joint Committee is fulfilling a very useful purpose in the area, as without its assistance each local authority would have to co-ordinate its own proposals with adjoining authorities; and, further, many local authorities are being encouraged to promote schemes which, but for the existence of the Joint Committee, would not ordinarily be promoted for some time to come.

As a result of the recent town-planning exhibition and conferences held in the Manchester Town Hall under the auspices of the Joint Committee, a considerable amount of interest has been aroused throughout the area with regard to town planning, town development, and reconstruction, and it is safe to say that a more enlightened and intelligent view has been taken as to the meaning and possibilities of town planning.

The enormous advantages to be gained by the proper application of town planning, not only from the point of view of providing and improving facilities for movement



MAP SHOWING THE AREA OF THE MANCHESTER AND DISTRICT JOINT TOWN-PLANNING ADVISORY COMMITTEE.

of traffic, but also with regard to the protection of various classes of building user, whether residential, commercial, or industrial, together with the methods which can be employed for the provision for recreative facilities and the preservation of amenities, were well illustrated by the various maps and plans exhibited.

The Joint Committee, in order to be of still greater usefulness, is now considering the advisability of preparing a regional plan for the whole area. The preparation of such a plan would very materially assist the various local authorities in the preparation of individual schemes, as, instead of the various authorities having to initiate proposals, the Joint Committee's regional plan would form the skeleton upon which the various local authorities could build up detailed local schemes.

It is pleasing to record the smoothness with which the work of the Joint Committee is carried on, and the apparent desire on the part of all representatives to work for the good of the whole area, and, notwithstanding the variety of interest represented, to view the area as a unit—perhaps the most important unit in the whole country so far as the necessity for complete and judicious planning is concerned.

# Some Important Buildings of the Year

## Selfridge's New Extension

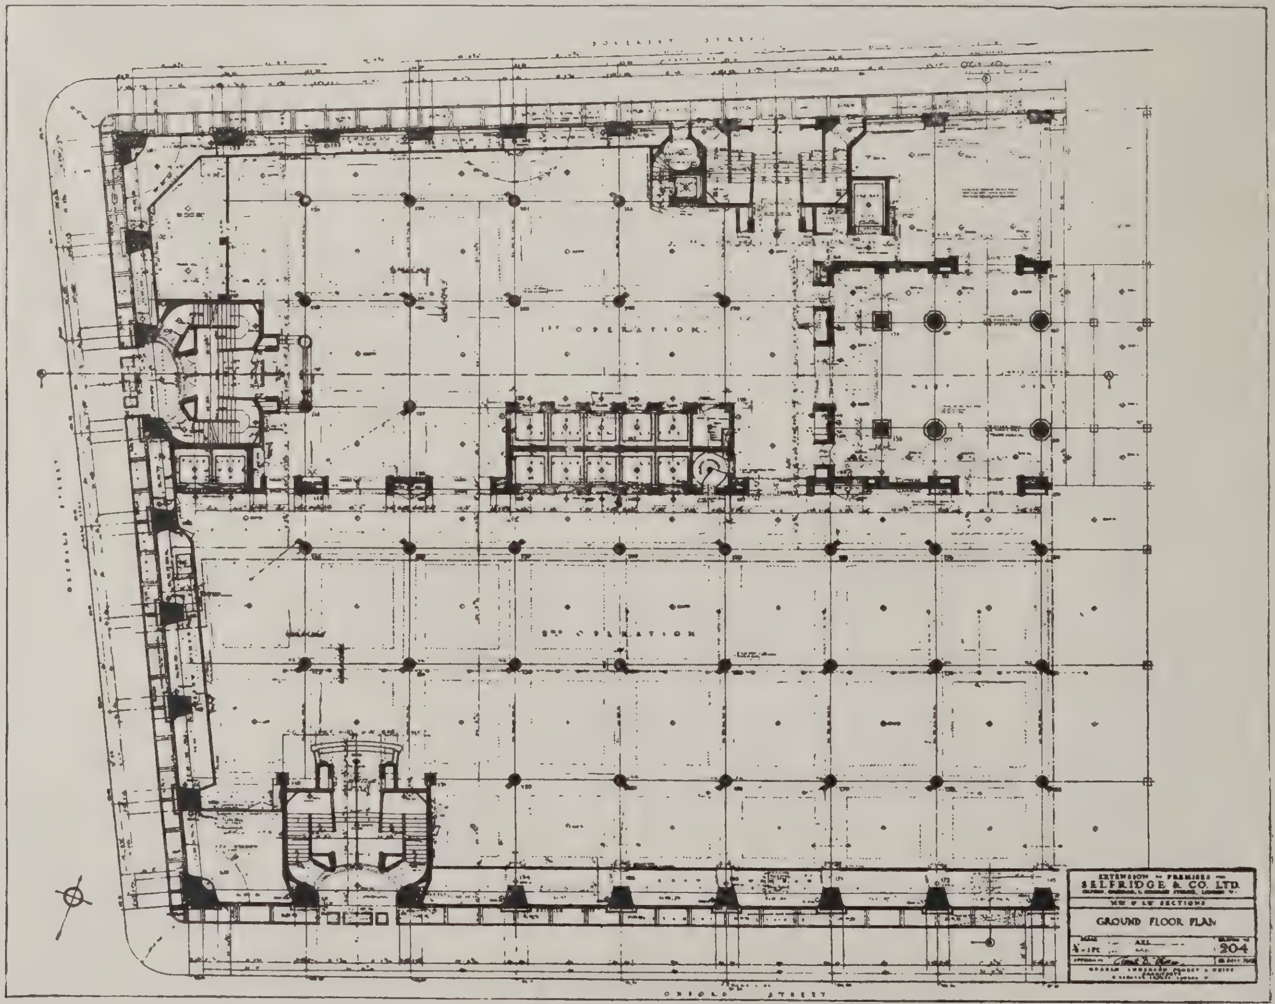
Graham, Anderson, Probst and White, and Sir John Burnet and Partners, Architects.

THE new building for Messrs. Selfridge & Co., Ltd., at the corner of Orchard and Somerset Streets represents the first section of the extension to the original premises. This very important island site will eventually have the colonnade motif on the three principal façades. Seven spacious stories constitute the building, with the mechanical plant three stories below the pavement level.

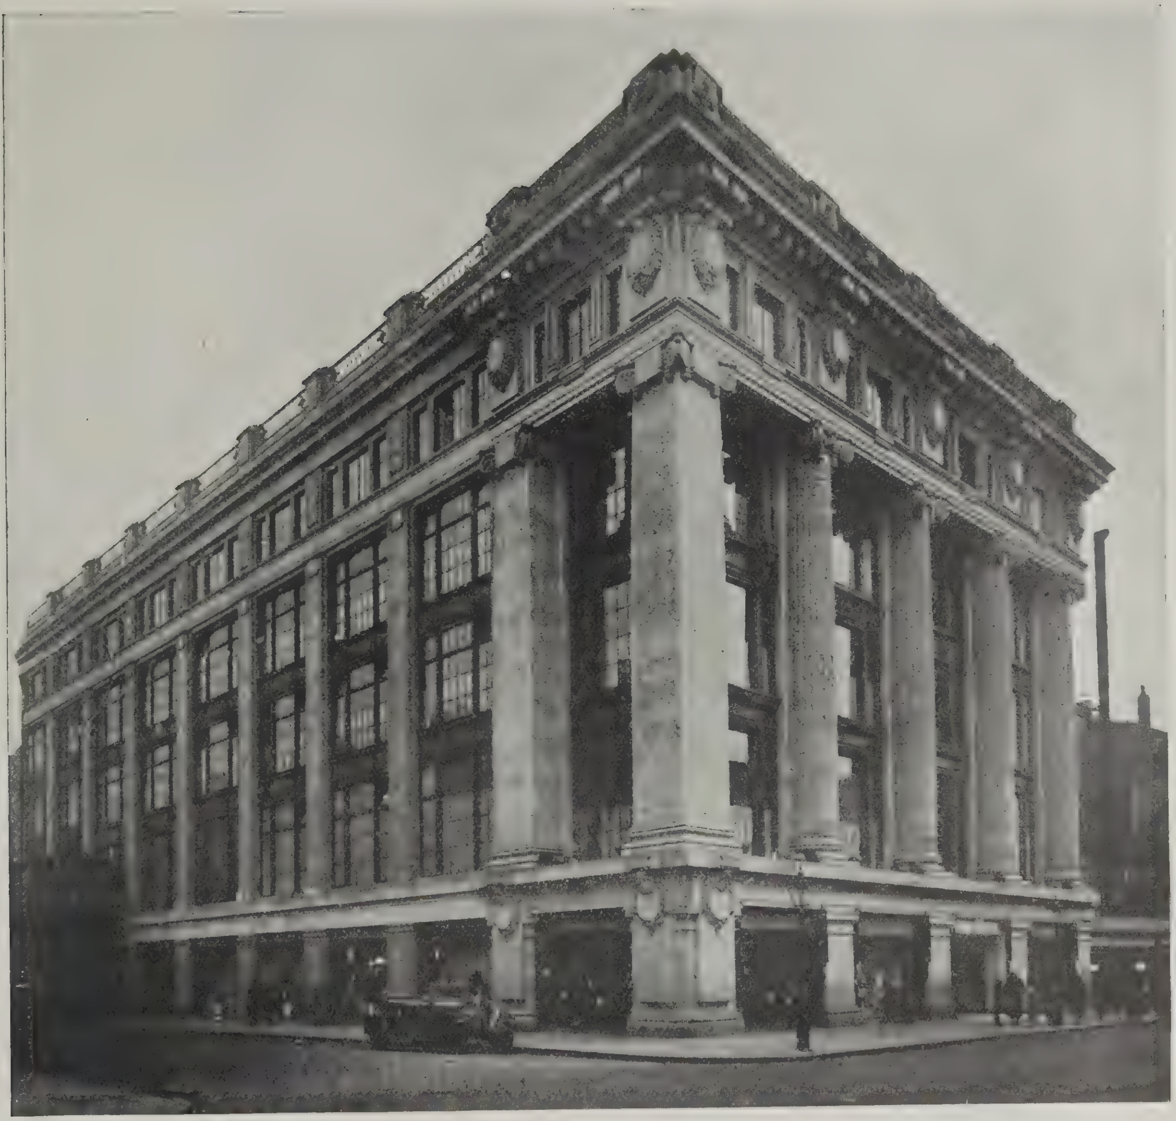
The exterior conception of the original building is recalled in the extension, and the metal infill between the columns with its bold and broad treatment suggests the light and air appropriate to a departmental store.

The carcase construction of the building is composed of reinforced concrete retaining walls and foundations, steel skeleton frame on cast iron bases and steel grillages, combination concrete and hollow tile fire-resisting constructional floors—all elements necessary to the stability of the modern fireproof building.

The two twin staircases are a novel feature, as they combine approaches to the ground floor, basements, and upper floors through one general entrance. Marble wall linings with contrasting inlays and terrazzo stairs and stringers with self-toned floor inserts are particularly designed for economy of maintenance. For public safety one stair is



GROUND-FLOOR PLAN



SELFRIDGE'S NEW EXTENSION: SOMERSET STREET AND ORCHARD STREET FRONTAGES.
GRAHAM, ANDERSON, PROBST AND WHITE, AND SIR JOHN BURNET AND PARTNERS, ARCHITECTS.

arranged as a fire tower, open to the street and protected from the weather by permanently open glass louvres.

Simplicity and efficiency have been the keynote in the design of the interior, and a careful distribution of materials has been made to form a pleasing background for the effective display of merchandise. The comfort and safety of the public have been given particular consideration.

Large spacious floor areas—so essential in the modern store—with the maximum size openings permitted in the divisional walls, render it possible to obtain as uninterrupted a view of the entire lay-out as practicable.

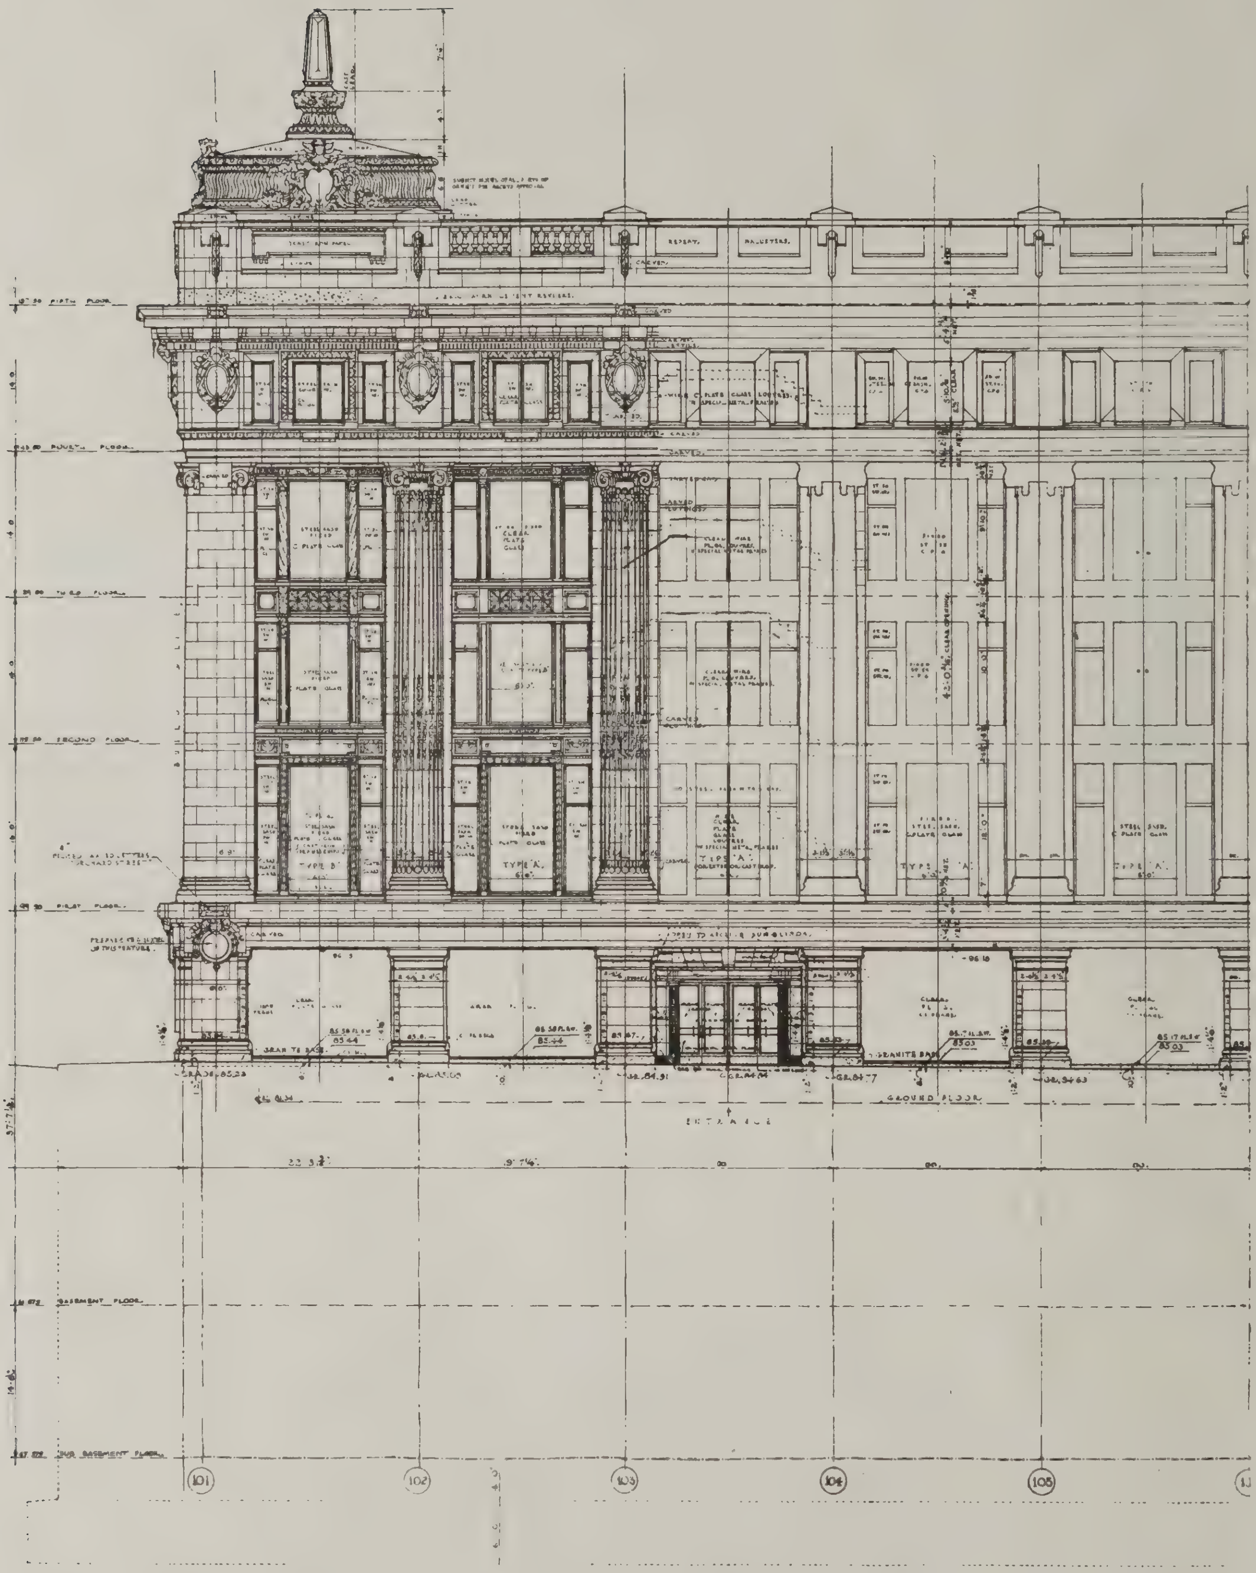
The passenger lifts with their cars in brilliant-hued lacquer have been arranged in groups of five, and their location is centralized in each compartment upon the main avenues of circulation, so that the public when arriving at any floor may conveniently approach the department desired.

The upper floors are covered with wood block of nutbrown colour with carpet runners, and white marble in large slabs is used on the ground floor.

Careful study of the lighting problems for the interior resulted in adopting the semi-indirect type of illumination through daylight glass bowls and hoods, together with special portable daylight standards on the counters. The exterior flood-lighting, lending itself appropriately to the exterior motif, is a new departure.

The mechanical installations, with all their modern appliances, have been scientifically studied, and pipe work is concealed from view, accessible for maintenance, and arranged in the most economical manner. Boilers in the sub-sub-basement with their oil fuel installation provide the heating and domestic hot-water service. Spiral gravity and band conveyors to distribute goods to departments for dispatch; a vacuum cleaning installation with appliances to clean all types of floor coverings and hangings; signal call systems; synchronizing clock systems; concealed sprinklers with outlets carefully distributed; electric light and power installations with centralized control cabinets and lighting points freely distributed so as to allow flexibility for the interchange of departments; all these are special branches of the work essential to the successful operation of the

A VIEW IN ONE OF THE NEW SHOWROOMS.



SELFRIDGE'S NEW EXTENSION: PART ELEVATION TO ORCHARD STREET.
GRAHAM, ANDERSON, PROBST AND WHITE, AND SIR JOHN BURNET AND PARTNERS, ARCHITECTS.

modern departmental store. Wherever practical, mechanical appliances have been permanently arranged for public view.

SELFRIDGE'S NEW EXTENSION: A VIEW INSIDE THE SOMERSET STREET ENTRANCE.

The show-windows, executed in American walnut in monotone with black inlays and illuminated by diffused and spot lighting, all reflect the simplicity and restrained character of the interior treatment.

In conjunction with the principal floors of this new section, which are devoted to men's departments, is the men's hairdressing saloon, a large and spacious room with special treatment rooms attached. It is finished with light tones and wall linings of white opaque glass, brilliantly illuminated and is equipped with all the modern services and conveniences.

The associated architects for the building were Messrs. Graham, Anderson, Probst, and White, and Sir John Burnet and Partners. Messrs. Graham, Anderson, Probst and White acted as structural and mechanical engineers and superintendents of construction, and F. D. Huntington, Ltd., were the general contractors.

[It is interesting to recall that the original Selfridge building was opened in 1909, having been completed from the designs of Mr. R. Frank Atkinson, F.R.I.B.A. It set a new architectural scale not only for Oxford Street, but for London, besides introducing to this country the characteristics of the modern American store. Mr. Selfridge has proved very conclusively that commerce, so far from being opposed to good art, can actually promote its best interests. He has also shown that fine architecture itself is an invaluable business asset, and for this service he deserves the best thanks of architects. The value of a building such as the Selfridge Store goes beyond the serving of its own immediate practical purpose. It fulfils a definite educational function, and thus helps to raise the general standard of architecture.

The Selfridge Store may be said to have introduced to modern commercial architecture in London the right use of the giant order, which is a very effective feature when skilfully handled, as it undoubtedly is in this instance. When the complete scheme of the store is finally realized, the building will rank as one of the most imposing things of its kind—certainly the equal of many of the finest stores in the United States.]

# The Port of London Authority Building

## T. EDWIN COOPER, F.R.I.B.A., Architect

THE formal opening of this great building by Mr. Lloyd George last October aroused considerable public interest in an undertaking that has occupied more than eleven years in fulfilment. In our issue for October 18 we published a plan and external view of the building; we now give some views of the interior.

The ground plan reveals the simplicity and boldness of the general conception—a perfect square with its sides facing the cardinal points of the compass, and having the angle cut off towards Trinity Square on the south-east. A great portico, the whole width of this angular front, is the principal entrance, and the remaining sides of the square form a hollow cube with a large circular hall (the rotunda) in the centre. The portico is carried up through three stories, and the main entrance hall is crowned with the great tower. The blocks forming the sides of the square are five stories high, with square pavilions, in which are the secondary entrances, on the south-west, north-west, and north-east corners. On the ground floor diagonal corridors lead from these three entrances to the rotunda, while central corridors intersect the side blocks through their whole lengths, and short cross corridors connect the centres of these side blocks with the rotunda. The circular form within the square gives three spacious spandrel-shaped courts, divided by the diagonal corridors on the ground floor only, and thus provides ample light and air to the side blocks.

The architectural treatment throughout is based on a careful study of the best examples of the English Renaissance, while Italian and French influences can be traced in some of the ornament. Richness of detail is concentrated on the portico and tower; and, to a lesser degree, on the five pavilions which mark the terminations of the square sides. The four flanking walls between these pavilions have severely plain window openings, and effect is obtained by means of the great cornice and of the shadows cast by the balconies to the second-floor windows.

Five doorways from the entrance hall lead direct to the rotunda, a circular hall 110 ft. in diameter and 67 ft. in height from the floor to the top of the dome. This vast hall, approximately the same internal diameter as the dome of St. Paul's, is one of the most impressive parts of the whole interior. Direct access to this chamber, where so much of the business of the port will be daily carried on, is provided from every part of the ground floor.

The four committee rooms on the south of the centre are interesting architecturally, each being treated in one

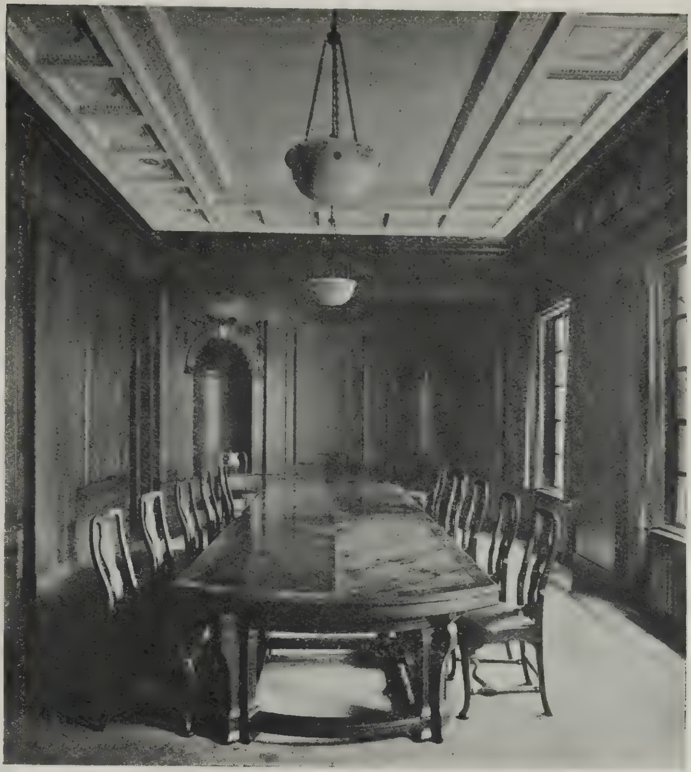
of the Orders; the first is early Doric, the next later Doric, the third Ionic, and the fourth Corinthian. All are in oak, with enriched plaster ceilings.



THE P.L.A. BUILDING: A COMMITTEE ROOM.

The contractors for the building were Messrs. John Mowlem & Co., Ltd. Mr. George A. Webster has acted as quantity surveyor for the Authority.

Wood carving.—The whole of the wood carving throughout the building was executed by Mr. George Maughton.

Among the sub-contractors were: Messrs. J. Whitehead and Sons, Ltd. (all internal stonework, pavings, and Subiaco marble); Messrs. G. Rome & Co. (plaster work); Messrs. F. de Jong & Co., Ltd. (fibrous plaster); Messrs. Mumford, Bailey and Preston (heating, ventilation, and kitchen equipment); Mr. William Smith (windows, special glazing, and all metal work, lamp, gates, grilles, etc.); Messrs. Smith, Major and Stevens, Ltd. (lifts); Messrs. James Gibbons, Ltd. (locks and door furniture); Messrs. John Mowlem & Co., Ltd. (screens, counters, and wall panelling); Messrs. J. P. White and Sons, Ltd. (furniture and fittings); Messrs. J. Whitehead (all architectural carving and internal plaster modelling); Messrs. Luxfer Prism Syndicate, Ltd. (fireproof glazing); Messrs. G. Matthews, Ltd. (grates); Messrs. J. A. Lawford & Co. (asphalt work); Messrs. Duke and Ockenden (well sinkers); Messrs. Hollis Bros. & Co. (oak wood-block floors); Mr. William Knight (painting); Messrs. Roberts, Adlard & Co. (slating); Messrs. Smeaton, Hanscomb & Co. (veneers to panelling in board room, etc.); Messrs. G. and T. Earle, Ltd., and the Wouldham Cement Co., Ltd. (cement work); the London Brick Co., Ltd. (Fletton bricks); Messrs. Joseph Brooke and Sons (stone steps and landings); Messrs. Haywards, Ltd. (iron circular staircases); Messrs. Matthew Hall & Co.(plumbing work); Messrs. A. and F. Manuelle (granite work); Messrs. F. J. Barnes, Ltd., and the Bath and Portland Stone Firms, Ltd. (Portland stone); Messrs. J. Gliksten and Son, Ltd.; Messrs. Wm. Oliver and Sons, Ltd.; and Messrs. Sidney Priday and Sons (hardwood); The Art Metal Equipment Co. (travelling ladder for dome); Messrs. Cope & Co. (tiling); Messrs. Dorman, Long & Co., Ltd. (steel erection); Messrs. Paripan, Ltd. (enamel work); Messrs. J. W. Gray and Son (lightning conductors); Messrs. W. H. Heywood & Co. (patent glazing); and Mr. W. J. Rasey (glazing).

# The London County Hall

## Designed by RALPH KNOTT, F.R.I.B.A.

## W. E. RILEY, R.B.A., F.R.I.B.A., Consulting Architect

THE County Hall is a building commissioned by a great municipality of comparatively recent creation whose business is to set precedents and not to rely upon them. In the first place they created a new precedent by placing their building on the south side of the river, and for its proper setting made a beginning with the southern embankment wall, thereby opening up a new era for Southern London and providing a magnificent opportunity for their chosen architect.

The plan of the building itself retains all the simplicity of the original competition design, but departs from it in the arrangement of offices on one instead of both sides of the corridors, in the provision of an additional entrance from Westminster Bridge Road, and in the semi-circular treatment of the centre portion of the river front. The bold differentiation of treatment between the centre or administrative part of the building and wings containing the offices is retained both in plan, elevations, and internal treatment, as also is the treatment of the roofs.

The Council Chamber is placed in the centre of the building, approached directly from all sides and cleverly arranged as regards levels to be reached without stairs except from the lower level of Belvedere Road. There is abundance of light everywhere; no dark corners or dark rooms, and no rooms looking out into narrow, ill-lit areas.

One of the most interesting features of the building is the arched and open stone-vaulted approach from Westminster Bridge Road.

On the Belvedere Road front the main entrance is marked by a colonnade of coupled instead of single Ionic columns as on the river front, surmounted with a high blocking course or parapet, behind which the tile roof is hidden.

The contractors were: Messrs. Holland and Hannen and Cubitts, Ltd. (general contractors); Messrs. F. and H. F. Higgs, Ltd. (the foundation work); Messrs. E. C. and J. Keay, Ltd., and Messrs. J. Westwood & Co., Ltd. (structural steelwork); Messrs. Farmer and Brindley, Ltd. (whole of the decorative marble work); Messrs. J. Whitehead and Sons (constructional polished Roman marble work in the various entrance halls); Messrs. Henry Hope and Sons (steel casements, hardware, etc.); Messrs. Doulton & Co. (sanitary and plumbing work); Messrs. J. Jeffreys & Co., Messrs. Richard Crittall & Co., Ltd., Messrs. G. N. Haden and Sons, and Messrs. F. A. Norris and Dutton (general heating system); Messrs. Benham and Sons, Ltd. (cooking apparatus); The London Brick Co. ("Phorpres" Fletton bricks); Sneyd Collieries (glazed bricks); Waygood - Otis, Ltd. (lifts); Crittall Manufacturing Co. (all the bronze doors, exterior and interior); Messrs. Vertigan & Co. (hardwood parquet flooring); J. L. Emms (cast lead gutters and rainwater heads); Messrs. F. and C. Osler, Ltd. (electric-light fittings for main corridors, chairman's room, lobbies, and principal committee rooms); Messrs. Faraday and Son, Ltd. (electric-light fittings); General Electric Co., Ltd. (heavy cast bronze and ornamental glass electric-light fittings for entrance hall and several rooms); Messrs. Ames and Finnis (roof tiling); Messrs. F. Braby & Co., Ltd. (copperwork for flèche, dormers, etc.); La Brea Asphalte Co. (asphalt); The British Luxfer Prism Co. (lantern lights); Messrs. J. W. Singer and Sons (iron and bronze gate to ceremonial staircase); Expanded Metal Co., Ltd. (reinforcement for concrete work); Bromsgrove Guild (bronze lamp standards); Messrs. Strode & Co. (bronze and wrought ironwork); Messrs. Hobbs, Hart and Co. (whole of the locks); Messrs. Korkoid and Ruboleum Tile Co. (Ruboleum flooring—approximately 650 sq. yds.); Messrs. Dorman, Long & Co., Ltd. (steel constructional work); Messrs. Gillett and Johnston (electric clocks); Messrs. Davey, Paxman & Co., Ltd. (hot-water boilers); Express Lift Co. (electric lifts); Messrs. Heffer, Scott & Co., Ltd. (painting—"Keystona").

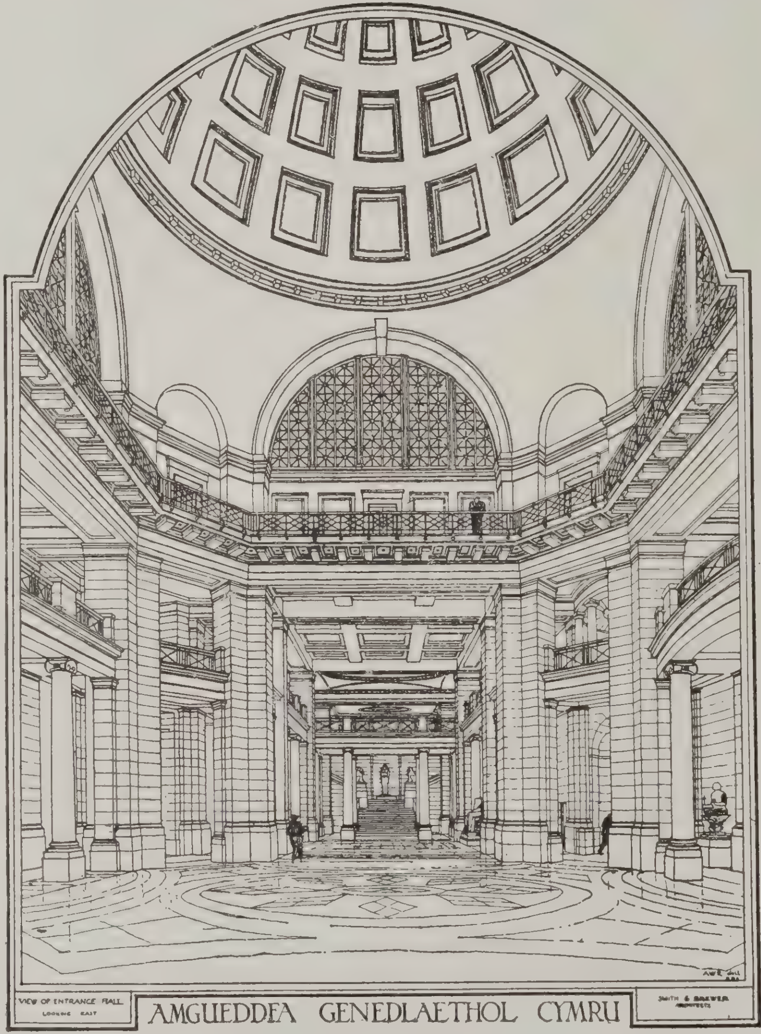
DETAIL OF ENTRANCE DOORWAY IN COURTYARD.

# The National Museum of Wales, Cardiff

## SMITH and BREWER, Architects

THE Welsh National Museum, opened on October 28, 1922, was begun in 1910, and work continued until 1915, but then, owing to the war, building operations ceased, and were not resumed again until 1920. A comparison of the model for the complete design with the actual building shows that the foundations for about half the building have been put in, that nearly a quarter of the superstructure, in an incomplete state, including the whole of the southern front, has been erected, while the portion now completed and opened to the public is about one-tenth of the complete scheme, and is situated in the south-west corner of the block. The building will ultimately use very completely a site about 4¼ acres in extent.

The leading motive of the plan is a large interior court 307 ft. long by 134 ft. wide, surrounded by the public galleries on two floors, while outside the public galleries is the space for the reserve collections with a mezzanine floor between the ground and first floors. This arrangement of the public galleries allows of the freest possible circulation on the ground floor, enables the maximum use to be made of the central garden, and permits of two floors of ample height without carrying up the external walls higher than those of the adjoining building.



VIEW OF ENTRANCE HALL LOOKING EAST
AMGUEDDFA GENEDLAETHOL CYMRU
SMITH & BREWER ARCHITECTS

THE ENTRANCE HALL

The magnificent entrance hall under the dome and two fine rooms to the west and east, intended for a children's museum and refreshment room respectively, occupy the south front, while immediately opposite the entrance is to be the Welsh Natural History Pavilion, designed for the display of the habitat groups in specially lighted alcoves. At the north end of the central court there is to be a similar pavilion for history and antiquities, while between them, in the centre of the basement, will be the aquarium. The lecture theatre, with its separate entrances, exits, and cloakrooms, is arranged on the east side, while in the north-east corner of the site it is proposed to erect an open-air theatre, constructed entirely of stone, and intended primarily for Welsh national folk-songs and dances. In the completed scheme the total superficial area in the public galleries and in the reserve galleries will be 81,000 ft. and 50,000 ft. respectively.

The administrative block, with library, committee-rooms, and offices, is arranged around the dome on the second floor; the basement is occupied by workshops, stores, and cloakrooms; and the sub-basement is used only for engineering plant, pipes, and the great ventilating trunks which carry the air to and from the vertical ducts in the walls.

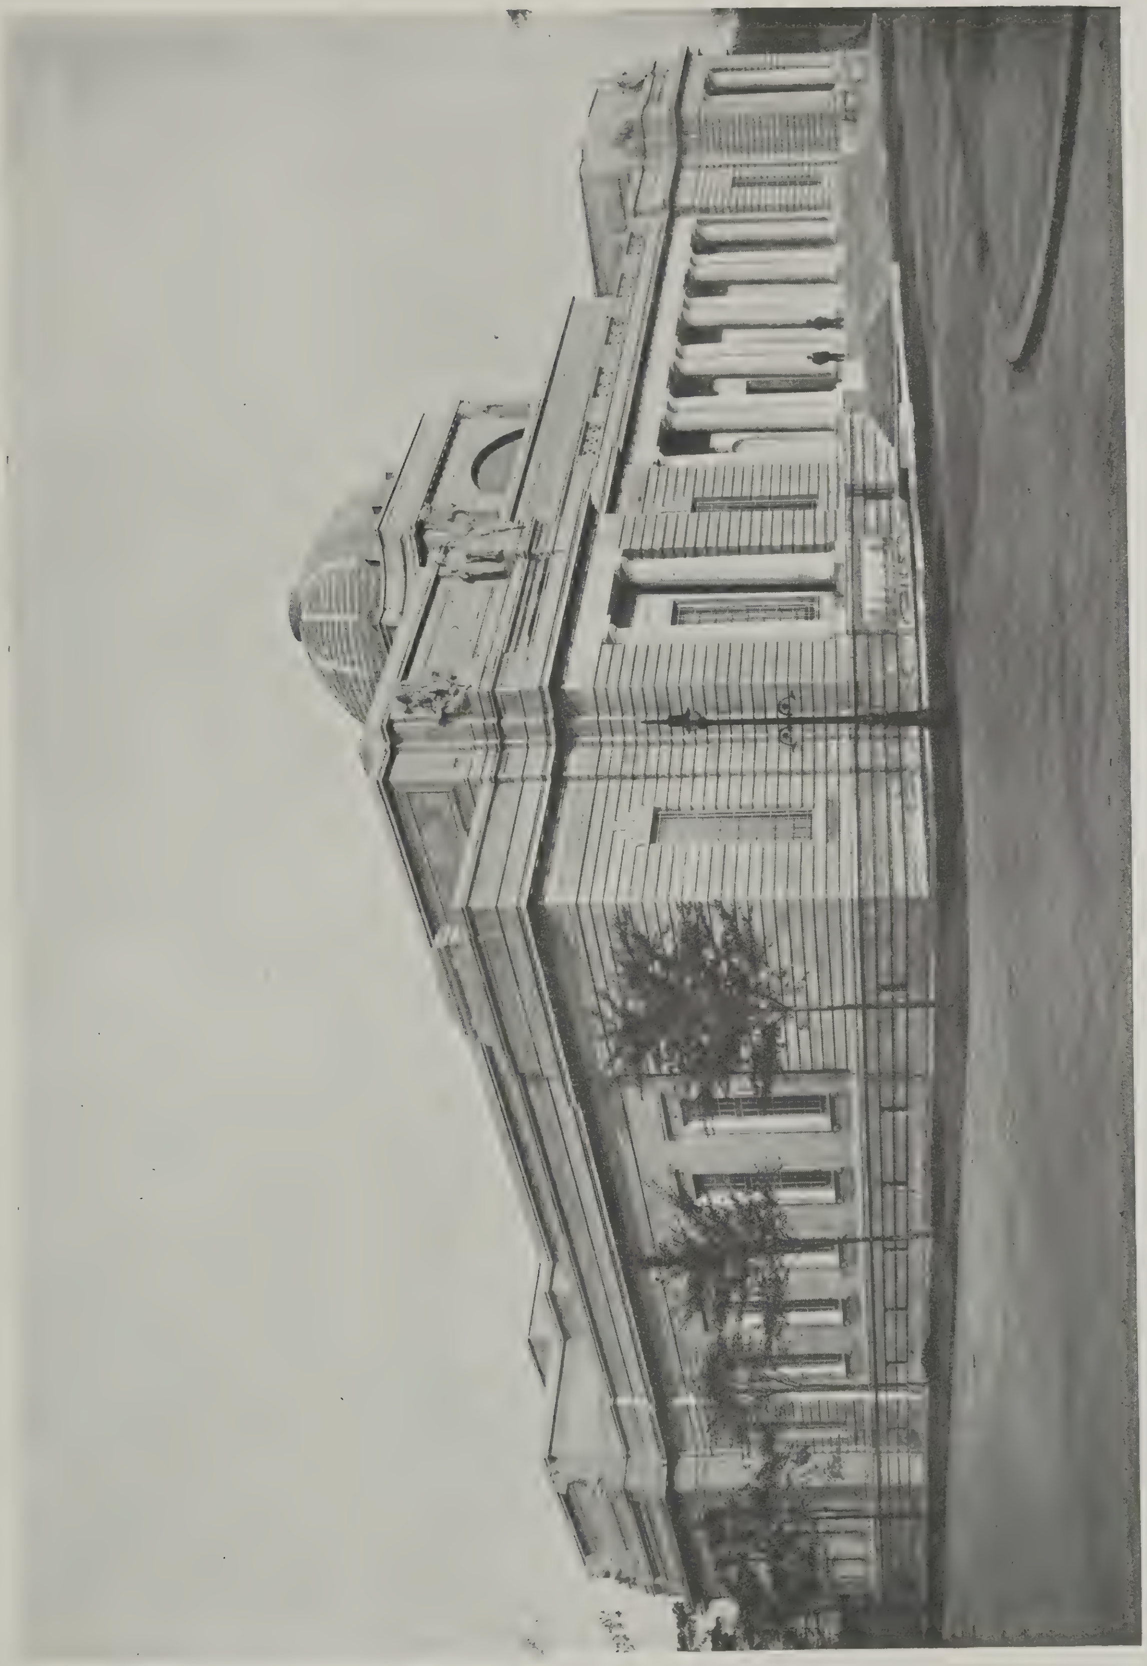
In the early perspective the dome was less lofty, and single columns were used in the entrance portico in the centre of the south front. This is now ably treated with a coupled Doric order, and is flanked by pavilions crowned by four groups of sculpture, the western pair, representing the Prehistoric and Classic periods respectively, being by Gilbert Bayes, while the eastern groups, executed by Richard Garbe, represent the mediæval and modern periods. The two groups on the western façade (facing the City Hall), representing mining and shipping, are the work of Thomas J. Clapperton, and are remarkable for their extraordinarily high architectural quality. The lions and dragons buttressing the dome are by A. Bertram Pegram.

Messrs. Joseph Armitage, George Alexander, and Harold Stabler were responsible for the general modelling work.

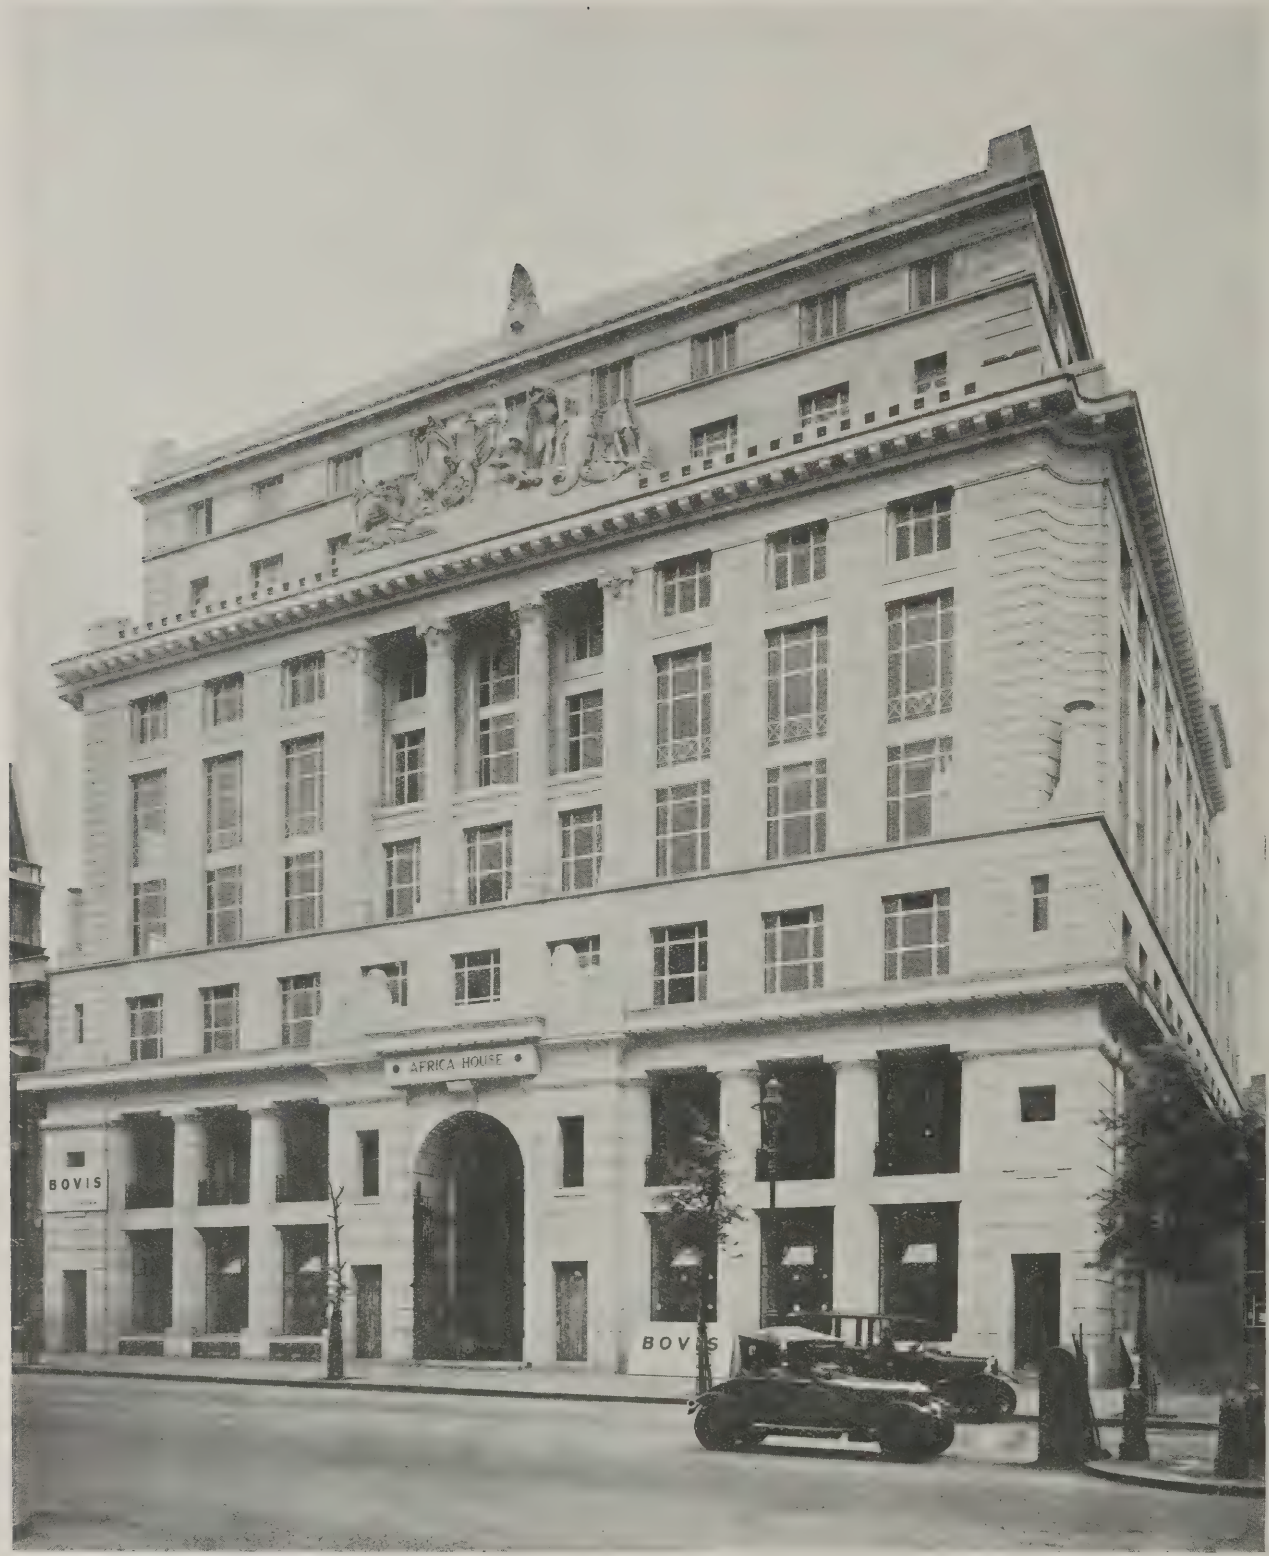
The contractors for the foundations up to 6 ft. above the ground level were Messrs. E. Turner and Sons, of Cardiff, while the superstructure has been erected by Messrs. H. Willcock & Co., of Wolverhampton. The consulting engineers for the steelwork were Messrs. Reade, Jackson, and Parry.

Among the sub-contractors were: Portland Stone Firms (stone); John Freeman and Sons & Co., Ltd. (granite); Glengarnock Iron and Steel Co., Ltd., A. D. Dawnay and Sons, Ltd. (steelwork); Art Pavements and Decorations, Ltd. (wall and floor tiles); Henry Hope and Sons, Ltd., Crittall Manufacturing Co., Ltd., John Williams and Sons (Cardiff), Ltd. (casements and casement fittings); Mellowes & Co., Ltd. (patent glazing and fittings); H. Willcock & Co., H. J. Cash & Co. (plumbing and sanitary work); A. Emanuel and Sons, Ltd. (sanitary ware); Bassant Bros., Ltd. (wood flooring); Fenning & Co., Ltd. (monolithic column piers, with carved capitals throughout the ground floor and decorative work to staircase, paving, steps, and skirtings, etc., throughout the various galleries); Korkoid and Ruboleum Tile Co. (rubber flooring); Crittall Freeman Bronze, Ltd. (bronze entrance doors); F. Geere Howard, Ltd., H. W. Cashmore & Co., Ltd. (electric light fixtures); Charles Smith, Sons & Co., Ltd. (door furniture); J. W. Singer and Sons, Ltd., Gardner, Sons & Co., Ltd. (handrails, balusters, etc.); Kingsmill Art Metal and Electrical Co. (gates); Arthur Sanderson and Sons, Ltd. (wall hangings); J. W. Gray & Co. (lightning conductors); Davey, Paxman & Co., Ltd., Colchester (boiler installation).

Mr. R. Howard Fletcher, B.A., was consulting electrical engineer, and Mr. T. J. R. Kiernan, B.Sc., consulting engineer for the heating and ventilating.



THE NATIONAL MUSEUM OF WALES, CARDIFF. SMITH AND BREWER, ARCHITECTS.



AFRICA HOUSE, KINGSWAY, LONDON. TREHEARNE AND NORMAN, ARCHITECTS.

## Africa House, Kingsway

MESSRS. TREHEARNE AND NORMAN, who have designed many of the new buildings of Kingsway, are also responsible for Africa House. This building is undoubtedly the most striking of their designs; it sounds quite a new note in commercial architecture, not only for Kingsway but for London.

In general conception it has a good deal in common with modern American work; there is the same sense of scale and proportion, the same reticence in elevational treatment. The use of a huge Order embracing the two lowest stories, and the setback of the two topmost floors, are also reminiscent of current Transatlantic practice.

Due emphasis has been given to the principal entrance which, occupying the height of two floors, is fitted with some well-designed wrought-iron gates.

The general contractors were Messrs. Bovis, Ltd., and among the sub-contractors were: Edw. Wood & Co., Ltd., of Manchester (steelwork); Medways Safety Lift Co. (main passenger lifts and electric goods hoist); Waygood-Otis, Ltd. (staff lifts); Nine Elms Stone Co. (stonework); Luxfer Co., and C. E. Welstead, Ltd., of Croydon (metal casements); British Reinforced Concrete Co. (reinforced concrete floors); Farmer and Brindley (marble work); Leyland and Birmingham Rubber Co. (rubber floors); H. Pontifex and Sons, and Shanks and Co. (sanitary fittings); Strode & Co., Ltd. (electrical work, iron doors, side entrances, and fire-hydrant main); J. W. Singer & Co. (iron entrance gates and doors); Benham and Sons, Ltd. (heating); Empire Stone Co. (staircases); Lion Foundry Co., Ltd. (escape staircases); Siemens Bros. & Co., Ltd. (telephones); Pyrene Co., Ltd. (fire extinguishers); F. B. Francis (carving); G. Jackson and Sons (fibrous plaster); James Gibbons, Ltd. (locks and furniture); Milner's Safe Co., Ltd. (strong rooms); Thos. Faldo & Co., Ltd. (asphalt).

The whole of the internal solid plastering was carried out by The Grano-Metallic Paving and Plastering Co., Ltd. The 'Metalcrete" flooring of the Grano-Paving and Plastering Co., Ltd., was put down in the basement.

## The Wallace-Scott Tailoring Institute

THE Wallace-Scott Tailoring Institute is the largest and finest structure of its kind, and enables Glasgow to challenge comparison with anything else in the country. The general plan is that of a right-angled U; this provides for the maximum of light and air reaching all parts. The main frontage has a total width of 170 ft. Here are placed the executive offices, approached by a handsome main entrance with massive marble stairway and oak-panelled walls. The four floors of each of the two wings are devoted to carrying on the various processes involved in the production of the company's specialities. The entire structure is practically fireproof, and, as an additional precaution, all stairways are outside the main walls.

Separately housed are extensive plants for cloth-shrinking and for the firm's own "weatherproofing" processes.

Among the contractors were: Considère Construction Company, Ltd. (structural engineers); Melville, Dundas, and Whitson (reinforced concrete structure); Geo. Rome & Co. (Glasgow), Ltd. (plaster work); Henry Hope and Sons, Ltd. (metal casements); J. and W. Guthrie and Andrew Wells, Ltd. (painter work); Waygood-Otis, Ltd. (electric hoist); Mather and Platt, Ltd. (water tanks); Wm. McGeoch & Co., Ltd. (door, window, and cloak-room fittings); Chubb and Son's Lock and Safe Company (safes); Jas. Slater & Co., Engineers, Ltd. (cooking apparatus); Wylie and Lochhead, Ltd. (carpets); Scott Morton & Tynecastle Company, Ltd. (special furnishings); J. W. Singer & Son, Ltd (stair railings); Jas. Allan, Senr., and Son, Ltd. (railings).

# The Chief Architectural Events of 1922

## GENERAL

SIR CHARLES RUTHEN addressed the Society of Architects at the beginning of the year on Housing, and by the expression of his views upon the subject raised a storm of indignation. He eventually resigned his office as President of the society, and Mr. E. J. Sadgrove was elected as President for the remainder of the term of office.

The question of Higher Buildings for London was a subject for controversy throughout the year. The R.I.B.A. showed themselves unfavourable to the project, wherefore the Incorporated Association of Retail Distributors pressed for an extension of the L.C.C.'s by-laws. In February the L.C.C. decided to allow the erection to a height of 80 ft. of buildings whose content exceeded 250,000 cub. ft.

Mr. John Greaves was the successful architect in the Bengal Legislative Building Competition.

The R.I.B.A. Garden Party, which on two previous occasions had been held at the Royal Zoological Gardens, did not take place, the financial committee not considering themselves justified in recommending it, on the ground of expense.

An Exhibition of Art in the Theatre was opened in Amsterdam on January 14 by Mr. Gordon Craig, and was later held in London at the Victoria and Albert Museum, and then in Manchester.

In January work was begun on the British Empire Exhibition Buildings at Wembley Park.

The condition of Lincoln Cathedral was reported upon by Sir Charles Nicholson, F.R.I.B.A., and restoration and reinforcement work took place.

An exhibition of Present-day Industrial Art was opened in the Victoria and Albert Museum in January.

The annual provincial conference of the R.I.B.A. was held at Cardiff in June.

The internal decoration of ocean liners has become a subject of interest to architects. In February Mr. Arthur J. Davis, F.R.I.B.A., read a paper on the subject before the R.I.B.A., and Mr. Dodd read a paper in Liverpool upon the same subject. A special issue of THE JOURNAL was also devoted to it.

The Société des Architectes Diplômés par le Gouvernement decided to place at the disposition of the Council of the Architectural Association a grand medal, to be presented to the best student who received the Diploma of the A.A. School.

The well-known buildings in Charing Cross Road occupied by Messrs. Crosse and Blackwell changed hands, and a new super-kinema is to be constructed on their site.

The International Building Trades Exhibition was opened at Olympia in April by Mr. Paul Waterhouse, P.R.I.B.A.

A competition for "a business building, facing on an ordinary London street, in which colour would be the dominant feature," was opened by the R.I.B.A. Sir Edwin Lutyens was one of the assessors, and Mr. Arthur E. Pierce submitted the winning design.

With a view to encouraging good design in street architecture, the R.I.B.A. offered to award a premium annually for the most meritorious external design.

The Franco-British Union of Architects held their second annual general meeting in Paris in the first half of the year.

During the warfare in Ireland the Four Courts, begun in 1776 from designs made by Thomas Cooley, and completed by Gandon, were destroyed.

The Rome Scholarship in Architecture was awarded to Mr. Stephen Welsh, A.R.I.B.A., and the Henry Jarvis Studentship, offered by the R.I.B.A., to Mr. George Checkley, A.R.I.B.A.

The Dean and Chapter of St. Paul's appealed for a hundred thousand pounds with which to pay for absolutely necessary repairs.

The new Council of the R.I.B.A. dissolved the Unification and Registration Committee, but formed a new Committee "to obtain expert advice to draft a Registration Bill."

The site for the new London University remained undecided upon.

Mr. Stanley Hamp, F.R.I.B.A., was elected President of the Architectural Association, succeeding Mr. W. G. Newton, M.A., A.R.I.B.A., retiring President.

The Tenth International Congress of Architects was held under the auspices of the Société Centrale d'Architecture de Belgique at Brussels in September.

The first A.A. Annual Excursion held since 1914 took place in September, the party journeying to Holland.

Mr. H. St. John Harrison was the winner of the Society of Architects' Victory Scholarship.

Mr. Arnold Mitchell made an important archæological discovery in Dorset in the unearthing of a Greek statue of a woman of great beauty and antiquity. This was given to the Ashmolean Museum.

An Exhibition of Contemporary British Architecture was held at the R.I.B.A. in December. The exhibition aroused unusual notice by the lay Press.

The Whitgift Hospital, Croydon, was menaced with destruction by the Croydon Council during the last three months of the year.

An important town-planning conference and exhibition, convened by the Manchester and District Joint Town Planning Advisory Committee was held in Manchester in October.

Mr. P. B. Haswell, B.Arch., Liverpool University, was awarded the R.I.B.A. Medal for designs.

Mr. E. J. Partridge, F.R.I.B.A., was elected President of the Society of Architects, in succession to Mr. E. J. Sadgrove, retired.

The Adelphi, the well-known quarter of London built by the Brothers Adam, was offered for sale.

The Institution of Structural Engineers adopted that title for their body in place of the Concrete Institute.

The R.I.B.A. War Memorial Tablet, designed by Mr. Trenwith Wills, A.R.I.B.A., was unveiled by the Earl of Crawford and Balcarres on November 20.

A Grand Committee for the Wren Bicentenary celebrations was formed, Mr. Paul Waterhouse being President.

The National Building Guild became financially embarrassed and was obliged to hand over control for the term of three years.

Mr. Percy Thomas, O.B.E., F.R.I.B.A., was elected President of the South Wales Institute of Architects.

A new club was formed called "The Architecture Club," composed chiefly of architects and writers. Its activities were to consist in managing exhibitions of architecture, and in fostering interest in and criticism of architecture in the Press. Mr. J. C. Squire, the editor of "The London Mercury," was the President.

## NEW BUILDINGS

Among the new buildings which were completed during the year were the Public Hall and Library at Cwmllynfell, South Wales, from the designs of Sir Charles Ruthen, F.R.I.B.A.

Great strides were made with the development of Aldwych and Kingsway. Work on the Bush Building went rapidly forward, and several other buildings in Kingsway were brought to completion.

A new "Victory Arch Memorial Entrance" to Waterloo Station, London, was opened by the Queen. Mr. J. R. Scott was the architect concerned.

The reconstruction of Drury Lane Theatre, London, was completed, and the building opened in April.

New premises in Argyll Place, London, for Messrs. Liberty & Co., were started upon from the designs of Messrs. Edwin T. Hall and E. Stanley Hall, M.A., F.R.I.B.A.

The British Pavilion at Rio de Janeiro Centenary Exhibition was erected from the designs of Messrs. John W. Simpson and Maxwell Ayrton, FF.R.I.B.A.

The new London County Hall, designed by Mr. Ralph Knott, F.R.I.B.A., in association with Mr. W. E. Riley, R.B.A., F.R.I.B.A., late architect to the L.C.C., was opened by His Majesty the King in July. The building had been for fifteen years in course of erection.

The Governors of the Bank of England announced that the Bank was to be reconstructed from designs by Messrs. Herbert Baker and F. W. Troup, FF.R.I.B.A.

The erection of a new Coptic General Hospital was begun at Sharia Abbas, Cairo. Ch. Bougatsos, Lic.R.I.B.A., was the architect.

Nineteen-Twenty-Two saw almost the last of Nash's Regent Street, the stucco architecture of which was pulled down to make way for bigger and more modern shopping premises. Towards the end of the year Nash's own house in Lower Regent Street was demolished.

The new Southwark Bridge, for the architectural treatment of which Sir Ernest George, R.A., was responsible, was opened in the first half of the year.

The Port of London Authority's New Building, designed by Mr. T. Edwin Cooper, F.R.I.B.A., was opened in October by Mr. Lloyd George.

The Welsh National Museum, designed by Messrs. Smith and Brewer, was opened to the public in October.

## PERSONAL

Mr. Thomas Hastings was the Royal Gold Medallist for 1922.

A portrait of Mr. John Simpson, PP.R.I.B.A., by Sir Arthur Cope, R.A., was unveiled at the R.I.B.A. by Mr. Paul Waterhouse, P.R.I.B.A.

Major H. Barnes, M.P., F.R.I.B.A., lost his seat for Newcastle-upon-Tyne East, but another architect, Mr. G. W. S. Jarrett, won a seat at Dartford.

Mr. W. C. Fenton, F.R.I.B.A., was installed Lord Mayor of Sheffield—the first architect who had ever filled that position in Sheffield.

Mr. G. Gilbert Scott was elected R.A. in March.

Sir Bertram Mackennal was made an R.A. in November.

Mr. Herbert Baker, F.R.I.B.A., was made an A.R.A. in December.

Mr. A. Pollard, chief architect of the North-Eastern Railway, retired at the beginning of the year, Mr. S. Wilkinson, F.R.I.B.A., of London, being appointed as his successor.

Professor W. R. Lethaby, F.R.I.B.A., retired in January, after eighteen years' service, from the position of Professor of Design at the Royal College of Art, South Kensington.

### OBITUARY

The year's obituary includes the following names: Mr. J. H. La Trobe, F.R.I.B.A., of the firm of La Trobe and Weston, Bristol; Mr. George C. Ashlin, one of the best-known Irish architects; Mr. W. T. Oldrieve, principal architect in Scotland to the Board of Works; Mr. William S. Weatherley, F.R.I.B.A.; Mr. H. T. Sandy, of Stafford; Mr. Ernest Newton, R.A., F.R.I.B.A., "whose like will never be seen again"; Mr. John Black Hector, M.S.A., who was vice-chairman of the Executive Council of the A. and S.A.P.U.; Mr. George Eley Halliday, F.S.A., F.R.I.B.A., of Cardiff; Mr. James Black Fulton, F.R.I.B.A.; Mr. Alfred Williams, F.R.I.B.A.; Mr. A. Mackenzie, a well-known Highland architect; Sir Thomas Brock, R.A., at the age of seventy-five; Mr. S. C. Searle, A.R.I.B.A.; Mr. J. Barlow Fraser; Mr. Arthur Harrison, F.R.I.B.A., of Birmingham; Mr. J. Crocker, of Exeter; Mr. Howard Henry Thomson, F.R.I.B.A., of Leicester; and, lastly, Sir Ernest George, R.A.

---

## Medals and Studentship for Business Buildings

Mr. Alfred C. Bossom, a distinguished English architect, who has for years been practising with signal success in the United States, recently revisited England, and was much impressed by the fact that the commercial architecture in England was not carried by the younger architects to the highest degree of economic advantage to the owner of the property.

He has decided to award annually in every large architectural training school in England and Scotland a silver medal for the best design for a commercial building based upon a programme prepared by some body of recognized standing like the Royal Institute of British Architects. With their drawings the students will have to submit their statement of cost and yield of the building, treating the matter as a real business proposition.

The designs by all the winners of the silver medal should then, he proposes, be judged by a jury consisting, if possible, of the president of the R.I.B.A., aided by a builder of wide reputation, who could check the estimates, and a property owner qualified to form an opinion as to possible revenue of such a building. To the winner of this second competition Mr. Bossom proposes to award a gold medal and travelling studentship to the United States, enabling him to study the very large industrial buildings and commercial undertakings in the United States.

---

## Competition News

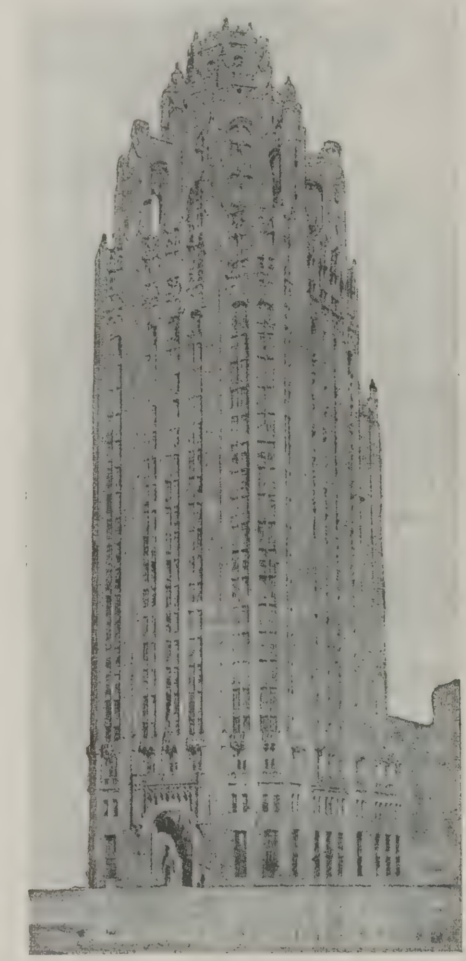
### *"The Chicago Tribune" Competition.*

In a competition organized by "The Chicago Tribune," for a design for office buildings for that newspaper, Mr. J. M. Howells, son of the well-known American novelist, won the prize, and with him was associated Mr. Raymond M. Hood.

Eliel Saarinen, Helsingfors, with whom were associated Messrs. Wallace and Grenman, was placed second.

The ten representative American architects whose response to the invitation to participate in the competition wins them an honorarium of $2,000 each, are: Bliss and Favile, San Francisco; Holabird and Roche, Chicago; Jarvis Hunt, Chicago; Schmidt, Garden and Martin, Chicago; D. H. Burnham & Co., Chicago; Andrew Rebori, Chicago; John Mead Howells and Raymond M. Hood, New York; Bertram G. Goodhue, New York; Benjamin W. Morris, New York; James Gamble Rogers, New York.

Designs which receive honourable mention were submitted by: Ernesto Fuchs, Guadalajara, Mexico; Thomas J. George, New York City; Guy Lowell, Boston; Hewitt and Brown, Minneapolis; Schmidt, Garden and Martin, Chicago; Edmund S. Campbell, Chicago; George F. Schreiber, Chicago; Richard Yoshijiro Mine, Urbana, Ill.; A. N. Rebori, Chicago; Louis Bourgeois, Francis E. Dunlap, and Chas. L. Morgan, Chicago, Ill.; Benjamin Wistar Morris, New York City; Alfred Morton Githens, New York City; F. Lilpop and K. Jankowski, Warsaw, Poland; Hugh G. Jones, Montreal, Canada; Charles H. Bebb and Carl F. Gould, Seattle, Washington; Felix Cabarrocas, Havana, Cuba; Jos. Schartz, Grand Duchy of Luxembourg; Otto Hoffmann, Vienna, Austria; Friedr. Stühmke, Berlin, Germany; Nicholas Wassilieff, Belgrade, Serbia; W. Th. Gregory and B. R. Saunders, London, England; Hutton and Taylor, Glasgow, Scotland; Jules Vanden Hende, Ghent, Belgium; Barry Hammond Dierks, Paris, France; Meischke and Schmidt, Rotterdam, Holland; Pierre Le Bourgeois, Nancy, France; Giuseppe Boni, Rome, Italy; Olaf Boye, Crawfurd Jensen, and L. W. Wilhelmsen, Christiania, Norway; L. Bode, Amsterdam, Holland; Hermann Herter, Zurich, Switzerland; A. Hamilton Scott and John A. W. Grant, Edinburgh, Scotland; Lechner Jeno, Budapest, Hungary; Lechner Lorand and Kantzky Tivadar, Budapest; Lippincott and Billson, Melbourne, Australia.



"THE CHICAGO TRIBUNE" COMPETITION: WINNING DESIGN.
HOWELLS AND HOOD, ARCHITECTS.

### *"The Daily Mail" Labour-saving Bungalow Competition.*

The number of designs entered by architects for the competition for labour-saving bungalows organized by "The Daily Mail" in connection with its Ideal Home Exhibition in March next totalled 768. The assessors, Mr. E. Guy Dawber, F.S.A., F.R.I.B.A., and Professor A. E. Richardson, F.R.I.B.A., have now made their report and the following awards:—

First Prize, £300—Mr. Jas. M. D. Henderson, A.R.I.B.A., M.S.A., Ayr, N.B. Second Prize, £125—Mr. C. Murray Hennell, F.S.I., in collaboration with Mr. C. H. James, A.R.I.B.A., Bloomsbury, W.C. Third Prize, £75—Mr. J. S. Hodges, A.R.I.B.A., Harlesden, N.W.

Messrs. Harold Williams, Tooting; E. Frank Ferry, Lic.R.I.B.A., Forest Gate; R. Collyer Clark, Wanstead; J. B. F. Cowper, A.R.I.B.A., Wildwood Road, N.W.; R. J. H. Minty, A.R.I.B.A., Charing Cross, W.C.; and Forbes and Tate, are highly commended.

Messrs. P. D. Hepworth, A.R.I.B.A., E.D.B.A., Gray's Inn Place, W.C.; B. de C. Jackson, A.R.I.B.A., Orpington, Kent; E. B. Musman, A.R.I.B.A., Bedford Row, W.C.; and V. F. Knowles, Oxhey, are commended.

### *Town Hall, Colwyn Bay.*

A premium of 50 guineas has been awarded to Messrs. J. M. Porter & Co., architects, of Colwyn Bay, for their design submitted in the above competition.

We shall illustrate the winning design in an early issue.

### *Town Hall, Colombo.*

The prizes in this competition have been awarded as follows:—

1st S. J. Edwards, M.A., A.R.I.B.A., of Singapore.
2nd W. H. Bourne, F.R.I.B.A., of Allahabad.
3rd R. R. Sharmer.

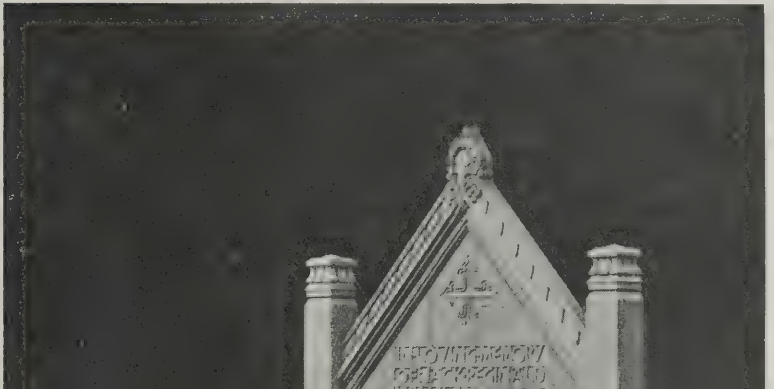
*With which is incorporated "The Builders' Journal."*

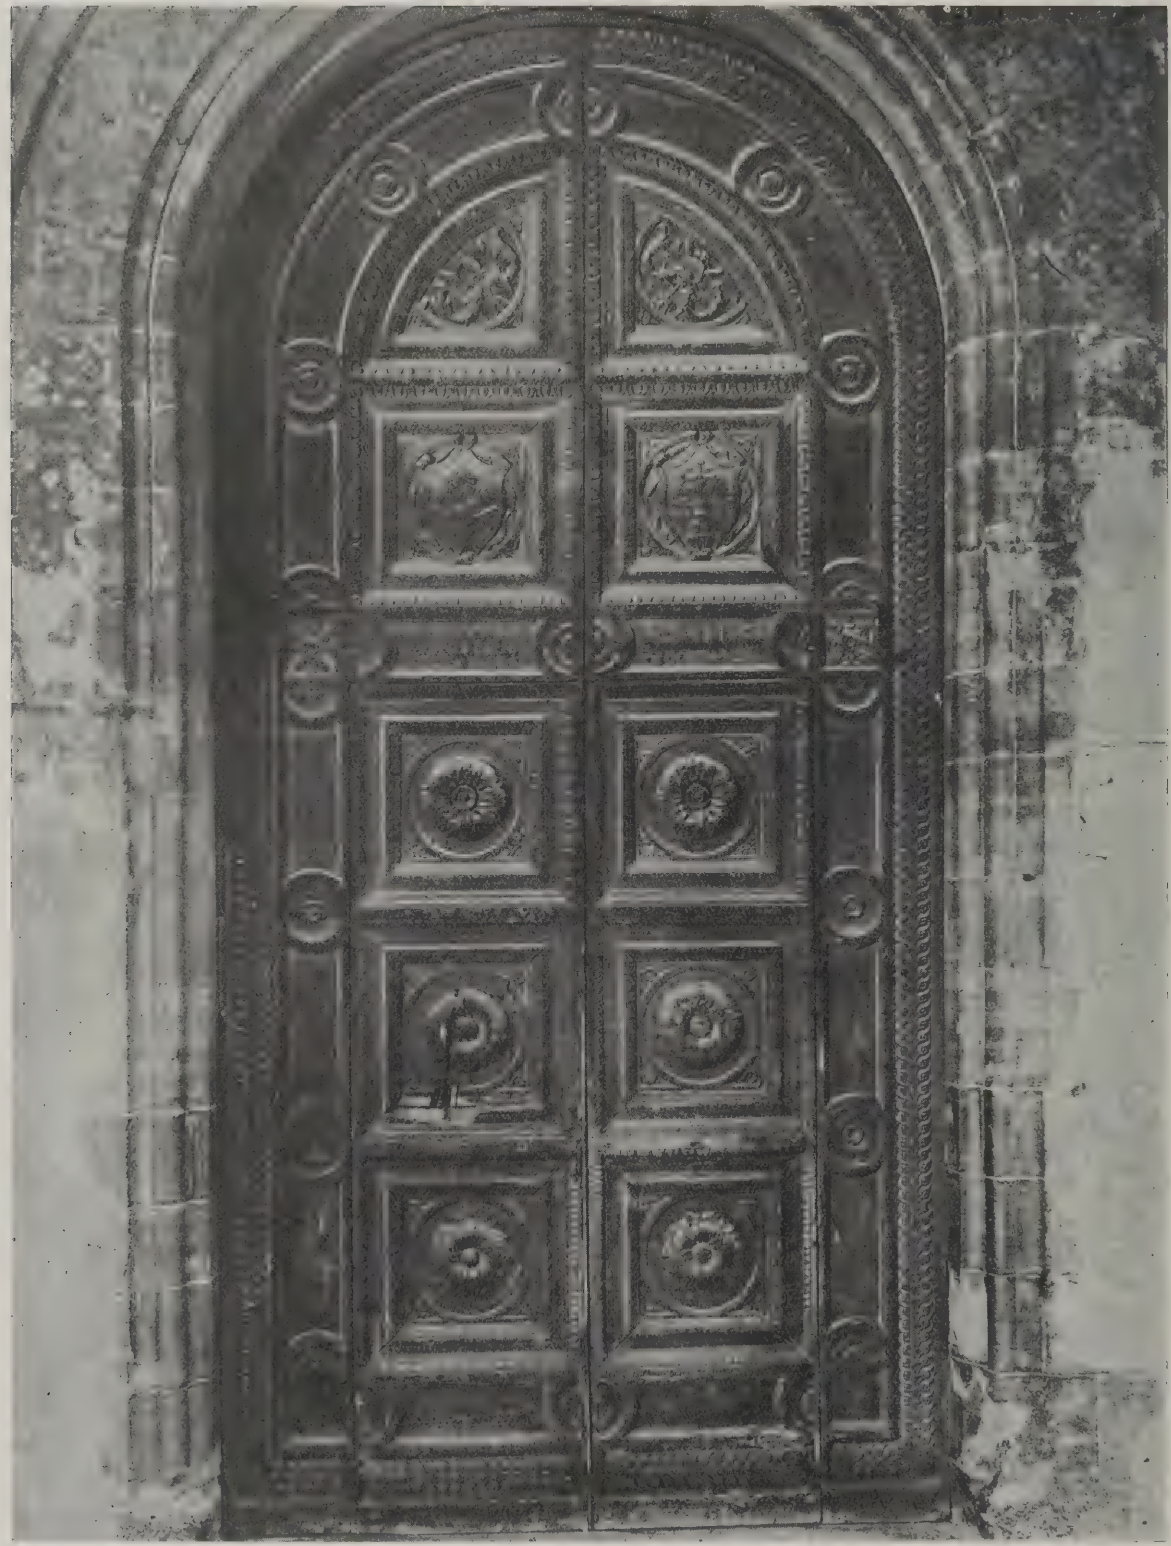


MEMORIAL CHAIR IN ST. JOHN'S CHURCH, STOURBRIDGE.
J. C. STYLES, ARCHITECT

27-29 Tothill Street, Westminster, S.W. 1.

# Architectural Details. 41.—Doorway in the Church of Saint Francesco, Montone

A. Bencivenne, Architect



This doorway—a fine example of Italian craftsmanship—was constructed in the sixteenth century. The mouldings and rosettes in each pair of panels differ in design, as also does each pair of rosettes on the architrave. Above the leaves of the door are two panels containing armorial bearings. The doorway is surrounded by a charming moulding.

# Architectural Prospects

THE year is not so far advanced but that a speculation as to the prospects which it holds for architects is a fitting pursuit. Generally speaking it may be said that as the war period recedes so confidence and stability are increasing, and these are as essential for building activity as for any other enterprise requiring co-operation and capital: stability as to the prices of the labour and material markets, and confidence that this stability is likely to endure. This confidence ultimately rests on a human relationship; labour must have confidence in itself, in its leaders, and in its masters, and they in their turn must have confidence in their rulers and in their men. For successful architecture, furthermore, in contradistinction to mere building, yet another confidence is essential, and that is a general confidence of the public in architects; a particular confidence of the client in his architect.

On all sides there are signs that these things are happening, and the fall of building prices is not likely to be succeeded by any considerable rise. It is doubtful, however, if the fall will continue for long, and unless there is a general realization that this spring will be an unusually propitious time to put in hand long-deferred building schemes, artificial methods may be employed to convince a pusillanimous public of this fact. This method will probably take the form of a slight increase in prices to demonstrate that the bottom has been reached; if, therefore, as we hope, the public has confidence in architects it will listen to their exhortations to build now and defer no longer.

The work this year will mostly fall under three headings: large commercial buildings, small houses, and town planning. In this respect there is a marked change since the time before the war in the almost complete passing away of the medium-sized six-to-twelve-bedroomed house, which constituted the country's most typical contribution to modern architecture and provided the bulk of the architectural profession with its means of livelihood. Large commercial and municipal buildings can at the best provide employment for only a few members of the architectural profession. This would be so however the work were distributed, but the benefits are particularly restricted owing to the not surprising fact that much of this work is in the hands of a few particularly successful men. While, therefore, being of the utmost benefit to the building trade by employing much labour and a diversity of trades who find no place in works of humbler character, such work benefits directly only a small number of architects. We say "directly" because one kind of building influences another, and so it is impossible to estimate the amount of work which may indirectly arise out of one big job.

The building of smaller houses has hitherto proceeded, for the most part, without the co-operation of architects. One result of this procedure is that with a reviving interest in houses there has come an awakening to this astounding fact, that the buildings which house the bulk of the nation are clumsily, uglily, and uneconomically planned, and architects are being blamed on all sides for work which is bad just because they had nothing to do with it. This blame, ironical as it may seem, however, is not without some justification. Architects should, in some way, have been associated with the speculative builder in the past, and so have guided his useful activities along healthy, beautiful, and economical lines. One of the prospects that the near future holds out is that this association may come about. This changed attitude towards the building of small houses is largely the outcome of the Government's activities in the matter. The services of architects were enlisted, and the vast difference which arose from their co-operation was at once appreciated. The Government also realized, however, that some special adjustment of fees was necessary to meet this new situation, and now the profession itself is alive to the fact that the old percentage scale of charges is an unsuitable method for the assessment of fees for small houses where there is much repetition. Moreover, co-operation with the speculative builder implies a different relationship from that which occurs in the triple co-operation of client, architect, and builder, where one of the architect's most important duties is to safeguard his client's interests. What the speculative builder requires from the architect is the exercise of his special knowledge and training in planning and design, and the proper use of materials, but not supervision as to the quality of material and workmanship. Suggestions have been made that all the speculative builder requires is a book of plans. This, however, is quite inadequate. Houses are not things that can be bought over the counter, and each house must be considered as a special case in relation to its surroundings and other influencing circumstances. We sincerely hope, therefore, that the year will witness a growth of this desire on the part of the profession to co-operate with speculative builders in the provision of small houses, which may develop to the mutual benefit of architects and of the community.

The other category, that of town planning, is already engaging the attention of many architects, but the work is only beginning and will increase steadily during this year and the next, unless some unforeseen changes in policy occur. Directly and indirectly much work must arise out of the numerous schemes that will be prepared, but the full tide of activity will not occur in the present year. The preparation of a scheme of comprehensive magnitude is not the work of days or weeks, but of months—perhaps years. Almost every branch of human activity must be considered. The complexity of a modern town is the epitome of the complexity of modern organization and civilization. To design a new town on ordered lines is a synthesis of all the diverse elements which go to make this organization and civilization. This is surely the most important work, not only upon which architects will be engaged in this and the succeeding years, but also upon which they ever have been engaged. To design a noble building is one of the greatest feats of mankind, but to design an ordered town is surely a work than which there is nothing of more supreme importance. It is constructive in every way, for upon it depend the physical, the mental, and the spiritual welfare of the people.

With so much in view, therefore, it may surely be said with some justification that the architectural prospects are good. But however ripe the fruit may be it requires plucking. Architects must prepare themselves for, and adjust themselves to, the new conditions; they must realize, once and for all, that the day of the rich patron has passed, and that they must seek their work in other ways. A few big works there will always be, that will come privately or be won in open competition, but the real prospects lie in co-operation in the production of small houses and in town-planning and all its manifold subsidiary developments.

---

## The London Guildhall Art Gallery

Why the City of London should be so ill able to bear comparison with provincial cities in the matter of art galleries is not so hard to understand as some critics protest. Liverpool, Manchester, Birmingham, and a few other cities whose art galleries are of high renown, are not augmented by the National and other galleries in which London is rich, and compared with which the Guildhall Gallery is a mere trifle. Nevertheless, that is no sufficient excuse for keeping the Guildhall Gallery so poorly supplied, and the City of London authorities have long chafed under the reproach of possessing what was probably the worst-equipped city art gallery in the kingdom, and they have made several attempts to deserve a better reputation. They have extended the Guildhall Gallery, sundry more or less important gifts and bequests of works of art having made necessary the addition of two large rooms, one for pictures and the other for sculpture. This "extension" has been opened without formal ceremony. About a hundred thousand persons visit the gallery in the course of a year, a fact which encourages the hope that ere long it will be perceived that so educative an institution, so potential an instrument of refinement, ought to be housed in a special building.

## A Travelling Studentship for the U.S.A.

We published in our last issue particulars of a new travelling studentship which is to be made available to students through the munificence of Mr. Alfred C. Bossom, the distinguished Anglo-American architect, who was recently on a visit to this country. During his stay here Mr. Bossom became "much impressed by the fact that commercial architecture in England was not carried by the younger architects to the highest degree of economic advantage to the owner of the property." To help to remedy this state of affairs Mr. Bossom proposes to award annually in every large architectural school in England and Scotland a silver medal for the best design for a commercial building based upon a programme prepared by a body of recognized standing, such as the R.I.B.A. These designs, it is suggested, shall then be further judged, and the winner awarded a gold medal and a travelling studentship to the United States for the purpose of studying commercial architecture. It would be churlish to resent the implied aspersion upon British architects. That commercial architecture in this country has not yet reached the high standard of the same class of work in the United States is generally admitted. But the fault is not so much due to a deficiency on the part of British architects as to a lamentable lack of acumen among our so-called business men. At the present moment, however, the point need not be further discussed. Let us be grateful to Mr. Bossom for his very generous suggestion, which we hope will be immediately taken up. That it will be seized upon with much enthusiasm by students we have no doubt. Mr. Bossom's studentship is likely to become a serious rival to the Prix de Rome.

## The New Architectural Knight

The knighthood conferred upon Sir Edwin Cooper, F.R.I.B.A., to whom we offer our hearty congratulations, is an honour well earned, and one that is calculated to enhance the profession of architecture in public estimation. The immediate *raison d'être* of the honour is, of course, the great Port of London building, opened but a few weeks ago. But Sir Edwin Cooper's distinguished record of work accomplished would justify the knightly distinction apart from the notable achievement of the P.L.A. building. Sir Edwin began his architectural career at Scarborough. He then went to the well-known firm of Goldie, Child, and Goldie, London. Returning to Scarborough, he joined in partnership with the late Mr. Herbert Davis and the late Mr. John Hall, practising under the title of Hall, Cooper and Davis, and winning the open competition for the Scarborough Municipal Schools. He shortly afterwards returned to London and collaborated with Mr. S. B. Russell, F.R.I.B.A. During this period much success was achieved in competition work. Mr. Cooper, in 1910, began practice on his own account, winning, in 1911, the competition for the Marylebone Town Hall. The Port of London success followed in 1912. Important buildings now in course of erection from the designs of Sir Edwin are the military hostel (which will be the British Red Cross War Memorial) on the site of the old "Star and Garter" on Richmond Hill, the Banque Belge pour l'Etranger, in Bishopsgate; new premises for Messrs. Spillers Milling and Associated Industries, Ltd., St. Mary Axe; University Buildings, Cambridge; and the College of Nursing, London.

SIR EDWIN COOPER, F.R.I.B.A.

## The Newcastle Election

Major Barnes will have the united good wishes of architects in his fight for the Parliamentary representation of East Newcastle, the seat which he held in the last Parliament and lost to Labour at the General Election. Considering their importance to the well-being of the community, architecture and building are very inadequately represented, numerically, in Parliament. Major Barnes, who made a considerable reputation as a parliamentarian in the last House, is too valuable a man to be allowed to remain outside its walls, and we hope that Newcastle architects will rally to his support. His opponents are Mr. Arthur Henderson (Labour) and Captain Gee, V.C. (Conservative). Polling is expected to take place on January 17 or 20.

# Modern Craftsmanship

## By BASIL OLIVER, F.R.I.B.A.

CRAFTSMANSHIP is defined in Murray's "New English Dictionary" as "The performance or occupation of a craftsman; skill in clever or artistic work; skilled workmanship. . . ." Craftsman, therefore, in its true sense, can be applied to anyone who has mastered his craft such as—to instance only the building trade—a first-rate bricklayer, mason, carpenter, joiner, plasterer, plumber, and, indeed, to all the best tradesmen on whom architects depend for the successful realization of their ideas.

The term should be an honourable distinction conferred by his fellow-workers in a particular trade on a man who has passed a certain standard of excellence, quite irrespective of extra remuneration, now made impossible by trade union rules. If it were otherwise the suggestion would not work, because it would become a matter of influencing the judging committee to secure an increase in wages for an unworthy candidate.

For a workman to be able to call himself a craftsman should be the laudable ambition of all those who really take a pride in their work, but the word is used nowadays as meaninglessly as "lady" and "gentleman." Perhaps the ideal will be realized when no man can call himself an architect until he has earned the right to do so. It is only fit and proper that he—for he is, in fact, the master-builder—should set the example.

If it is no longer possible for an employer to pay a good worker more than a bad one, the master can still get rid of the latter, and give preference to the former by the mere act of employing him. In the old days of craft guilds bad workmanship and slackness were dealt with by fines and other penalties, but we have to take things as they are now and make the best of them. What we have got to do to bring about craftsmanship in its true sense is to arouse and sustain the interest of building trade employees. Something in this direction might be done at the commencement of every job by the architect treating the workmen as allies, showing them the plans, and explaining his intentions. It would surely stimulate the enthusiasm of even the labourers if they knew beforehand what it was all about, and it might conceivably reduce the monotony of perpetually mixing mortar and handling bricks, and so forth.

It is always an advantage, too, when the contractor is more than that, and it makes for more harmonious working when the client is not obsessed with the idea that the builder is a rogue. If the employer expects the best out of his architect, his builder, and the builder's workmen, he is more likely to get it. As in all things it is the human touch that is wanted.

The time has now arrived when it may be a matter of interest also to take stock of the post-war position of the artistic branch of craftsmanship usually known as Arts and Crafts, as distinct from the less fashionable, but more necessary, skilled craftsmanship of the building trades.

The main points for consideration are supply, demand, and quality.

With regard to the first there is no question. As recently as May 13 last, in "The Morning Post," that distinguished French artist and writer, M. Jacques-Emile Blanche, made the amazing statement that "Living in Paris to-day are at least fifty thousand professional artists, who show their work, think they have genius, and hope to earn a livelihood by means of the brush." This stupendous figure, be it noted, only relates to painters of canvas, or, in other words, to what is generally known to the lay mind as Art, and even High Art. What would be the number in London one wonders? Well, if the same state of things exists here—and probably it does—it must be obvious to the would-be successful painter that the chances of earning a living wage are small indeed, with so many competitors to beat.

The supply of sculptors seems adequate, and it is notorious that the architectural profession is overcrowded, though there is always room for more in the ranks of those who may fitly be called artists.

One could enumerate some of the lesser arts and crafts all of which have their full quota of budding aspirants.

The inference, therefore, is that those about to embark upon an artistic career should divert their gifts into less familiar channels with a view to beautifying and improving articles of everyday use. Easel-pictures are often delightful, but they cannot be called essential.

There is still immense scope for originality in furniture designing, especially in that for household purposes, by which is not necessarily meant cabinet-making only, but everything that goes to the making of a home.

Under the heading of demand comes the question of educating the public. The Design and Industries Association constantly, the British Institute of Industrial Art periodically, and the Arts and Crafts Exhibition Society spasmodically, have all done invaluable work in this direction. Public taste in recent years undoubtedly has improved, as, for instance, in the ever-increasing appreciation of the best of our modern posters, constituting what has been called the "Poor Man's Art Gallery." These small influences must, however, be multiplied indefinitely before they can even approximate to the insistent power of modern advertising. The official figures given of those who visited the most recent exhibition of modern industrial art at the Victoria and Albert Museum afford a most gratifying proof of public interest. But for a still more representative exhibition, which is likely to be of more discriminating selection, of contemporary work we must await the next effort of the intermittent Arts and Crafts Exhibition Society.

It was a great step forward on the part of the Royal Academy when that body placed the Burlington House Galleries at the disposal of the Society for its last exhibition held during the war. Under the now more favourable conditions the omens are that the forthcoming exhibition of Arts and Crafts which opens on the 15th instant, in conjunction with the Royal Academy Exhibition of Decorative Art, may well be the most successful ever held, at least in quality if not in quantity.

If only society paragraphists in the newspapers would conspire to make the Private View Day of such exhibitions as important social functions as those of the Annual Summer Exhibition at Burlington House, the public would probably "keep the turnstiles busy"—as the saying is—with advantage to the cause of modern British craftsmanship. After all, this would be only a method of attracting the superficial, but none the less influential section of society. Of far greater importance is it to educate and interest the great "third class passenger" section of the community.

When Mr. Bernard Shaw made Mrs. Patrick Campbell express herself in "Pygmalion" more forcibly than had hitherto been usual on the stage (except, perhaps, at rehearsals) the success of the play was assured. So it is with art exhibitions. There should always be a predominant attraction, regrettably vulgar as this may seem, to make the show a financial success.

With regard to the all-round quality of modern British craftsmanship, it never ranked higher. Before the war we had good proof of the estimation the French and Belgians had for our work by the very successful exhibitions held in Paris and Ghent respectively. No artists in the world to-day are painting so well as the British, excepting, of course, the negligible few incompetents seeking a short cut to fame by shock tactics; our native sculptors and architects generally can more than hold their own, while our country-house architects are acknowledged pre-eminent by all foreign rivals. There are half a dozen or so stained-glass painters in England who are doing the finest work in the world.

At poster designing, woodcut engraving, and lithography we are just as good, in our own way, as the French, and there is little to choose between us and Americans and Germans at book production, which naturally includes both printing and binding. It is a fact, however, that the excellence of modern German printing can be traced to the revival of good lettering in England. The improvement is entirely due to what the Germans absorbed here before the war. As an instance of their customary thoroughness they sent representatives over to this country especially to study (? to copy) the furniture of the late Ernest Gimson, and it was quite characteristic of us that when the Germans visited High Wycombe and inquired where Gimson lived no one knew!

Our best metal-workers and jewellers exhibit character and individuality. Examples of their work are to be found in American and Continental art galleries and museums. Their merit has long since been recognized by discerning curators.

How we stand with foreign countries in regard to ceramics, textiles, and wood-carving it is hard to say. We have greatly improved, and are doing very fine work, but so are they.

Our war memorials are no worse than those in France. The best of ours are very, very good, but the worst are horrid. The provincial monumental mason in France has been more ambitious, so his fall has been greater in many cases, but what could be more banal than the average war memorial to be seen in going about rural England to-day? It is curious how the idea has prevailed so frequently of employing the local monumental mason, regardless of his limitations, both to design (a euphemism) and to execute war memorials. What is even more distressing is that members of committees, with conspicuous exceptions, have not got the knowledge to distinguish between good and bad, which brings us back again to the all-important question of the education of the public.

How truly Professor Lethaby has pointed out that "We do not allow shoddy in cricket or football, but reserve it for serious things like houses and books, furniture and funerals."

No consideration of the subject of æsthetics would be complete without reference, so far as the affairs of the church are concerned, to the intelligent functioning of the newly-formed diocesan advisory committees whose activities must have been of great assistance to perplexed chancellors in need of expert advice. It is all to the good that the granting of a faculty in the future will not be such an easy and merely formal proceeding as it has too frequently been in the past, and the check on vandalism will be considerable. This commendable innovation is distinctly a forward move, and is more than a ray of hope for the encouragement of the best contemporary craftsmanship. The example thus set is bound to bear fruit in other directions. For instance, the new machinery set up incidentally strengthens the work of the Society for the Protection of Ancient Buildings, and less directly that also of the Civic Arts Association.

Another healthy sign is the way in which the admirable suggestion for a register of craftsmen, made by Mr. H. B. Creswell (in his letter to the "Journal" of the R.I.B.A. of September 23), is gaining ground and looks like becoming an accomplished fact. Some such scheme is urgently needed to help the individual and genuine craftsman in his fight for a living against the bottomless purse of mere commercialism. Mr. Cresswell put the case so well that all architects should read and re-read his letter and mark, learn, and inwardly digest what he has written without any exaggeration. He referred to sub-letting. That really is the crux of the whole question. If architects would, whenever possible, try only to deal with the actual executants, half the battle would be won. Moreover, each individual craftsman should have credit for his work.

Notwithstanding the apathy of the frivolous and movie-minded, to say nothing of trade fluctuations, British art and craftsmanship survive and flourish, and I, for one, feel that there is every reason for optimism in the future outlook.

# The War Memorial Chapel at the Royal Military College, Sandhurst

### A. C. MARTIN, F.R.I.B.A., Architect

WHEN completed the Chapel of the Royal Military College, Sandhurst, will be one of the greatest memorials to officers in existence, commemorating upwards of seventy regiments and corps, the Indian Army, the Cavalry, and very many individual officers. The Royal Military College was moved from Great Marlow to Sandhurst in 1812. The first chapel was a room opening out of the Grand Entrance, and it was first used in 1813. When a new chapel was opened in 1879 this room became a museum, later on was a mess room, and it is now a library.

When it was decided to build a separate chapel a discussion arose as to the most suitable site, and some of those in authority wished it to be in front of the College buildings. The present site, however, was selected, and in 1879 the chapel was dedicated with the name of Christ Church.

The Royal Engineers were responsible for the design of the building, and they took a church in Florence as their model. Shortly after the chapel was built a scheme of decoration, copied from the Cathedral Church at Siena, was drawn up by Colonel R. H. Williams, R.E. This consisted of a combination of alabaster and choice marbles. A remnant of it can still be seen near the vestry door.

In June, 1883, a Memorial Fund was instituted, with the intention of inscribing on special "War Panels" the names of all those who had passed through the College and had lost their lives on active service. Circular marble tablets were also put up, and, by direction of the Commander-in-Chief, H.R.H. the Duke of Cambridge, they were reserved for the names of past Governors of the College. Relatives were also allowed to have private memorials cut on the walls, between the tablets and panels.

Ten of these war panels were completed with the names of those who fell in the campaigns from 1855 to 1898, and they bear some 240 names in all.

Then came the South African War, and its toll of 262 lives of past Sandhurst Cadets. Only three panels remained, and these were quite insufficient for so many names. Some new arrangement had to be made, and Mr. G. F. Bodley, R.A., was called in to advise. He suggested that the original dado of strips of coloured marble should be removed, and that a series of twin panels of Rossa Antica marble should be put up in its place. This was carried

out on the south wall, and on these panels are the remainder of the names from the South African War, and names from later campaigns as well. Sad to relate, the discarded marble was cast aside into some outhouses, and was seriously damaged by exposure to the weather.

At the same time Mr. Bodley was asked to draw up a new scheme of decoration. He made several recommendations, and some of these, as time and funds allowed, were carried out.

The new building of the College was completed in 1911, and the number of cadets in residence was largely increased. The chapel was not large enough to seat all at one time, and so it was that in this year the enlargement of the chapel first came to be considered.

It was then looked upon as a necessary addition to the College and a fair charge on public funds. The only difficulty was to decide exactly how the enlargement should be done, and General Stopford and others who were interested spent much time in an endeavour to devise the best method of carrying out the alteration.

Nothing was done before the war. During the war Captain Arthur Campbell Martin, a Fellow of the Royal Institute of British Architects, was appointed temporarily to the staff of the College. As an officer of the College, who, at the same time, was an architect by profession, it was natural that his opinion should be asked, and it was he who suggested that the enlarged building should be placed across the original chapel, which would then become the centre of the whole structure. It may be said at once that the orientation offered no difficulty, as it was merely a change from south-east to north-east. The advantages of this plan were that a building of good proportions and with ample accommodation could be erected, and that at the same time it would present great possibilities for the decorative treatment of the interior.

Captain Martin entered into the matter with enthusiasm and, on his own initiative, drew plans to show how, in his opinion, the alteration could best be made. The fitness and the beauty of these plans were quickly appreciated, and an eminent architect was asked for his criticisms on them. He received them with great praise, and declared that the whole conception was a stroke of genius.

While this plan for enlarging the chapel was gradually taking form, many were turning over in their minds—

WAR MEMORIAL PANELS IN THE CHAPEL AT THE ROYAL MILITARY COLLEGE, SANDHURST haphazard, more than by design, for the war was not at an end—the possible forms a memorial to past cadets might take. It had become a tradition of the place that the names of all cadets who afterwards fell on active service should be inscribed upon the chapel walls. Yet the walls were already so covered that they would hardly hold another name. To take all the new names the chapel must be enlarged.

The way now seemed clear and obvious. If the size of the chapel was increased there would be seating room for all the College, and there would be space upon the walls to record the names of the fallen, which number over 4,000, and so carry on the old tradition.

So it was that the scheme of enlarging and decorating the chapel was definitely adopted as the War Memorial of the College. A committee was formed, and the approval of the Army Council obtained. Captain Martin's plans were at once accepted, and later they were exhibited in the Royal Academy.

A Memorial Fund had been in existence on a modest scale for many years, and it now became the foundation on which new funds were to be raised. The first appeal was sent in January, 1918, to the relatives of those who had laid down their lives. A further general appeal was issued in October of the same year.

Permission was obtained to commence the work and to carry it on as funds became available. No doubt it would have been more economical to wait until there was sufficient money to undertake and complete the whole plan in a single contract. However, many had responded to the general appeal for funds, or had undertaken to provide their own private memorials. They were not prepared to wait for an indefinite period, and it was only natural, and, indeed, inevitable, that it should be so. In these circumstances it was felt that personal sentiment and opinion had a prior claim to strict financial policy, and it was decided to carry out the building in four sections—the laying of the foundations, the building of a new east end, the conversion of the existing chapel into the centre part of the enlarged chapel, and, finally, the erection of a new west end.

The contract was given to Sir Henry Holloway (Messrs. Holloway Brothers, of Westminster), and in the autumn of 1918 the new foundations were commenced. They were completed in the following spring, and then lack of funds stopped the work for a year.

On March 1, 1920, the new east end was commenced. The building took some fourteen months, and on May 5, 1921, the Archbishop of Canterbury performed the opening ceremony.

Then came another interval of a year. On May 29, 1922, work was again started, and the original building was altered to the design of the new plans. It was opened on November 5, 1922, with a general dedication of all the memorials by the Bishop of Oxford.

The building of the west end is a matter for the future. The architecture of the enlarged chapel follows the Byzantine style of Northern Italy, but the combination of white marble with oak woodwork is quite unique. It is of interest that the style of the original chapel was also taken from Northern Italy. The general scheme of decoration was that the names should be engraved in the marble or oak on the walls and pillars. Not only is the main structure the work of the architect, but almost every detail of the interior decoration as well.

The piers and columns are of marble, the domes are being adorned with mosaics, and the windows filled with stained glass. The work is being carried out in three sections. Seventy regiments of the British Army have provided their own regimental memorial panels, many of which have been erected in this part of the church.

THE QUEEN'S PANEL IN THE MEMORIAL CHAPEL AT THE ROYAL MILITARY COLLEGE, SANDHURST.

The structural work on the second section, the central portion, is particularly interesting. In a building which is intended to convey an impression of beauty the decorations, as a general rule, hide the construction. In this chapel, therefore, the reinforced concrete work is entirely covered.

All the domes and the vaults are of reinforced concrete, as well as the pendentives. The dome at the back of the altar consists of an inner and an outer dome separated from each other by an air space. The reason for this construction was that the exterior of this dome is exposed to the open air, whereas the other domes and the vaults are protected by the main roof. The dome is covered with costly decorations.

The sub-contractors were as follows: Farmer and Brindley and Anselm, Odling and Sons (marble); Walton, Gooddy and Cripps (marble paving); H. H. Martyn & Co., Cheltenham (oakwork and carving); A. May (oakwork and carving around wall panels); C. Hall, Hampstead (wrought ironwork); G. Jackson and Sons (plasterwork); Powell and Sons and Kempe & Co. (windows); Trussed Concrete Steel Co., Ltd. (reinforced concrete work). The mosaic over the altar is the work of Mr. B. Anrep. The whole of the vaulting is eventually to be clothed in mosaic by him.

# English Architecture

MR. HUBERT C. CORLETTE, in reading a paper on "English Architecture" before the Manchester Society of Architects, said:—Architecture is a something in buildings when we consider them as a whole and not in their parts alone. It involves both the plan, or arrangement for accommodation, and the external appearance of any work, as a whole, a completed unit, together with the many parts that all combine and make this whole. And it also involves, perhaps more than anything else, the consideration of the materials used, the methods of construction employed, and the climate of the country in which the building is found. These are the elementary utilities out of which it is made and without which it cannot exist. They are the rugged raw materials upon which mind must operate before building commences and before architecture begins to be released from its tomb of unhewn rocks; or before the product of the furnace and the kiln is clothed or shaped by another fire of energy controlled by mind and marshalled by imagination into things of form that are a new creation.

We have seen the confusion bred by Italian revivals, Greek revivals, Gothic revivals. And we are all probably agreed that no revival that will mean an effort to reproduce the works of the past has any interest for us to-day. But it may be that we can still discover fresh ideas in these old forms of thought that will help us and find new ways of solving questions which we are meeting every day.

Much of the failure that has followed these revivals can be traced to false principles which have apparently governed those who advocated and took an active part in causing them.

One thing seems to have been a common fault of procedure in all these different attempts to change or return to the course of tradition, or to return from a state of affairs in which all real sense of tradition had been lost. That thing was this. Men studied parts of buildings in detail and forgot to regard their form as a completed whole. And surely there can be little doubt that it is form in the mass and whole conception that calls first for attention if we would know anything of architecture, past, present, or future. Detail and decoration, fragments of buildings, these are not architecture. They are like chapters and paragraphs extracted from larger volumes. And it must be conceded that no man ever appreciated the full idea of a book in its structure and form, character, style, and meaning without knowing it as a whole instead of by chapters or by chapter headings.

Other reasons helped to cause failure in these revivals. In one case we find an attempt to introduce into northern climates methods of building and design suitable in southern climes and developed to be used where there was much sun and little rain. Or the architectural thought of a Greek or a Latin race is imposed on a Gothic people. Again we find that revival in one country may be, as it was in Italy, an attempt to return to and recover their own national tradition that had been lost. With the people of that country and climate it was a legitimate aspiration. It was an actual effort to revive something lost. But to carry this same attempt at revival beyond the borders of the country where it was revived, and try and make it apply where it had never been known as a native tradition was to falsify history and destroy one national tradition by the introduction of another and an alien one.

If we turn to consider Gothic conceptions in architecture we shall find that they possess much the same sense of unity in design as the Greek builders expressed so well. In their essential nature both these traditional schools followed like principles. These principles showed that structure was the necessary element by which form could be, and should be, developed. And all changes of essential form were to be derived from structural needs. In fact, the plan, with the use for which a building was made, was the foundation out of which all real building tradition and architectural design arose. Climate allowed, or demanded, certain forms; materials dictated some methods. But these all met together and were combined in one. And it was the functional office, the structural nature, worked out as a building problem, in every subordinate part, that provided new ideas, suggested differences of form, and gave architectural importance and interest to the finished work.

This practical basis made all good architecture reasonable. It gave impetus to thought. It made the creative aspect of the art rest on common sense while it was contriving to make each useful thing a piece of beauty in a beautiful total conception. Our creative effort must begin with things, not abstract ideas alone. And so we come back to fact and find that necessity in building is the mother of invention in architecture. That is how the Greeks, within their limits, were architectural inventors. And it is by this same means, using new method, that the Gothic builders became such architectural creators.

There are few things so remarkable in the history of the arts as the apparent ease, the entire freedom, with which the Gothic builders turned from one kind of work to another. And when they moved from one problem to the next they did so with their characteristic energy of action and of thought. They approached their task without fear, and attacked it without misgivings. For every new enterprise they were ready with fresh ideas. And in building they seldom, if ever, said the same thing twice over in the same way. They took things as they came, handled them and left them, and passed on to the next, never looking backward, but always forward, to see what might be coming. They lived architecturally not in the past, but in the present, doing what it demanded, not waiting, but moving on to meet the future.

We see this in their parish churches and in their vast cathedrals.

If we examine the old cottages of the period, the comparatively few that remain, or the houses both large and small, of which there are many in all parts of England, it is still possible to see what the Gothic mind, working through English tradition could do when it was turned away from ecclesiastical to secular building during nearly two centuries.

There is little need to urge the Gothic character and quality in all these houses. It is evident. It is obvious. And it is generally admitted. That they showed in part, and mostly in small details, some evidence of Italian influence none can or need deny. This only proves an English readiness to be receptive and to use contributions of skill and of idea from all quarters. The growth of the whole body of the national language in all its literary forms showed the same power to absorb useful elements. But it should have been the same in the language and traditions of architecture as it was with the language of the nation. In the one case the imposition of a foreign tongue had been refused and rejected more than once. In the other, as the history of English architecture shows too clearly, a foreign idiom was imposed by foreign scholarship, brought from foreign schools, both by foreign and by English agencies.

A question may be asked. What use is it now to dwell on these particular buildings; we have already much knowledge of them? That is true. But it may be said we can never know too much about them. And we shall probably never know all the different influences and powers, mental and social, political and ecclesiastical, that brought them into being. Our purpose in studying them is to try and find, or to suggest, if we cannot find some of the ideas, the principles and methods of work that seem to be hid in them. It is important that we should know more, if we may, because they are the result, the evidence of what an English national building and craft tradition could do.

# The British Empire Exhibition (1924) in Embryo

### By PERCY L. MARKS, Licentiate R.I.B.A.

IT is a far cry from Sir Edward Watkin to the British Empire Exhibition, but there is a certain connection between them after all; or, at least, it may be said that they are on common ground at the accessible Wembley Park. Sir Edward's dreams of a vast development at this spot were never realized. For many years the landscape for miles around was rendered hideous by the four-legged skeleton platform of the would-be rival to the Eiffel Tower; in very truth it proved to be but a second Tower of Babel, and, like that tower, it disappeared into the realms of nothingness.

There is, however, every reason to suppose that the exhibition now rising from the ground on a freehold site of 120 acres will meet with the success of which Sir Edward dreamed in vain. If enterprise, enthusiasm, breadth of purpose and public support can accomplish this success, then the latter is assured.

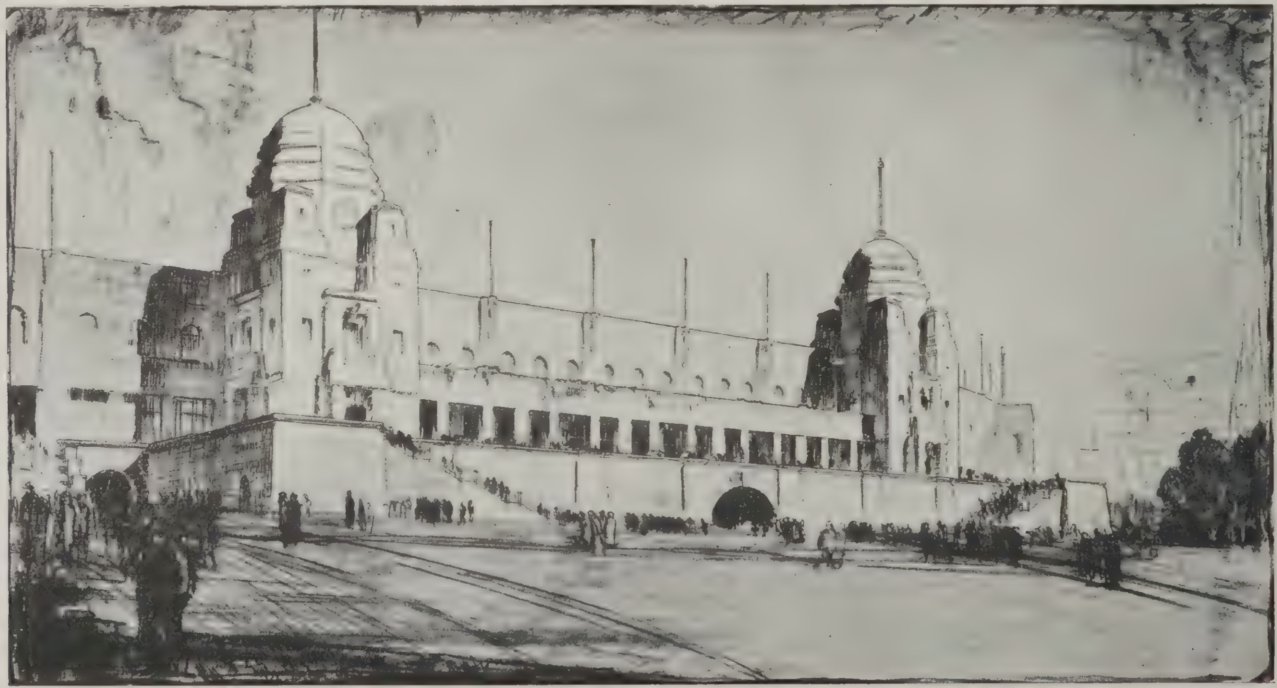
The scheme was initially due to the imperialistic visions of the late Lord Strathcona. Temporarily suspended during the raging of the World War, it was revived in 1919, and is destined to mature next year. Indeed, a portion, and that not an unimportant section, is to be completed by next April, when it is intended to open the stadium for the holding of the Football Association Cup Tie Final. By that time, too, the whole scheme will doubtless present an appearance more in accord with the necessities of the general inauguration of the exhibition in April 1924.

At the moment, it is true, there is not much to see, except the stadium; and this dominates the landscape, even as the Colosseum at Rome overlords it on the City of Seven Hills. But before giving an account of these works, it is well to mention the names of some of those responsible for the gigantic creation of the near future. The architects for the whole scheme are Mr. John Simpson, P.P.R.I.B.A., and Mr. Maxwell Ayrton, F.R.I.B.A.; with them is associated as consulting engineer Mr. E. O. Williams, B.Sc., who is getting out the details of the structures, and whose genius is even now apparent in the stadium and industrial hall works. An engineer of Mr. Williams's repute may be trusted to calculate stresses and strains properly, but at the same time it is a curious point in local authority tactics to delegate authority in practice, and to resort to the Gilbertian method of allowing the engineer to approve his own scheme; in other words, the Wembley U.D.C. declines to accept the responsibility of deciding whether the stadium is, or is not, well and truly designed to carry the loads, and it elected to disapprove *in forma* the plans submitted, and upon the inadequate plea that no precedent exists for an urban authority dealing with a work of such magnitude.

It is to be hoped that if architects, other than Messrs. Simpson and Ayrton, are employed for designing the Dominions blocks, the same air of permanence will be obtained as these architects are providing, and proposing to provide, in such blocks as are with certainty being entrusted to them.

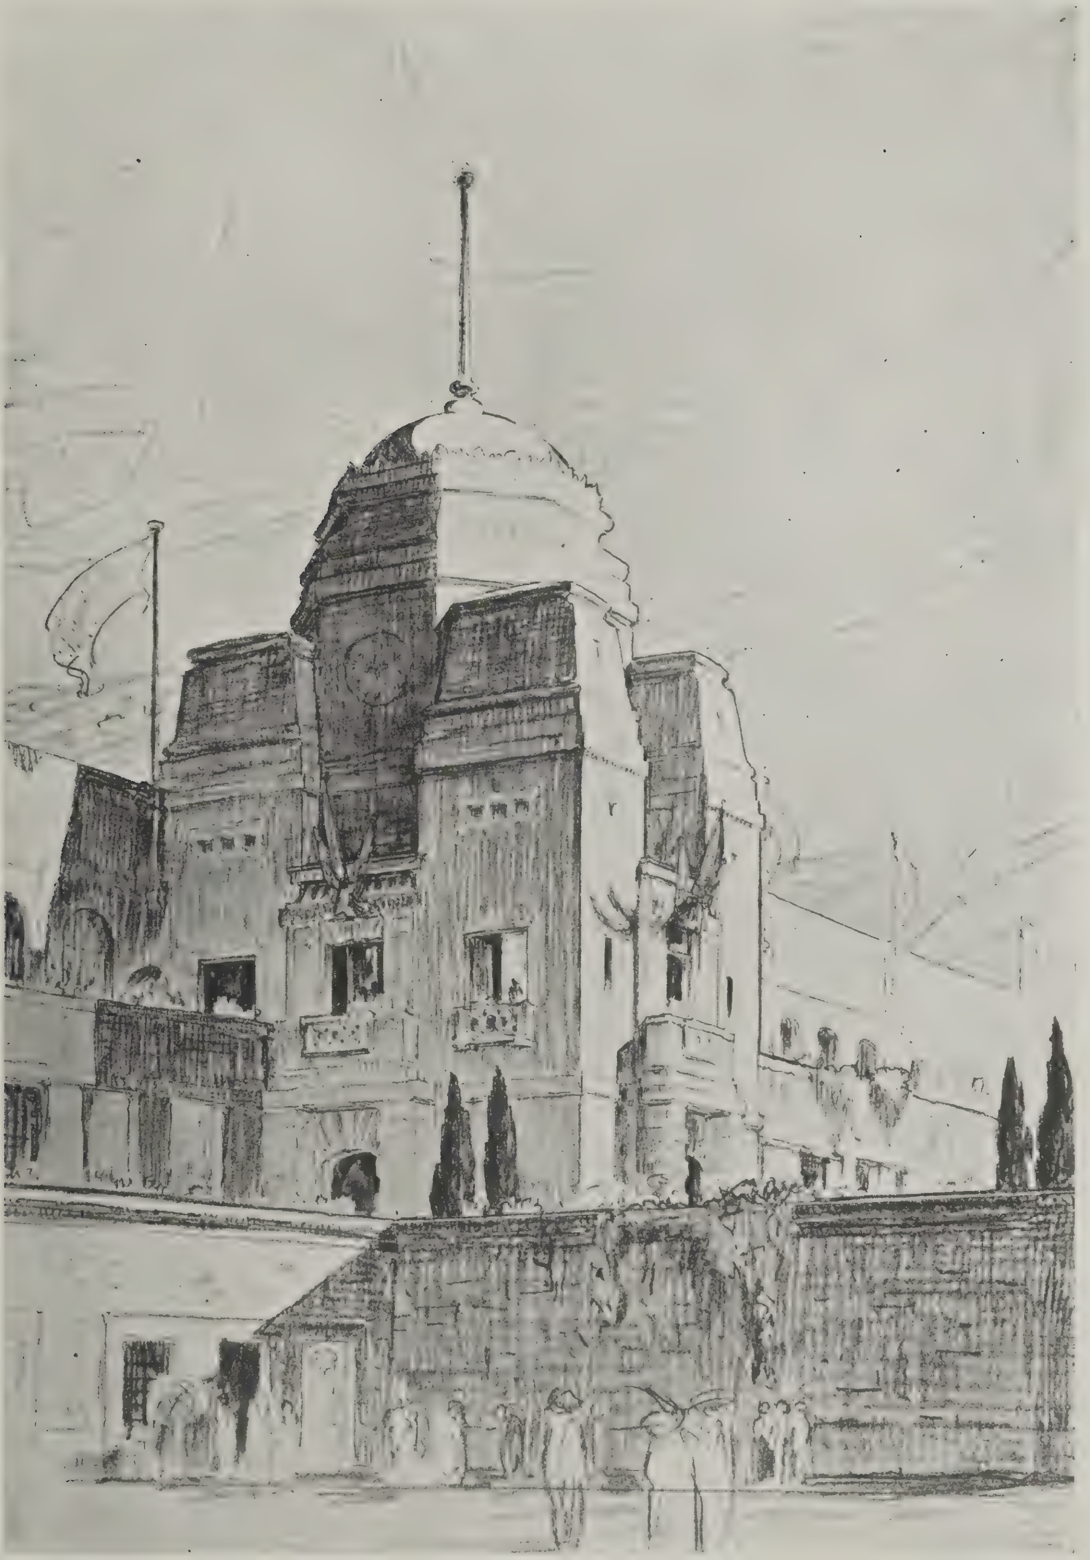
It is, indeed, a source of great satisfaction (which other exhibitions have not furnished) that the buildings are intended to be erected *en permanence*, instead of the "Staff" eccentricities, to which one has unfortunately become accustomed, though not inured. And this difference of character is apparently to be reflected in the architectural design of the elevations, if one may judge not only by the portion of the stadium in evidence, but also by the paper designs of some of the other buildings. In viewing the stadium, the work of capable architects is at once apparent in the mass and in the distribution, the former having the terrace approach to prove the justice of this criticism, and the latter having the encircling arches, 50 ft. span and 45 ft. in height and semi-circular-headed. The Royal entrance archway is excellent. The latter is entered from the external ground level, but the encircling arches which admit to the public accommodation are approached by flights of steps, spaced at intervals of four of the arches. There is also the perron approach to the main terrace with its flanking towers, though it is early as yet to judge of the effect which these towers may produce. The encircling archways give entry for a 40 ft. road, under the shelter of the stands, thus providing comfortable access to the various portions of the theatre.

A width of seat, 17½ in. only, scarcely seems adequate for comfort, and it would be better to sacrifice some of the accommodation rather than make everyone uncomfortable. And there is one thing more which I desire to say before proceeding to other points, which is, that anything in the nature of fulsome or unmeaning praise of the work of architects, engineer or others concerned would be objectionable; let it therefore suffice to



A VIEW OF THE STADIUM.

JOHN W. SIMPSON, P.P.R.I.B.A., AND MAXWELL AYRTON, F.R.I.B.A., ARCHITECTS.



THE BRITISH EMPIRE EXHIBITION, WEMBLEY PARK: A CORNER FEATURE.
JOHN W. SIMPSON, P.P.R.I.B.A., AND MAXWELL AYRTON, F.R.I.B.A., ARCHITECTS

add, that whereas the outcome of the architects' labours may possibly not satisfy the artistic views of all, or even of nearly all, one feels confident that the great bulk of educated opinion will approve their work.

Some less general remarks may advisedly follow at this stage. And, firstly, to deal with the stadium, which is (and is likely to remain) the *pièce de résistance*. Earlier the almost obvious comparison was made to the Colosseum; but the Wembley building is much larger than its prototype, being, in fact, half as large again, whilst the enclosed area is two and a half times the size. Comparing the accommodation of the Roman and English amphitheatres, the figures are as 80,000 to 126,000. Do not these particulars better indicate the gargantuan proportions of the later structure than such statistics as the following, to which, however, readers of this JOURNAL are very welcome? Can you or I comfortably visualize one-seventh million tons of excavation; one-five-hundredth million tons of structural steel, half a million rivets, and one-fortieth million tons of concrete? But it may be more readily visualized when it is stated that the outer circumference of the structure approximates half a mile.

The only completed portion so far is the arena, which, in defiance of its etymological significance, is turfed; but it cannot be expected that footballers shall play upon a sanded surface merely to satisfy ultra-precisionists. Some 2½ acres is thus laid under turf 2½ in. thick, obtained from the adjoining old golf links. The foundation of the playing pitch is the natural clay, which has been covered with 10 in. of varying grades of cinder, and above that and immediately beneath the turves is a bed, 5 in. deep, of specially prepared soil.

There are two running tracks, namely, a ¼-mile oval track round the playing field, and a sprint track, providing not only for 100 yards racing, but also for 220 yards; the latter is notable in being the only straight 220 yards' track in the United Kingdom, and this arrow-flight is obtained by means of a tunnel under the stand in the southern wing, which permits the longer sprint to start before entry into the arena. The pity of it to me seems to be that, whilst providing for such a huge amphitheatre, it was not made even larger, so as to permit the full, straight track on the arena, and thus enable spectators to witness the start-off of the sprints.

Accommodation for about 500 athlete competitors will be found under the stand, with shower baths and lavatory fittings. A direct gangway thence to the major axis of the arena is provided by way of a central tunnel passage. For footballers there will be separate dressing-rooms, with baths; their training quarters in connection will contain a gymnasium, plunge bath, recreation-room, and offices.

An integral part of this vast building will be a restaurant, with a capacity for 1,000 visitors, and it is intended to render this available for dances, conferences, and the like purposes; but what about the 125,000 balance (or the large proportion of them) who will be wanting to be fed simultaneously? However, they will find large tea-rooms, a buffet or so, and cloak-room accommodation.

The members of the fourth estate are to be provided for with special care; a spacious gallery in the best position will be allocated to the Press, and equipped with all the latest conveniences. Crows' nests will be also provided for cinematographic purposes.

To revert, however, to the general public (professional enthusiasm having led me astray for the moment), the architects have devoted the greatest and most thoughtful attention to the provision of a building that will *contrast* favourably, rather than merely *compare* favourably, with sports buildings elsewhere. The use of reinforced concrete is, of course, a powerful aid to them in being able to minimize obstructive details of construction, and of this they have taken full advantage.

Mr. E. O. Williams has evolved from the architects' radical idea a highly eminent work of steel and concrete. The sloping terraces are formed of reinforced concrete beams, carried on radial steel girders, which at their outer ends are supported on and in the curtain wall. The ground falls from west to east, on the latter side the level of the arena approximating to the former ground level. This necessitated east to west excavation, which was carried out by means of the Bucyrus dragline excavator, removing a ton of soil at a bite, and the excavated material was utilized to form the embanking at the eastern end. This has been supplemented above the ground level by a continuation of the sloping terraces on a system of steel framework, supported by reinforced concrete stanchions. Across the radial girders are placed the precast reinforced concrete steps for the accommodation of the public, the curtain wall, of course, being formed in situ by means of shuttering, which is of wood, and where the effect of tooling is desired (as, for example, to the bases of the towers), the necessary channels are prepared in the timbering.

Messrs. Edward Wood & Co., of Ordsall, are supplying the steelwork to the extent of 1,400 tons; pneumatic riveting is employed, the plant for this work comprising a standard "Sentinel" compressor and receiver by Messrs. Alley and MacClellan, with some half-a-dozen pneumatic riveting hammers supplied by the Ingersoll-Rand Co.

The stanchions, roof trusses, and other precast work of the stadium and industrial halls are being cast on the exhibition site; an upright drum mixer, supplied by Messrs. Stothert and Pitt, is used for mixing the concrete, the ballast being furnished by the Rickmansworth Gravel Co., and the cement by the Cement Marketing Co.

The sewering of the exhibition is being carried out with Stanton-Hume reinforced concrete pipes of diameters ranging from 6 in. to 4 ft. 6 in. These pipes are made by a special centrifugal process, automatically removing the water and thus obtaining a highly dense concrete. Certain lines of drains up to 9 in. diameter are being laid with glazed stoneware pipes supplied by Messrs. Thomas Wragg and Sons. A special type of Hailyburg manhole cover is being supplied to the design of the drainage engineers, Messrs. Field and Bean.

Contrasting with water discharge is the water service supply, which is being laid in cast-iron pipes ranging in diameter from 3 in. to 9 in. to an extent of several miles, the Staveley Coal and Iron Co. being the supplying firm.

The general contractors for the exhibition are Sir Robert McAlpine and Sons.

Though at present the stadium is chiefly in evidence, yet the industrial hall is also beginning to make a show with its structural stanchions and roof trusses in reinforced concrete. The main spans are 70 ft., and the subsidiary spans are 50 ft., but at the period of inspection the embryo condition of this hall was only less embryonic than the exhibition in general. At a later date this JOURNAL will be very pleased to supplement this present account with a more detailed description of the British Empire (1924) Exhibition.

## The Bicentenary of Sir Christopher Wren

American architects are preparing to observe next February the two-hundredth anniversary of the death of Sir Christopher Wren, who has left an indelible impression on American architecture.

The American observance will be consistent with the celebration in England, where the Royal Institute of British Architects has set aside the entire week commencing February 26, 1923, as Commemoration Week in honour of Wren.

In America there is hardly a city that does not boast one or more Wren spires on its churches. The White House is distinctly Wren; the National Capitol shows his influence; Independence Hall, Philadelphia, with his palladium motif of one tall arch window flanked by square-topped ones, is Wren. In Boston the State Capitol, designed by Charles Bullfinch, who drew his inspiration from Wren, and the old South and North churches are among the notable Wren examples.

New York boasts one of the finest Wren spires in the country on St. Paul's Chapel, which stands with its face turned away from Broadway. Other noted Wren spires are seen on Trinity Church, Newport; the First Baptist Church of Providence; Christ Church, Philadelphia; the First Christian Church, Hartford; Park Street Church, Boston; First Congregational, Lyme (Conn.); and others. In Chicago the best example of the Wren type is St. Paul's of the Midway. Here, however, the spire has never been completed.

The grand committee which is organizing the Christopher Wren Bicentenary Celebration, to take place next February, has arranged for the publication by Messrs. Hodder and Stoughton of an illustrated memorial volume dealing with the career and achievements of the greatest of British architects. This volume will be edited by Mr. Rudolf Dircks, Librarian of the Royal Institute of British Architects, and will contain chapters contributed by eminent architects, men of science, and others who can speak with authority of Sir Christopher Wren's place in the history of British art and science. The whole of the profits arising from the sale of the book will be handed over to the fund which is now being raised by the Dean and Chapter of St. Paul's for the preservation of the cathedral. Only a limited number of copies will be printed, and it is hoped these will be purchased mainly by learned societies.

These details are of the library staircase at St. John's College, Cambridge, and the baluster of the pulpit stair in Thaxted Church. The various Cambridge colleges are very rich in delightful 17th and 18th century staircases, both of the humbler and more homely variety, and of the more imposing type of which the library staircase at St. John's is an example. It is characteristic of the richness and interest of Thaxted Church that, besides all its wealth of Gothic stonework and woodwork, it should afford such a charming example of Renaissance work as the pulpit and pulpit stair of which the above is a detail.

## Influence of Flood Lighting on Architectural Form

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—The illustration of Wolseley House in your issue for December 13 makes it appropriate perhaps for a layman in architectural matters to ask a pertinent question on the influence of "flood-lighting" on architectural form. If the effectiveness of cornice and capital, moulding and hood, depends largely on their catching the light of heaven and trapping the shadows, will it now be necessary to design these features of a building so as to secure equal effect by day or by night? Or is architectural detail so simple and so adaptable that an artist can rejoice every night to see his creation standing with unruffled composure on its head?

It is no doubt true that in the past buildings have had to submit to the test of being seen in the oblique light of street lamps, but "flood-lighting" would seem to introduce a principle of illumination not mildly unsuitable, but wildly contradictory to that which is natural. However, I am anxious to draw the views of architects on the point rather than to express my own opinion.

W. MCG. EAGAR.

## Weaknesses of Collar Roofs

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—In the article published in your issue for December 27, "Architect" switches off from the weaknesses of collar roofs to the subject of economy in roof construction. Mr. Gunn's original note dealt with the question of strength, and my subsequent contribution was intended as an addition and to give what I considered to be the best way to make a collar roof strong, viz., by putting at the point of junction a support (purlin) under the collar and rafter, the latter bird's-mouthed, and therefore resting on it and the wall plate without thrust on the wall.

This weak spot is not really eliminated in Mr. Aston's Fig. 1, though his other roofs are excellent, but more suited for farm sheds, etc., than for dwelling-houses.

My roof is by no means extravagant. In place of a principal I have just a simple beam across the middle of the room, supporting the purlins at the centre of their length, all weights are dead, and there are no spreading thrusts. The two inner purlins under the ceiling are not vital to the work, but add to security and to the satisfaction of the eye and of the heirs of the builder, and for the same reason possibly the upper purlins are on the side of slight redundancy, but it is not necessarily economical to sail very near the wind when it comes to a matter of strength in building. I wanted my client's great-grandson to be pleased about the roof.

W. B. HOPKINS, A.R.I.B.A.

# "The Daily Mail" Labour-saving Bungalow Competition

THE assessors, Mr. E. Guy Dawber, F.R.I.B.A., and Professor A. E. Richardson, F.R.I.B.A., have made the following awards in "The Daily Mail" Labour-Saving Bungalow Competition :—

First Prize, £300 : Mr. Jas. M. D. Henderson, A.R.I.B.A., M.S.A., 1 Holmston Road, Ayr, N.B. Second Prize, £125 : Mr. C. Murray Hennell, F.S.I., and Mr. C. H. James, A.R.I.B.A., 19 Russell Square, Bloomsbury, W.C.1. Third Prize, £75 : Mr. J. S. Hodges, A.R.I.B.A., 19 Craven Road, Harlesden, N.W.10. 768 designs were submitted.

The first prize is a posthumous award, Mr. Henderson having died on November 21. Mr. Henderson had been on the staff of the Ayr Burgh surveyor for fifteen years and was chief architectural assistant. In a recent open competition for a housing scheme in the town his plans were placed first by the assessor, but owing to his position as an employee he was not entrusted with the work. He was thirty-seven.

The assessors, in judging the designs, have had in view the suitability of erection in any part of Great Britain. Their report states: That placed first fulfils these important requirements inasmuch as its character, though traditional, is thoroughly modern and economical. It could be built in brick and tile in the Home Counties; in rough-cast and thatch in Somerset and Devon; in stone in the Cotswold district; in roughcast and slate in Scotland, Wales, and the Lake District.

The Design Placed First.—The plan is symmetrical, the bathroom and bedrooms on the one side balancing the kitchen and servants' quarters on the other. There are no dark corners, and natural lighting is assured. The roofing is simple, and perfectly expresses the plan. If built, it might be advisable to omit the gables and to carry the hipped roof through at either end.

The Design Placed Second.—The plan is direct and the lighting good, the bedroom accommodation balancing the kitchen and dining-room. Its main lines follow the design placed first. There are, however, minor points which are not so straightforward. The elevations are in good taste, but lack the simplicity of the successful design.

The Design Placed Third.—This plan closely follows the lines of the first and second, but looks generally more official than domestic. It could be improved by adopting a less severe treatment.

In conclusion, the assessors wish to record their appreciation of the greatly improved standard of the work submitted in this competition, which is a distinct advance on that of previous competitions for designs for small houses. But they would strongly emphasize the fact that many of the designs submitted have no architectural character and show eccentric ornamentation and unnecessary features that should be avoided. Designers of this type of house should realize that the simple use of materials without any meaningless detail and absurdities would produce far more pleasing results at much less cost.

Appended are some interesting details with regard to the planning and construction of the successful design :—

The foundations to be of cement concrete, the walls to be of brick, built of two 4½ in. thicknesses, with 2 in. space between, the outer and inner thicknesses to be tied together with iron ties. The exterior of walls to be covered with cement rough-casting. The roof to be covered with red tiles. The floors throughout are finished with a surface of jointless flooring, with covings at intersection of wall and floor. All corners to be coved and mouldings practically eliminated, to prevent accumulation of dust and dirt.

All lengthy passages and waste space have been eliminated as far as possible.

Special attention has been given in this design to the grouping of all the bedrooms and bathroom together in one wing, with a cut-off door in passage, thus giving complete privacy to this part of the house.

The dining-room has been placed convenient to the kitchen, and a serving hatch is provided between these two rooms, thus saving an immense amount of walking between these two apartments. This service arrangement is practically a cupboard in the wall, with serving hatch in the centre drawer below, and shelves for china, etc., above.

There are no bright fittings; all door handles, taps, heating, cooking and washing appliances are either vitreous enamel or oxidized iron.

Reception rooms and bedrooms are fitted with power plugs for electric fires. Radiators heated from kitchen boiler are fitted in hall and maids' rooms, and are hung in such a way that they may be swung out from the wall for cleaning purposes.

Steel casement frames are proposed for all window sashes, being hung and built in such a way that both sides may be cleaned from the inside. The maintenance of such windows is infinitesimal, and they are not liable to rot.

# Magazines of the Month*

## A Literary and Pictorial Digest

THE January issue of THE ARCHITECTURAL REVIEW is its usual sumptuous self. The frontispiece is composed of a three-colour reproduction of a William Walcot painting, "The Etruscan Temple of Jupiter Capitolinus." In sheer beauty of colour it could not be excelled. Mr. Kineton Parkes contributes an article on American Sculpture. Of this, the writer says: "It may be taken for granted that firstly, American sculpture, like British sculpture, followed Canova and Thorvaldsen as nearly as its practitioners were able to get to those masters' styles; secondly, it began to change when the influence was removed from Rome to Paris, for France has, above all claims in universal culture, that of preserving a high, and in varying ways, dignified status of the art of sculpture, and all the other countries of the world have benefited by this consistency; thirdly, the traditional French influence began to wane when Rodin, Rosso, and Meunier had definitely made themselves felt forces by which they impelled in the newer directions of naturalism, realism, and impressionism, many of the more vital of the young men and women of America as of other countries. Moreover, America suffered the invasion of the young continental artists who went from Europe with the fresh gospel already developed; the new ideas and technique perfected in Munich and Florence, and ready, not only for the perversion of the old classical traditions, but ready, indeed, to pervert the doctrines of Rodin, Rosso, and Meunier, and to preach a still higher message."

"With all these potent sociological factors at work it is not surprising to realize the fine assorted virtues which American sculpture possesses: its idealism; its realism; its historic sense and its classical tendencies, all expressed in portraits and monuments and memorials; in fountains and garden groups; in studies of children and animals; in Indian studies and in museum and domestic pieces. American sculpture is an accomplished composite thing, full of seriousness, intensity, and honesty; it lacks only one thing—a great revelation.

"There are humanity and truth; insight and imagination; decorative and architectural feeling; a love of human and animal form; and in American sculpture, as a whole, there are earnestness, accomplishment of treatment, and good taste. Finally, it must be said that American sculpture, apart from some retrogressions in the early classical periods, has never been decadent. With the quite modern influences, the archaic, the primitive, and the negroid, New York is not universally concerned; not more so than London, much less so than Paris, Belgrade, Budapest, Munich, Amsterdam, the Scandinavian countries, and Finland. New York and London rely mostly for the exhibition of these phases of the plastic art of to-day on foreign exponents. Cubism, post-impressionism, vorticism have their votaries in America as in England, but the English - speaking nations have never distinguished themselves by vivid and avid discoveries of, or futurist excursions into, the dim and distant past. Greece and Italy, with occasional back-glances at Assyria and Egypt, have been our hunting-grounds when we might very well have been employed in the more exciting and more profitable employment of pure creation."

A new feature is begun in "Leaves from a Sketch Book," Sir Reginald Blomfield's sketch-book being the first to be drawn from. Of those given, we reproduce one.

The December issue of GARDEN CITIES AND TOWN PLANNING expresses itself as being neither disappointed nor elated by the results of the General Election, "whatever may be the opinions of the association's individual members."

"It is true," the commentator continues, "that certain parties have been quick to declare that no new National Housing

Scheme will now be produced, and that early steps will be taken to repeal the Rent Restriction Acts. We do not feel any certainty on either of these points. If the Rent Restriction Acts are repealed, the housing issue will become clearer—and more acute—than ever, and no determination to live in tranquillity could resist the pressure for an adjustment of wages which—to the great profit, be it said, of the owners of houses built before the war—would enable economic rents to be paid for houses built at post-war prices. The production of a National Housing Scheme is not so important as the formulation of a National Housing Policy which will, quite apart from *a priori* convictions on the desirability or detestability of State enterprise, secure the provision of an adequate number of houses, of adequate quality, in the places where their building will most adequately meet the industrial and social needs of the country. In any case there is no need to despair of a Government which has expressed its intention of securing peace and tranquillity. There can be no peace for any government which does not deal constructively with the material conditions which create discontent and unrest, physical deterioration and moral disintegration"

GROUND-FLOOR PLAN OF THE COOPER FREE PUBLIC LIBRARY, CAMDEN, N.J.
(*From "The American Architect*.")

The American Architect and the Architectural Review for December 6 illustrates the Cooper Free Library, Camden, N.J. (Walter T. Karcher and Livingston Smith, architects).

The type of construction selected was wall-bearing steel, fireproofed. In fact, comparatively little steel was used in this building. The massive walls all carried straight up, and the only steel necessary was that required for lintels and roof-rafters. All walls both exterior and interior are of masonry, all floors and roof of reinforced concrete slab.

Limestone is used throughout on all four sides of the exterior. Granite is used for the steps. All window frames and sash and the exterior lamps are of bronze. The roof is covered with red quarry tile, in order that the building may not look unsightly when viewed from above from any overlooking office buildings or apartment houses. Incidentally, a feature of the base of the building is the stone seat that entirely surrounds the library. It is not only effective architecturally in this case, but situated in a public square, as this building is, it is a most practical feature.

Another distinctive element of exterior treatment is the glass mosaic frieze back of the large columns of the front portico. This frieze extends entirely across the front, is over 50 ft. in length and 7 ft. high. No piece of glass in this frieze is over $\frac{3}{8}$ in. in size. It was executed by Nicolo D'Ascenzo. The use of a coloured frieze in this position relieves the dull monotony of the usual grey wall back of such a colonnade and gives a richness to the shadow that is decidedly unusual and most pleasing. A row of electric lights concealed above the architrave within the portico permits this frieze to be lighted at night with striking effect.

The December issue of THE ARCHITECTURAL FORUM concerns itself with hospitals, and articles are contributed by experts on Modern Hospital Design, The Selection and Development of Sites, Details of Planning, Equipment, Prevention of Sound Travel, Heating and Ventilating, etc. Of the many illustrations given we reproduce the Fifth Avenue Hospital, New York.

Mr. Richard Schmidt, F.A.I.A., in his comprehensive article on "Modern Hospital Design," treats of the general hospital, hospitals for the insane, contagious hospitals, tuberculosis hospitals, open-air buildings, obstetrical, surgical, and children's hospitals. We trust that the following observations by the author upon the subject of "atmosphere" will be regarded: "A proper mental attitude of the patient was hardly possible in the older forms of hospitals which resembled correctional institutions, and it cannot be questioned that patients will be more cheerful, looking forward to the success of operations with more certainty, and benefiting greatly if everything they see about a hospital is familiar and inviting, rather than calculated to arouse curiosity and possibly fear. Many discerning hospital administrators have not been slow to appreciate the desirability of making their institutions attractive to the eyes and minds of the patients, and have happily compromised between the most rigid simplicity and the details of hotel and house finish and decoration. It may cost a little more to clean a projecting architrave and panel work than it does the institutional flush casings of doorways, or to use flat paints than it does glossy enamel, but the results in the quick recovery of patients seem to be worth the additional expense.

"The entrance, reception rooms, parlours, and porches for convalescing patients, for receiving their relatives and friends, should be furnished with as much care as is used in the best hotels and residences. In very large hospitals, parlours for the reception of friends and relatives should be convenient of access to every convalescent, and the cost of replacing the more delicate furniture required for the kind of furnishings mentioned should be considered a necessary expense."

What is said about the necessity for better provision in the accommodation for nurses and staff should also be marked:—

"The very low ratio of non-employment in this country in the past three or four years has made it increasingly difficult to attract women to the profession of nursing. Due to this, and also because it is only common justice, it is desirable to provide proper and adequate accommodations for the nurses, internes, orderlies and other employees of the hospital. Many hospitals are built with little thought of the number of nurses which will be required or the accommodation they should have, and when the hospital is built and completed there is generally not sufficient money available to build a proper nurses' home, and they are lodged in rented quarters, obviously unsuitable, and fed in unattractive, cramped basement dining-rooms. Manifestly every estimate of the cost of a hospital should include the cost of a proper building for the nurses, with social, reception and dining-rooms, sewing

room and laundry where they can do a little of that kind of work when necessary, also a sitting-room in connection with each group of sleeping rooms where the nurses can relax before retiring.

"It seems to be the consensus of opinion among superintendents of nurses that single-bed rooms are more desirable than two-bed rooms, though possibly some nurses may suffer less from nostalgia during their freshman years if they have roommates. If the hospital can afford them a gymnasium and swimming pool will be appreciated accommodations, and if a training school is combined with the hospital, the teaching rooms, laboratories, diet kitchen and demonstration rooms are better located in the nurses' home than in the hospital proper. The home should be sufficiently removed from the hospital to permit the nurses to relax when off duty, and to enjoy themselves in natural and reasonable pleasures without disturbing the patients in the hospital. The accommodations should be made as nearly as possible like those of a good American home."

L'ARCHITECTURE for November gives M. Guillaume Tronchet's project for a war memorial stadium, which would be the biggest in the world and capable of seating 80,000 spectators.

The December issue of L'ARCHITECTURE illustrates work exhibited at the Salon d'Automne, among which is a photograph of the remarkable staircase (reproduced) designed by M. René Binet for the Grands Magasins du Printemps—since destroyed by fire.

## The Art of the Ancient Egyptian

Professor Flinders Petrie, in a lecture upon Ancient Egyptian workmanship at King's College, spoke of the extraordinary skill, conscientious Workmanship, and manual dexterity of the ancient Egyptian. He first exhibited some wonderful photographs of examples of ripple-flaking in flint, done purely for decorative purposes.

The regularity of the work was marvellous, and has never been approached, yet the specimens illustrated were executed 7,000 years before Christ, or about ninety centuries ago. Work of the same kind done much later, about the beginning of the historic period, showed signs of deteriorated workmanship because the use of copper had begun, and men preferred to work in the more plastic material.

Photographs of stone vases and circular bowls were next shown, and these too were executed with perfect skill, though no lathe or other rotary appliance had been used in their manufacture.

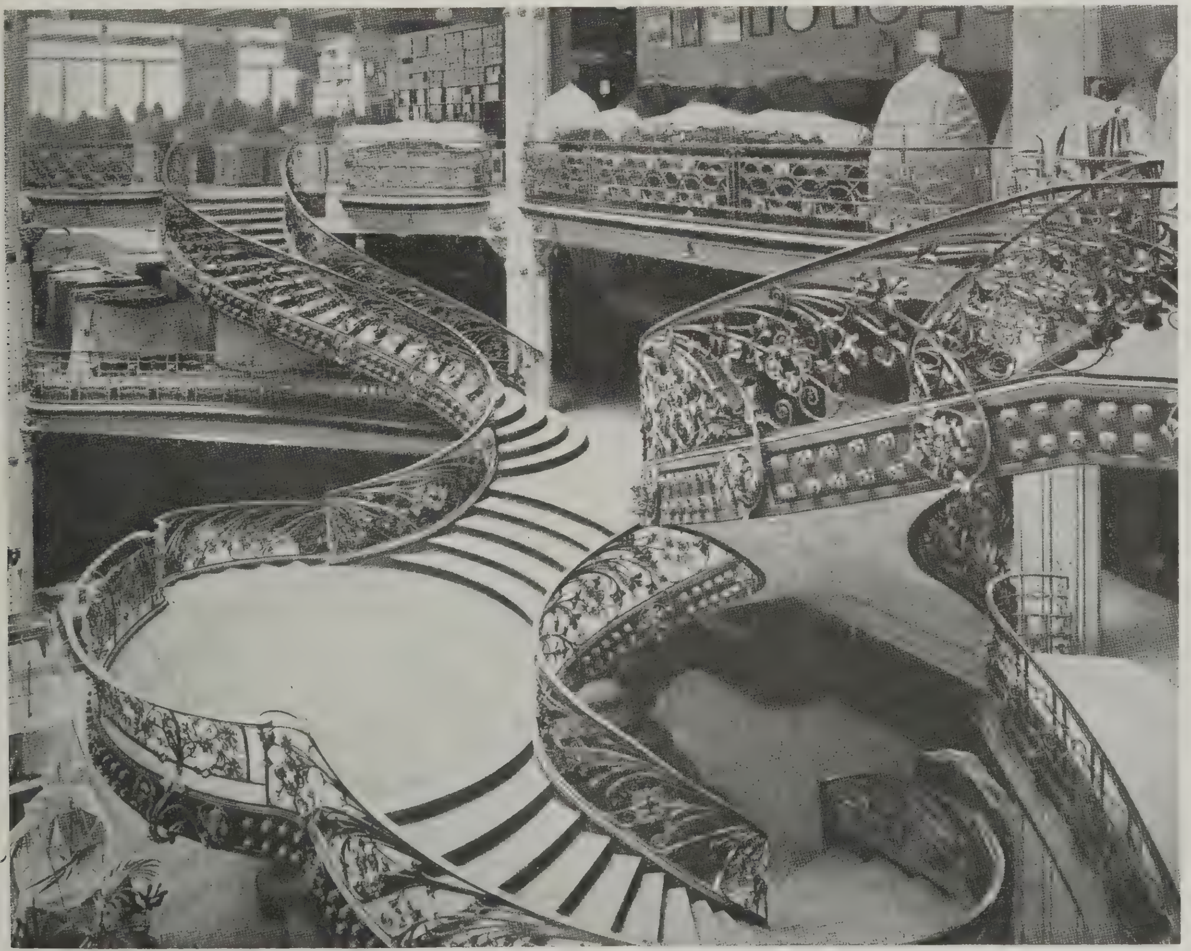
They were fashioned and rubbed down by hand, yet the work was so true that a large stone bowl 2 ft. in diameter was nowhere more than a quarter of an inch thick and was perfectly circular in form.

The skill and æsthetic appreciation of perfection of form in the ancient Egyptian had never been equalled, and the wonder of it all was that most of his work was not intended for exhibition but to be placed in a tomb out of human sight for ever. Professor Petrie said he had measured work in Egypt which was true to the straight within four-thousandths of an inch, yet it was entirely hand-wrought.

Next there was shown a photograph of two pieces of cloth, one taken from an Egyptian tomb about 7,000 years old, the other a piece of the finest modern cambric handkerchief. The ancient fabric more than rivalled the modern in evenness of thread and regularity of weaving, yet the former was handspun and handwoven, while the latter was the product of the most perfect machinery that could be devised.

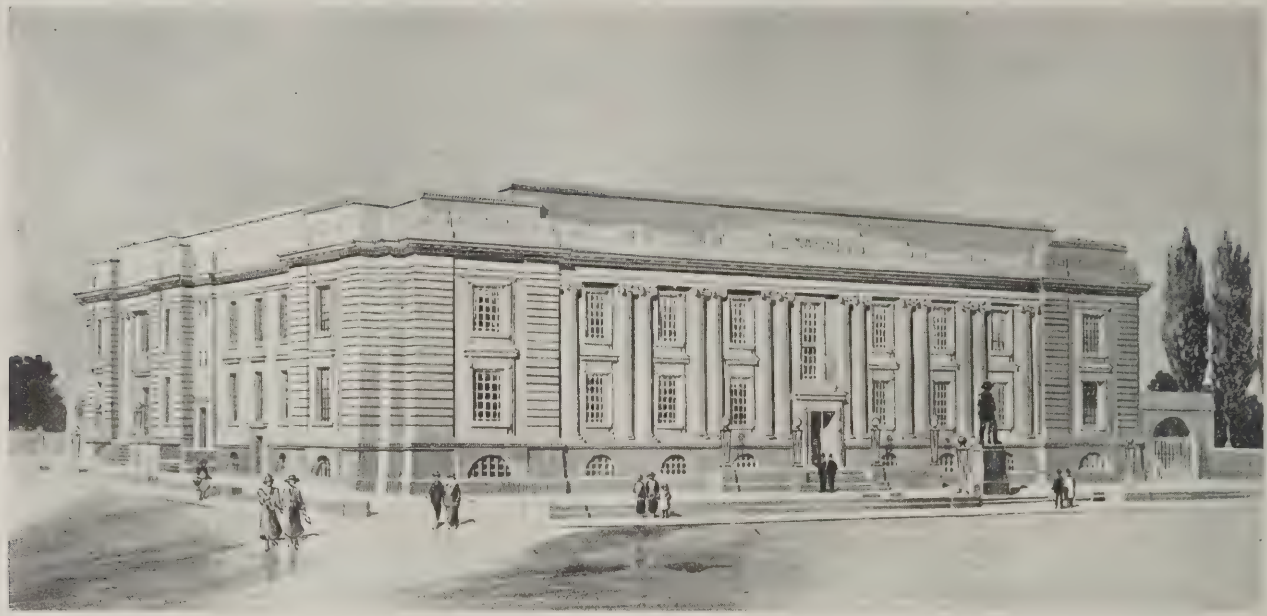
Many other beautiful things were shown, including specimens of goldsmiths' and jewellers' work, woven coloured patterns, and so on, which modern skill could not reproduce. Professor Petrie mentioned that one of the pieces of inlaid metal and coloured stonework shown was recently taken to the most expert jeweller in Paris, who was asked to make a copy of it. The jeweller said he could not do it, and that it would take years of specialized training before the most expert workman could even attempt it.

The same minute perfection was observable in Egyptian statuary work, where small anatomical details that modern sculptors ignored were reproduced with complete fidelity.



THE STAIRCASE IN THE GRANDS MAGASINS DU PRINTEMPS, PARIS.
RENÉ BINET, ARCHITECT.

(*From "L'Architecture."*)



THE WINNING DESIGN.

# Colwyn Bay Town Hall Competition

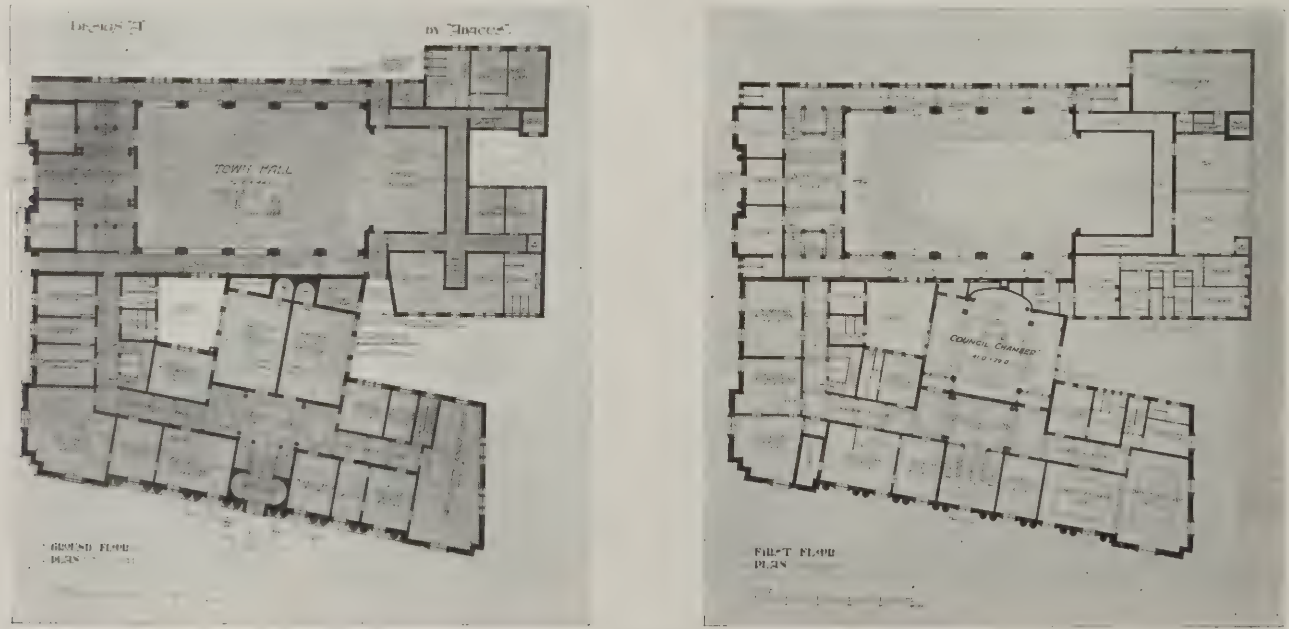
As announced in our last issue, the assessor, Mr. F. P. Lockwood, has awarded first place in the Colwyn Bay Town Hall competition to the design submitted by Messrs. J. M. Porter and Co., of Colwyn Bay, architects.

In the successful design the general lay-out of the buildings is such that provision has been made for complete municipal offices and town hall, each of which could be erected separately. The authors suggest that the town hall portion, together with the fire and ambulance stations, might be built first.

After the first portion had been erected (if it was found necessary to proceed with the construction of the offices) a part could be arranged to temporarily accommodate a certain number of the officials while the existing premises were removed and the whole scheme completed.

The town hall portion has been designed for use in connection with the social and public requirements of the town and district. Twelve hundred people can be seated in the body of the hall and in the balcony on the first floor, but this accommodation could be greatly increased. The main entrance to the hall, from Coed Pella Road, gives access through a vestibule into a foyer, from which two large staircases lead up to the crush hall on the balcony floor. Along each side of the hall on both floors is a promenade corridor giving easy access to the various seats, and allowing ample exits being provided direct into the open. A stage is provided, together with the necessary retiring rooms, and is sufficiently large to be used for theatrical purposes. In the event of the hall being used for dances or other public functions, a kitchen and scullery are arranged for catering. There is also an ambulance station (with store) to accommodate two motor ambulances, a fire station to house a complete equipment, a workroom for repairs, and caretaker's quarters with separate entrance.

In the municipal offices ample provision has been provided for the existing staff, but provision has been made for future expansion. The main entrance is in the centre of the building facing Conway Road, and leads to an entrance hall giving direct access to the "rates" offices, so planned that in the event of large extension in this portion of the work being required they can be thrown into one room. In direct communication with each of the "rates" offices is a private room for collectors and overseers. On each side of the entrance are the main



GROUND AND FIRST FLOOR PLANS OF THE WINNING DESIGN

J. M. PORTER AND CO. ARCHITECTS.

offices for the gas and electricity departments, and also for the accountant. Provision is also made for the medical officer of health and sanitary inspector, and to these particular rooms a subsidiary entrance is given from Coed Pella Road, which entrance also gives direct access to the gas and electricity showrooms placed in the basement.

The council chamber is on the first floor, and is centrally situated directly opposite the main staircase. Access to the chamber is obtained from an ante-hall, and there are the usual retiring-rooms for the chairman, members, and lady members. The public gallery is on one side of the council chamber, and is reached by a separate staircase over which the caretaker would have special supervision from the outside of the building.

The two large committee-rooms are so planned that they may be formed into one room by the removal of a sliding partition. On this floor accommodation is also provided for the staff of the town clerk and the surveyor. Means of communication are provided between the town hall and the offices, through the main corridors on both floors, also from the council chamber. Retiring-rooms for the staff, internal telephone call office, and town information bureau are provided, and an electric lift, in addition to the secondary staircase, will serve the three floors of offices.

The basement is devoted to storage for the various departments, and to the showrooms for the gas and electricity departments. A boiler-house is centrally situated, large enough to accommodate the necessary fittings for the complete heating and ventilation of the buildings.

The elevations to Coed Pella and Conway Roads are shown to be carried out in stone, the whole design being based upon the Greek Classic style. Effect is obtained by broad masses rather than by small detailed work, elaboration in this having been carefully avoided, except in the case of the main cornices and entablature.

# Reinforced Concrete Calculations for Beginners. V

## By Professor HENRY ADAMS, M.Inst.C.E.

(*Continued from December 6, page 813.*)

When a beam is supported at the ends and loaded on top the bending moments produce not only the longitudinal stresses of tension and compression, but also shearing forces. Suppose the beam to be composed of a number of thin planks laid one above the other, they will slide on each other as in Fig. 9, showing that in a solid beam the same tendency to horizontal shear must exist. The load also produces a tendency for the different parts of the beam to slide on each other vertically, as in Fig. 10, but we cannot show this experimentally without using carefully devised apparatus. It must be sufficient for the present to take it on trust that these stresses exist. With a central load the vertical shear is equal from end to end of the beam, but with a uniformly distributed load the shear varies from a maximum at the ends, equal to half the total load including the weight of the beam itself, to nothing at the centre of the span, as in Fig. 11. In comparing the bending moments and the shear stresses it will be seen that where one is at a maximum the other is at a minimum, and vice versa. As the longitudinal reinforcement is put in to provide for the bending moments, so it is necessary to see that the shear is provided for. The concrete is allowed to take 60 lb. sq. in. of total vertical cross section, therefore 24 × 12 × 60 = 17,280 lb. In the present case the maximum shear is only 9,600 lb., so that the concrete is sufficient to meet it without any added shear reinforcement.

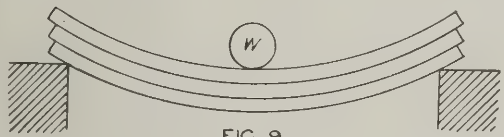


FIG. 9

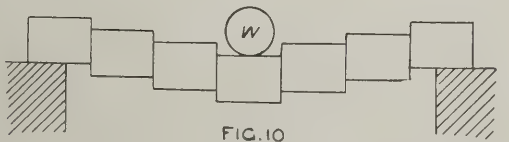

FIG. 10

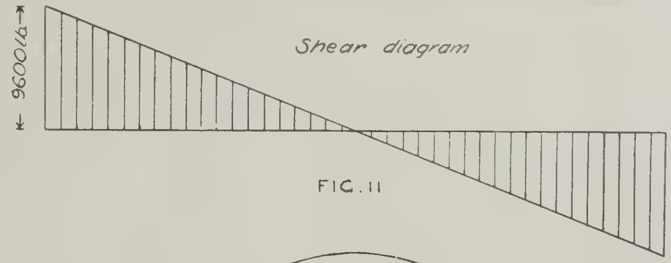

FIG. 11

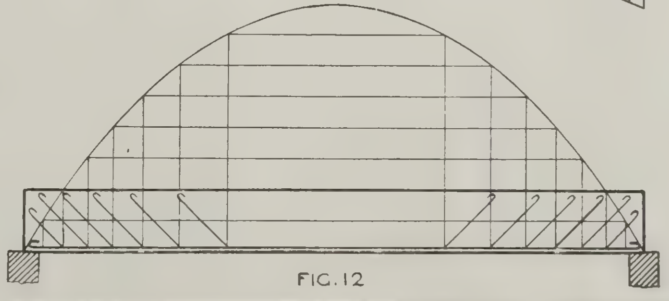

FIG. 12

Some designers prefer to put in special shear stirrups to take all the shear, finding their position as in Fig. 12. The parabola is made any height, the centre line divided into eight or ten equal parts. The intersecting points projected downwards and shear stirrups twisted round the longitudinal bars and bent up at 45 deg. as shown. Adopting this method the stirrups are brought automatically closer together towards the ends of the beam, enabling uniform sections to meet the varying stress. Sometimes these stirrups are placed vertically, but as the direction of the stress they have to meet is diagonal, the resultant of the vertical and horizontal forces, it is better to place them as shown. They should be secured in the positions shown, so that they do not slip while the concrete is being placed in position. The writer has found cases of failure where the stirrups were misplaced through ignorance of the workmen.

Each stirrup will be double, hence the name, and there are frequently two stirrups together at the same point of the span. The total sectional area of the stirrups at each point should be sufficient to provide for the shear half-way to the next stirrups on each side. The simplest way to provide for the approximate requirements is to make the total sectional area of shear members on each side of the centre $\frac{1}{48}$ of the sectional area of the beam. A more correct method is to take the maximum shear stress, subtract sixty times the sectional area of beam to allow for shear strength of concrete, divide the remainder by 10,000, the allowable shear stress on steel, which will give the total sectional area required on each side of centre. Dividing this again by the number of stirrups will give the requisite sectional area of each, placed as in Fig. 12.

# Societies and Institutions

### *R.I.B.A. Council Meeting.*

The Council of the R.I.B.A. at its last meeting accepted an invitation from the Architectural League of New York to dispatch the Exhibition of Contemporary Architecture to that city to form the British Section of an International Exhibition of Architecture. The exhibition will open in February, and it is anticipated that it will afterwards be sent to a number of other large cities.

Other business transacted at the meeting included the following :—

London Squares.—The Council endorsed the action taken by the Art and Town-planning Committees and the London Society with regard to the measures to be taken for protecting London squares.

The Franco-British Union of Architects.—The Council made a grant of £20 in aid of the work of the British Committee of the Franco-British Union of Architects for the current year.

The British Engineering Standards Association.—Mr. Max Clarke was appointed to represent the R.I.B.A. on a sub-committee appointed to consider the standardization of cast-iron half-round and other moulded gutters.

National Registration of Plumbers.—Mr. H. D. Searles-Wood was appointed to represent the R.I.B.A. on the council for the National Registration of Plumbers.

The Royal Sanitary Institute Congress, 1923.—Mr. H. D. Searles-Wood and Mr. John Bilson were appointed representatives of the R.I.B.A. at the Thirty-fourth Congress and Exhibition of the Royal Sanitary Institute to be held in Hull from July 30 to August 4, 1923.

### *Exhibition of Architecture, Town-Planning, and Complementary Arts.*

The Council of the R.I.B.A. have approved in principle and referred to the Art Standing Committee for consideration a proposal for the holding of an exhibition of architecture, town-planning, and the following complementary arts: 1, Mural decorative painting; 2, Sculpture and ornamental carving and casting; 2 (*a*), Furniture and woodwork; (*b*), Tapestries, weaving, and decorative hangings; (*c*) Pottery and ceramics; (*d*) Metal work; (*e*) Household utensils and appliances.

### *Architectural Vacancy in Palestine.*

The R.I.B.A. have received the following particulars of a vacancy for a chief architectural draughtsman in the Department of Public Works, Palestine :—

Qualifications.—Energetic and rapid architectural draughtsman with a sound knowledge of construction and design. Must be able to develop working drawings from sketches, and be capable of directing the work of others. Some years of experience in an office of repute essential.

Salary.—Commencing salary £30 per month, increasing £1 per month for every year of satisfactory service up to a maximum of £35 per month, plus a high cost of living allowance liable to fluctuation, but at present amounting to £2·80 per month.

Quarters.—If married, Government may provide living accommodation for which 8 per cent. of total emoluments will be deducted monthly from salary.

Leave.—Six weeks in each year of service.

Passage.—Second class by boat and first by train to Palestine, and back at conclusion of contract.

Probation.—For one year the candidate will be on probation, during which time he will be liable to discharge on the expiration of three months' notice. On the other hand, if his work gives satisfaction, he may, at the end of the probationary year, be offered a post in the permanent service of the Palestine Government.

Candidates, in the first instance, should address their applications to Mr. Ian MacAlister, Secretary of the R.I.B.A., 9 Conduit Street, London, W.1.

### *The Allied Societies and the "R.I.B.A. Journal."*

Arrangements have been made for the supply of the "R.I.B.A. Journal" (post free) to members of the allied societies who are not members of the R.I.B.A. at a specially reduced subscription of 12s. a year. Those who wish to take advantage of this arrangement are requested to send their names to the Secretary of the R.I.B.A., 9 Conduit Street, W.1.

### *The Wessex Society of Architects.*

An important development in the organization of the architectural profession in the West of England has just been completed by an agreement between the Bristol Society of Architects and the Gloucestershire Architectural Association. The two bodies have been combined in a new body known as "The Wessex Society of Architects." The new society will have as its province the counties of Somerset, Gloucestershire, Wiltshire, and Dorset, and the two constituent societies will retain their original titles as branches of the Wessex Society. Mr. Thomas Hardy, O.M., the poet and novelist, who is an Honorary Fellow of the R.I.B.A., has accepted the first Honorary Fellowship of the new body, which has been admitted as an "Allied Society" of the Royal Institute.

### *Period Costume Ball in Birmingham.*

The Grosvenor Room at the Grand Hotel, which one associates with long dinners and longer oratory, recently presented a pretty and novel picture. Under the light diffused by electric chandeliers and bulbs, a hundred or more figures moved rhythmically to the strains of the languorous waltz or the newer or more lively dance tunes. In the modified revelry that prevailed one felt that a very good attempt had been made to recapture the gaiety of nights that belong to the ante-bellum period. The bringing together of all these people in such happy circumstances was the outcome of efforts started by the Birmingham Architectural Association, and resulting in the formation of a committee of management representing, in addition to that body, the Central School of Art, the Birmingham Society of Artists, the local branch of the Institute of Civil Engineers, the Civic Society, the Repertory Theatre and the Midland Arts Club. By this social gathering the various artistic and scientific bodies were brought into closer relationship with the ultimate object of making their ideals effective in civic improvement. The ball was intended to display period costumes, but as evening dress was optional too many of the company took advantage of the opportunity to escape exercising their ingenuity. Still, if the periods were inadequately represented in costume, there was a very lively introduction of colour and variety. One saw, for instance, the Stuart, the Georgian, and the Early Victorian types reproduced. Another English type of feminine beauty displayed suggested Dolly Varden. Two of the most striking figures were an Early Dane in a helmet and cloak and a lady whose shimmering dress of gold and pink conveyed a capital idea of the dazzling glory of a Queen of Sheba. An Egyptian in white raiment, throwing up the dark square-trimmed beard and sun-browned complexion, found a delightful partner in a lady dressed after the Turkish fashion. Later on when several members of the repertory company arrived, still more variety in colour and costume was added to the company. Though, perhaps, not achieving all that was expected by the Civic Arts Carnival Committee as a period costume ball, it proved an enjoyable social function.—"The Birmingham Post."

### *A Handy Pocket Diary.*

A handy "Architects' and Surveyors' Pocket Diary" has been issued by the Architects' and Surveyors' Assistants' Professional Union. In addition to the diary proper, pages devoted to personal memoranda, such as engagements, telephone numbers, and cash notes, there are a large number of particulars of the greatest value, with regard to the leading professional bodies and training centres, and the various architectural scholarships and prizes. A list of the latest technical publications is also given, together with much useful technical data, and a variety of other useful information. The president of the Professional Union is Mr. A. J. Penty, Licentiate R.I.B.A., and the general secretary is Mr. John Mitchell. The head office is at 36 Victoria Street, London, S.W.1, and there are sub-branches in numerous areas.

### *The Institution of Structural Engineers.*

Pursuant to an Order of Court made by Mr. Justice Eve on November 28, 1922, and confirmed by the Board of Trade, the title of The Concrete Institute has been altered to "The Institution of Structural Engineers." With the advent of concrete, reinforced concrete, and special steels, a specialized profession has been developed during the past few years—that of the structural engineer; so that civil engineering is now divided under three main heads—electrical, mechanical, and structural. The former two divisions have been represented by powerful professional institutions for many years past, and, as a matter of fact, the structural division has been for many years represented by The Concrete Institute, which has now changed its title the more accurately to denote its special functions as a professional society for structural engineers. The classes of membership are: Members, Associates, Associate-Members, Graduates, and Students. Admission is by examination through the Graduate or Associate-Membership Class. The address continues for the moment to be Denison House, Vauxhall Bridge Road, Westminster; but we learn that there is a prospect that in the near future the Institution will acquire premises of its own.

# Land Conveyance and Building Prospects

AT a meeting of the Auctioneers' and Estate Agents' Institute, held at Russell Square—the president (Mr. James S. Motion) in the chair—Mr. T. P. Bennett, F.R.I.B.A., discussed the subject of "Land Conveyance and Building Prospects" in an exhaustive and valuable paper. He remarked that there was a French proverb which stated "If building goes well, all goes well," and it might be proved without difficulty that this was in accordance with actual experience. Active and satisfactory building was a necessity for the well-being of any community, and it appeared to him that no body of professional or business men could influence this matter to so great an extent as could those who were dealing with land. The land agent, surveyor, and landowner were all in various ways and various degrees in control of this basic commodity of building propositions, and if they were actively interested in building, the well-being of the nation would be advanced enormously. That a large amount of co-operation was possible between estate agents and architects seemed to him indisputable—on the one hand, co-operation of individuals, which probably obtained to a substantial extent at the present moment, and on the other, collective co-operation, which was only in its infancy, but which should have very large and important results. The men of the Victorian era were essentially individualists; the men of the present time appreciated more and more the value of collectivism, and the results which accrued to the individual as a result of collective effort. It was beyond question that knowledge and ability amongst architects had increased enormously in the past few years. It seemed to him that even in his own comparatively short experience this standard had advanced. He did not wish to suggest that it was limited to the younger generation of architects, for he thought it had spread over the whole of the profession. If this was so, it was possible that the time had arrived when auctioneers and estate agents and architects should reconsider their spheres of activity, and should examine the advantages which might accrue from closer collaboration. Mr. Bennett proceeded to tabulate the contributions which he thought each side might make to such a system of collaboration, and which would be to their mutual advantage, to the encouragement of building, and to the ultimate advantage of every member of the community. A survey of the methods of land conveyance in use all over the country suggested that even some surveyors themselves had not yet decided whether one method was any more suitable than another. If, amongst the wide differences of practice, it was possible to generalize, then he would say that apparently land which was reasonably low in cost was dealt with under the freehold system, and land which tended to be dearer was dealt with under leases. Pre-war (a very useful term) the bulk of the houses erected in this country were the result of the work of the speculative builder. Much as we condemned him in some respects, we owed him a certain debt of gratitude, but we could never have tolerated him or obtained half the benefit we had if his activities had not been kept in check by the leasehold system and the control exercised under it by the ground landlords and their surveyors. If we were to extend the system of providing houses for a large number of purchasers of small means, then some extensive system of hire-purchase for land appeared to him to be a necessity. He was convinced that all building on an extensive scale by public authorities was financially impossible. The private owner with sufficient means to purchase the freehold was, unquestionably, the most desirable prospective building owner and of the greatest use to the public at large. With regard to the leasehold system, pure and simple, this was a transaction which had appealed in the past primarily to the speculative builder. In the light of public and political feeling at the present time, he thought that speculative building would have an immense chance of success if it was carried out by active co-operation between land agents, architects, and builders, upon some economic system of collaboration which would provide houses with the maximum standard of comfort, artistic appearance, and economy of cost.

Mr. J. Geo. Head, proposing a vote of thanks to Mr. Bennett for his excellent address, said he thought the plan of co-operation was a sound idea. They would all agree that the production of houses was dependent upon confidence, and the best thing they could do to establish confidence was to remove the spectre of uncertainty which met them at every turn.

Sir Howell Williams said he was sorry to find that underlying Mr. Bennett's remarks there was a strong tendency to favour the leasehold system. He hated it; he had hated it with all his mind and reason all his life. The only other country he knew of that had a leasehold system similar to ours was Turkey. He owned a very large estate in the North of London—the Copenhagen estate. It was freehold. There should be no dual ownership of land and the property that was on it. In his opinion only a public authority should hold ground-rents and create leaseholds.

Colonel G. E. Kent (Portsmouth), Mr. W. S. Edgson, Mr. J. C. Platt, and Mr. C. E. Young also took part in the discussion.

Mr. Bennett, in reply, referring to a question raised by Mr. Head, said he thought we had reached a very fair measure of stabilization of building prices. Those prices were sufficiently stable to justify people in building if they wished to do so, if they had any reason for doing so. As to another question put by Mr. Head whether they could produce schemes with costs attached to them, he (Mr. Bennett) thought that in general they could.

---

# Three More Women Associates

THREE women, Miss Gertrude W. M. Leverkus, Miss Winifred Ryle, and Miss Eleanor K. D. Hughes, have been elected Associates of the R.I.B.A. This is the first time for over twenty years that a woman has qualified for membership. There are now five women Associates, the other two being Miss Bessie A. Charles and Miss Ethel M. Charles, who were elected in 1900 and 1898 respectively, and the latter distinguished herself in 1905 by winning the Royal Institute Essay Medal.

Miss Leverkus, whose portrait appears on this page, was born in 1898 and educated at the Sydenham High School, Sydenham, where she matriculated in 1915. Miss Leverkus took the Bachelor of Arts degree course at the Bartlett School of Architecture, University College, and obtained her degree in June 1918. Since then she has been with Messrs. Horace Field and H. Dighton Pearson, FF.R.I.B.A., with the exception of the time spent travelling on the Continent.

MISS GERTRUDE W. M. LEVERKUS.

Miss Hughes studied architecture first at the Municipal College, Bournemouth; then for three years in the Architectural Association Schools, and afterwards worked for the Final Examination under Mr. C. E. Varndell, F.R.I.B.A.

Miss Winifred Ryle spent three years at the Brighton School of Art, and became a student at the Architectural Association Schools in 1917, when they were first open to women. After staying four years at the A.A. Miss Ryle worked by herself, with private coaching, for the Final Examination of the R.I.B.A., which she took last June. Miss Ryle is now busy with two small houses which are in course of erection at Pangbourne.

Women are finding architecture extremely attractive as a career. There is a good percentage of women students in the schools of architecture, where many of them have already achieved distinction, and in the near future there is likely to be a great increase in the number of women applicants for admission to the R.I.B.A. and its allied societies.

# Law Reports

## Builders' Claim

*Coe* v. *Carless.*

Dec. 19. Official Referees' Court.
Before Mr. G. A. Scott.

This was an action in which the plaintiff, Mr. Chas. Henry Coe, builder and decorator, of Walton-on-the-Naze, claimed from the Rev. C. Carless, also of Walton, the sum of £228 6s. 1d., balance of account of £818 6s. 1d., for work done at defendant's premises. It appeared that the order for the work was given in March 1920, at which time defendant was purchasing the premise upon which it was done. It consisted of three parts—a double-fronted house known as Gunfleet House, a cottage, and St. Joseph's College. The defendant purchased the property cheaply because it was in a dilapidated condition. He paid £1,800 for the lot, which had been occupied by the military during the war and had suffered accordingly. The defendant called in the plaintiff to put the premises in repair, the chief work required being decorations, plastering, and carpentering. Shortly after the work was started the defendant went to reside at the college and saw what was going on. The work extended from March to September 1920, and no complaint, said counsel, was made about the quality of the work or the charges until defendant was pressed for payment. The plaintiff's charges were based upon the net cost of materials and labour, plus 10 per cent., which included profit and overhead charges.

The defendant did not dispute that the work had been done, but pleaded bad workmanship and excessive charges. He paid £100 into court.

Mr. Gould, architect and surveyor, of Station Road, Clacton, gave evidence for the plaintiff, stating that after inspection of the work done by plaintiff in detail he priced it at £815, having regard to the high cost of labour and materials prevailing at the time.

His Lordship, after hearing a great deal of evidence on both sides gave judgment for the plaintiff on the claim for £153 6s. 1d. with costs. He also gave judgment for plaintiff on a counterclaim set up by defendant, with costs.

## Light and Air Dispute

*Page* v. *Pirie and Another.*

Dec. 7. Chancery Division.
Before Mr. Justice Sargant.

In this case Mr. G. D. Page, of Monkville Avenue, Finchley Road, sued Mr. A. Pirie, of Monkville Avenue, and Mr. S. M. Wilson, of Ramsgate, in regard to the light to his premises. He sought to restrain defendants from erecting or permitting to remain any building on land in Monkville Avenue belonging to Pirie so as to obstruct the windows of plaintiff's premises, which were conveyed by Pirie to plaintiff on September 15, 1921. The house Monkville was conveyed to plaintiff by Pirie in consideration of a payment of £2,525. At that date Pirie was the owner of the adjoining land on the western side of the house, the boundary being a wooden fence. Plaintiff's case was that the house enjoyed full access of light over defendant's land which, at the date of the conveyance, was unbuilt upon. It was alleged that in July, 1922, Pirie removed a portion of the fence, and began to build a wall along the site of the fence in such a manner as to materially obstruct the plaintiff's light. The defendant Marshall is the mortgagee in possession of the land retained by Pirie.

Defendants denied that the fence was the property of the plaintiff, and that at the date of the conveyance plaintiff's house enjoyed full access of light over the land retained by Pirie. It was alleged that during the negotiations for sale plaintiff was well aware that Pirie intended to build on the land retained by him, and he never intended to grant any right of light to Monkville which would prevent him so building.

After hearing evidence in support of plaintiff's case, His Lordship adjourned the hearing in order to personally inspect the property concerned. On his return to court he said he had come to the conclusion that there was such an obstruction of light as would amount to a nuisance and would seriously interfere with the comfortable enjoyment of plaintiff's house. At the same time the obstruction was not such that he ought to grant a mandatory injunction. It was a case for damages. He would assess the damages at £190—£10 a year on an eighteen years' purchase, and £10 for obstruction down to the date of the trespass. Plaintiff would be allowed costs, and the £190 would be provided by the first mortgagee, who would add it to his security.

---

# Obituary

*The late Mr. J. Carmichael.*

It is with deep regret that we record the death, in Glasgow, of Mr. James Carmichael, of Lochgilphead and Kilmichael-Glassary, Argyllshire, builder and contractor, at the age of sixty-seven. Mr. Carmichael was probably the largest individual employer of labour in Argyllshire. One of his most prominent contracts was the Crinan sea-wall. It is of Irish masonry, and is admired by the many passengers going through the Crinan Canal en route for Oban. The breast wall extends almost from Minard to the head of Lochfyne. His other works include: the house "Fasnacloich"; a house at Argyll for Mr. T. Bullough, of Lancashire, together with the steadings, cottages, dam, etc. (Neill Gillies, architect); "Ardkinglas," and the renovation of Dunderave Castle, for Sir Andrew Noble (Sir Robert Lorimer, architect); Bargullean House, for Mr. Martin McDonald (Sir Robert Lorimer, architect); Schuna House, on the Island of Schuna, together with piers, breakwaters, etc., for Mr. McLean Buckley (Neill Gillies, architect); additions to Dunmore House, for Fraser Campbell, of Dunmore (Neill Gillies, architect); Sanatorium for Consumptives, Oban (Neill Gillies, architect); "Scotnish," for Mr. Ralph Walker, of Leicester (Albert E. King & Co., architects); Eredine House, Loch Awe, for Mr. James Scott (the late James Edgar, architect); Ardtarig House, with roads, fishing pools, etc., for Sir Kenneth Anderson (Alfred E. Gregg, architect); additions to Invernoden, for Sir Harry Lauder (John Breignen, architect); additions to Toward Castle, for Major Andrew Coates, D.S.O. (F. W. Deas, architect); and additions to Taynish, for Lt.-Col. D. Campbell, of Ross.

In addition Mr. Carmichael carried out eighteen miles of new roads, artificial lochs, repairs to the church, etc., on the Island of Jura, for Mr. Crossman and Lord Astor, and for thirty years maintained and developed the whole of the roads in the Mid-Argyll district, together with new roads on the islands of Islay and Kintyre.

*The late Mr. S. B. Rudd.*

By the passing away of Mr. Samuel Bentley Rudd, of Grantham, in his eighty-third year, the building trade is poorer by a notable figure. Up till about two years ago, when failing health caused him to retire from active business, Mr. Bentley Rudd was head of the firm of Rudd and Son, a name which he had made stand for work of the highest character. He carried out works of a considerable size of general character, but the work which he excelled in and which was nearest his heart was the building and repairing of churches. From the architect's point of view, Mr. Bentley Rudd was an ideal builder in every way. He had worked for practically all the prominent church architects of the latter half of the nineteenth century, from Pugin, Gilbert Scott, Brooks, Pearson, Bodley, Blomfield, and a host of almost forgotten people, to Tapper Temple Moore, and Nicholson.

From his long experience he was ever ready with assistance in overcoming difficulties, and though his suggestions were never obtruded, yet architects could depend on his sound advice. He was exceedingly diplomatic, and was frequently able to smooth away difficulties with clients who wished to do things detrimental to the work in hand. Clergy and church architects especially valued him knowing that his devout churchmanship not only made him treat a church reverently, but ensured it being reverently treated by all who worked there. He had the trust and confidence of every architect for whom he worked; his work, being done by a trained body of workmen whom he knew and who knew him, had that personal touch which is essential for all work of the highest class. He had served his town well, having been Mayor as far back as the first Jubilee, and was for forty-one years guardian of his parish church as churchwarden. His pride in the good work which he did was only excelled by his joy in the doing of it.

# The Week's News

### *Hull War Memorial.*

It is proposed to build a war memorial at Hull.

### *Darlington Grammar School.*

The Education Committee are to make alterations to the Grammar School.

### *Aberdeen's War Memorial.*

Aberdeen is to expend £66,000 on a war memorial court and additional accommodation at the Art Gallery.

### *New Hospital for Malton.*

Earl Fitzwilliam has offered to the town of Malton a site in the Middlecave Road for the new hospital.

### *An Edinburgh War Memorial.*

A war memorial is to be erected at Merchiston Castle School, Edinburgh, at a cost of about £15,000.

### *Westminster Hall Roof.*

The Office of Works have presented to the Royal Institute of British Architects a piece of timber from the roof of Westminster Hall.

### *New Year Honours.*

Sir Frank Baines, C.B.E., M.V.O. Director of H.M. Office of Works) was promoted C.V.O. in the list of New Year honours.

### *New Church for Allerston.*

The Pickering Wesleyan Circuit have ssued instructions for the preparation of estimates and plans for a new church at Allerston.

### *Building Companies in Scotland.*

During the past year sixteen companies connected with the building and kindred trades were registered in Scotand. The aggregate capital was £160,500.

### *Professional Practice.*

Mr. Alfred H. Weeks, F.S.I., has commenced practice at 35 Commercial Street, Newport, Mon., as a "chartered quantity surveyor."

### *The Wertheimer Sargents.*

The portraits of the family of the late Mr. Asher Wertheimer, by Sargent, are now on view in Room XXVI at the National Gallery.

### *Whitby War Memorial Hospital.*

The trustees of the Whitby Cottage Hospital have acquired land in Spring Hill as a site for the War Memorial Hospital.

### *Wrexham Road Improvements.*

The Wrexham Rural District Council have approved sewerage and road improvement schemes involving an outlay of £135,000.

### *Messrs. C. D. and E. Chuter and Mrs. L. Hoyle.*

The President of the Royal Institute of British Architects has appointed Mr. Max Clarke, F.R.I.B.A., as arbitrator in this matter.

### *Old London Church Unsafe.*

The Wren church of St. Margaret's, Lothbury, has been reported upon as unsafe. Mr. Mervyn Macartney has been consulted.

### *Builders' Wages.*

Trouble is threatened in the building trade, consequent on the desire of certain sections of employers to reduce wages and increase the number of working hours.

### *"Metal Worker to the King."*

The Royal Warrant of Metal Worker to H.M. the King has been granted to Mr. J. Starkie Gardner, of 121 South Lambeth Road, London, S.W.8, art metal worker.

### *Major H. Barnes, F.R.I.B.A.*

Major H. Barnes, F.R.I.B.A., is to stand again for Newcastle in the Parliamentary by-election caused by the death of the recently elected Labour member.

### *Housing in Scarborough.*

A scheme of flats in the east ward at Scarborough is incorporated in a draft housing scheme approved by the Scarborough Town Council.

### *Folkestone Sewerage.*

The Ministry of Health have sanctioned a loan of £55,000 to construct a large outfall sewer along the beach to Copt Point where it discharges into the sea. The engineers for the scheme are Messrs. W. H. Radford and Son, of Nottingham.

### *Architectural Partnership.*

Mr. E. Keynes Purchase, F.R.I.B.A., F.S.I., and Mr. Roland Welch, A.R.I.B.A. have entered into partnership. The title of the firm will be Messrs. E. Keynes Purchase and Roland Welch, and the address 20 and 22 Maddox Street, W.1. Telephone: Mayfair 2404.

### *£4,000,000 Scheme for Beautifying Paris.*

The Paris City Fathers contemplate spending more than £4,000,000 during 1923 in beautifying and improving the capital. It is proposed to spend £8,000 on cleaning out the lakes in the Bois de Boulogne, and another £150,000 on providing public baths.

### *223–227 Regent Street.*

In reproducing the elevation of the above building in last week's issue of THE ARCHITECTS' JOURNAL, it should have been made clear that Mr. Gordon Jeeves is architect for the reconstruction of No. 225 only. Messrs. Yates, Cook and Darbyshire are entirely responsible for the remainder of the block.

### *The Chelsea Arts Club Ball.*

The Chelsea Arts Club Ball this year will have the president of the Royal Academy in charge of its scheme of decoration, which will centralize on an Antarctic setting, Commander Wild and the officers of the "Quest" having promised to lend the architect their assistance.

### *Rubber Roads in London.*

A stretch of roadway in Borough High Street, Southwark, has just been covered with a new type of rubber block to test the value of rubber roads. Half an inch of the top portion of the blocks consists of rubber of the quality and resiliency which has proved successful in previous tests. The remainder is of hard rubber.

### *The Chapels of St. Peter and St. Andrew's College, Grahamstown.*

The Chapels of St. Peter and of St. Andrew's College at Grahamstown, South Africa, illustrated in our issue for December 27, were designed by Mr. Herbert Baker, A.R.A., F.R.I.B.A., in collaboration with Mr. F. K. Kendall, who was then his partner at Cape Town. Mr Kendall was primarily responsible for the work carried out by Mr. Baker at that time in Cape Colony.

### *Belfast Art Gallery.*

In 1914 the Belfast Corporation proposed to build a public art gallery and museum, and sixty-nine competitive designs were submitted to the assessor, Sir John J. Burnet. Mr. James C. Wynnes, F.R.I.B.A., was appointed architect for the new buildings. Owing to the outbreak of the war the erection of the buildings was held over. It has now been arranged to proceed with their erection at a probable cost of £80,000.

### *Changes of Address.*

Mr. Hugh T. Morgan, A.R.I.B.A., has moved his office to 14 Gray's Inn Square, W.C.1. Telephone: Chancery 8058.

Mr. Henry Tanner, F.R.I.B.A., has moved to 3 Hanover Square, W.1. Telephone: Mayfair 861, 862.

Mr. C. Cowles-Voysey, A.R.I.B.A., has moved his office to 14 Gray's Inn Square, W.C.1. Telephone: Chancery 8058.

Messrs. F. J. Fisher, M.S.A., and S. H. Fisher, A.R.I.B.A., have moved to 38 Bloomsbury Square, W.C.1. Telephone: Museum 4889.

Mr. Percy Bacon, late of 11 Newman Street, has moved to 4 Endsleigh Gardens, London, N.W.1. He has practised the art of stained glass at the old address for some thirty years, and has moved to much larger premises on account of a greatly increasing amount of work.

### *Goldsborough Hall, near Knaresborough.*

The old Elizabethan Yorkshire home of Princess Mary and Viscount Lascelles has almost been reconstructed internally. For six months the builders have been at work making separate entrances to some of the rooms, and restoring a recessed window to a room in the south-west corner. The room, which has a rich Jacobean plaster frieze, will, it is supposed, become the Princess's private sitting-room. The hall at one time possessed only two bathrooms, now eight more have been added, making ten altogether.

### *New Cambridge College.*

Sir Aston Webb, President of the Royal Academy, has been commissioned to design the new buildings for the Wesleyan College at Cambridge University. The Wesleyan College at Cambridge was founded last year in order to provide facilities for Wesleyan students to take the divinity course at one of the premier universities. A fund of £66,000 is already available, and it is hoped to secure a further £22,000 to complete the £40,000 required for endowment.

*Town Planning in West Middlesex.*

At the last meeting of the West Middlesex Joint Town Planning Committee Messrs. Thomas Adams and Longstreth Thompson, the consultants appointed by the committee to prepare a regional plan, presented a preliminary report upon their survey of the existing conditions in the region. The report was very favourably received.

*New Warehouse for Johannesburg.*

The office of His Majesty's Trade Commissioner in South Africa reports that the largest footwear dealers in South Africa have purchased an important site in Johannesburg with an area of 10,000 sq.ft. for the erection of a warehouse to be a centre of distribution of their goods. It is stated that plans are in course of preparation by the architects, and it is hoped that building operations will commence shortly. United Kingdom firms interested in the supply of building and constructional materials may obtain the name and address of the architects and the footwear firm on application to the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1.

*Lectures on Salesmanship.*

A course of five lectures on salesmanship is to be given by Captain Oliver A. Minns, Fellow and Vice-President of the Incorporated Society of Advertisement Consultants, and Fellow of the Royal Economic Society, at the Stillness Road Commercial Evening Institute, Brockley Rise, Honor Oak Park, S.E.23. The lectures, to commence on January 15, will deal with salesmanship as a career, the personality of the salesman, the science of selling, sales management and organization, and selling schemes. The following fees will be charged and should be sent to the principal of the Institute in advance: for students resident in London, 5s.; for students resident outside but working in London, 8s. 6d.; and for students resident outside and not employed in London, 17s.

## Regional Planning—South Wales

It is interesting to note that local authorities are beginning to take action on the lines of the report of the South Wales Regional Survey Committee. That Committee reported in favour of the setting up of a Regional Council for South Wales, but realized that this was a matter requiring a considerable amount of time for its evolution. They therefore recommended for immediate action the setting up of a series of Joint Town Planning Committees.

On December 15, 1922, the Cardiff Corporation called a conference at the City Hall, Cardiff, of the local authorities, in the region of East Glamorgan, that the South Wales Regional Survey Committee had recommended should form a Joint Town Planning Committee. Some sixteen authorities were represented at the conference. Mr. G. L. Pepler, of the Ministry of Health, was unanimously invited to take the chair. Mr. Pepler read a short report on regional town planning by joint committees, and subsequently there was an interesting discussion. As a result it was unanimously decided to recommend to the authorities represented that they should constitute the proposed Joint Town Planning Committee.

It is understood that other groups of local authorities in South Wales are about to take similar action.

## Competition News

*International Labour Office Competition, Geneva.*

The President of the R.I.B.A. has nominated Mr. Edward P. Warren, F.S.A., F.R.I.B.A., as the British member of the jury in connection with the above competition.

*"The Chicago Tribune" Competition.*

The accompanying design submitted by Messrs. Hutton and Taylor, of Glasgow, architects, obtained honourable mention in the worldwide competition for the new office buildings for "The Chicago Tribune," which is to be the "most beautiful building in the world"! The building rises to a height of 400 ft., and comprises twenty-three floors for office space. The winning design was illustrated in our last issue.

[*For list of Competitions Open see page* xxiv.]

## Coming Events

*Wednesday, January* 10.

Glasgow Chapter of the Incorporation of Architects in Scotland.—Symposium: "Architectural Prospects."

*Thursday, January* 11.

Sheffield, South Yorkshire and District Society of Architects.—"Notable Houses of Northamptonshire." By J. H. Gotch, Esq.

Birmingham Town-Planning Lecture. By H. H. Humphries, M.Inst.C.E.

*Friday, January* 12.

Royal Technical College Architectural Craftsmen's Society, Glasgow. — "The Architectural Melting Pot." By John S. McKay.

Institute of Heating and Ventilating Engineers. — "Automatic Temperature Control." By B. R. Wingfield, Ph.D., M.I.E.E.

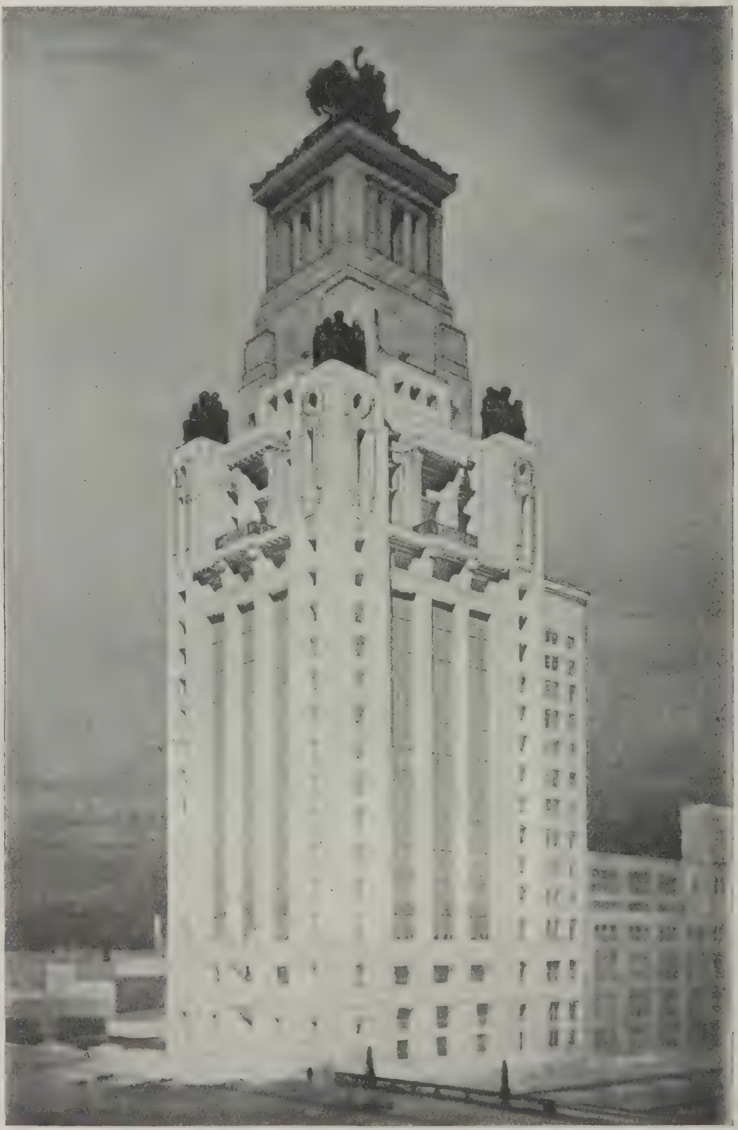
*Monday. January* 15.

Stillness Road Commercial Evening Institute.—"Salesmanship as a Career." By Captain Oliver A. Minns.

*Wednesday, January* 17.

Northern Architectural Association.—"The Rise and Fall of English House Design." By Nathaniel Lloyd.

Royal Society of Arts.—"Hygienic Methods in Painting—the Damp Rubbing Down Process." By C. A. Klein.



"THE CHICAGO TRIBUNE" COMPETITION.
THE HONOURABLE MENTION DESIGN OF HUTTON AND TAYLOR, ARCHITECTS.

# Composition and Jointless Flooring

A LECTURE on "Composition and Jointless Flooring" has been delivered to the Northern Polytechnic stitute, Department of Architecture, rveying, and Building, by Mr. R. R. tler, M.Sc., A.I.C., F.C.S., who treated subject both from the theoretical and practical aspect. The lecturer divided remarks into three sections: (*a*) the blem; (*b*) the chemist's solution; and patent literature.

Dealing with the first section, four in divisions were considered: (1) facy floors subject to much wear and ight; (2) warehouse floors subject to s wear but much weight; (3) shop ors where destructive influences varied; d (4) house floors where the wear was e mainly to pedestrian traffic.

The influences mainly responsible for destruction of the surface in the above ical cases were grouped under six dings: (*a*) attack by the iron tyres trolleys and similar vehicles, particu- ly in warehouses and factories; (*b*) attack on the rubber tyres of trolleys, ., by the materials composing the floor. is also applied particularly to factory l warehouse conditions; (*c*) the effect of on the flooring, as evidenced in oil rks, margarine factories, etc.; (*d*) stantly wet floors; (*e*) the chemical ack on the floor due to *acid* conditions; l (*f*) foot traffic.

The materials available for the pro- ction of a jointless composition were cussed with reference to the binding terial, the groups being: (1) Portland ent; (2) magnesite cement; (3) halt; and (4) rubber.

These various considerations were inter- ted by the lecturer diagrammatically he following manner:—

actory—iron tyres, Portland cement; ehouse — rubber tyres, magnesite; p—oil, water, acids, asphalt; house, t traffic, rubber.

Turning to the second section of his remarks, the lecturer dealt with the four possible binding materials individually, pointing out the influences which were capable of destroying or disintegrating them. He said that freshly laid concrete was liable to attack by such oils as bone oil, wood oil, olive oil, whale oil, tallow, etc., but concrete over a month old was practically unattacked. Mineral oils, derived from the distillation of coal products, etc., were without action on the cement, unless containing free acids.

Water was practically without action on cement. The waterproofing of cement was not a case of protecting the cement from attack, but of filling the pores of the material with an impervious substance thereby preventing the percolation of water through the pores.

Acids were very destructive if allowed to remain in contact with cement, even weak acid such as vinegar having a disintegrating effect. Cases had been known in which the floors of distilleries had been affected by the carbonic acid gas produced in large quantities during the fermentation process.

Alkalies such as potash and soda, and such salts as calcium chloride and sodium chloride had no harmful action, but it appeared that ammonium compounds cause disintegration of the surface in time.

Tar derivatives, if containing no acid, were harmless, and bitumen was used frequently as an acid proofing for cement. The lecturer referred to the publication by the U.S. bureau of standards of data concerning the use of bituminous materials with cement.

Organic fertilizers and manures had a harmful effect on lean concrete (containing a bare percentage of binding material) when freshly laid where a good quality concrete one month old was not affected.

Before proceeding to a consideration of patents in connection with jointless flooring the lecturer mentioned such materials utilized as a cementing agent the binding properties of sodium silicate (water glass). He said that such materials as "Asbestic" and "Uralite" had as basis waste asbestos (short fibres), and this frequently was compressed into sheets sprayed or soaked in a weak solution of sodium silicate and dried.

The production of hard burnt "plaster of Paris" (burnt at about 400 to 500 deg. C.) was described, and its use as flooring mentioned. The great objection to such use was the length of time required for setting, but a great advantage was the intense hardness of the finished floor.

Dealing with the patent literature upon the respective binding materials, mention was made of a patent containing sand, pumice, and Portland cement (1916), which was claimed to be sound and resistant. A fire-proof composition of Portland cement, waste asbestos fibre, and clay (1917) was mentioned; and the lecturer referred to a composition of Portland cement, sawdust, slag, and whiting, which was declared to be acid-proof.

A method of fire-proofing rubber was the subject of one patent (1919), the material used being hydrated aluminium oxide, while another suggested fireproof composition (1916) consists of rubber, cork, and sodium ungstate.

A discussion followed the lecture and was contributed to by Messrs. H. J. Axten, A.R.I.B.A., A. C. Martin, A.R.San.I., H. T. Deacon, and others. During this discussion a case of corrosion of iron work by a specimen of magnesite flooring was mentioned, as well as the laying of magnesite flooring on wood by the use of wire-netting, and the use of sodium silicate as a top dressing to prevent and cure the "dusting" of Portland cement surfaces.

# Trade and Craft

*Street Lighting by Gas.*

he current issue of "A Thousand and Uses for Gas" (No. 106) contains a es of illustrations showing the night ting of London's most important hbourhoods and thoroughfares—kingham Palace, Parliament Square, falgar Square, Whitehall, Regent eet, and Victoria Street—as well as e good examples of side-street and ge illumination. Copies of this resting publication can be obtained ce 6d. post free) from the British mercial Gas Association, 30 Grosor Gardens, S.W.1.

*The Stewart Hollow Concrete Floor.*

Hollow Concrete Floors" is the sub- of an interesting illustrated booklet ch has just been issued by Messrs. nd W. Stewart, of 12 Berkeley Street, don, W.1, contractors and specialists einforced concrete construction and crete piling. The system, for which y advantages are claimed, is the out- e of a long experience in the construc- of concrete floors.

constructing a floor by means of this em: (1) Two reinforcement bars pro- d with nuts and threads at each end are laid side by side, their distance apart being fixed by an end washer plate with holes in same through which the ends of reinforcement bars must pass; (2) a series of hollow concrete blocks are assembled between the two reinforcement bars; (3) the nuts on the bars are tightened against the washer plates and the blocks firmly strung together; (4) a complete hollow beam is thus formed and swung or slid into the required position; (5) the floor can now be used for temporary purposes such as the assembling further units; (6) after a series of hollow beams have been laid side by side the space between is filled with concrete and solid "T" beams are made between the blocks. When the concrete has thoroughly set, which usually takes three to four weeks, the floor is ready for use.

All "T" beams have a standard distance apart of 15 in. C. to C. This can be slightly varied if necessary. For contracts abroad or at a long distance from a railway station the firm can manufacture the blocks on the site, thus keeping the cost at the lowest possible figure.

Among the many advantages claimed for the floor are the following: Temporary timber shuttering is eliminated; erection is rapid, as several floors can be completed at the same time; the wide range of various sized blocks reduces concrete mixed on the site to a minimum; reinforcement cannot be displaced and bars are visible before concrete is laid; the floor sound resisting and fireproof to pass 1a Standard of the Fire Offices' Committee if necessary; designs may be obtained as required to L.C.C. regulations, R.I.B.A. specification or local conditions; the dead weight is exceptionally low, thus reducing the cost of beams and columns and the loads on foundations, etc.; it is adaptable for openings and trimmings to offsets, splayed walls, or reconstruction, and the soffit is flat and roughed for plaster, or can be left for limewashing only.

A recent certified test on two 15 ft. spans with 4 ft. 6 in. cantilevers, for a specified load of three cwts. per sq. ft., and a deflection limited to 1-600th of the span gave a load of six cwts. per sq. ft. and a deflection of 1-1,500th of the span without any fractures or cracks. Guaranteed safe floors are a feature in which the firm specialize.

# Rates of Wages in the Building Trades*

The following table, which is published in the first issue of THE JOURNAL for each month, shows the rates of wages of craftsmen (bricklayers, masons, carpenters and joiners, woodcutting machinists, slaters, plumbers,* plasterers, painters †) and labourers in the building industry. The labour rates for London are given in the Table of Current Prices on pages xix, xx.

| District. | Grade A. | | Grade B. | | Grade C. | | Grade D. | |
|---|---|---|---|---|---|---|---|---|
| | Craftsmen. | Labourers. | Craftsmen. | Labourers. | Craftsmen. | Labourers. | Craftsmen. | Labourers. |
| | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. |
| North East Coast .. .. .. | 1 8 | 1 3 | — | — | — | — | — | — |
| Yorkshire .. .. .. .. | 1 8 | 1 3 | 1 6½ | 1 2 | 1 4½ | 1 0½ | — | — |
| North Western Counties‡ .. .. | 1 8 | 1 3 | 1 6½ | 1 2 | 1 4½ | 1 0½ | 1 4 | 1 0 |
| Midland Counties .. .. .. | 1 8 | 1 3 | 1 6½ | 1 2 | 1 5 | 1 0¾ | 1 4 | 1 0 |
| Eastern Counties .. .. .. | 1 4½ | 1 0½ | 1 4 | 1 0 | 1 3 | 0 11¼ | — | — |
| Southern Counties .. .. .. | 1 4½ | 1 0½ | 1 4 | 1 0 | 1 3 | 0 11¼ | — | — |

| South Wales .. .. .. .. | 1 8 | 1 3 | 1 4 | 1 0 | — | — | — | — |
| Scotland§ .. .. .. .. | 1 8 | —¶ | 1 7 | —¶ | 1 6 | —¶ | — | — |

* In the case of towns printed in *italic type* below, the rates shown in the Table for craftsmen do not apply to plumbers.

† Except in Scotland, where painters are not included within the scope of the area grading scheme.

‡ Excluding Liverpool and Birkenhead, where the rates are 1s. 10d. for plumbers, 1s. 9½d. for mason's fixers, 1s. 9d. for other craftsmen, 1s. 5d. for scaffolders, and 1s. 4d. for labourers.

§ Excluding Aberdeen, where the rates remain unaltered at 1s. 7½d. for masons, joiners, and plasterers, 1s. 8d. for slaters, and 1s. 9d. for plumbers.

¶ In Scotland, labourers are not included in the general grading scheme.

## Grading of Towns.

The localities in which the above rates have been reported to be in operation are as follows. In the case of localities printed in *italic type*, the rates shown in the above Table for craftsmen do not apply to plumbers. The rates of wages per hour for men employed by electrical contractors in England and Wales (except Southampton) and Londonderry are as follows:—Grade A districts (London and Watford) 1s. 10d. Grade B (including Burnley and Preston) 1s. 7¾d. Grade C 1s. 6¼d. Grade D (including Sussex) 1s. 4¾d. In Southampton and Belfast the rates are 1s. 6¼d. per hour. Londonderry: bricklayers, masons, carpenters and joiners, slaters, plasterers, and painters, 1s. 5d. Newry: bricklayers, masons, plasterers, and slaters, 1s. 8d.

NORTH EAST COAST :—

*Annfield Plain*, *Birtley*, Bishop Auckland, *Blackhill*, *Blyth*, *Chester-le-Street*, *Consett*, *Darlington*, *Durham*, *Ebchester*, *Gateshead*, *Hartlepools*, *Hebburn*, *Hexham*, *Jarrow*, *Lanchester*, *Leadgate*, Medomsley, *Middlesbrough*, *Morpeth*, *Newcastle*, *North and South Shields*, *Seaham Harbour*, *Stanley*, *Stockton*, *Sunderland*, *Thornaby*, *Tynemouth*, *Wallsend*, *Whitburn*, and *Whitley Bay*.

YORKSHIRE :—

*Grade A.*—*Altofts*, *Barnsley*, *Batley*, *Bingley*, *Birstall*, *Bradford*, *Brighouse*, Calder Valley, Castleford, *Cleckheaton*, *Colne Valley*, *Crosshills*, *Dewsbury*, *Doncaster*, *Gomersal*, Grimsby, *Guiseley*, *Halifax*, *Harrogate*, *Hebden Bridge*, *Heckmondwike*, Holmfirth, *Horbury*, *Hoyland*, Huddersfield, Hull, *Ilkley*, Immingham, *Keighley*, *Knottingley*, *Leeds*, *Liversedge*, *Mexborough*, *Mirfield*, *Morley*, *Normanton*, *Ossett*, *Penistone*, Pontefract, Pudsey, *Rawdon*, *Rotherham*, Scunthorpe, *Selby*, *Sheffield*, *Shipley*, *Sowerby Bridge*, *Stocksbridge*, *Wakefield*, *Wombwell*, *and Yeadon*.

*Grade B.*—Barnoldswick, Beverley, Bridlington, Goole, Hornsea, Scarborough, Skipton, *Whitby* (plumbers 1s. 7d.) and York.

*Grade C.*—Driffield, Kirby Moorside, Malton, Norton, Pickering, and Wetherby.

NORTH WESTERN COUNTIES :—

*Grade A.*—*Accrington*, Adlington, *Alderley Edge*, *Altrincham*, *Ashton-under-Lyne*, *Atherton*, *Bacup*, Barrow, Birkdale, Bispham, *Blackburn*, Blackpool, Blackrod, *Bolton*, Broughton (Flints), *Burnley*, *Bury*, Carlisle, Chester, Chorley, *Church*, Cleveleys, *Clitheroe*, *Colne*, Connahs Quay, Dalton-in-Furness, *Darwen*, *Denton*, *Droylesden*, *Eccles*, *Farnworth*, Fleetwood, Frodsham, *Glossop*, *Great Harwood*, *Haslingden*, Hawarden, Helsby, *Heywood*, Higher Kinnerton, *Horwich*, *Hyde*, Lancaster, *Leigh*, Leyland, *Littleborough*, Longridge, Lymm, Lytham, *Manchester*, *Middleton*, Morecambe, *Mossley*, *Nelson*, *Ormskirk*, *Oswaldtwistle*, *Oldham*, *Padiham*, *Pendlebury*, Poulton, *Preston*, *Prestwich*, Queensferry, *Radcliffe*, *Ramsbottom*, *Rawtenstall*, *Rishton*, *Rochdale*, Runcorn, St. Anne's-on-the-Sea, St. Helens, *Saddleworth*, *Sale*, *Salford*, *Shaw*, Shotton, Southport, *Stalybridge*, *Stockport*, *Swinton*, Thornton, *Todmorden*, *Tyldesley*, *Walkden*, *Warrington*, Westhoughton, *Whalley*, *Whitefield*, Widnes, Wigan, and *Wilmslow*.

*Grade B.*—Askam, Broughton, Buxton, Cleator Moor, Congleton, Coniston, Crewe, Distington, Egremont, Grange-over-Sands, Harrington, Knutsford, *Macclesfield*, Maryport, Market Drayton, Middlewich, Millom, Mold, Nantwich, *New Mills*, Northwich, Sandbach, Tarporley, Ulverston, Winsford and Over, Whitehaven, Workington, and Wrexham.

*Grade C.*—Ambleside, Bala, Bangor, Bowness-on-Windermere, Carnarvon, Colwyn Bay, Conway, Grasmere, Holyhead, Holywell, Kendal, Langdale, Llandudno, Llandudno Junction, Mostyn, Penrith, Prestatyn, Rhos, Rhyl, and Windermere.

MIDLAND COUNTIES :—

*Grade A.*—Alfreton, *Belper*, Bilston, *Birmingham*, *Blackheath*, *Burslem*, *Cheadle*, *Chesterfield*, Coalville, Coventry, *Derby*, *Hanley*, Heanor, Hinckley, *Ilkeston*, Kenilworth, *Leicester*, Lincoln, *Long Eaton*, *Loughborough*, *Mansfield*, Newcastle-under-Lyme, *Nottingham*, *Nuneaton*, Oldbury, Ripley, Stoke-on-Trent, *Sutton Coldfield*, *Sutton-in-Ashfield*, West Bromwich, Willenhall, and Wolverhampton. (Plumbers employed by the Birmingham Master Plumbers' Association within 8 miles of Birmingham, 1s. 9d.)

*Grade B.*—Atherstone, Bewdley, Boston, Brierley Hill, Bromsgrove, Burton-on-Trent, Cannock, Coseley, *Darlaston* (plumbers 1s. 7½d.), Dudley, Gainsborough, Gornal, Grantham, Halesowen, Hednesford, Kidderminster, Knowle, Leamington, *Leek*, Lichfield, Louth, Malvern, Market Harborough, *Matlock*, Melton Mowbray, *Newark*, Northampton, Oakengates, Old Hill, Peterborough, Redditch, Retford, Rugby, *Rugeley* (plumbers 1s. 7½d.), Sedgley, Shifnal, Shrewsbury, Skegness, Sleaford, Solihull, Southwell, *Stafford*, Stamford, Stourbridge, Stourport, Stratford-on-Avon, Swadlincote, Swanwick, Tamworth, *Walsall* (plumbers 1s. 7½d.), Warwick, Wednesbury, Wellington, Worcester, and Worksop.

*Grade C.*—Ashbourne, Bridgnorth, Church Stretton, *Horncastle*, Kettering, Ludlow, Newport, Oakham, Oundle, Raunds, Rushden, Spalding, Thrapston, Uttoxeter, Wellingborough, and Wirksworth.

*Grade D.*—Buckden, Eaton Socon, Huntingdon, St. Ives, and St. Neots.

EASTERN COUNTIES :—

*Grade A.*—Baldock, Bedford, Berkhamsted, Biggleswade, Braintree, Brentwood, Chelmsford, Cambridge, Colchester, Halstead, Hatfield, Harpenden, Hemel Hempstead, Henlow, Hertford, Hitchin, Hoddesdon, Ingatestone, Ipswich, Letchworth, Luton, Norwich, Ongar, St. Albans, Sandy, Sawbridgeworth, Stevenage, Stotfold, Ware, Welwyn, and Witham.

*Grade B.*—Aldeburgh, Ampthill, Attleborough, Aylsham, Braughing, Chatteris, Cromer, Dovercourt, Dunstable, Ely, Fakenham, Felixstowe, Frinton, Gorleston, Halesworth, Harwich, King's Lynn, Leighton Buzzard, Leiston, Lowestoft, March, Much Hadham, Newmarket, North Walsham, Puckeridge, Renthem, Saxmundham, Southwold, Standon, Stowmarket, Walton-on-the-Naze, Wickham Market, Wisbech, Woodbridge, Wymondham, and Yarmouth.

*Grade C.*—Bungay, Coltishall, East Dereham, Royston, Saffron Walden, and Tring.

[N.B.—Bury St. Edmunds :—bricklayers, masons, carpenters and joiners, slaters, plumbers and plasterers, 1s. 4¼d.; painters, 1s. 2d.; labourers, 11d.]

SOUTHERN COUNTIES :—

*Grade A.*—Abingdon, Addlestone, Amersham, Ascot, Ashford (Middlesex), Banbury, Beaconsfield, Bournemouth, Bracknell, Brighton, Byfleet, Chalfont, Chesham, Christchurch, Cremborne, Eastbourne, Eastleigh, Egham, Eton, Gerrard's Cross, Goring, Gosport, Gravesend, Guildford, Henley, Hove, Laleham, Maidenhead, Marlow, Northfleet, Oxford, Poole, Portsmouth, Reading, Southampton, Staines, Stanwell, Sunningdale, Sunninghill, Tilehurst, Tonbridge, Tunbridge Wells, Wallingford, Windsor, Winkfield, Woking, Wokingham, and Wycombe.

*Grade B.*—Arundel, Ashford (Kent), Aylesbury, Bagshot, Basingstoke, Bexhill, Bicester, Bletchley, Bognor, Bosham, Broadstairs, Brockenhurst, Buckingham, Burgess Hill, Camberley, Canterbury, Chatham, Chichester, Chipping Norton, Cranleigh, Deal, Dorking (plumbers 1s. 5d.), Dover, Fareham, Faringdon, Faversham, Fenny Stratford, Folkestone, Gillingham, Godalming, Hailsham, Haslemere, Hastings, Havant, Herne Bay, Horsham, Hythe, Lambourn, Liphook, Littlehampton, Lymington, Maidstone, Margate, Midhurst, Milford, Milton Regis, Newbury, New Milton, Newport Pagnell, Oxted, Pangbourne, Petworth, Ramsgate, Redhill, Reigate, Rochester, Sandgate, St. Leonards, Sevenoaks, Sittingbourne, Strood, Stony Stratford, Stow-on-the-Wold, Thame, Walmer, Wantage, Wendover, Westerham, Westgate, Whitstable, Winchester, Winslow, Witney, Wolverton, Woodstock, and Worthing.

*Grade C.*—Andover, Ardingley, Farnham, Godstone, Hawkhurst, Hartley Wintney,* Haywards Heath, Horley, Isle of Wight, Liss, Petersfield, Rye, Smallfield, Staplehurst, Steep, Turners Hill, and Uckfield.

[N.B.—Leatherhead :—painters, 1s. 5½d.; plumbers, 1s. 6½d.; other tradesmen, 1s. 6d.; labourers, 1s. 1½d.]

SOUTH WESTERN COUNTIES :—

*Grade I.*—Bristol.

*Grade II.*—Plymouth * and Devonport.*

*Grade III.*—Dartmouth,* Exeter,* Kingswear,* Newton Abbot, Paignton, Portishead, Stroud,† Taunton, and Torquay.

*Grade IV.*—Barnstaple, Beaminster, Povey Tracey, Bradford-on-Avon,* Bridgwater, Bridport,* Brixham, Bruton, Burnham-on-Sea, Calne,* Castle Cary, Cheddar,* Cirencester,* Clevedon, Coleford,* Corsham,* Crewkerne,* Dawlish, Dorchester,* Exmouth, Fairford,* Frome,* Glastonbury, Lydney,* Melksham,* Midsomer Norton, Minehead,* Radstock, Shepton Mallet, Street, Swanage,* Teignmouth,* Tetbury,* Thornbury,* Totnes,† Trowbridge,* Wells, Westbury,* Weston-super-Mare, Weymouth,* and Yeovil.*

[N.B.—Bath, Cheltenham, Gloucester* (except painters), Hereford,* and Swindon* :—tradesmen, 1s. 5d.; labourers, 1s. 0¾d.]

SOUTH WALES AND MONMOUTHSHIRE :—

*Grade A.*—Aberavon, Aberdare, Abergavenny, Ammanford, Barry, Bridgend, Briton Ferry, Brynmawr, Cardiff (plumbers, 1s. 8½d.), Chepstow, Duffryn Valley, Ebbw Vale, East Glamorganshire and Monmouthshire Valleys, Garw Valley, Gorseinon, Llanelly, Maesteg, Merthyr, Mountain Ash, Neath, Newport, Ogmore Vale, Pontardulais, Pontypool, Pontypridd, Porthcawl, Port Talbot, Rhondda and Rhymney Valleys, Sirhowy Valley, Swansea, and Tredegar.

*Grade B.*—Haverfordwest, Pembroke and Pembroke Dock.

[N.B.—Brecon and Carmarthen :—tradesmen, 1s. 6d.; labourers, 1s. 1½d. Llandrindod Wells :—tradesmen, 1s. 5d.; labourers, 1s. 0¾d.]

SCOTLAND :—

# Architecture and the Cinema

MUCH has been written and published in periodicals and the daily press lately to rouse public interest in the arts, and in architecture in particular. It is believed that, had the aims of these able writers been directed more towards the cinema and its possibilities, their efforts would have met with more success in dealing with a twentieth-century public. At a cinema, not long ago, it was refreshing to see a film of a recent addition to London's civic architecture, and appreciative remarks (not strictly architectural) on the outstanding merits of the building were plainly audible. The writer's pulse throbbed with delight and surprise when he felt that the audience were really interested. The picture was part of a "topical film," but there was no "cinema" or "unveiling" crowd present. The building had apparently been filmed just because of its architectural interest and general impressiveness, and was shown in detail, slowly passing from the ground level to the crowning feature, with, in addition, the groups of sculpture full picture size. It is a pity, however, that the name of the architect was not given.

On another occasion a fairly successfully tinted film of one of our great Gothic cathedrals was shown, exhibited to a scale large enough to show jointing, carved details, and expression in the sculpture. The film of the general building and the feeling of life in an interesting foreground, followed by large details showing the great scale of the structure, made it a picture of general interest. Apart from the immense value of such films to students and architects, it is an encouragement to others, to the general community, to be appreciative of additions to civic surroundings—which are generally paid for by the ratepayers—and to take a real live interest in the "public" art of architecture.

The public will not stand forcible education in matters of art, but comfortably seated with a pipe or chocolate between its teeth, a lot could be done to cultivate and foster an interest, by getting our cinema managers to sandwich a really good "sculpture" or "architectural" film between our "Charlie Chaplins" and "Mary Pickfords."

Speaking generally, it is what might be called the "poster" qualities of architecture that appeal to the "man-in-the-street" most directly. There is no real depth in public appreciation or criticism of the mistress art. Great scale, picturesqueness, so-called originality or novelty, takes the place of tradition, good proportion, beautiful expression, and refinement in the arts. With the means at the disposal of film experts and their decided ability to take advantage of the best and often unusual viewpoints, along with grand effects of light and shade, even a small but refined and well-proportioned work of architecture could be served calculated to impress, and palatable to the most commercial taste. For there is a plane of quality where all critics agree and where the architect finds it less difficult to persuade his client that the great work of the past is the correct basis for all work of to-day and of the future.

Children at school are taught drawing and painting, dancing and music; visits to art exhibitions and orchestral concerts are also sometimes included in the curriculum. But what is wrong with architecture that it is not included or a sufficient knowledge of it imparted to enable the young student to appreciate the art of our city streets? Has the subject ever been thought of, or considered by educational authorities? It seems to be a clear duty of citizenship. It would open up new vistas and avenues of thought, and the study of the styles, in a general way, would give additional importance and interest to otherwise dry historical dates and geographical facts of elementary school training. For the purpose of illustrating such art study the cinema could not be put to better service.

Apart from the general educational value, it would be a real treat for any architect to be taken, by film, round the Acropolis at Athens, or even the Pyramids, familiar as they are in shape to all of us; yet few there are who have any real notion of their scale or the size of the stones of which they are built, and their charming surroundings.

The Temples of Luxor and Karnak would form delightful subjects of general interest. A moonlight study is always attractive, and it makes more readily apparent the general architectural mass and proportions of these picturesque temple ruins of "the glory that once was Egypt's." It is the spirit of adventure associated with exploration, the thrill of discovery and the stupendous estimated value in pounds sterling of the finds, resulting from the recent excavations in the Nile Valley, that impress the public most. The forging of another link in the long still uncompleted chain of ancient history and art is an entirely secondary consideration. To see a film record of the locality, the tomb, the excavators at work, and their newly-found treasure, would fire the imagination of the layman and rouse public interest in the "basic" arts of ancient civilization. It is to be hoped that in this twentieth century some such record will be "produced" for the information of posterity, all art lovers, and others interested.

The public has really very little opportunity or facility for obtaining guidance in the general study of our street architecture. Apart from schools of architecture for professional students, public instruction on the subject is never provided. Our universities and corporations arrange free public lectures during the winter months, on subjects of general interest, literature, citizenship, political economy, but architecture is seldom, if ever, included in the programme, and yet, even without the aid of the cinema, the evolution of style in architecture is a story of intense interest and fascination.

In America the services of the cinema are being utilized to promote the welfare of many forms of municipal, public, and private activity, such as town-planning schemes, disposal and lay-out of estates, clearing of slum areas, etc., the idea of the promoters being to carry public opinion with them and so encourage voluntary public subscription. In one particular case, an unusually attractive suburban plot was selected, model houses were constructed and suitably furnished. A five-reel film was produced showing the actual erection of this six-apartment brick house, equipped and furnished complete with a family "living happily ever after." The theory was that any one seeing the construction of such an attractive model would be persuaded to become an owner. The film and descriptive "titles" are said to correct some of the popular misconceptions of the difficulty and cost of building.

All these ideas might be further developed. In picture houses, between films and during the raising and lowering of the lights, slides might be shown of a good painting, an acknowledged piece of sculpture, or an architectural masterpiece, with short descriptive notes, and so give one the opportunity to carry away something in the mind's eye which will be of service in genuinely improving the taste and forming a sounder basis for art judgment.

Silly things can be shown so beautifully on the screen that it is a pity the cinema is not always used to the best advantage. There are great possibilities for the "screened" picture on the lines indicated, and any corporation, enterprising cinema manager, or educational authority who gives these suggestions serious consideration would be doing a real service to the community.

---

## The Whitgift Hospital

At a town's meeting last week, the burgesses of Croydon decided by a large majority to oppose the promotion in Parliament of a Bill for a street widening scheme which would involve the demolition of the Whitgift Hospital. This interest of the general public in matters of local architectural amenity is a most encouraging sign of the times. The civic consciousness has been so long in awakening that one had begun to despair of its ever emerging from its age-long slumber. Now it is at last awake, it must be kept awake, and the best way to do it is for every town to have its own civic society. Many have them already—Birmingham is a shining example. It is by constant vigilance on the part of its citizens that a town's amenities may best be safeguarded against vandalism.

## The Building Trade Dispute

It is unfortunate that last week's meeting of the Wages and Conditions Council of the Building Industry should have ended in deadlock. The proposals of the employers that there should be (1) a reduction of 20 per cent. on both time and piece rates; (2) a longer working week; and (3) the introduction by stages of a bonus system of payment by results, were regarded as unreasonable by the men's representatives, who urged that the cost of materials should be reduced before any further demands were made upon labour. What the operatives do not apparently realize is that wages for labour is by far the heaviest charge upon all production, and that until some economy is effected in this respect, no real reduction of costs is possible. Happily there is no immediate prospect of a struggle, as the existing agreement does not expire until the end of February. In the meantime we hope that moderate counsels will prevail so that there may be no impediment to the reopening of negotiations.

## Sir Banister Fletcher and the Bridges

In discussing, a few weeks ago, the project for a new Thames bridge, Sir Banister Fletcher, F.R.I.B.A., made a point that has been too frequently overlooked. "The proposal," he argues, "to throw any bridge over the Thames is not, and cannot be, merely a City matter, but must be a London matter, to be considered in the wider light of its greatest usefulness to the greatest number of Londoners." This view is an expression of the "larger civics," and is one that has been frequently put forward in the pages of this JOURNAL, with reference to other matters besides the design, construction, and maintenance of bridges. In fact, we have always felt, and have lost no appropriate opportunity of reiterating that opinion, that a merely parochial view of the functions of the rulers over a great Empire city is deplorably misconceived. It is a great good-fortune for civic amenity that Sir Banister Fletcher speaks on such questions not only as an architect, but as a City magnate also. The combination is invincible, and Sir Banister always exercises it with wisdom and discretion. Nor does he ever make the mistake of censuring the City Fathers—an absolutely fatal and futile thing to do; but he never fails to remind them of their good deeds. For example: "The generous action of the Court of Common Council in securing Epping Forest and Burnham Beeches, besides providing the Tower Bridge (itself outside the City confines), is an assurance that the Court takes a broad view in administering funds under its control." These are not merely courtly phrases; they are a temperate statement of the strict truth, and in his manner of making it, Sir Banister shows the true method of presenting the case for civic amenity.

## The Chesterfield Spire

Architects will be concerned to learn from the report by Mr. Leslie T. Moore, F.R.I.B.A., which we publish in our present issue, that the famous twisted, lead-covered spire of Chesterfield Parish Church is in so serious a condition that immediate repairs are necessary. There is an inclination of as much as 7 ft. 6 in. in one direction, which is an increase of 12 in. during a period of eighty years, though whether or not this deflection has taken place gradually is difficult to determine. The presence of wet rot and *Xestobium tessellatum*, which must have occurred since 1898–9, when the spire was thoroughly repaired, appears to support the view that the increased inclination is of recent date. We must be thankful that restoration has been undertaken in time, and that it is entrusted to safe hands. The spire's extraordinary twist has been the subject of a good deal of controversy in the past, and various theories have been advanced to account for it. Only one man, so far as we know, has denied that there is any twist at all, and that was John Henry Parker, who wrote: "the lead is so disposed as to give the *appearance* of the spire being twisted." *He* should have consulted an oculist. Others have held that the twist was deliberately designed when the church was rebuilt in 1370, though there is little evidence to support such a supposition. Looking at the illustrations, which we give in this issue, readers will notice that the herringbone arrangement of the lead work gives the spire an appearance that would be represented on plan by a sixteen-sided star. Actually it is octagonal, the apparent intermediate indentation between the ribs being purely an optical illusion.

## Wren's Deficiencies as a Builder

Wren's reputation as a builder received some rather rough handling at the last meeting of the Architectural Association, when Mr. Laurence Turner, after reading a paper on "The Workshop," in which he dwelt upon the value to an architect of a thorough knowledge of materials, pointed the moral of his tale by indicating some of the structural weaknesses of St. Paul's. It is really extraordinary that a man of Wren's scientific genius should have countenanced such a shoddy and empirical method of construction as ashlar facings with rubble filling for the walls of his great building. Granted his difficulty in the matter of securing a sufficient supply of stone, it is still extraordinary that his brilliant inventiveness—shown, for example, in the construction of the dome—should not have enabled him to hit upon a better solution of the problem. The conclusion forced upon us is that even Wren, like Homer, nodded. For the lesser men of earth there is a very human satisfaction in the knowledge that even the great ones have their moments of weakness.

# Misconceptions about St. Paul's

## Some Announcements at the A.A.

MR. LAURENCE A. TURNER addressed a meeting of the Architectural Association last week, the President, Mr. Stanley Hamp, occupying the chair. Previous to the giving of
e address, it was announced that Messrs. Higgs and Hill,
uilders and contractors, had given a donation of one
undred guineas to the Endowment Fund, and the
resident thanked them for "their very generous and
andsome gift."

Mr. Turner took as his subject "The Workshop"—a
bject with a wide scope, he said, though he had to
arrow it from being able to talk about only his own
orkshops.

He strongly recommended that a lad who was to become
architect should spend the first two years with a good
untry builder, so that he might get an all-round know-
dge of how to build. Only in this way could he know
w joinery was conducted, by working at it himself. In
e same way he would gain practical knowledge of masonry
d brickwork, and get first-hand information from the
asterer and painter. Unless the architect had a thorough
owledge of the materials he was handling, and the right
rm of construction applicable to those materials, he could
t be expected to get a right sense of fitness of design.

Dealing with the shops in which architectural work was
rried out, he took first the mason's shop. He said unless
architect had some experience of stone, how could he
dge what was good and what was bad; or what sort of
ctions he should draw for the mason to work in a par-
cular stone or marble? With figured marble it was waste
good labour and material to work anything but the
nplest of mouldings. Many marbles were so hard and
ulty that the only possible way in which mouldings could
produced in them was by wearing the marble away by
bbing and the use of the grub saw. Beer stone and Port-
nd stone required different sections from Bramley Fall
the Chellynch bed of Doulting stone. The natural bed
some stones was very difficult to see; even Portland
one, which was so dense and even that the bed was hardly
scernible, had a right and a wrong way if the stone had
bear any great weight. Sometimes a piece of Portland
one would be condemned and replaced by another which
ould not have a tenth of the lasting quality of the con-
mned piece, for it was not the clean white stone which
d the longest life—some Portland stone would not with-
and the London atmosphere for five years.

In connection with woodwork, he said an architect
ould know more than a smattering about the different
alities and characteristics of wood. All woods did not
ack in the same way; neither did the same wood always
ack alike. Sequoia, for instance, did not crack with the
ain, but in a diagonal direction, and therefore he did not
nsider it a good wood to use for floor boards. He believed
e law which was made many years ago proclaiming that
ks might only be felled in the spring, when the trunk
s so full of sap as to make the tree burst and put forth
ds, was still in existence. Oak never recovered properly
en cut down at such a time; it took years of washing in
stream to get the sap water out of it, whereas if it were
t when the sap was quite down the wood might be used
ter twelve months' seasoning.

All wood should be quartered to exhibit the beauty of
e grain, although there were exceptions in some of the
rd woods, such as figured ebonies. Most hard woods
ich came from hot countries were particularly bad with
gard to shrinkage, which could be attributed to the fact
at they were evergreens and consequently the sap was
ver down. For plain surfaces all such woods should
veneered, and the wood they were veneered on to
uld be veneered on both sides, so that there would
equal tension on both sides. Boarding should never be jointed with dowels unless to butt one piece of end grain to another, for the dowels, being the reverse way of the grain, would not shrink in the same manner as the board.

The great architect, the bicentenary of whose death they were about to commemorate, would have saved those who came after him much anxiety and money if he had had a more thorough knowledge of building. Even Sir Christopher Wren, with all his glory and sound theory for construction, was a bad builder, or he would never have allowed a Norman method of building a wall to be applied to a classic building. If he really knew it was unsound it only made matters worse. They knew he was put into a difficulty for want of stone, so he sanctioned the building of an ashlar wall with a rubble filling, but he could not have realized how wrong it was or he would never have permitted it. Within thirty years of its composition St. Paul's Cathedral had to be closed for repairs, which, again, were disgracefully done. "The tendency nowadays," he concluded, "is to specialize in everything, with the result that the good all-round craftsman is becoming more and more difficult to find. The men I like to get hold of are those who have been brought up in workshops in small country towns where they have to apply themselves to all sorts and conditions of work. These men are invaluable, and during the war their worth was realized."

Mr. Turner subsequently mentioned that the architraves of the three west doors of St. Paul's Cathedral were really marble, though they were indistinguishable from Portland stone until closely examined. The deposits of soot upon the Cathedral, he said, actually preserved the fabric.

In the discussion which followed, Mr. Charles Spooner said that the architect's position to-day was a little out of scale. He was expected to be a specialist in about 500 different ways. Such a position was simply impossible, and he could not help thinking that architects had got to think out a much better scheme of working than that in operation at present. The subject was of great importance, and an endeavour should be made to define the architect's position more clearly than it was defined at present. The architect could not possibly be a specialist in everything. It seemed to him that the architect should be more in the position of the conductor of an orchestra. The architect should be the conductor of an orchestra of craftsmen; he could not be a craftsman in all the crafts but he must have a ready sympathy with all the crafts working with him. He thought it almost essential to fine architecture that architects should have a good knowledge of a craft, and he believed they suffered a good deal from the lack of it. First-hand personal experience of materials and the use of tools and the way a material behaved under the hand of the worker were things which no amount of looking or talking would teach, and he would like to see every architect spend some time in learning and practising a craft. Most modern buildings were extraordinarily dead in texture. The way the stone was worked had taken all the life and interest out of it, and it took fifty years of Nature's workmanship to overcome man's mistakes in using the material. A new building ought not to be a hard, unsympathetic, mechanical-looking thing—there was no need for it to be so. If architects had a knowledge of the mason's craft it would not be difficult to find ways of working the stone to get a more pleasant and interesting effect.

Mr. T. S. Tait said that the best advice he could give was to be continually picking the brains of the artist and craftsmen. Architects realized the value of having craftsmen around them, and should get into touch with them. The young sculptor or painter might become famous by working in his garret and executing his own work, but the architect must rely on the craftsman for the execution of his work.

# "Things Seen in Dreams"

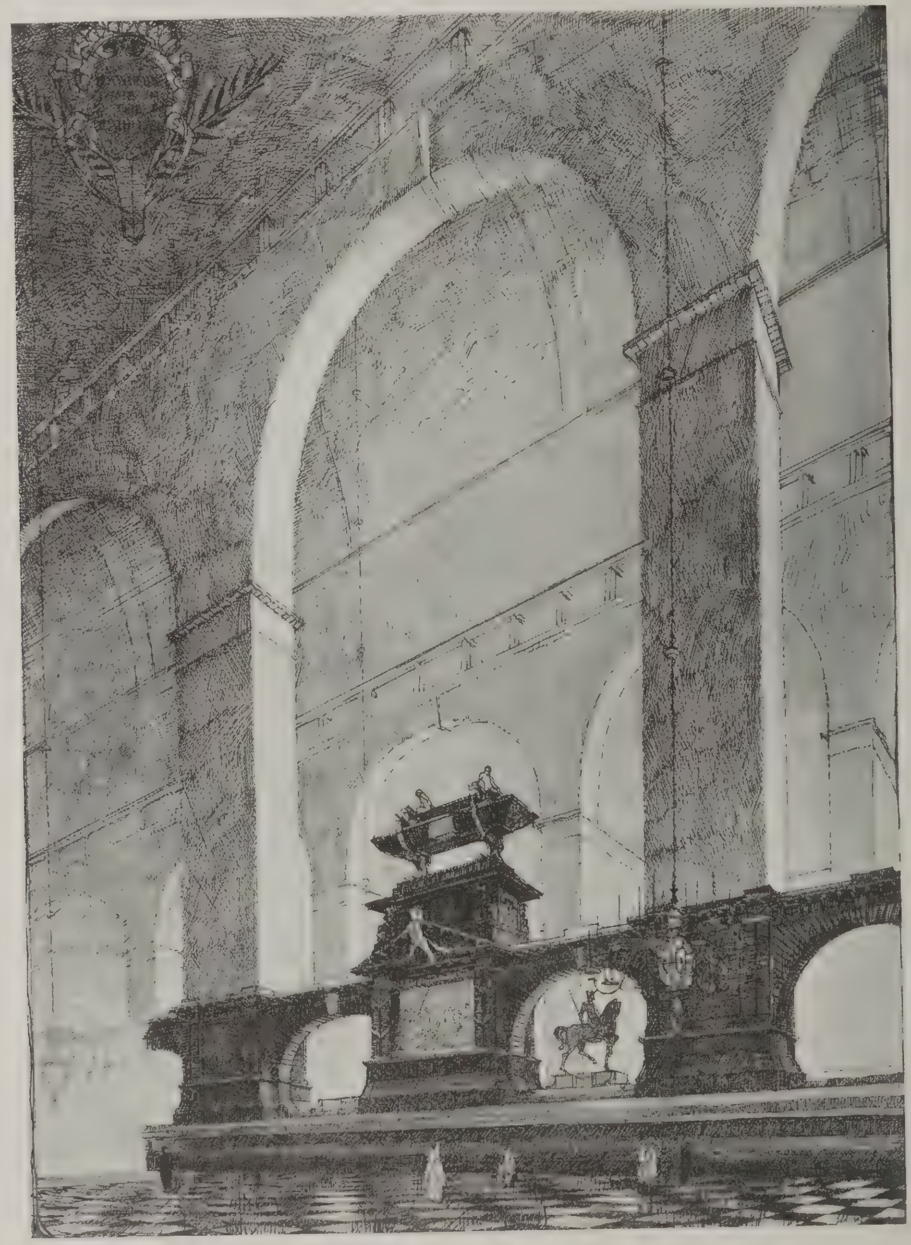
*"In the early stage of my malady, the splendours of my dreams were indeed chiefly architectural: and I beheld such pomp of cities and . palaces as was never yet beheld by the waking eye, unless in the clouds."*—DE QUINCEY.

THE exhibition of architectural phantasies at the Architectural Association shows that architects are given to dreaming. Sometimes their dreams have great dignity, and sometimes they are horrible nightmares. Some of them should have been told at the breakfast table, and then forgotten. But many of the dreamers have been afflicted as was the Ancient Mariner, and at certain times cannot rest until they have delivered themselves of the affair. Having found listeners perhaps they are shrived, and will depart and solicit us no more.

"Many years ago," De Quincey tells us, "when I was looking over Piranesi's Antiquities of Rome, Mr. Coleridge, who was standing by, described to me a set of plates by that artist, called his *Dreams*, and which record the scenery of his own visions during the delirium of a fever. Some of them represented vast Gothic halls; on the floor of which stood all sorts of engines, and machinery, wheels, cables, pulleys, levers, catapults, etc., etc., expressive of enormous power put forth, and resistance overcome."

Obviously, Giambattista Piranesi was something like a dreamer. His visions are bestrewn with grinning death's-heads, tumbled columns, hour-glasses, and the like. He is represented in this exhibition by a number of original etchings lent by Mr. Batsford.

The most ordered of phantasies seem to have come to Mr. Gilbert Scott and Mr. Stanley Hamp. They are, indeed, so ordered as to be outside the category of dreams. Rather more disordered are W. M. Keesey's "Island of the Faun," H. St. John Harrison's conception of Mr. Ching (the A.A.'s housemaster) as "The Administrative Block," and especially E. R. Jarrett's terrible hallucination.



"TOMB IN A CATHEDRAL."

*From a Drawing by Gilbert Scott, R.A., in the Exhibition.*

Mr. Howard Robertson presents "A Departmenta Store," which rises sheer like a cliff from the pavement, wit balconies before the plate-glass windows of each floor P. Hepworth's "Les Marches," "Les Portails," and hi "L'Usine," are splendid dreams. Other exhibitors ar Philip Tilden, L. H. Bucknell, and T. Frank Green.

One comes away disappointed at the orderliness of archi tects' dreams. Had they stared into a red fire for a hal hour they might have seen greater things. Or a littl opium or raw meat taken before going to bed would hav been beneficial.

VIEW FROM GARDEN.

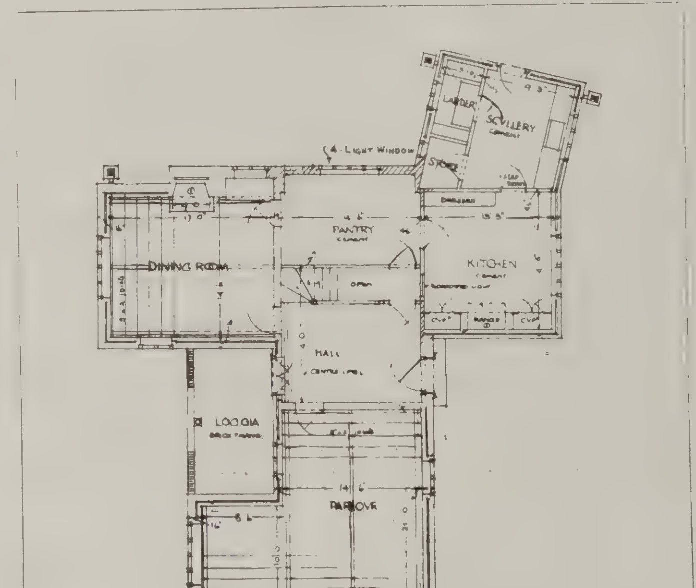
# The Houses of Well-known Architects

## 2. Mr. E. Guy Dawber's Residence at Long Wittenham, Berks

MR. GUY DAWBER'S house at Long Wittenham, near Abingdon, was designed by himself before the war. It is of red brick with a tiled roof. The gardens were all planted and laid out by the architect, and when the photographs were taken in August were well-nigh at their best.

Long Wittenham is a quiet little village in the Thames Valley. It is a mile or two from the nearest railway station, and a mile or two from the nearest town. Journeying by train, you get out at Didcot Junction, an hour's run from Paddington on the Great Western main line. Leaving Didcot—which seems very new and very ugly—you are faced by the generous slopes of the valley, and a white and lonely high road. You feel a long way from London, and begin to wonder why you should go back.

A mile or so, and you turn off the road and take to a narrow path across a wide cornfield, which seems to claim you straightway as does the sea or the desert. Your boots get red with trampled poppies, and then the tiled roofs of a village appear from behind distant trees. The road through the village is very quiet, and there seems no one of whom to ask the way.



GROUND FLOOR PLAN.

Mr. Dawber's house stands somewhat hidden from the road, and from the garden no other house seems near. The prevailing quietness of the place seems to have entered into its very design. There is nothing special to be said about it. You notice that it has big chimneys, and then again notice that the chimneys are not big after all.

The house is very much part of the garden, and the things of the garden have begun to fasten themselves to it. Walking to the back, you find yourself looking down a level lane of grass, which runs between what is almost an avenue of marguerites and sweet-williams. Big trees—oaks, and elms, and ash—stand around, and at the foot of the garden have taken up an unbroken line. Between them you see green fields stretching away over rolling country.

The deep loggia at the back of the house adds much to its quality. It seems so much a place to sit in during the day and behold that row of giant trees, and to sit in at night and behold those trees knee-deep in mist.

There is other of Mr. Dawber's work in the village—a pair of converted thatched cottages, and the small village hall. These will be illustrated in a later issue. H. J.

# A Pioneer Survey: The Doncaster Regional Planning Scheme*

THOSE who have a cynical contempt for what the world calls progress, and who wonder if, with all our scientific advancement, the world tends towards better conditions for the majority of mankind, would do well to peruse the report on the Doncaster Regional Planning Scheme, and those who are in any way interested in town planning, either in theory or in practice, would do well to study it.

When industrialism swept over the country in the middle of the last century, with such virulence that it veritably threatened to bring about the extinction of the race (had not Lister discovered by the use of carbolic how to stamp out hospital gangrene which spread alarmingly as accidents grew in factory and on railroad), towns grew up without consideration for communal good, without thought for subsequent requirements, and without precautions to ensure ultimate economy. Two generations have bemoaned and suffered from these mistakes, mistakes which were almost inevitable, and now we are shown what should have been done had not the whole situation developed with such extraordinary rapidity.

AN AEROPLANE VIEW OF THE HIGH STREET.

In the interim, garden cities have grown up, but Letchworth and Welwyn are in no way comparable with the development of an already thickly populated district on comprehensive lines to meet new requirements and conditions. For the development of the first, lessons with similar ideas and aspirations combine for a specific purpose, that purpose being the erection of a town and the organization of a community on certain pre-arranged lines. The development of the second is made difficult by a hundred conflicting human interests, by physical circumstances, and by existing conditions. The problem is indeed a gigantic one, and that it should be undertaken on such lines marks a new era in local government and communal enterprise, and to Doncaster is the honcur of the pioneer. For although there have been other regional surveys, such as the South Wales Regional Survey and the South Lancashire Civic Survey, which was the outcome of work conducted during the war, these have been concerned rather with generalities and emphasis upon the need of joint action amongst contiguous authorities than with the production of a detailed working programme (although the Survey of Road Traffic undertaken by the South Lancashire Civic Survey resulted in some valuable detail work), nevertheless the Doncaster report is the first to present a detailed programme with a definite constructive aim to meet probable immediate requirements.

The report of the Doncaster Joint Town-planning Committee represents nearly two and a half years' work, and may be said broadly to cover every aspect of the subject except, and this would seem to be a matter of some importance, the financial. A regional survey in which several local authorities (in this case no less than seven : one corporation, four urban, and two rural district councils) combine for their mutual benefit is a new departure. A single local authority is a recognized public body spending public money under public control, but a composite regional committee has no recognized position in the hierarchy of public spending departments. It can and does report, but how are its recommendations to be put into effect? With whom does the responsibility of alloting the expenditure amongst the various bodies reside? Already the system by which a local authority bears the cost of maintaining a road, the distinction of which is caused by through traffic, is found to be far from satisfactory. The maintenance of roads is no longer a parochial affair, and occasional grants from superior bodies only tend to complicate the matter without placing it on a satisfactory basis. That this aspect of the problem has difficulties is evidently realized by the authors of the report, for they refer to the possibility of a regional rating scheme, the object of which in this case is to provide funds for "free cultural institutions" in Doncaster, which shall be available for all the satellite towns which the report proposes as the ultimate means of developing the district. There exists, however, at present, no means or authority for levying a regional rate. May it not be that the time is ripe for a

* "The Doncaster Regional Planning Scheme." The report prepared for the Joint Committee by Professor Abercrombie and T. H. Johnson, with an appendix on Coal Subsidence by Joseph Humble. The University Press of Liverpool, Ltd. Hodder and Stoughton, Ltd., London, 1922. 10s. net.

revised method of local government, or at least for local government finance? At all events financial proposals would have added enormously to the interest, and, we think, to the value of the committee's work.

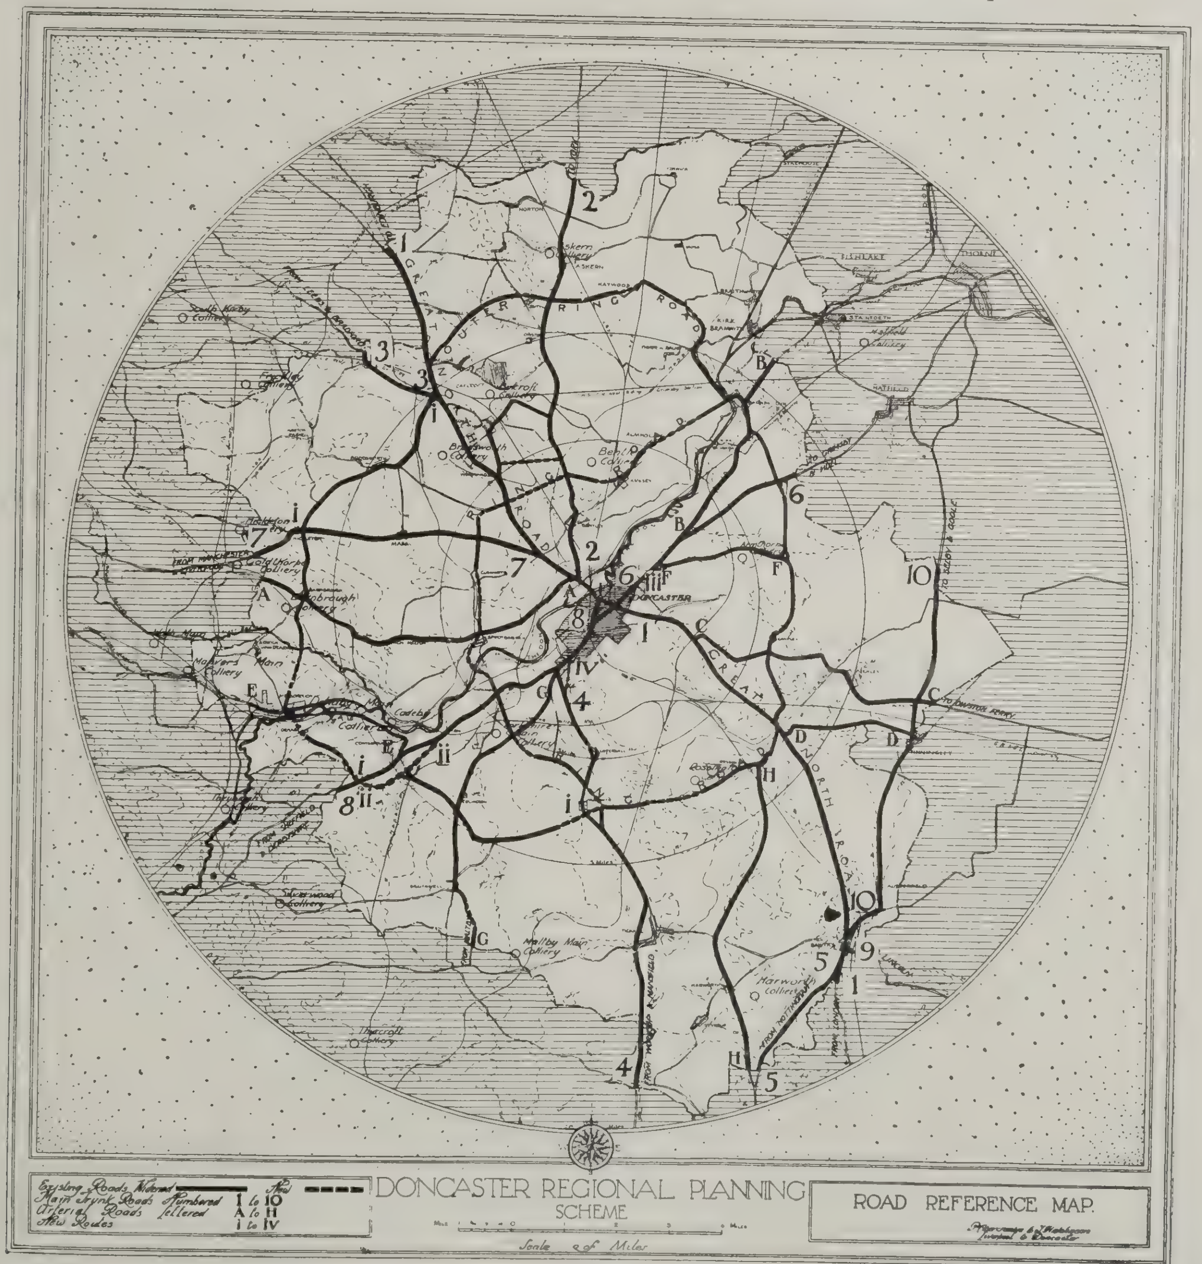
The report itself is the work of Professor Patrick Abercrombie and Mr. T. H. Johnson, an appendix on coal subsidence, by Mr. Joseph Humble, being also included. It is divided into seven parts dealing respectively with: general considerations of the nature of the Region; zoning or regulations for the specific use of areas; communications; the effect upon Doncaster of the general proposals of the report; the West Don Valley development; present condition, suggested improvements, and future growth of existing villages in the Region; the development of new residential centres and their relation to Doncaster. Already in the introduction it is clear why the subject of this survey is one of paramount interest. "Here is a district which has the chance of showing that industrial prosperity can be achieved without loss of amenity or health; and that an indulgence in the simple pleasures of a homely family life may be combined with the enjoyments of the highest flights of art, usually found only in the Great City—'La ville Tentaculaire.'

"The Doncaster Region, equipped by man, without any forethought to its industrial future, with unrivalled roads and railways, possesses in its most difficult feature—the low-lying tracts—the opportunity of grouping new industries in a manner at once fortunate for themselves and fortunate for those who will work in them. Coal, the *primum mobile* of this growth and the cause of its attendant difficulties, is found at such a depth that the worst infirmity of a mining district is absent—surface cracks and frequent pitheads.

"But it is in the grouping of the population that the chief attractiveness of the picture is found. It is no longer, one hopes, possible for a single city of the numbers and density of Leeds or Sheffield to come into existence; and one contemplates with only less horror a town, equal in population, but with its people spread out at the rate of fifty to the acre.

"Instead, there should spring up in this Region ten or more communities—new, or so changed as to rank as new—towns complete in every respect, but of moderate size, manageable in their loose texture. Central to these, but in no sense dominating their individual existence, is to be a city, neither swollen nor tentacular, but, in the truest meaning of the word, metropolitan. For major pleasures, for higher studies, for contact with great Art, dramatic, musical, and visual (which includes architecture, painting, and sculpture), the inhabitants of the surrounding communities would have, within easy reach, this focus of civilization."

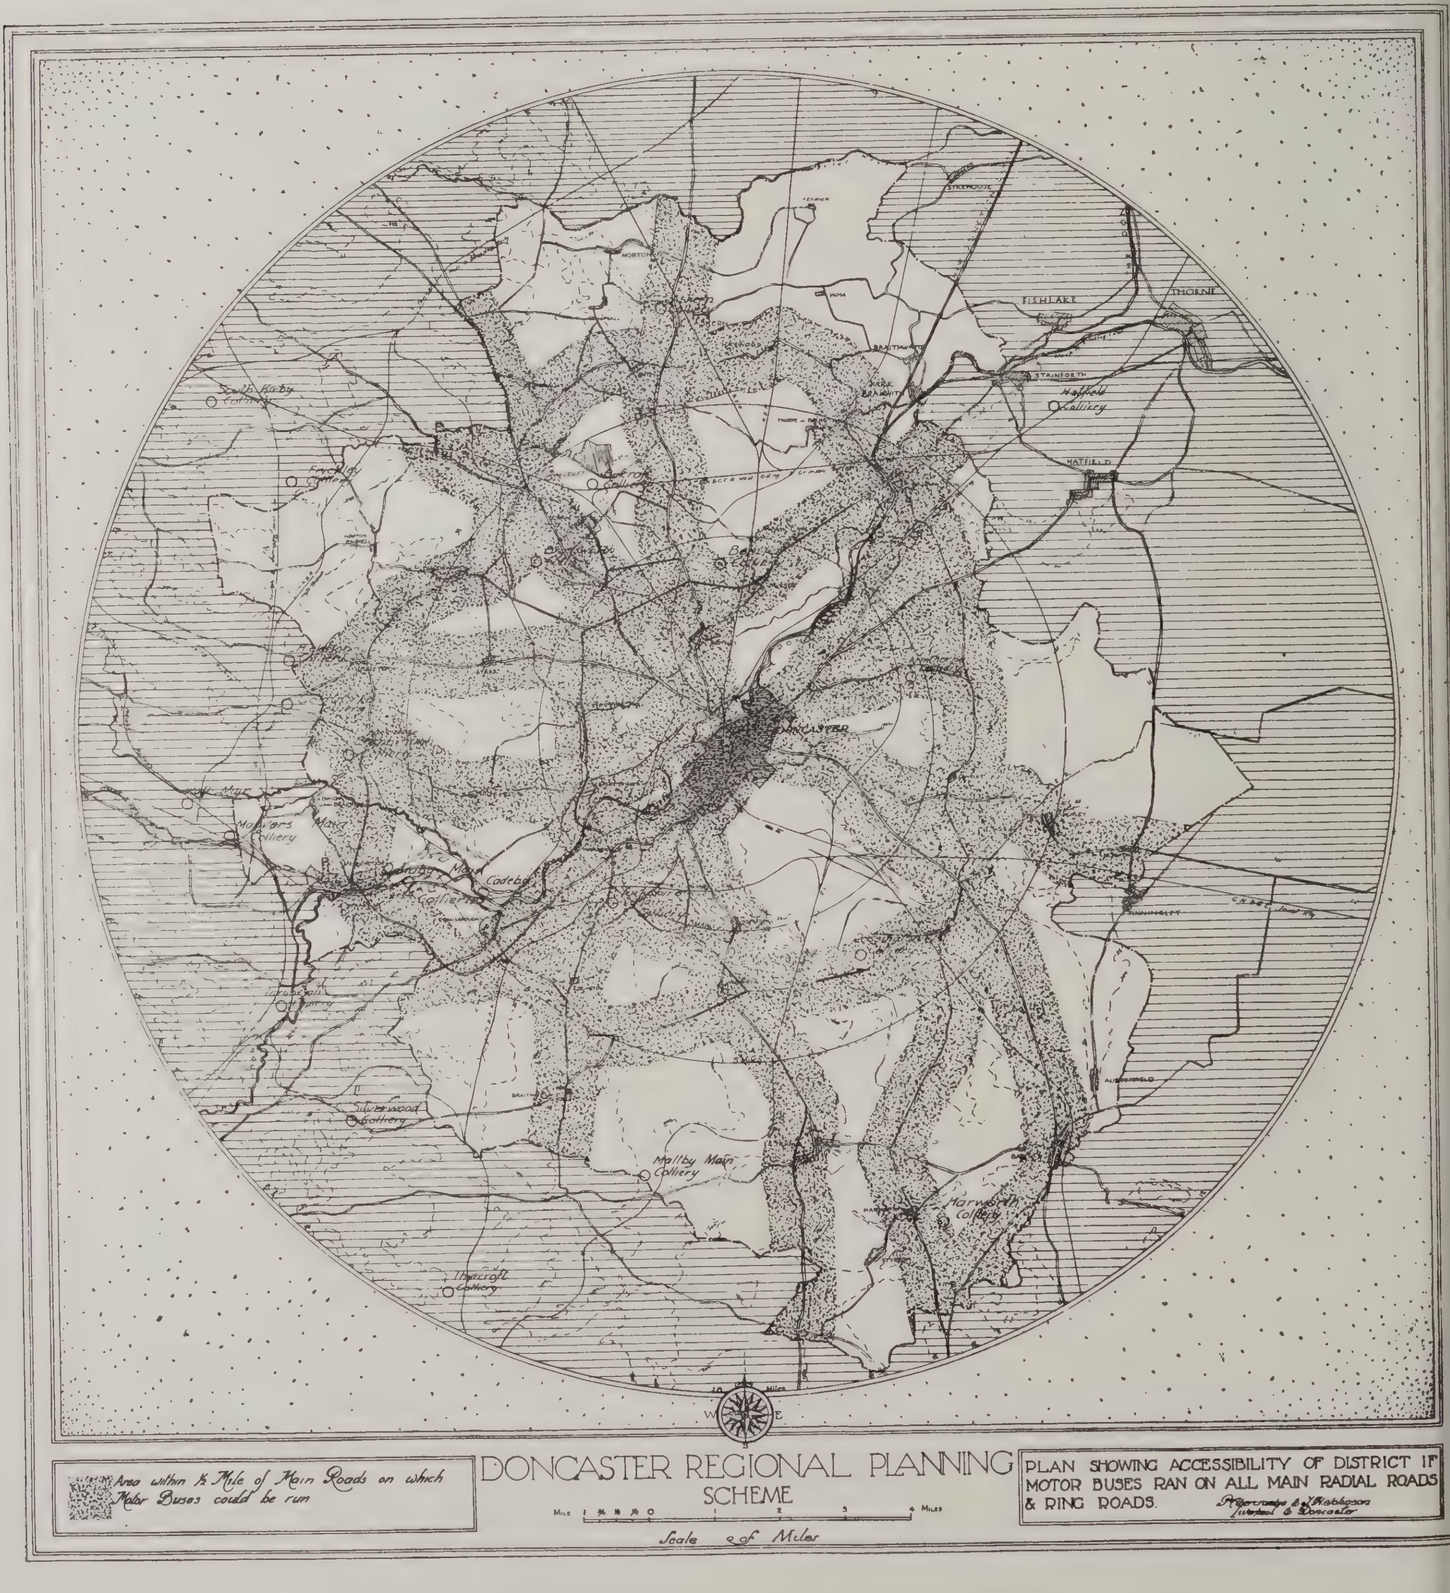
We have quoted these paragraphs *in extenso* because the whole report is but an amplification of their content.



In Part I we find a brief historical account of the growth of Doncaster, which, despite its ancient lineage from Roman times, its favourable position, and the rich mineral deposits in its neighbourhood, was mercifully passed over in the first virulence of the attack of industrialism. Since the establishment of the Great Northern Railway works in 1849, only two pits were opened until 1907, and during the next fourteen years a further ten were opened, so that the exploitation of the area may be said to be scarcely begun. Statistics as to the size and population of the area are then dealt with; 108,165 acres with a population of 139,940 at the last census. The physical characteristics of the area—which is for the most part low-lying, coal working—and prospects regarding power, electricity, and water supply for factories are also included in this first part.

Particular interest attaches to the sections devoted to zoning. The authors of the report have wisely refrained from being over-emphatic in their recommendations, and except where land is definitely allocated for housing and recreational purposes there are no restrictions. Apart from these ear-marked areas there are low-lying tracts of agricultural land which may be used for industrial purposes, but which are unfit for housing, and there are neutral tracts which may be used for housing, for collieries, or for factories of a non-smoke-producing character, but not indiscriminately, for these areas will all be developed in accordance with their local town-planning schemes.

Housing, agricultural, and recreational areas are then discussed; the last includes recommendations for the preservation of certain features of particular natural beauty, such as at Sprotborough, or of particular historical interest, such as Conisborough Castle. Regulations governing the height of buildings are suggested.



DONCASTER REGIONAL PLANNING SCHEME

PLAN SHOWING ACCESSIBILITY OF DISTRICT IF MOTOR BUSES RAN ON ALL MAIN RADIAL ROADS & RING ROADS.

Finally, it is clearly pointed out that no zoning regulations, whether dealing with density, height of buildings, or their character, if considered reasonable by the Minister of Health, can be made matters for compensation. This is a clear statement of the whole principle upon which town or regional planning rests. The proposals are for the general good of the community for which the individual may be compelled to suffer if necessary. It is the reversal of the policy which has led to the growth of those great towns, whose existence we now deplore, in which the community suffered for the good of the individual.

Part III, dealing with communications, is the largest in the report. In our quotation from the introduction, reference was made to the excellence of the communication by road and rail to Doncaster. These roads, however, invaluable as they are for connecting the district with the outside world, leave the region itself comparatively ill-knit. "Thus villages within four miles of the cross-roads of Doncaster find themselves provided with perhaps three or four trains a day and no road conveyance at all." The solution suggested in the report is the construction of circumferential inner and outer ring roads—the eastern portions of the two rings coinciding—and certain switch roads to avoid the villages.

For a great part of its length the ring road will only necessitate widening pieces of existing roads and linking them together. The suggested section shows a 120 ft. road between fences with a 24 ft. carriageway. The ring road within the town itself has much to recommend it, whether, as in Vienna, a thoroughfare of noble buildings, or, as in Frankfurt, a circle of open spaces. It is no less valuable for affording intercommunication in a district and suggesting the position for open spaces when that district tends to develop to its full capacity.

SUGGESTED ARRANGEMENT FOR THE RADIAL AND RING ROADS.

DONCASTER REGIONAL TOWN-PLANNING SCHEME.

Beyond a statement that the ideal road surface which will suit both horse and motor traffic has not yet been found, there is no reference to the actual road construction, nor are there any suggestions for regulating the speed of heavy lorry traffic which is the main cause of damage.

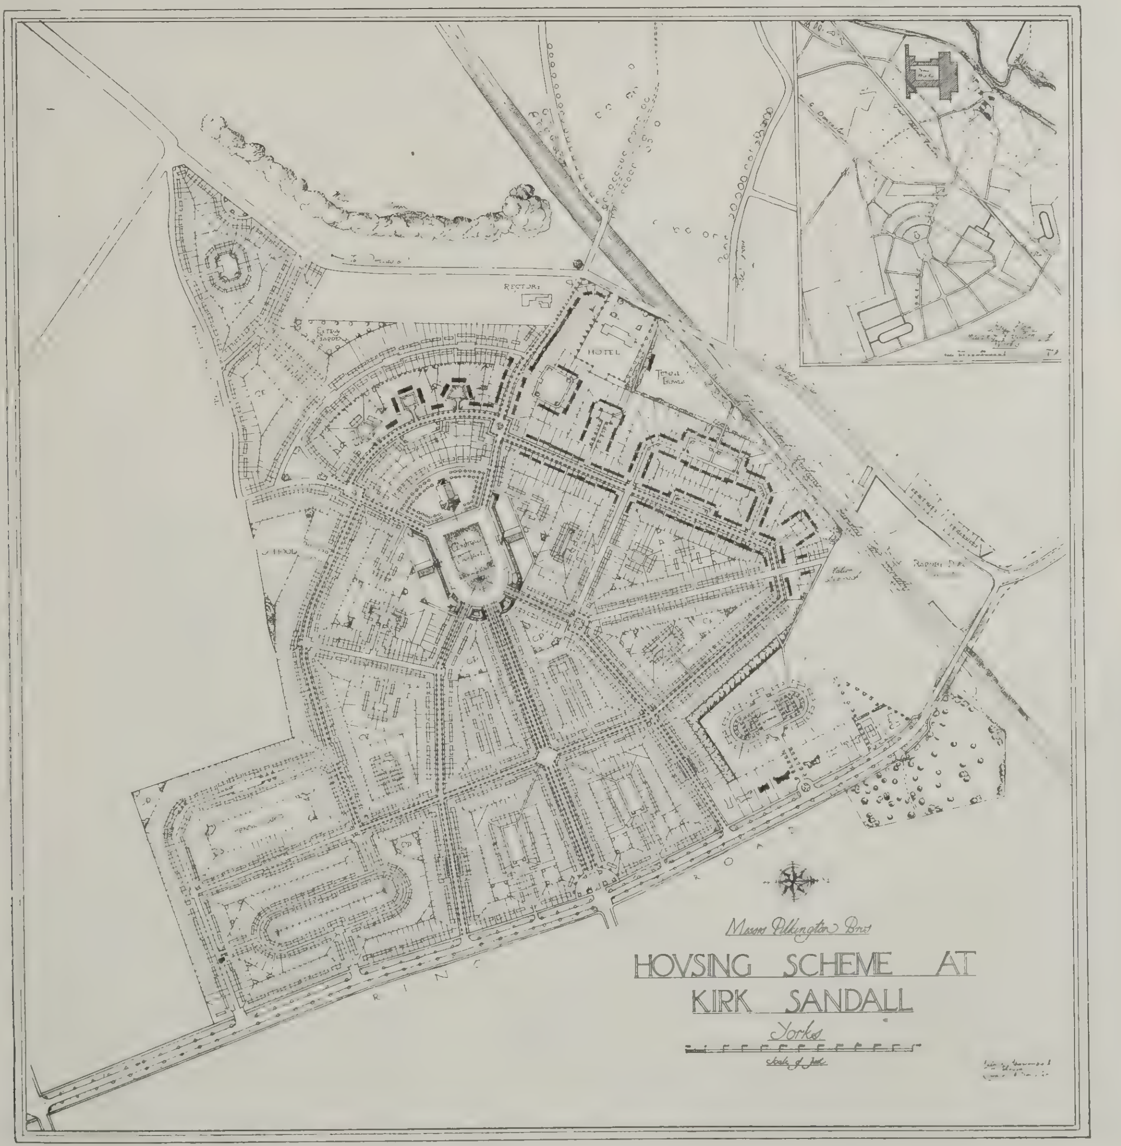
The whole question of traffic and road surface is one that must be faced. Concrete roads would seem on the whole best to withstand the hard wear of motor traffic, but this surface, when wet, is inimical to horses. Meanwhile, until the horse is entirely superseded, it would seem necessary, either that heavy vehicles are pneumatic shod, or that their speed is governed. The report then passes on to the consideration of railways. No fewer than eight companies serve the district, and yet for local passenger traffic the service is inadequate. Suggestions for making good this deficiency are contained in this section, and water transport and passenger transportation are also considered.

The next two parts of the report deal with the subsequent development of the Region. In the first of them each of the fifty-four villages within the district are considered and dealt with according to the purpose for which they are deemed most suitable in the ultimate regional development. Some will form the nucleus of the new satellite towns, others, on account of their low-lying position, should, in accordance with the zoning scheme, not be added to. The Region is fortunate in possessing some excellent housing schemes. One at Kirk Sandall, the work of Professor Abercrombie, is so disposed that its base lies along the route of the proposed new King Road. This, and Mr. Percy Houfton's scheme at Woodlands, are examples from which it is hoped subsequent schemes will benefit. The next and last part of the main report contains a plan—which we are unfortunately unable to reproduce on account of its colour—which shows the suggested lines of future growth, by clearly indicating the position of these satellite towns, the whole forming the Doncaster Industrial Region.

The fact is clearly emphasized that these communities are in no sense to be garden suburbs dependent upon Doncaster, but independent, self-supporting communities looking to Doncaster as a central metropolis supplying certain of the larger commercial, intellectual, and artistic needs in the form of a Chamber of Commerce, well-equipped lending libraries, concerts, drama, and picture exhibitions, such as are only obtainable in really large communities. It is suggested, however, that each of these towns should be based on the garden city type (in strict contradistinction to the garden suburb), with an aggregate density in residential districts of not more than twelve houses to the acre.

We cannot close this review without a word of praise for those responsible for the format of the report. In the simplicity of its binding, the beauty of its type, and the clarity of its diagrams, it is indeed a model of excellence. May this excellence be but an indication of the standard which the realization of the recommendations it contains will achieve.

[We are indebted to the courtesy of the publishers of the report for the loan of the blocks.]



THE LAY-OUT OF THE HOUSING SCHEME AT KIRK SANDALL.

# The Restoration of Chesterfield's Twisted Spire

### LESLIE T. MOORE, F.R.I.B.A., Architect

THE remarkable crooked spire and the tower of the Parish Church of St. Mary and All Saints, Chesterfield, are being restored under the direction of Mr. Leslie T. Moore, of Messrs. Temple Moore and Moore, architects to the Restoration Committee. The spire inclines 7 ft. 10 in. to the south-west, 7 ft. 6 in. to the south, and 3 ft. 2 in. to the west. It is believed that the tower (*circa* 1325–1350) was intended to receive a spire, and it is assumed that this was added *circa* 1375. Numerous spires built of timber and lead were erected in the Middle Ages. Notable examples were Old Saint Paul's, London, constructed in 1315, destroyed by lightning in 1561; Lincoln Cathedral Central Tower finished in 1311, blown down 1548; Hereford, 1320; Rochester, 1343.

Massively built of timber, the octagonal sides of the Chesterfield spire are covered with lead applied in oblong strips meeting chevronwise, giving to each of its eight faces the appearance of being channelled, which is an illusion. But that the spire in 1842 overhung its centre by 6½ ft. to the south, and 2½ ft. to the west, is no illusion. These were the figures given by Sir Gilbert Scott, who, in his restoration of Chesterfield Church in that year (which was his first essay in church restoration), suffered the spire to remain as giving character and quaint antiquity to the building.

Some years before—in 1817—"this singular pile was supposed to be in danger of falling." Expert advice was requisitioned, and a vestry meeting called at which the inhabitants strenuously opposed the idea of depriving them of their peculiar steeple. Other counsel was sought, and after a searching inspection, followed by a more favourable report, it was agreed that the crooked steeple should remain as it then stood. In later days Mr. Temple Moore in a report stated: "the inclination or leaning to the south-west . . . does not appear to have increased," and, acting upon his suggestion, in 1898–9 the spire was thoroughly repaired and strengthened at the cost of £300. One of the timbers then inserted was a piece of Norwegian oak 48 ft. long.

Many wild theories have been advanced regarding the cause of the spire's deformity. It is practically impossible that the spire could have been wholly erected in a perfect manner and warped to such an extent later; its internal construction points rather to intentional eccentricity, intensified by the clinging weight of the lead, combined with the action of the sun—in warping it towards the direction of its strongest rays—and so producing a quaint but unintentional result. Warping and sagging early in its history are undoubtedly the chief reasons of its distortion.

In consequence of the war much necessary work to the spire and tower was unable to be undertaken. Last summer the vicar and churchwardens ordered certain repair work to the lead covering of the spire. The report received from the contractor as to the condition of much of the leadwork and the supporting timbers was of such a character that it was decided to at once call in the architects to the Restoration Committee. A preliminary examination by them revealed the urgency of the case if the safety of the spire was to be assured, and immediate steps were taken to strengthen certain of the interior timbers of the spire which had given way, and at once to repair, and where necessary renew, the outside leadwork.

A complete report made by Mr. Leslie Moore fully bore out the preliminary investigations. This report was laid before the Church Restoration Committee by the vicar and churchwardens, who confirmed their action, and decided to take all necessary steps to preserve the spire. The parochial council, at a special meeting, endorsed the action taken, and authorized the issue of a public appeal for funds.

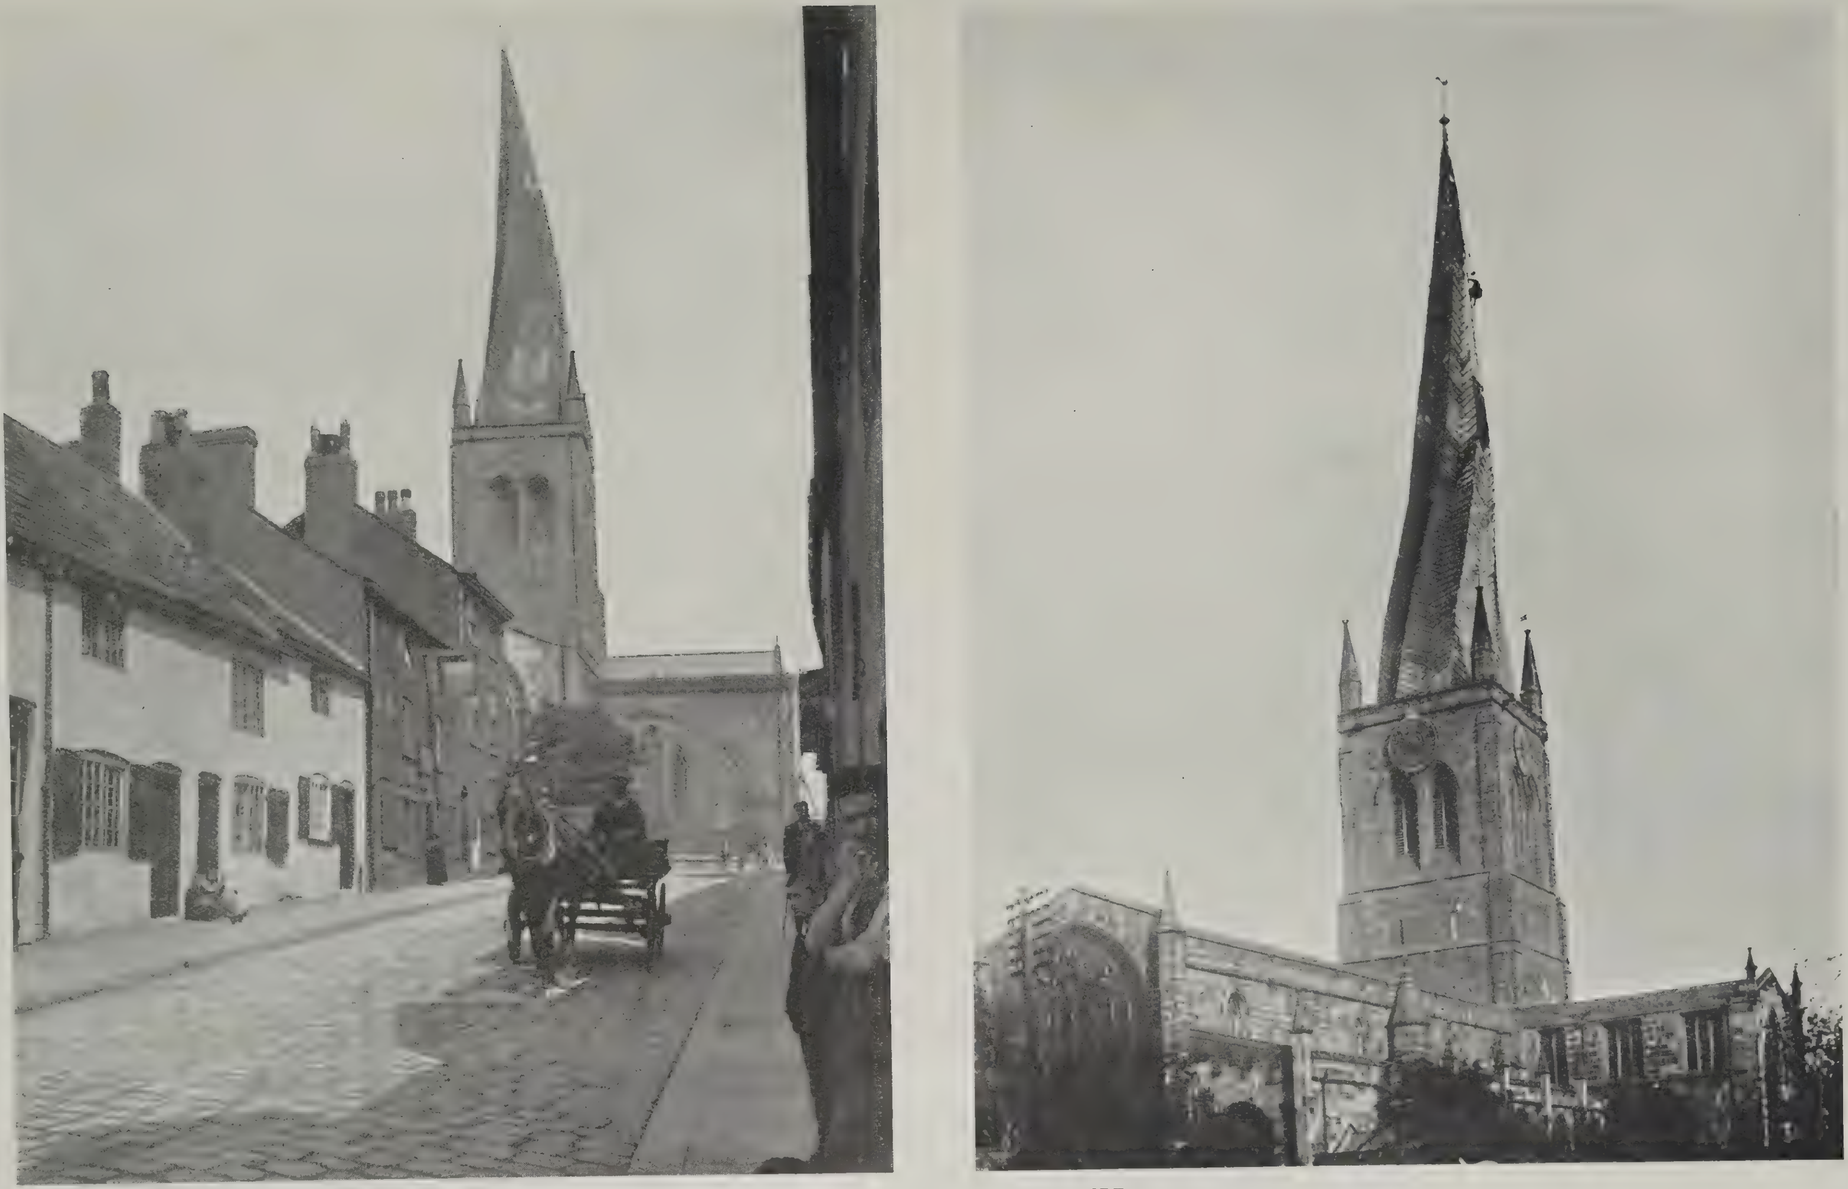
Following is the report of Mr. Leslie Moore :—

*The Spire.*

"In considering the spire, the lead covering forming the protective 'skin' is of primary importance, for the least displacement of the lead results in leakage, and it is the penetration of water and the loose condition of this leadwork that first gave cause for anxiety at the present time.

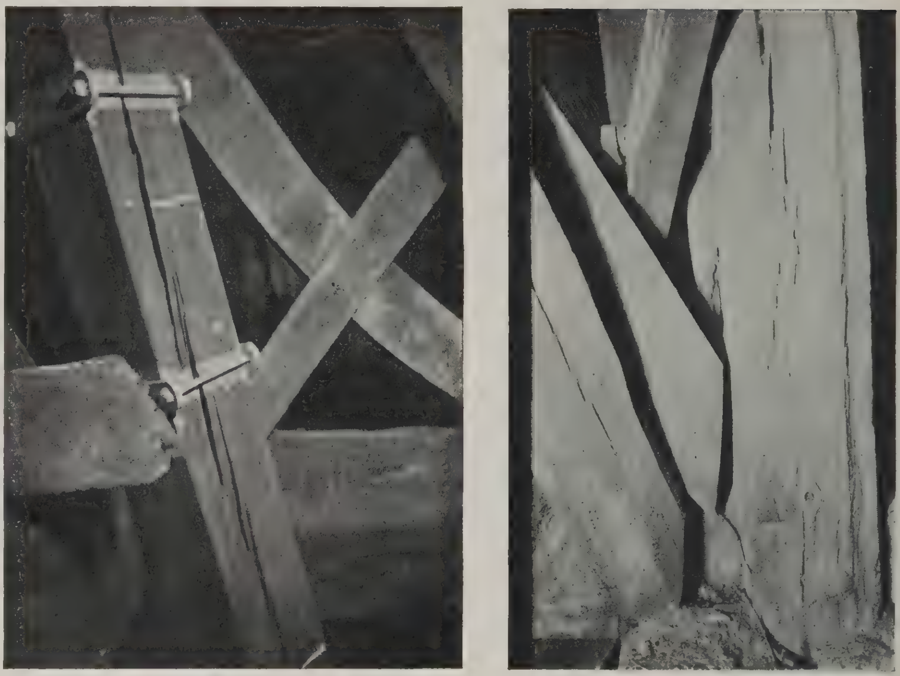
"The lead is laid in a herringbone pattern with welted joints, and has been replaced so often that very little, if any, of the original remains—probably that on the south-east side is the oldest. The

CHESTERFIELD PARISH CHURCH



TWO VIEWS OF THE TWISTED SPIRE.

THE RESTORATION OF THE SPIRE AND TOWER OF CHESTERFIELD PARISH CHURCH.
LESLIE T. MOORE, F.R.I.B.A., ARCHITECT.



The left-hand illustration shows how the 65 ft. long 10 in. × 10 in. beam is split by the weight of the spire. It is also bowed. The iron clamps have been inserted recently. The right-hand illustration shows how the supporting timbers have been forced out of position by the weight of the spire.

repairs have been executed from time to time in patches (one is dated 1735); milled lead has been used in places, and, as can be clearly seen from the ground, the welted joints are very irregular on the different faces of the octagon owing to the difficulty of execution and the joining up of new work to old. This is one source of weakness in the roofing, but the principal cause of the present defective state is that the 'tacks' which fix the lead to the boarding have become loose and ineffective owing to the rusting of the nails by which they are fixed to the boarding, and also to the decay of the latter.

"This method of fixing the lead has been adopted throughout and has practical advantages. The support of the metal is very largely dependent on the nails holding the tacks; they cannot be made secure without stripping the whole of the lead, renewing the boarding, recasting and relaying the metal. This would entail a large expenditure which it is thought would be prohibitive at the present time.

"About 40 ft. super of leadwork on the south-east side must be reinstated, recasting the old lead and relaying. It is proposed to secure the remainder of the lead by means of bolts having a 1½ in. diameter lead-covered head. These will take the place of nails that have been used previously for the same object. The bolts will be more effective, having a greater grip on the lead, and having a nut and washer on the inside of the boarding. Wherever possible the decayed board should be made good with new ¾ in. well-seasoned oak. By this means the leadwork, on which the life of the whole structure depends, will be preserved for many years, thus postponing the work of recasting the whole covering until more economic times.

"It was stated in 1855 'that the stability of the original construction was gone, and that the structure was upheld by the timbers subsequently added.' This is undoubtedly more true to-day than ever it was. The external appearance of the spire is remarkable, but the internal framing is far more so from the constructional point of view.

"The result of a plumbing of the spire taken recently was as follows: Inclination to the south 7 ft. 6 in., to the south-west 7 ft. 10 in., and to the west 3 ft. 2 in., and comparing these figures with those taken in 1842 it appears the deflexion to the south has increased 12 in.; whether the additional inclination has been gradual during the last eighty years, or has taken place recently, can only be conjectured. However, it is clear that the timbers on the south and south-west sides are severely strained, particularly the large vertical timbers inserted about a century ago: old shakes in the timber have developed near the base of that on the western side, and the strain has caused it to bend over to some extent. The long 10 in. by 10 in. strut fixed on the south side at the same time also shows signs of stress from compression at the scarf joint about 25 ft. up. This joint is well bolted with iron plates.

"The general construction of the spire is formed with four main converging stanchions continued the whole height, with horizontal framing in diminishing stages, the lower stage being 19 ft. 6 in. high, and that at the crowhole about 7 ft.; the horizontal members extend to the points of the octagon, supporting the angle hips and purlins of the roofing.

"All the old timber is framed with pinned joints. Iron straps have been added at various times to strengthen the structure, and the inserted timbers have been plated and bolted. All this ironwork is badly corroded, and several of the earlier straps no longer serve their purpose.

"The hip timbers are badly decayed in several places, particularly that at the south-south-west angle, the foot and head at the lower stages having gone.

"The foot of the north-north-west hips has also perished. The horizontal framing to the hips is decayed at the south-south-west angle (first stage) and east-north-east angle (second stage). The rafters in several places have rotted—in some cases where they have already been repaired. On the west and south-west sides the rafters have racked from the torsion, which is considerable. The original pinned scarfed joints of two rafters on the west have broken and sunk 2 in. Cross-struts inserted to strengthen these bays of rafters are fractured. Several rafters on the north and north-east sides have perished, and other struts and wind braces need careful attention. These defects occur at about a third of the height of the spire where the weak framing probably has to withstand the greatest strain. Similar defects occur in the upper stages, but their importance is not so great and enumeration would be confusing.

"The timbers named are vital to the maintenance of the imposed weight, for the deflection to the south-west naturally throws a greater stress on the timbers this side than that they were intended to carry.

"The causes of the defects are mainly due to wet rot and worm (*Xestobium tessellatum*); on inspection some joints were spongy with water. The inherent deflexion is an additional motive to be reckoned with under this heading.

"The main long vertical struts inserted a hundred years ago should be braced with iron straps where strained, the decayed timbers to be removed where possible and reinstated with pre-war felled English oak of scantlings rather larger than the timbers replaced. The perished timber that cannot be removed with safety should have fish-pieces bolted on the side or coach screws used where bolts are not feasible. Additional struts are required in places, and the main stanchions should be further braced at the upper stages. All ironwork should be cleaned and painted to arrest further corrosion.

"The spire has reached that state when the necessity for regular annual inspection is imperative; this should take place in the spring of the year. At present it is exceedingly difficult, not to say dangerous, to examine all parts owing to the condition and darkness. I strongly recommend that gangways be formed at the various levels giving proper access, and that electric light be installed, the wiring being carried up in steel screw tubing with plugs at the gangways, and two hand lamps with stoutly cased flexible wire be supplied; the switch being in the belfry. The cost of such would not be great compared with its value for inspection and the execution of internal repairs. Lanterns are, in my opinion, dangerous.

"The gutter at the base of the spire is laid with milled lead and should be protected with oak gratings similar to those fixed to the gutters of the nave and aisle roofs. In my opinion the public should not, as a general rule, be allowed to this level; the parapet is only 2 ft. 6 in. to 2 ft. 9 in. high now, and with the additional gratings will be less.

"The lightning conductor should be overhauled; the copper tape connecting the spire and four pinnacles has become detached in places, particularly near the ground.

### *The Tower.*

"The stone facing of the tower is much weather-worn, the pointing has washed t, and the north and south faces where e mediæval high-pitched roofs formerly isted should be refaced with better one, matching the other work. The isting soft stone which was originally otected by the roof on the north side is ry badly decayed and a weakness to e tower. The joints of the stonework the four faces of the tower, including e angle buttresses, require to be raked it and thoroughly repointed. The ping to the parapet is loose, the iron amps which were lead covered having rished, bursting the stonework and stening the decay. These should be placed with copper cramps, and the o top courses of the parapet partially built and reset with slate dowels.

"Certain timbers below the bell-frame e displaced, and it appears that some d decayed beams adjoining the main mbers carrying the bells are no longer rving any useful purpose and are liable infect the sound wood.

"The louvres fitted to the belfry win-ows some years ago protect to a large tent the timber framing to the bells, but e tracery of the windows on all sides, cept the south, is open, and being ex-osed to all weathers the wet must pene-ate to the detriment of the wooden ame and the bells themselves. While ppreciating the value of these openings r the exit of the sound, further protec-on seems desirable.

"I have not investigated the effect of e ringing of the bells on the spire; the ng appears to be well disposed, and ough the largest bell swings in the direc-on of the inclination of the spire, its ction is probably counteracted by the thers.

"The central tower is a fine example of e fourteenth century, and the large ire, probably of the same date, is unique r its size and eccentricities, and not nly does it form an interesting mediæval object to Chesterfield, but is a national heirloom, and demands every effort to be made for conservative preservation."

Some general particulars about the church may here be appropriately included.

Within the church is a wealth of original carved oak and other work of far greater interest to the archæologist than is the quaint steeple overhead.

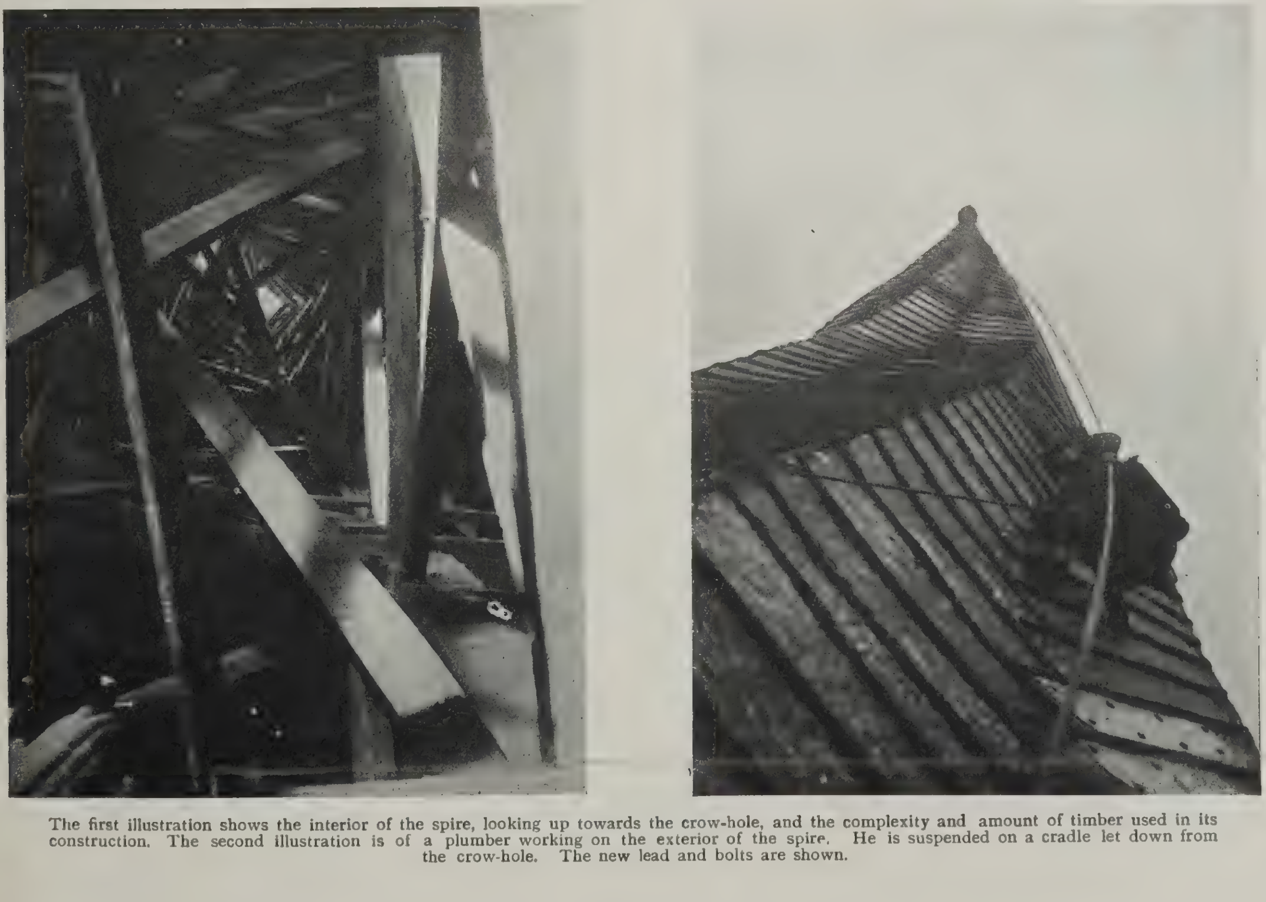
The early history of the parish church is extremely vague. Its records have all disappeared, and it is now only possible to trace its beginnings by reference to existing architectural features, or to historical mention elsewhere. From Saxon days it appears never to have been attached to any monastic body, but always to have been a parish church served by a vicar, chantry priests, and guild chaplains. Godfrey Foljambe, in 1595, endowed a "Lectureship" which is in the patronage of the Archbishop of York; it is usually held by the vicar, whose appointment is by the bishop of the diocese. The present incumbent, the Rev. Edmond Francis Crosse, is the lecturer and also the first Archdeacon of Chesterfield, being appointed thereto in October 1910, when the third archdeaconry of the diocese of Southwell was constituted. The registers date from the first year of Queen Elizabeth's reign, 1558.

The ground-plan in outline is that of a Latin cross, with a tower at the central crossing, a type favoured by the Norman builder. The south chapel has an apse which is polygonal, itself interesting, for it is the only one of the fourteenth-century type in the district. King William II (Rufus) presented the church (together with its several chapelries) to the Dean and Chapter of Lincoln Minster (1087–1100), and for several centuries the Deans of Lincoln were the rectors and patrons of the vicarage.

Of that edifice, erected in the Norman style, or perchance one of ruder Saxon work, only a few stones remain. During restoration they were found embedded in the walls rebuilt during the fourteenth century. Some with characteristic Norman sculpture were obtained from the east end, and when the plaster was removed from the nave walls it was seen that the fourteenth-century masons had worked in a quantity of large squared Romanesque stones from a much older church. A portion of the carved timber ridge-piece from the twelfth-century roof was also recovered, while coeval with these a stone coffin-lid now forms one of the tower newel steps. An ancient incised stone, high up in the internal south wall of the nave, and the time-worn Saxon font point to the more remote building. Further, a copy of an original charter (A.D. 1093–1094), still in the Lincoln chartulary, makes mention of a church at Chesterfield in the reign of King Edward the Confessor. The old shriving bell is still rung every Shrove Tuesday at 11 a.m., and the Angelus bell is tolled three times daily, morning, noon, and night.

That a church was here prior to the Norman Conquest is considered to be proved conclusively. At the least two earlier buildings must have occupied this site before the present one was fashioned. The oldest part extant was raised soon after the grant of King John's Charter (1204). Much work of that period remains; its thirteenth-century characteristics are apparent in the foundation and columns of the south transept, the arches, pillars, and grotesques of the north transept, and in the extensive corbel-table supporting the south parapet of the Foljambe Chapel.

The greater portion was rebuilt, or completed, at several intervals during the fourteenth century, in the successive reigns of the "Three Edwards," A.D. 1272.



The first illustration shows the interior of the spire, looking up towards the crow-hole, and the complexity and amount of timber used in its construction. The second illustration is of a plumber working on the exterior of the spire. He is suspended on a cradle let down from the crow-hole. The new lead and bolts are shown.

1377. Similar "intervals" were caused throughout the land by the dread visitations of the "Black Death" (1348).

During the Middle Ages the great church at Chesterfield was in effect a guild church, in addition to serving as a parochial one. We see this in the five altars—the chantry or guild chapels—situated at the eastern extremity of church, besides others of uncertain site. The guilds were particularly active in Chesterfield towards the close of the fourteenth century, contemporaneous with the erection of the church.

If a close inspection is made of the stonework within the church, it reveals the fact that two interruptions intervened whilst it was being erected by the fourteenth-century masons. There are three distinct and progressive types of their work noticeable in its details. The nave was the latest undertaken (*circa* 1360), its west façade being afterwards renewed in the sixteenth century "perpendicular" when bluff King Hal imperiously dominated this realm (A.D. 1509–1547). A perpendicular re-arrangement of the fifteenth century is also apparent in the chancel.

There is an early-fifteenth-century screen in the north transept, and one of similar perpendicular style, but which approximates to the early sixteenth century, in the south transept.

The Foljambe Chapel contains a collection of table tombs, brasses, and recumbent effigies of no mean order, all dating from the sixteenth century, A.D. 1510–1604.

The Foljambe family came from the Tideswell and Wormhill district, where one of them was an hereditary forester in the Conqueror's day; the present head o the family is the Earl of Liverpool.

Such is the church to-day, with its modern fittings and a few minor alterations, the most regrettable being the partial rebuilding of the north transept (1769), in what was vainly imagined to be Gothic architecture; still, it is an interesting early example of the return to Gothic ideas. In dimensions the greatest length of the church is 170 ft. 11 in., the breadth across the transept arms 109½ ft., and its spire rises to the height of 230 ft.

Funds are urgently needed to carry on the restoration work. Donations should be sent to Mr. H. Ryde, Newbold Road, Chesterfield. Cheques may also be paid in direct to the Chesterfield Parish Church Restoration Fund at the London County Westminster and Parr's Bank, Ltd., Chesterfield.

# New Furniture Workshop at Windermere

## KENNETH M. B. CROSS, M.A., Architect

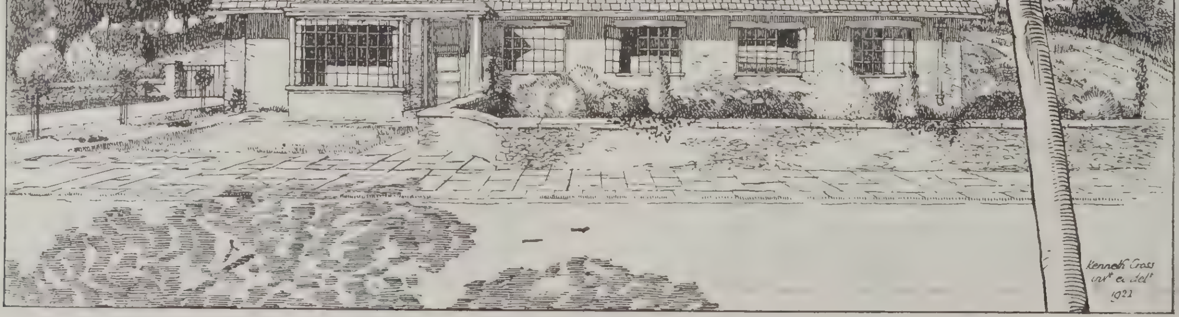
THIS building is now in course of erection from the designs of Mr. Kenneth M. B. Cross, M.A., of Messrs. A. W. S. Cross, F.R.I.B.A., and Kenneth M. B. Cross, M.A., architects. It is situated in New Road, between Windermere and Bowness, and consists of a woodworking shop with a small office and showroom adjoining. The latter overlooks a forecourt laid out with random paving surrounding a lawn, and provides a quiet, yet attractive, vantage ground, public, yet off the beaten track, from which to view the select pieces of hand-made furniture which the building owner, Mr. Stanley Davies, proposes to exhibit. A private roadway, destined ultimately to form a drive to a house at the farther end of the site, leads to a courtyard at the west side of the building. From this courtyard may be obtained a delightful view of the lake, but it is planned for the more practical purpose of providing for the egress of larger pieces of furniture and also to provide access to the various timber storage sheds destined to be grouped around it.

All the stone walling is of random rubble laid in mortar, and the external walls are 1 ft. 6 in. thick. The walling is quarried on the site, with the exception of the limestone quoins, which, owing to the difficulty of working the blue rag stone, are to be used at the corners. The chimney stacks (circular on plan with battered sides), the rough oak lintels over the window openings, the uneven texture of the external wall surfaces, and the long, low lines of the elevational treatment are an attempt to adhere to the old-established building tradition of the Lake District.

All the external woodwork, including the window frames, the porch, and the front door, is of oak; and metal casements and frames are being used. For the roof local green slates have been laid in diminishing courses over felting and boarding, as heavy rainfall is usual in the district. Internally the showroom and office have plastered walls and ceilings, a storage space being contrived in the roof above these rooms. The workshop has an open timber roof, and the walls are to be left rough and twice whitewashed. The fireplaces are to be formed with rough-hewn stone lintels, chimney breasts, and hearths.

It is the intention of Mr. Stanley Davies to use this workshop as a centre from which to demonstrate to the public that the craft of hand-made furniture following structural forms in design and relying for its æsthetic effect on the quality of its workmanship and on the nature of the materials with which it is made, is still worthy of support in an over-industrialized country.

The general contractors are Messrs. J. Braithwaite and Son, of Windermere. Messrs. James N. Gibson and Son, of Windermere, are providing some of the joinery, and the metal casements and frames are supplied by Messrs. Crittall, Ltd.



THE NEW WORKSHOP.

# The Acoustics of Buildings

## By W. H. THORPE

THOUGH much has been written lately upon this subject, it may not be unacceptable to give a summary of what information has been available during the last 200 years. It is not surprising to find that Sir Christopher Wren, who was well-informed on many matters, had his ideas on this subject, though rather in connection with the carrying power of the human voice within buildings, than with the effect of the building upon the voice. For churches Wren considered that a moderate voice might be heard 50 ft. in front of the preacher; 30 ft. on each side; and 20 ft. behind him, and says: "A Frenchman is heard further than an Englishman, because he raises his voice, and sinks not his last words." Evidently Wren had closely pondered over the question, and drew the conclusion that the best size for certain new churches to be built would be 60 ft. broad, by 90 ft. long, with a chancel at one end, though St. James's, Piccadilly, somewhat exceeds these dimensions. He very wisely adds: "To build more than that every person may conveniently hear and see is to create noise and confusion." This last passage strongly suggests that Wren was alive to the reverberations liable to occur in over-large buildings. Having regard to the avoidance in Wren's churches of large flat surfaces, his preference for forms of ceiling arched or slightly domed, and other features, it is probable that he had ideas other than those concerning size only. His methods generally were precise where, with the then existing state of knowledge they could be, but his judgment was well trained and excellent, and this on occasion he did not disdain to use for no better reason than that it could not be expressed as a formula.

For more than 100 years after Wren's death there does not seem to have been any pronouncement upon questions of building acoustics other than occasional appeals to precedent by writers on architectural subjects. About 1831 fresh interest seems to have been aroused by an inquiry into the acoustical qualities of the old House of Commons, and evidence was taken by a select committee of the House. The evidence shows that by this time the materials of the inner surface of a building were understood to have an important bearing on the matter, but no very definite conclusions were reached.

Later, in 1835, the old Houses having been destroyed by fire, a further inquiry was held relating to the new chambers. At this inquiry Dr. Reid, F.R.S.E., made statements which, perhaps, mark advanced thought on the subject at that date. He affirmed that for a debating chamber the shape should be "about square," the walls as low as practicable and arranged to avoid reflection from side to side, the seats rising from a central space, the roof to be low-pitched, rising from the sides at a flat angle (about 25 deg.) to a centre ridge line so that the direct voice should be strengthened by a single reflection from the roof, when it should be destroyed upon a sound-absorbing floor. He insisted that acoustic difficulties in public buildings were due less to want of power in the voice, than to the interruption of prolonged reverberations, and that the cubic contents of a chamber should be as small as possible. He appreciated the difference in the sound-absorbing qualities of different materials, but gave no values.

Prof. Tyndall, giving evidence much later in 1868, favoured the speedy extinction of reflected sound, noted the quenching effect of an audience, and affirmed that high ceilings caused the original sound to be confused by late following echoes. He considered clear definition in speech more important than loudness.

Herschell, in a profound treatise upon "Sound" in the "Encyclopædia Metropolitana" for 1849, had hardly touched the subject, but said truly: "In small buildings the velocity of sound is such that the dimensions of the building are traversed by the reflected sound in a time too small to admit of the echo being distinguished from the principal sound. In great ones, on the other hand, the echo is heard after the principal sound has ceased." He states, being in this curiously at variance with other investigators, that open windows, deep recesses, hangings or carpeting and a numerous audience are inimical to good hearing. Herschell seems, indeed, to have regarded the acoustics of buildings more particularly with regard to musical renderings, and considered absorption of sound an evil.

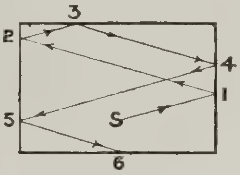

FIG. 1.

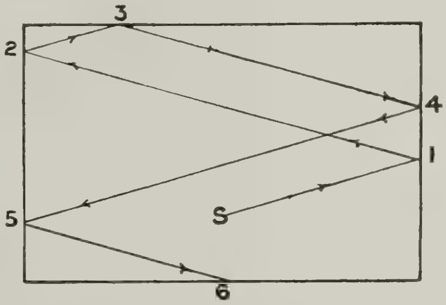

FIG. 2.

Diagrams showing that with increased size of building the distance travelled by a sound (S), and the time required to extinguish it, are proportionately greater.

Rodolphe Rodan, a Frenchman, writing some time before 1870, seems to have shared Herschell's objection to deep recesses as "strangling sound." He considered the chief defect of buildings to be an "excessive resonance" (i.e., continued reverberation). Writing of the deadening effect of some materials, he quotes the case of St. Paul's Church, Boston, where the preacher's voice is heard but once a year—on Christmas Day—when "it is decorated in such a way that the arches are less sonorous."

A paper read before the R.I.B.A. in 1860 by T. Roger Smith, architect, which was somewhat discursive in character, was bettered by the same authority in a little treatise published about 1872 upon "Acoustics in relation to Architecture and Building." In this book, indicating the kind of surfaces which absorb sound, he says: "The same surfaces which would most effectually destroy, and least reflect the motion of any solid body, such as a ball, propelled forcibly against them, will also most thoroughly absorb sound. . . ." This statement though not perhaps universally true, is broadly correct, and appears to be the first indication of any classification of sound-absorbing materials. He regards the information then available as being insufficient to enable an architect to forecast results with any precision, but useful as indicating what expedients to adopt in an endeavour to meet acoustical troubles. This book, though written fifty years since, is not yet out of date, is not at variance with what has later been ascertained, and may still be studied with advantage.

Lord Rayleigh's monumental work of 1,000 pages on "The Theory of Sound," published nearly fifty years since, contained much matter bearing indirectly upon the question, but its extremely mathematical character makes it a closed book to most. Indeed, an expert is needed to derive from it any conclusions useful to an architect. The following quotation, however, is much to the point: "In large spaces bounded by non-porous walls, roof, and floor, and with few windows, a prolonged resonance seems inevitable. The mitigating influence of thick carpets in such cases is well known. The application of similar material to the walls and to the roof, appears to offer the best chance of further improvement." This, and more than this, was well known, but left the practical application of the knowledge largely a matter of guesswork, and it was not till Prof. W. C. Sabine, of Harvard University, established certain fundamental principles, and by experiment determined the precise sound-absorbing values of various kinds of surface, that any definite calculation became possible of the time during which troublesome reverberation would persist, giving thus a means of forecasting or controlling results.

A sound produced in any hall will ultimately die out, to be no longer heard. That which destroys sound, as sound, is its absorption or transmission by wall and other surfaces under repeated blows of the sound wave. If the chamber is small, the number of blows necessary for extinction—a little of each blow—may be given in a short time, there being but a small distance to be travelled between blows. If, on the other hand, the building be large, but of similar form (see

Figs. 1 and 2), the total distance traversed for a sound wave to make the same number of blows will be proportionately greater, and reverberation may be objectionably long.

For strictly similar buildings the time during which reverberation may be heard will thus be proportional to the linear dimensions. Strict similarity must include similarity of surface materials, for material largely influences results. It is quite possible so to vary the materials that greatly divergent effects may be secured, so that no useful deductions may be drawn without strict knowledge of the sound-absorbing power of materials. Sabine, as a result of his studies, established a formula for the duration of reverberation for any case in which the necessary particulars were known, which is (corrected from metric to British units) :

$$\text{Time in secs.} = \frac{\cdot 050 \times \text{volume in cu. ft.}}{\text{Absorption power of surfaces.}}$$

the absorption power of surfaces being the area in sq. ft. of each particular variety, multiplied by the proper experimental value. This value is, for surfaces, always less than unity—unity being the absorption value of an open window.

Typical values are :—

| | |
|---|---|
| Open window .. .. .. | 1·000 |
| Glass, plaster on tile, brick .. | ·025 |
| Plaster on lath .. .. .. | ·033 |
| Wood-work (hard pine) .. .. | ·061 |
| Heavy rugs, curtains .. .. | ·250 |
| ½ in. hair-felt .. .. .. | ·470 |
| 1 in. hair-felt .. .. .. | ·750 |
| Audience (close, reckoned on floor area) .. .. .. .. | ·960 |
| Audience, at per person .. .. | 4·700 |

For instance, in a hall having 250,000 cu. ft. capacity, a floor of 5,000 sq. ft. with full audience, and walls and ceiling of plaster (mean value, say, ·030) of 20,000 sq. ft., there should be reverberation lasting :—

$$\frac{\cdot 050 \times 250{,}000}{5{,}000 \times \cdot 96 + 20\cdot 000 \times \cdot 030} = 2\cdot 31 \text{ secs.}$$

An informing series of articles upon the subject by Prof. Sabine may be found in "Engineering Record," 1900.

But reverberation is not the only effect which may by long continuance produce disagreeable effects of confusion. Echoes of marked character may occur in large buildings due to concentration or focusing of sound at particular points. Such concentrations (as in Fig. 3) are due to the geometrical form of roof (or of walls), and may easily be avoided in design. For small buildings having the same form distinct echoes are not noticeable, because though existent, they follow too close upon the originating sound to be distinguished.

The auditorium of the University of Illinois, not having justified its name, became the occasion of further inquiry by which finally the principles enunciated by Prof. Sabine were triumphantly vindicated, and much further information of value was secured. The investigation was carried out by Paul Sabine, and was further developed by F. R. Watson and I. M. White, for particulars of which the University of Illinois Bulletins Nos. 73, 87, and 127 may be consulted. It is to be noted that both the earlier and the later inquiries had their origin in the unsatisfactory character of buildings already constructed.

The Illinois auditorium, of 100 ft. diameter, when first built, was quite impossible acoustically, having pronounced echoes and a period of reverberation of six seconds when full. A careful study of echo effects was first undertaken, and measures adopted to eliminate these, and reduce the time of reverberation by the application of hair-felt to convenient surfaces. The ultimate result was a reverberation period of 1·9 secs., with no definite echoes, which, as the building was to be used for music as well as speaking, was considered satisfactory.

In connection with the question of time limit, in 1906 M. Marage submitted to the Academy of Sciences a paper giving a useful account of results obtained in six lecture theatres in Paris, varying in capacity from 2,200,000 cu. ft. to 22,600 cu. ft. The difference of duration for these chambers, full or empty, was very marked, being commonly twice as great for the empty condition. M. Marage's conclusion was that for good hearing of the speaking voice the "duration" should be between ·5 and 1·0 sec.

This, though somewhat less, is not at variance with Prof. Sabine's conclusions, he having indicated a period of from 1·0 to 1·5 secs. as suitable for buildings to be used both for speaking and for music, while approving a yet longer period for music alone, the ideal requirement for the two cases being somewhat dissimilar. The measurement of "duration" by M. Marage may not, however, have been strictly in conformity with that of Prof. Sabine.

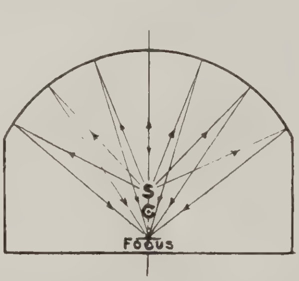

Fig. 3.—Illustrating the fault of concentration of sound (echo) at level of audience.

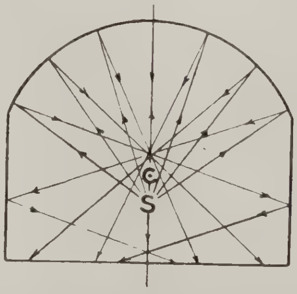

Fig. 4.—Showing dispersed reflection of sound (S) from arched ceiling having its centre of curvature (C) well *above* the speaker and audience.

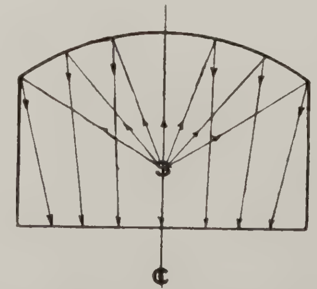

Fig. 5.—Showing dispersed reflection of sound (S) from arched ceiling having its centre of curvature (C) well *below* the speaker and audience.

The position with respect to the acoustics of buildings is now so far improved that it need no longer be a matter of grave doubt what the acoustic character of a building will prove to be, and further, cases which have hitherto been regarded as hopeless in this respect may be taken in hand with a reasonable prospect of improvement. The work carried out by Prof. Sabine, and those continuing his labours, leaves but little now to do, but there is one particular in which further investigation will be useful, that is, in determining the precise sound-absorbing values of different kinds of plaster surface, which may differ greatly for different varieties, according to porosity, weight, and rigidity, and may or may not be conformable to the plasters considered by Prof. Sabine. A standard method of determining "duration" should also be established.

The conclusions following, submitted by the present writer, may be of some service :—

For chambers not exceeding 25,000 cu. ft. capacity the walls and ceiling may be flat, and of any usual material without ill effects.

For chambers exceeding 25,000 cu. ft., but not exceeding 175,000, marble, heavy glass, and smooth hard plasters should be sparingly used, and the ceiling arched or deeply coved. Alternatively, with flat ceilings, a considerable area of the walls should be made sound-absorbing, to give, as the major limit of size is approached, a mean sound-absorbing value per sq. ft. of ·25, equivalent to the use of ¼ in. hair-felt on the whole wall surface. For a scant audience the floor should be mat covered in either case.

Chambers of more than 175,000 cu. ft. capacity may well be made the subject of special study, having regard to the precise data now available.

Any arched ceiling should have its centre of curvature well above or well below the level of the audience, or of the speaker, to avoid objectionable concentrations of sound (see Figs. 4 and 5). The useful effect of an arched ceiling so formed is that sounds reflected from it are thrown down, without serious concentrations, to be quickly damped out on the audience, whereas with a flat ceiling, and more of upper wall surface exposed, there will be continuing reflections, and in the case of large halls prolonged reverberation, rendering imperative the use of sound-absorbing material; great height is objectionable.

The application of these rules alone will, except as to the special case of very large halls, ensure that there shall be no serious disappointment in the acoustical character of any building.

The theory that reflecting surfaces by reinforcing the speaker's voice are to the hearer's advantage may be good so far as it goes, but it does not go far enough. Reflection in aid is followed by reflection producing confusion; volume is secured, but enunciation is blurred. There is more loss than gain. In no building of ordinary size does the voice need help; it is best left to reach the hearer direct, and die if it will.

In conclusion it may be said that Roger Smith's little treatise, and the work done by Prof. Sabine together give all that the practising architect needs in dealing with problems of acoustics.

# Reinforced Concrete Calculations for Beginners. VI

## By Professor HENRY ADAMS, M.Inst.C.E.

*(Continued from last issue, page 129.)*

IN ordinary reinforced concrete building construction the beams are continuous over intermediate supports. This gives a special bending moment diagram which includes negative bending moments over the supports, and over the ends also when they are securely fixed. When a beam under load bends hollow on the top, the upper layers are in compression, and the bending moments are positive, but when as in a loaded cantilever the bending is rounded on top the upper layers are in tension and the bending moments are negative. When a beam is fixed firmly at the ends it is in the same condition as if it were continuous over several supports, there will be negative bending moments at the ends and positive in the middle portion. This is more fully shown in Fig. 14, where a beam with fixed ends is shown continuous over two spans and the tendency to bend will be as indicated in Fig. 13. Where the curvature changes the points are known as "points of contraflexure," the thickened lines showing the parts in compression.

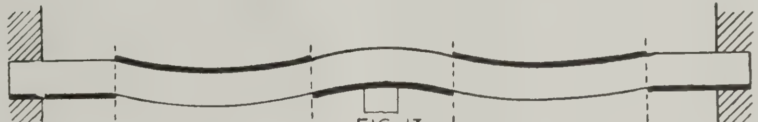

FIG 13

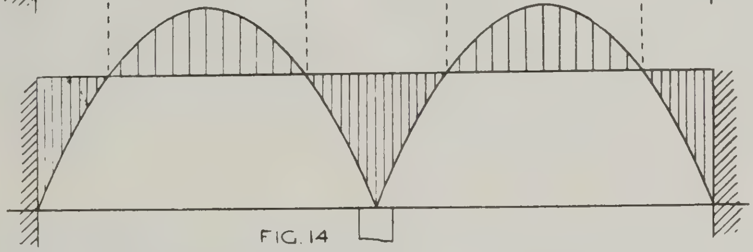

FIG. 14

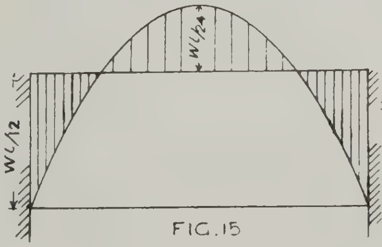

FIG. 15

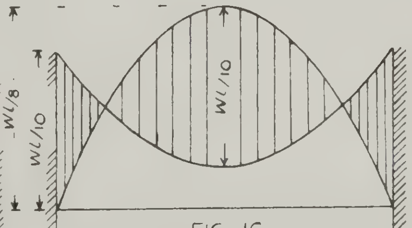

FIG. 16

A beam with properly fixed ends over a single span will be like one span of the continuous girder and the theoretical bending moments will be as in Fig. 15, but to provide against any deficiency in fixing the ends the present L.C.C. regulations specify the bending moments to be allowed for as in Fig. 16.

Taking the same loading as before, six tons on a span of 20 ft., with both ends fixed and four ¾ in. rods, but reducing the total depth to 18 in.,

then, $\frac{A_s}{A_c} = p = \frac{\cdot 4417 \times 4}{16\cdot 625 \times 12} = \cdot 00885,$

$m = 15,$

$$k = \sqrt{(p^2m^2 + 2.p.m.)} - p.m.$$
$$= \sqrt{(\cdot 00885^2 \times 15^2 + 2 \times \cdot 00885 \times 15)} - \cdot 00885 \times 15$$
$$= \sqrt{(\cdot 0000783 \times 225 + 2 \times 15 \times \cdot 00885)} - \cdot 00885 \times 15$$
$$= \sqrt{(\cdot 0176 + \cdot 2655)} - \cdot 1328 = \sqrt{\cdot 2831} - \cdot 1328 = \cdot 532 - \cdot 1328$$
$$= \cdot 3992.$$

The weight of beam will be 20 × 12 × 18 = 4,320 lb., the superimposed load six tons = 13,440 lb., and the total load 4,320 + 13,440 = 17,760 lb. The maximum bending moments by L.C.C. regulations

$$= \frac{WL}{10} = \frac{17760 \times 12 \times 20}{10} = 426{,}240 \text{ lb. in.}$$

The maximum tensile stress,

$$t = \frac{B}{p.b.d^2\,(1 - \frac{1}{3}k)}$$
$$= \frac{426{,}240}{\cdot 00885 \times 12 \times 16\cdot 625^2\,(1 - \frac{1}{3} \times \cdot 3992)}$$
$$= \frac{426{,}240}{\cdot 1062 \times 276\cdot 39 \times \cdot 867}$$
$$= \frac{426{,}240}{25\cdot 449} = 16{,}709 \text{ lb. sq. in.}$$

The maximum compressive stress,

$$c = \frac{2.B}{k.b.d^2\,(1 - \frac{1}{3}k)}$$
$$= \frac{2 \times 426{,}240}{\cdot 3992 \times 12 \times 276\cdot 39 \times \cdot 867}$$
$$= \frac{852{,}480}{1137\cdot 5} = 749 \text{ lb. sq. in.}$$

These figures are rather higher than they should be under the present regulations, but the difficulty may probably be overcome by making the beam ½ in. deeper.

We found before that we might have obtained an approximately correct section for a simple beam by making 95.*b*.*d*² equal to the bending moment, in a similar manner we can find the approximate section for a continuous beam by making 120.*b*.*d*² = bending moment. Say we have to provide for 426,240 lb. in., then 120.*b*.*d*² = 426,240, or with 12 in. width of beam the effective depth will be

$$\sqrt{\frac{426{,}240}{120 \times 12}} = \sqrt{296} = 17\cdot 2 \text{ in.}$$

We assumed an effective depth of 16·625, and found it was not sufficient, and suggested another ½ in., making it 17·125, showing that we should have been much nearer the proper size to start with if we had used the above rule to estimate it.

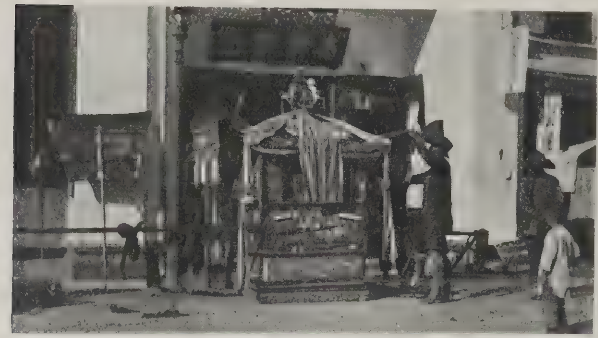
All the remarks made upon beams apply with equal force to floor slabs, 12 in. being taken as the width in the direction of the cross beams or secondary beams, and the calculations are identical with those shown above. If the end bays of slabs or beams are not "fixed" as firmly as if they were continuous, they must be calculated as if only supported at the ends, but top reinforcement must be provided at the inner ends as for continuous beams.

*(To be continued.)*

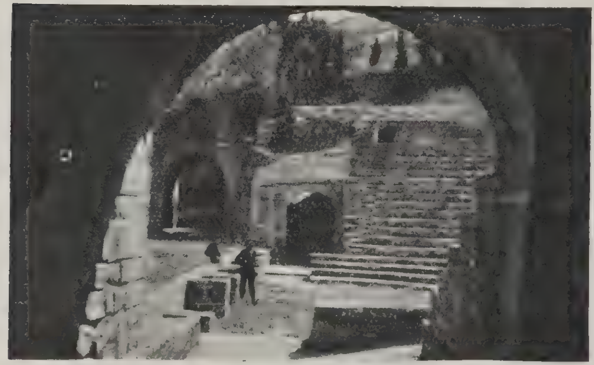
# A Pictorial Review

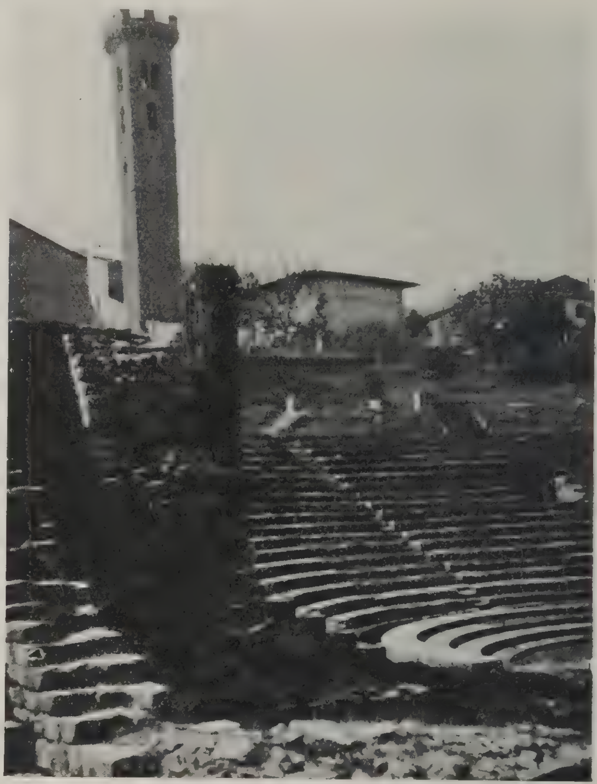
## Illustrations of Topical, Practical, or Curious Interest

*Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.*

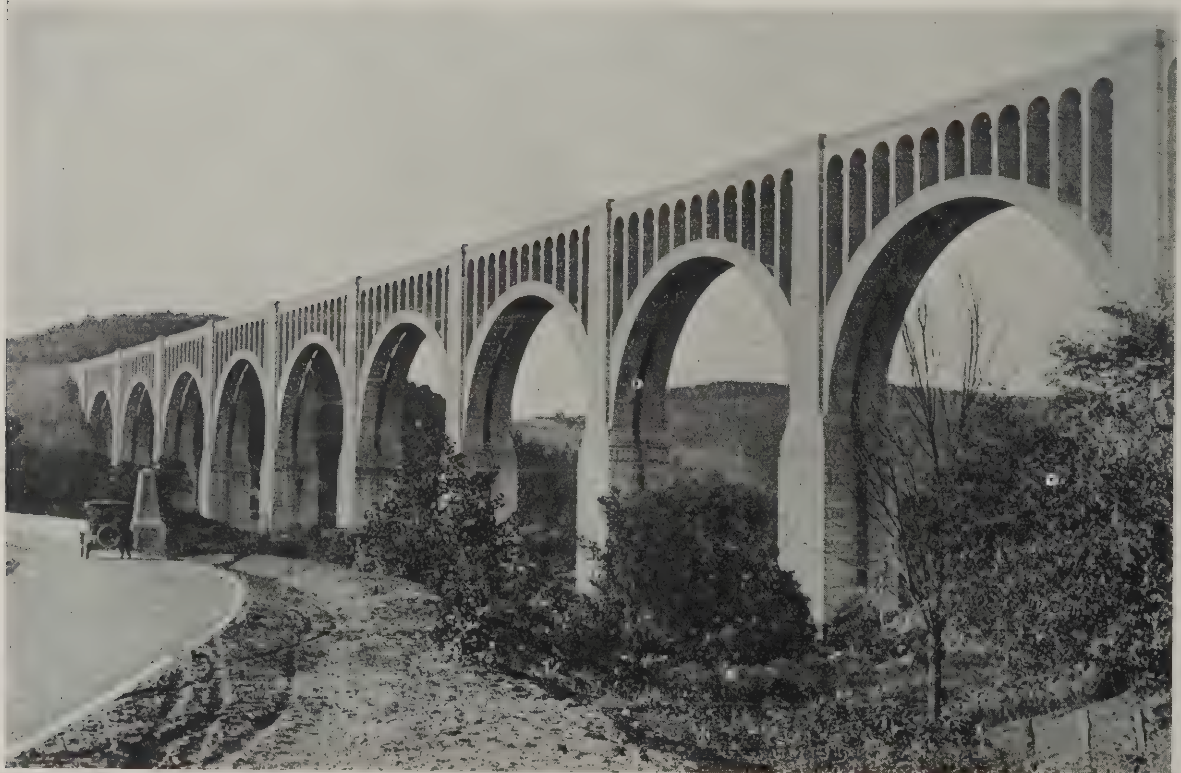


This street scene in Singapore reveals the picturesque in one or two utilitarian objects. The intricate ornament and admirable composition of the funeral bier, the Chinese signs, and even the Western lamp-post, are all works of art common to the Eastern street.—F. C.

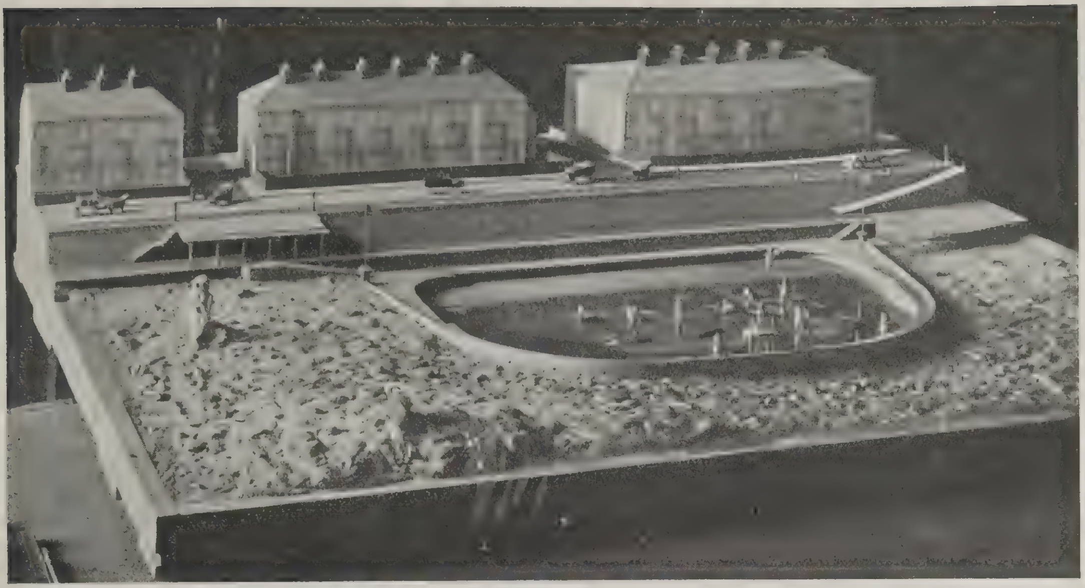




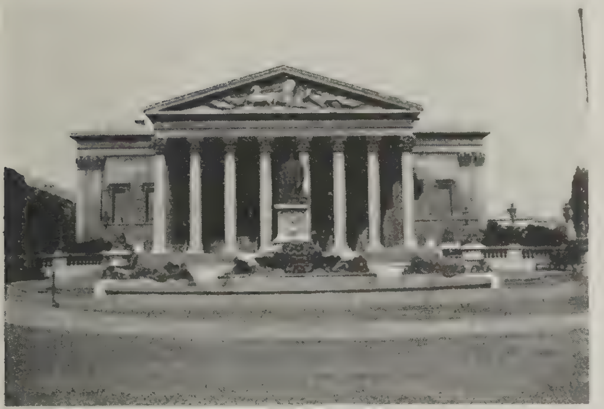
These two views of a Roman theatre at Fiesole are specially interesting in view of the articles appearing in THE JOURNAL on Architectural Acoustics. Plays are still produced in the theatre, and the acoustics are excellent—R E.E.



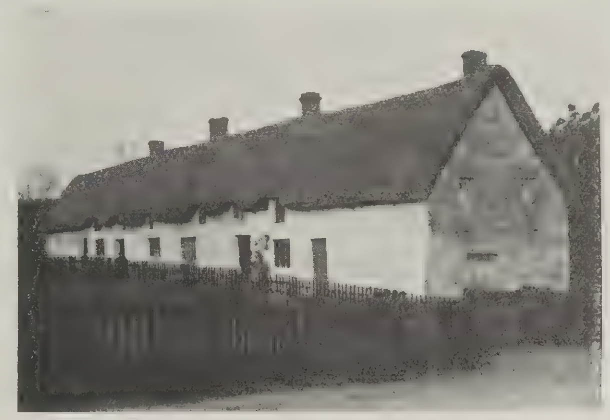
The Nickolson Viaduct, Pennsylvania, is the largest concrete viaduct in the world, and the foundations go down in the stream 90 ft. and 75 ft. on dry land. It is on the Lackawana Railway, and its construction shortened the line by thirty-eight miles. The old track now used for an automobile road, can be seen on the left of the picture.—R.



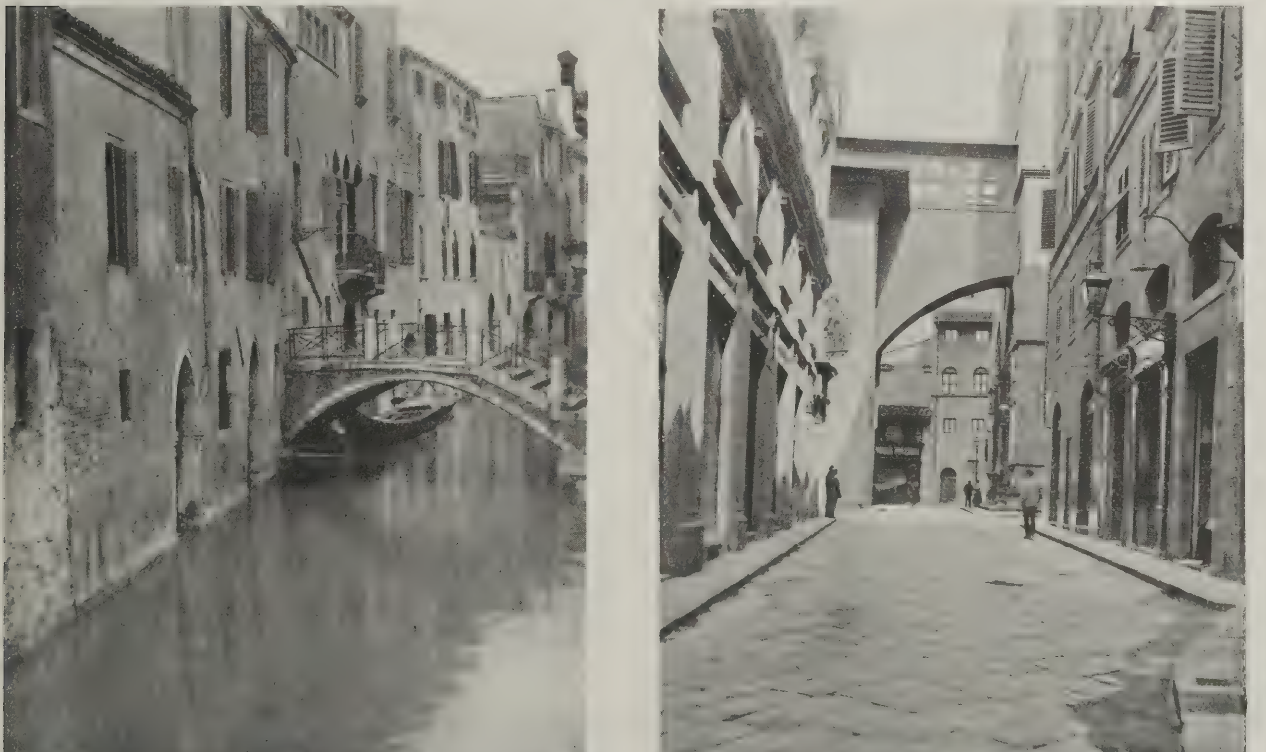
This model shows the general lay-out of the open-air bathing pool, one of the schemes to be begun shortly by the Hartlepool Corporation for the relief of the unemployed. The promenade and the new concrete road in the background are rapidly nearing completion.—E. E. O.



According to Latimer (the Bristol historian) the foundation stone of this building, the Victoria Rooms, Bristol, was laid on May 24 (Queen Victoria's birthday), 1838, and opened May 24, 1842. It cost approximately £23,000. The architect was Charles Dyer, and his name is cut in the frieze over the left-hand column.—H.



Ancient mud cottages at Naseby in Northants. Until about 1850 nearly all the smaller houses and farm buildings in this town were built of a mixture of mud and straw. The walls of the cottages are some two feet thick.—J. B. T.



These two snapshots show (left) a view on one of the smaller canals in Venice and (right) a street in Florence. The bridge in the former shows the characteristic Venetian curve. The bridge in the background of the Florence street, with its "half arch" treatment, is common in many Italian towns, and suggests the double purpose of flying buttress and means of communication.—J. V. D.

# R.I.B.A. Final Examinations

## Alternative Problems in Design

*Instructions to Candidates.*

1. The drawings, which should preferably be on uniform sheets of paper of not less than Imperial size, must be sent to the Secretary of the Board of Architectural Education, R.I.B.A., 9 Conduit Street, W., on or before the dates specified below.

2. Each set of drawings must be signed by the author, and his full name and address, and the name of the school, if any, in which the drawings have been prepared, must be attached thereto.

3. All designs, whether done in a school or not, must be accompanied by a declaration from the student that the design is his own work and that the drawings have been wholly executed by him. In the preparation of the design the student may profit by advice.

4. Drawings for subjects (*a*) are to have the shadows projected at an angle of 45 deg. in line, monochrome, or colour. Drawings in subjects (*b*) are to be finished as working drawings. Lettering on all drawings must be of a clear, scholarly, and unaffected character.

*Subject LXVII.*

(*a*) A COVERED WAY BETWEEN TWO GOVERNMENT BUILDINGS.—This covered way connects the first floors of two Government office buildings and spans a semi-private roadway which separates these buildings.

Its face would be set back 15–20 ft. from the line of the main façades of these buildings which are of the same architectural character. The covered way will provide a corridor with an internal width of 8 ft.

The distance between buildings is 50 ft. A pavement for foot passengers must be left on each side of the roadway.

The height from pavement to first-floor level of the buildings is 18 ft.

*Drawings :* ¼-in. scale. Half-plan at corridor level. Half-plan at ground-floor level. Elevation and cross section.

(*b*) Working drawings including ½-in. scale section and elevation of any previously approved design; the approved design to be submitted together with the new working drawings.

*Subject LXVIII.*

(*a*) Design for a SEASIDE HOUSE WITH GARAGE.—The area of land to be covered by buildings not to exceed 1,500 feet super. The accommodation to be provided on two floors.

*Drawings :* Two plans, four elevations, and one section to ⅛-in. scale.

(*b*) Working drawings, including ½-in. scale section and elevation of any previously approved design; the approved design to be submitted together with the new working drawings.

*Subject LXIX.*

(*a*) DESIGN FOR A SCHOOL LIBRARY.—The library is to be a double cube, measuring 55 ft. by 27 ft. 6 in. by 27 ft. 6 in. It is connected to the other school buildings by a covered way or cloister. One entrance will be from the cloister, and another from the playing fields. The arrangements of the book-cases are to be shown. A gallery, with convenient access thereto, is to run right round the room.

*Drawings :* Two plans, two elevations, and two sections to ⅛-in. scale.

(*b*) Working drawings to ½-in. scale of design Subject No. LXVII (*a*) (A Covered Way between two Government Buildings), if this design has been approved. The design to be submitted together with the new working drawings.

*Subject LXX.*

(*a*) AN ARCHITECTURAL TREATMENT AT THE HEAD OF A LAKE.—A large piece of ornamental water forming a lake, such as the Serpentine in Hyde Park, is supplied with water from a source situated at one end of the lake.

It is desired to treat a portion of the ground adjoining the lake's edge in a decorative manner, to include some feature symbolizing the supply of water to the lake.

The area available is 100 ft. by 200 ft., 200 ft. being the frontage to the lake.

*Drawings :* Plan at $\frac{1}{32}$-in. Main architectural features at ⅛-in. Details at ½ in.

(*b*) Working drawings of Design No. LXVIII (*a*) (Seaside House), provided that the design has been approved.

The drawings submitted under (*a*) to be submitted together with a new ground-floor plan showing drains, one section and one elevation all to ½-in. scale.

*Subject LXXI.*

*a*) A CEMETERY CHAPEL to seat sixty people.

Provide for ample porch, easy access for carriages, small vestries, and bell.

*Drawings :* ⅛-in. scale. Ground plan, east, west and south elevations, longitudinal and cross sections.

(*b*) Working drawings of Design Subject No. LXIX (A School Library). The design for the school library may, after it has been approved, be re-submitted with the addition of one ½-in. scale elevation and two ½-in. scales finished as working drawings.

The section to show the book-case fittings.

*Subject LXXII.*

(*a*) TEA HOUSE IN A PUBLIC PARK, consisting of a tea-room with open loggia on three or four sides, kitchen, offices, and retiring rooms for both sexes. The tea-room and loggia together accommodate 250 people at small tables.

The arrangement of the kitchen equipment is to be shown on the plan. Only light refreshments are to be served. Gas, water and electricity are laid on. Provision should be made for the washing and storage of crockery, glass, etc.

*Drawings :* ⅛-in. scale. Ground plan, roof plan, one elevation, one section.

(*b*) Working drawings for Design No. LXX (*a*) (An Architectural Treatment at the Head of a Lake), provided the design has been approved. The working drawings are to be to ½-in. scale, and are to be submitted together with the approved design.

*Dates for Submission of Designs in* 1923.

Subject LXVII, February 28.
Subject LXVIII, April 30.
Subject LXIX, June 30.
Subject LXX, August 31.
Subject LXXI, October 31.
Subject LXXII, December 31.

# Societies and Institutions

*R.I.B.A. New Members.*

At a general meeting of the Royal Institute of British Architects held last week, the following members were elected :—

As Fellows.—W. M. Epps, J. L. Fouracre, D. L. Solomon, B.Sc.Lond., C. W. W. Thompson, and T. Walker.

As Associates.—W. A. Devereux, A. S. Dunn, I. A. Moodie, and G. B. Scotland.

The Special War Examination of the Royal Institute of British Architects was recently held in London, Liverpool, and Leeds. Of the 197 candidates admitted, forty-one passed, and 156 failed to satisfy the examiners. The names of the successful candidates are as follows :—

F. J. Barton, F. E. Bennett, K. E. Black, R. Blain, S. V. Bradford, D. L. Bridgwater, R. W. Briggs, C. Button, H. S. Clark, H. A. Clist, A. Crombie, W. J. T. Godwin, W. L. Haile, F. Higginson, G. G. Howard, S. G. W. Hunt, I. R. Jones, W. King, C. J. W. Lindley, J. S. McKay, F. W. Marshall, C. E. Mee, H. C. Morton, A. J. Norcliffe, J. P. Nunn, N. R. Paxton, A. R. D. Pictor, F. K. Pope, T. R. Radford, C. H. Roberts, H. G. Simms, S. Simpson, I. G. Smith, J. E. Sterrett, T. Stott, E. J. Symcox, B. G. Warr, E. B. Webber, J. C. Williams, W. S. Wort, H. T. Wright.

*The Society of Architects' Annual Report.*

The thirty-eighth annual report of the Council of the Society of Architects tends to show that the forecast made last year of further progress and development was justified and that the Society was never in a stronger position than it is at present. This is particularly noticeable in regard to its finances. During a session of ten months some sixty-eight Ordinary, Council and Standing Committee meetings have been held as well as those of many Sub-Committees. In addition the Society's delegates have taken an active part in the deliberations of the various Joint Committees and conferences convened by the kindred institutions on which the Society is represented. The Society is represented on the following institutions and committees : R.I.B.A. Unification and Registration Committee; R.I.B.A. Board of Education; R.I.B.A. Conditions of Contract Conference and Drafting Committee; R.I.B.A. Building Code Committee; R.I.B.A. Competitions Sub-Committee; R.I.B.A. Joint Committee on Civic Surveys; R.I.B.A. Sub-Committee on Professional Charges; R.I.B.A. R.E. Headquarter's Mess Committee; R.I.B.A. Sir Christopher Wren Bicentenary Committee; Architects' Benevolent Society Council; Building Trades Parliament; Assistants' Welfare Committee; Architects' and Surveyors' Approved Society; Professional Classes' Aid Council; Beaux Arts Committee; Royal Academy Ateliers' Council; British Engineering Standards Association Committee on Sand Lime Bricks; Architects' Welcome Club, Olympia; Demarcation Conference (Plumbers and Heating Operatives).

The Council at its first meeting in November 1921 appointed the following Standing Committees and Boards: Art and Literature, Examination, Finance, Practice, General Purposes, Board of Examiners and Board of Professional Defence, whose reports are included in the report of the Council. It is stated that "The loyal support which the Council receives from the general body of members of the Society, gives it that sense of confidence which enables it to decide and act promptly in what it conceives to be the best interests of the members and of the profession in any matters which it is called upon to deal with."

### *Royal Institute of the Architects of Ireland.*

At the annual general meeting of the Royal Institute of the Architects of Ireland, held in Dublin, the president declared the election of Mr. G. P. Sheridan as president of the Institute for the coming three years.

The new Council is as follows: Messrs. H. Allberry, J. H. Webb, F. G. Hicks, F. Hayes, T. J. Byrne, R. M. Butler, R. H. Byrne, A. G. C. Millar, and J. J. Robinson. Mr. Sheridan has been a member of the Institute since 1896, and has been for many years a member of the Council, filling the office of treasurer during the years 1919-21.

### *The Grand Manner in Architecture.*

A lecture on "The Grand Manner in Architecture" was given by Professor T. Harold Hughes to the Glasgow Institute of Architects in the Engineers' Institute, Elmbank Crescent, Glasgow, last week. Mr. James Lochhead, president of the Institute, presided. Professor Hughes defined "The Grand Manner" as a building or group of buildings with the setting and relation to site and other buildings conveying the sense of an architectural scheme nobly conceived as a whole, and in which the accessory parts and details are subordinate to one fine idea.

---

# Architect and Engineer

## The Need for Collaboration

THE provinces of the architect and engineer touch at so many points that it is very desirable that there should be sympathetic collaboration between them. Let us consider a few instances.

In the past, towns, especially in this country, were usually laid out in the most haphazard fashion and, generally, the interests of the landlord and tenant were allowed to take precedence of those of the community. To-day the planning of new towns and the alterations to the old ones are considered more and more in their relationship to the advantages of the town as a whole; in short, the interests of the siteholder are regarded as subsidiary to the general welfare.

The picturesque appearance and the amenities of a town depend, of course, in the first place, on the ground contours and on the system of streets and roads, and the street system is the framework of the whole plan. The engineer always endeavours, *ceteris paribus*, to construct straight roads with easy gradients—it is an instinct with him—but the amenities of a town may not always be best served by this simple and straightforward method.

The electricity, gas, water, and sewage systems all fall within the province of the engineer; and the most economical layout of mains to meet the present and probable future requirements of the town must be left to him.

Where the collecting reservoirs or other sources of water supply are at such a level or pressure that pumping must be resorted to, with all the outlay in machinery, waterworks buildings, and power which it entails, collaboration between architect and engineer, when the town is being planned, may effect a diminution in initial outlay on pumping plant and buildings and a reduction in pumping costs later, which will be reflected in a lower water rate. Again, where a town is built on the top or on the side of a steep hill, and it is necessary to construct a water-tower at the summit to provide the necessary pressure-head and reservoir of water for the higher levels, this tower is such a prominent feature in the landscape and can make or mar the appearance of the town, that, although an engineering expedient, it ought, for æsthetic reasons, to be designed by an architect and not an engineer.

While electric power stations, gas, water, and sewage works all fall to the lot of the engineer, nevertheless, the architect has a right to expect that he shall be consulted when the choice of locations for these public works is under consideration. How many towns in this country are disfigured unnecessarily by carelessness and indifference in this respect?

Moreover, the architect should be consulted in regard to the allocation of sites for all factories within the area of the town plan, as well as for the buildings composing the factories, so that the amenities of the district need not suffer.

It is obvious that the sewage and drainage system is so closely related to the contours, gradients, and street system of the town plan, that economic sewage disposal necessitates close collaboration between architect and engineer.

Bridges or aqueducts, whether of stone, brick, reinforced concrete or steel, clearly belong to the province of the engineer, but the decorative treatment of the approaches, roads, and parapets, ought, without exception, to be left to the architect.

Indeed, we should like to think that in future the architect's advice will be generally sought in regard to the treatment of the whole of the exterior surfaces of all bridges in towns, and that he will also have an opportunity of expressing his opinion when the locations of these bridges are being considered.

Where the bridges are viaducts, and hence form definite links in road and street system, this should present no difficulty, but when the bridges carry railways and canals, it is desirable in the interests of the town that the engineer and architect should confer.

A river (and in some cases a canal) flowing through a town usually provides one of the greatest opportunities for decorative landscape treatment in respect of the embankments and boulevards, which can be laid out along its sides. And, if for no other reason, the railway tracks in a town should not run by the sides of rivers.

When the town plan is being prepared, it is desirable to allocate the sites for electric power stations, gas, water, and sewage works, and to indicate the routes for railway tracks. For the capital sunk in these undertakings is so considerable that if they have been laid down haphazard at the beginning, it is very difficult, owing to the great cost involved, to obtain powers to have them removed to more suitable locations at a later date.

There are many materials employed by both engineers and architects; we may instance: varieties of building stones, timbers, cast-iron columns, rolled steel joists, concrete, and reinforced concrete, etc., etc. Scientific research and testing of these materials are carried on constantly for the purpose of preparing specifications suitable for the most general practical applications.

The British Engineering Standards Association carries out work of this kind on some of these materials, and it is certain that an enormous amount of scientific research remains to be done, especially on building stones and timbers.

And there seems to be no good reason why architects and engineers should not combine in this work for their mutual benefit and to prevent overlapping and waste of labour and expense in research. The architectural and engineering institutions could do very much to bring about a closer working union between these two professions. By means of joint meetings at which papers are read by architects and engineers it should be possible to show that in the interests of the community at large a fresh demarcation of work, combined with closer collaboration, is necessary to provide full opportunities for town planning.

T. W. MACALPINE.

## List of Competitions Open

| Date of Delivery. | COMPETITION. |
|---|---|
| Feb. 1 | War Memorial to be erected in the Public Park, Brechin, adjacent to the Gleneadam Railway Bridge. Cost not to exceed £1,200. Apply Mr. F. A. Ferguson, Town Clerk, Brechin. |
| Feb. 28 | Scheme for the distribution of drinking water for the town of Mantes-sur-Seine. Apply Mairie, Mantes, or at the offices of La Renaissance des Cités, 23 Rue Louis le Grand (11c). Premiums: 4,000, 3,000, and 2,000 francs. |
| March 31 | War Memorial for Port Said, Egypt, to the memory of the soldiers of the Australian and New Zealand Forces who fell in Egypt, Palestine, and Syria during 1916, 1917, and 1918. Premiums: 250 guineas, 100 guineas, and 50 guineas. Apply High Commissioner for Australia, Australia House, Strand, W.C. |
| March 31 | War Memorial in Crow Nest Park, Dewsbury. Assessor, Professor C. H. Reilly, O.B.E., M.A., F.R.I.B.A. A copy of the conditions together with plans of the site may be obtained on application to Mr. H. Dearden, A.R.I.B.A., Borough Surveyor, Town Hall, Dewsbury, on payment of one shilling. |
| No date | New Town Hall for Cork. Limited to Architects living or practising in Ireland. |

## Competition News

*Bournemouth Pavilion Competition.*

The President of the R.I.B.A. has nominated Sir Edwin Cooper, F.R.I.B.A., as assessor in this competition.

*Tunbridge Wells Pavilion Competition.*

The President of the R.I.B.A. has nominated Mr. E. Guy Dawber, F.S.A., F.R.I.B.A., as assessor in the above competition.

*Castleford Cottage Hospital Competition.*

Members of the Society of Architects are requested not to take part in the Castleford Cottage Hospital Competition without first ascertaining that the conditions have been approved by the Council of the Society.

## Builders' Hours and Wages

The building operatives under an agreement of last May have been receiving 1s. 8d. an hour for a forty-four-hour week. As the agreement expires in March the National Wages and Conditions Council met last week to consider the question of a revision. Nearly 800,000 men are affected.

Prior to this meeting the Joint Industrial Council for the Building Trades, which comprises a large number of employers' and workers' representatives from all parts of the country, met at the Ministry of Labour to consider questions affecting the industry generally. Decision on the hours question was reserved for the conference of the Wages and Conditions Council, which sat in London later.

The agreed official report was as follows:—"Upon the invitation of the National Wages and Conditions Council for the building industry, a meeting of the executives of the various organizations affiliated to the council was held to-day under the chairmanship of Mr. S. Easten, at Montagu House, Whitehall, for the purpose of securing a better understanding of the position by those whose province it is to secure the application of the council's awards, as to which difficulties have been experienced from time to time.

"As this was the first meeting of the kind since the Wages and Conditions Council was established, some review of its work took place, and some of the difficult questions about to be considered by the council were referred to. Eventually a vote of confidence in the council was carried unanimously, and the meeting adjourned."

The National Wages and Conditions Council for the building industry met for the consideration of the proposals, and upon adjourning it was stated by the representatives of the operatives that a "serious situation" had arisen. Matters, it was added, had reached a deadlock, and the conference had broken down.

## Lancs and Yorks Railway Company's Memorial

This war memorial is placed in the booking hall at Victoria Station, Manchester. It is 30 ft. long and 5 ft. high, and is executed, in high relief, of cast bronze, weighing over two tons. The general conception of this tablet was due to Mr. Henry Shelmerdine, who was at the time architect to the Lancashire and Yorkshire Railway, and the design and execution of the work was placed in the hands of Messrs. George Wragge, Ltd., of Salford, in whose works many ex-service men assisted in its production. The tablets, of which there are seven, contain the names of 1,470 men who gave their lives in the Great War, each tablet being framed in enriched laurel borders, and over each one the arms of the principal towns of the Lancashire and Yorkshire Railway service—Liverpool, Bolton, Preston, Halifax, Huddersfield, and Bradford. A base of green marble completes the memorial. At each end of the tablets are finely modelled figures depicting St. Michael and St. George, each framed with pilasters, on which are the torches of Unity, Courage, Sacrifice, and Strength.

## Coming Events

*Wednesday, January 17.*

Northern Architectural Association.—"The Rise and Fall of English House Design." By Mr. Nathaniel Lloyd.

Royal Society of Arts.—"Hygienic Methods in Painting—the Damp Rubbing Down Process." By Mr. C. A. Klein.

Royal Academy.—"Architecture and Decoration." By Sir Reginald Blomfield, R.A. 3.30.

*Thursday, January 18.*

Edinburgh Architectural Association.—"The Work of the Mediæval Builder." By Professor G. Baldwin Brown, M.A.

Birmingham University.—Lecture on "Town-planning." By Mr. H. H. Humphries, M.Inst.C.E.

Institute of Structural Engineers.—Finance and General Purposes Committee. 5.30.

*Friday, January 19.*

Art Workers' Guild.—"Pastels."

Institute of Mechanical Engineers.—Symposium of Papers on "Indicators."

*Monday, January 22.*

R.I.B.A.—"The London County Hall." By Messrs. Ralph Knott and W. E. Riley. Award of Prizes and Studentships.

Institute of Structural Engineers.—Membership Committee.

Institute of Mechanical Engineers.—Graduates' Section. Informal Discussion: "The Value of College Training to Engineers."

Stillness Road Commercial Evening Institute.—Lecture on "Salesmanship." By Captain Oliver A. Minns.

*Tuesday, January 23.*

Liverpool Architectural Society.—"Some Notes on the Details of Theatre Construction." By Mr. T. R. Milburn, F.R.I.B.A.

The following other lectures will be given in the Royal Academy Galleries on Wednesdays, at 3.30:—

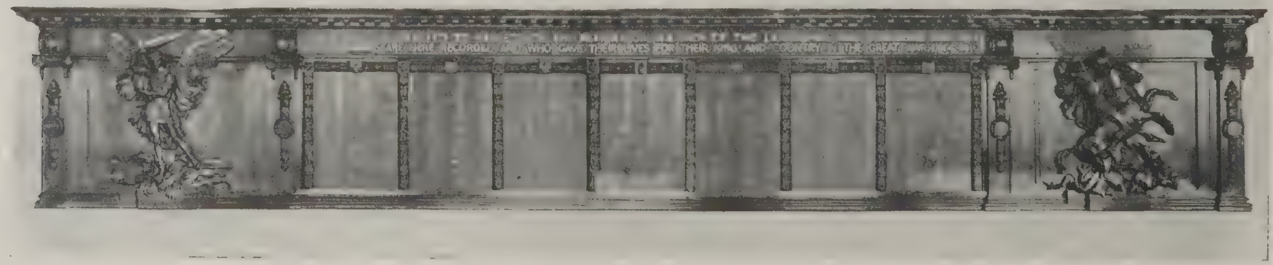
January 24.—"Decorative Painting," Mr. George Clausen, R.A. Chairman, Mr. Charles Sims, R.A.

January 31.—"The Rise, Aims, and Early Days of the Arts and Crafts Movement," Mr. Selwyn Image. Chairman, Mr. Sydney C. Cockerell.

February 7.—"The Influence of the Arts and Crafts Movement on Architecture," Mr. A. R. Powys. Chairman, Mr. Emery Walker.

February 14.—"The Crafts and Life," Lord Ferrers. Chairman, Mr. R. Anning Bell, R.A.

February 21.—"The Everyday Crafts," Mr. Henry Wilson. Chairman, Mr. W. R. Lethaby.



WAR MEMORIAL TABLET AT VICTORIA STATION, MANCHESTER.

# The Week's News

### *New Bells for Eastrington Church.*

A peal of bells is being installed in Eastrington Church.

### *Howden and a Smallpox Hospital.*

Howden Rural District Council are onsidering the question of providing a mallpox hospital.

### *Resignation of North Riding Architect.*

Mr. W. H. Brierlay, F.R.I.B.A., F.S.I., of York, has tendered his resignation as county architect to the North Riding County Council.

### *The late Colonel J. B. Wilson.*

The death has taken place in Glasgow of Colonel J. B. Wilson, architect. He had been for very many years connected with the 3rd Lanark Volunteers, afterwards 7th Battn. Scottish Rifles.

### *Mansion as Hospital.*

Lord Tredegar has given to the King Edward VII Welsh National Memorial Association a country mansion known as Cefr Mably, situate between Newport and Cardiff, to be used as a hospital for tubercular patients. The cost of conversion is estimated at £41,000.

### *New Partnership.*

Mr. H. Austen Hall, F.R.I.B.A., has entered into a partnership with Mr. T. B. Whinney, F.R.I.B.A. The name of the firm will be Whinney, Son, and Austen Hall, and the practice will be carried on from 8 Old Jewry, E.C., and 6 New Burlington Street, W.1.

### *Grosvenor Galleries.*

Early in February the following exhibitions will be opened at the Grosvenor Galleries: Landscapes by Sir John Lavery, R.A.; Still Life and other Pictures by E. Q. Henriques; London and other Landscapes by H. J. Gunn; Portrait Drawings and Landscapes by William Rothenstein.

### *Roman Remains at Bath.*

The Bath City Council have decided to demolish the derelict buildings at the east end of the Roman Baths and excavate the site, with a view to opening up any Roman remains found. It is known that part of the original Roman Thermæ occupied this site, and it is hoped that some interesting discoveries will be made.

### *Arterial Roads in Surrey.*

The Surrey County Council have decided to co-operate with the Ministry of Transport and the London County Council in the construction of two new arterial roads in Surrey, and the work is to be put in hand at the earliest possible moment. The total estimated cost is £490,000.

### *Alabaster Figures in the Victoria and Albert Museum.*

The National Art Collections Fund has purchased and presented to the Victoria and Albert Museum a complete set of alabaster figures in relief of the Twelve Apostles, English work of the fifteenth century. Although isolated figures of the Apostles exist in public and private collections, no other complete set is at present known.

### *The late Mr. G. T. Brown.*

The death has taken place of a well-known Sunderland architect, Mr. George T. Brown. Mr. Brown was at one time president of the Northern Architectural Association, and it was principally through his interest that the School of Architecture was founded in connection with the Armstrong College at Newcastle.

### *Aberdeen Art Gallery.*

Instructions have been given to Mr. A. Marshall Mackenzie, R.S.A., LL.D., architect, to prepare specifications for the new hall and additional accommodation in the Art Gallery, Aberdeen, and for a war memorial court. The expenditure represents over £66,000. A sum of £20,000 is being provided by Lord Cowdray.

### *Changes of Addresses.*

Messrs. Newman and Jacques, architects and surveyors, have moved from 2 Fen Court, E.C.3, to 61 West Ham Lane, Stratford, E.15.

Mr. Frank Windsor, F.R.I.B.A., M.S.A., has moved to new offices at 56 High Street (Scarbrook Chambers), Croydon. He commenced practice in 1899.

### *Building Work at York.*

The Ministry of Health have sanctioned the raising of the following loans by the York Corporation: Alterations at Fairfield Sanatorium, including nurses' quarters and stockman's cottage, £2,902; furnishings and ambulance, £836. Married men's quarters are to be completed in connection with the fire station. The York Housing Committee are recommending the Corporation to advertise for tenders for thirty additional houses of the parlour type, to be built on the Tang Hall Estate, and to sell some building sites at Acomb.

### *£500,000 Building Sale.*

The Manchester Corporation Improvements and Buildings Committee have accepted the offer of a United States syndicate to purchase Victoria Buildings, which include the Victoria Hotel, leased to Messrs. Spiers and Pond, scores of offices, and an arcade. The work of demolition will begin almost at once and an imposing hotel, containing about 700 bedrooms, will be built on the site, which covers an area of 5,600 square yards. In addition to the hotel an up-to-date arcade will be built. The purchase price is understood to be £500,000.

### *Slum Clearance in Scotland.*

Scottish cities have the clearance of slum dwellings under contemplation. At Greenock the area scheduled includes 1,400 houses, besides workshops and offices. A total outlay of £300,000 is contemplated. For Dundee the cost of the complete scheme would be £792,066. A report is being sent by the Town Council to the Scottish Board of Health. The Housing Committee of Aberdeen Town Council are also placing a report before the Board of Health. The scheme provides for the clearance of a large area, and the demolition of 1,099 houses, and the erection of 1,120 new houses at an estimated cost of £587,500.

### *Rates of Interest for Housing.*

The Ministry of Health in "The Ministry of Health (Rates of Interest) Amendment Order (No. 2), 1922," just issued state: "Subject as hereinafter provided the Ministry of Health (Rates of Interest) Amendment Order, 1922, (*a*) and all Orders made before the date of this Order fixing special rates of interest in respect of particular local authorities are hereby revoked. As from the date of this Order the Ministry of Health (Rates of Interest) Order, 1921, (*b*) shall have effect as if the words "five-and-a-half per cent." were substituted for the words "six-and-a-half per cent." and the words "five per cent." for the words "six per cent." in the Schedule to the said Order: Provided that nothing in this Order shall affect the rate of interest on any advance made or any expenses incurred by a local authority before the date of this Order."

### *The Government and Housing.*

The Cabinet Committee which, under the chairmanship of the Minister of Health, Sir A. Griffith-Boscawen, is considering the whole housing situation has not yet completed its inquiries, but its report will be ready in ample time to be made the basis of the housing proposals which the Government will lay before Parliament in the coming session. These proposals will, in the main, states "The Times," be devised to encourage private enterprise to develop again its great resources in the provision of houses which enabled it to supply 95 per cent. of the dwellings built for the working classes in the years before the war.

### *Glasgow School of Architecture.*

The first exhibition and "criticism" of the session has been held in the School of Architecture of the Glasgow School of Art. Professor R. S. Rait, LL.D., gave a short lecture on college chapels, and Mr. G. Paterson, F.R.I.B.A., Vice-President of the Glasgow Chapter of the Incorporation of Scottish Architects, gave a criticism of the designs prepared as the first part of the session's work. At the conclusion of the criticism a lecture was given to the School of Architecture Club by Mr. Allan D. Mainds on "Æsthetics."

The following designs were placed first in order of merit:—

First year, Mr. F. R. Wylie.
Second year, Mr. P. McNeil.
Third year, Mr. L. G. Farquhar.

### *Scotland's War Memorial.*

The proposal to place the National War Memorial within the precincts of Edinburgh Castle has caused a good deal of discussion in Scotland, especially in regard to its effect on the existing Edinburgh Castle buildings. A second report by the Ancient Monuments Board of Scotland to the First Commissioner of Works has been issued objecting to anything that will effect a marked change in the outline of the castle, an outline which has remained substantially the same for nearly 600 years. The proposed shrine, adds the report, "as viewed from the streets on the north and east or from any aspect outside the city, would form an isolated and dominant feature foreign to the traditional character of the castle buildings and decidedly superseding the Crown Square block as the centre of interest."

# Zoning in the Control of Large Cities

MR. FRANK HUNT, a member of the Council of the Surveyors' Institution, in reading a paper before that Institution on "Zoning in the Control of Large Cities," said that the term "zoning" as used for the purpose of his paper came from America, and was there defined as being, in relation to city planning—

> "action by the State, or by the city under the authority of the State, to control, under the police power,
> (*a*) the heights to which buildings may be erected;
> (*b*) the area of lots that must be left unbuilt upon; and
> (*c*) the uses to which buildings may be put."

Like so many of the words that had passed into current use on the other side of the Atlantic, "zoning" was not a strictly correct word to use in this connection. With us the standard definition of the word "zone" was "a belt or girdle; any well-marked band or strip running round an object"; but perhaps it was unnecessary for one to be a purist in this matter as long as it was clear what was the exact meaning attached to the word in our use of it, and so long as it served a useful purpose.

Americans themselves had felt the inadequacy of the word, and frequently the term "districting" was used as an alternative. This was perhaps a little closer to the real meaning although it still left something to be desired.

It will have been noticed that in the definition of "zoning" emphasis was apparently attached to the fact that the regulations were made under the "police power." It did not mean that it had any relation to police as the word was understood in this country, but rather to one of two separate doctrines arising out of the American Constitution. A power to make regulations and laws for the comfort and protection of the subject and the good government of the community fell within that section of American jurisprudence known as "police power," and not under the doctrine of "eminent domain." When property was taken under the power of "eminent domain," compensation must be paid to the owner if he could prove damage, but no such compensation was paid for limitations imposed upon the use of a property if those were imposed under the "police power." It appeared that in America various State Courts, as well as the United States Supreme Court, had decided conclusively that zoning regulations as adopted in the United States did fall under the "police power." The regulations dealt not only with limitations as to the height of and space about buildings, but also as to user, and, it had been stated, they broadly extend to public health, safety, and morals, the public convenience, and the general prosperity of the community. This extension to general convenience had apparently been needed because it was felt that if "police power" extended only to public health, safety, and morals, it might be difficult in certain circumstances to show by conclusive evidence that every detail of a zoning scheme came within a competent exercise of the "police power"; but with the scope so extended, it was hoped that every feature of it could be shown to be a legitimate exercise of the "police power."

With regard to the question of the application of town-planning provisions to built-up areas, Mr. Hunt said that this was an important matter for consideration. Proceeding, he said: Two important reports—that of the Royal Commission on Housing in Scotland, 1917, and of the Departmental Committee on Unhealthy Areas, 1921—have recommended such an extension of the Act. The Royal Commission on Housing in Scotland in their report say:—

"1874. The powers of the local authority to ensure proper development of their presently unbuilt-upon areas by operations under the town-planning section of the 1909 Act are so far an advance upon those previously possessed, and are capable of being exercised without undue payment of compensation, that we have considered whether the areas already built upon should be brought into line with the unbuilt-upon areas which are controlled by suitable town-planning regulations. We have concluded that there are such obvious advantages in an extension of the principles of the town-planning section of the 1909 Act, as applied to an undeveloped area, to a congested area, that those principles should be extended to the town-planning of built-up areas in order that future developments in such areas may be suitably regulated.

"1875. It should be competent to effect the replanning without the owners of slum and other property being permitted to benefit by the improvement at the public expense. The amended legislation should provide that no new building should be erected within the built-up area, and no alteration to an existing building should be made, unless such new building or such alteration conforms with the new town plan; that is to say, no new interest should be permitted to be created that would ultimately need to be bought out at the public expense. Where an owner desires to demolish or rebuild, the local authority should have power to purchase, under special safeguards for the public purse; that is, on the basis of compensation recommended in chapter xxiv. The local authority should have power of compulsory excambion as amongst the various owners, and should have vested in them the ownership of the solum of streets that may be closed under the town-planning scheme."

The basis of compensation in chapter xxiv, referred to in the extract, has been, in its main particulars, given effect to by the Acquisition of Land (Assessment of Compensation) Act, 1919.

The Departmental Committee presided over by Mr. Neville Chamberlain to consider slum areas endeavoured to follow this line of thought, and apply it to slum areas and the immediate neighbourhood which was likely to develop into slums, and their recommendations on this point are as follows:—

"(1) That the town-planning powers should be extended to enable local authorities to prescribe the lines of main traffic routes and to arrange for 'zoning' built-up areas;

"(2) That reconstruction schemes under Parts I and II of the 1890 Act should conform to a plan of the whole town concerned, together with its surrounding area, such plan to provide for the ultimate distribution of dwelling-houses, commercial and business premises in the area."

With regard to the town-planning of built-up lands they say:—

"*Town-Planning Built-upon Lands.*—We believe that interest in the subject would be greatly stimulated if town-planning powers were extended to land already built upon, as is the case in Canada, and to some extent in the United States. It is not necessary to introduce any complex conditions or procedure, but local authorities should have the power in the public interest to prescribe the lines of main traffic routes, and also to arrange for 'zoning' in a built-up area. In this connection we should like to call attention to the evidence of Mr. Lawrence Veiller, Secretary to the National Housing Association of the United States. Mr. Veiller informed us that the practice of 'zoning'—that is of dividing a town into a number of districts and then prescribing for each district certain restrictions upon the user and height of buildings as well as the proportion of site to be occupied by them—had been adopted in some fifteen cities, of which the most important is New York, and that it had proved a popular and practical innovation. It is significant that where zoning has been adopted after careful preparation of public opinion no compensation has been paid, and no complaints have been made public. It has, in fact, been found that values have been stabilized instead of being disturbed by the process."

The first purpose of town-planning of built-up areas recommended by the committee is in order to prescribe the main traffic routes. The object would be to secure by town-planning such new streets as are now constructed as street improvements, and it is an important question as to how far such town-planning would be economical and efficient for the purpose. As examples, in London, Charing Cross Road and Shaftesbury Avenue may be taken, in order to consider how far the conditions would involve difficulties in such circumstances in case a town-planning scheme were put into effect to secure such main traffic thoroughfares. These were constructed by the Metropolitan Board of Works some considerable time ago, but they, no doubt, are typical of the conditions still existing in London in districts of a similar character.

Information as to the ownership of property at the time when the streets were constructed is available, and it reveals an extraordinary complexity in the number of interests involved. In some cases the new streets absorbed the whole, or practically the whole, of a property, whilst in other cases little or no part was taken by the actual street sites.

The plots, according to the existing ownership, on the frontages to the new street would be, as a rule, inadequate for the development for premises of character suitable to such streets. addition to the number of interests at would have to be dealt with, there the difficulty of synchronizing suffi ntly the work of re-development to oid great loss. While it would be easy lay down a plan to which all building ould conform, the practical difficulties giving it effect in conditions of such mplexity would be great, and it may doubted whether a new street would be ured more cheaply, or anything like expeditiously, by town-planning as mpared with the present method of rchasing outright the property that is considered necessary to acquire, and ling or letting the surplus land not quired for the site of the street.

It is probable that the difficulties which uld have militated against the success carrying out of a scheme of town anning in the West End would equally ply in connection with slum clearance eas, as experience has always shown e number of separate owners to be great, d the holdings to vary considerably size. The reconstruction would in lve very complicated legal proceedings, ich, under the present condition of our nveyancing law, render it impracticable the score of cost alone to effect any heme of rearrangement of holdings.

As already explained, the American hemes are based upon the exercise of e "police power," which involves the yment of no compensation. The glish code has proceeded on different es in town-planning an unbuilt-upon ea; the interests concerned are much s complicated than those met in dealing th a developed district, and in a large oportion of the land covered by a town anning scheme the building element is rdly apparent. Town-planning hemes, therefore, under English legis ion present the simplest phase of this oblem, and yet the Legislature had ovided that, if damage can be shown by owner arising from the making of the eme, compensation is payable by the thority. It is true that claims for com nsation cannot be made in respect of y restrictions imposed similar to those ich existing legislation or by-laws uld demand; and it is specifically pro ded that compensation cannot be arded if the provisions of a scheme pre ribe, with a view to securing the ameni s of the area, the space about buildings, limit the number of buildings to be ected, or prescribe the height and aracter of the buildings, such pro sions being considered by the confirm g authority to be reasonable.

The general attitude of the legislation this question of compensation was cidentally considered in the Court of ppeal in 1920 on a case arising under the wn-Planning Scheme for the Ruislip rthwood area. Under the scheme a ilding line was defined for the High reet, which had the effect of seriously d injuriously affecting a long, shallow ot of land which the owner considered e for the erection of shops, and after oceedings before the Arbitrator and e High Court, the case ultimately ached the Court of Appeal. In the urse of the judgment of Lord Justice ve he discusses the question of the right an owner under the Town-Planning t to compensation. For this purpose e following extract is illuminating, not ly as representing his view, but by reason of the fact that he quotes decisions of eminent judges in times past with approval, but by reason also of the fact that those have been the judgments of other courts on similar questions on previous occasions :—

"In connection with this and the next question it must be borne in mind that we are here considering an Act which expressly and in terms recognizes the right to compensation in respect of property injuriously affected by the scheme, and that, in examining these parts of the Act which create exceptions, the canon of construction applicable is that they must not be deemed to take away or extinguish the right unless it appear by express words or by plain implication that it was the intention of the Legislature so to do. *Western Counties Railway Company* v. *Windsor and Annapolis Railway Company* (1). Brett, M.R., in *Attorney-General* v. *Horner* (2) states the rule in these terms : 'It is a proper rule of construction not to construe an Act of Parliament as interfering with or injuring persons' rights without compensation unless one is obliged to so construe it. If it is clear and obvious that Parliament has so ordered, and there is no other way of construing the words of the Act, then one is bound to so construe them; but if one can give a reasonable construction to the words without producing such an effect, to my mind one ought to do so.' Lord Davy, in *Commissioner of Public Works* (*Cape Colony*) v. *Logan* (1) says : 'Such an intention,' i.e., an intention to take away property without any compensation, 'should not be imputed to the Legislature unless it be expressed in unequivocal terms. This principle has frequently been recognized by the courts of this country as a canon of construction.' And finally, Bowen, L.J., in *London and North Western Railway Company* v. *Evans* (2) sums up the matter thus : 'The Legislature cannot fairly be supposed to intend, in the absence of clear words showing such intention, that one man's property shall be confiscated for the benefit of others or of the public without any compensation being provided for him in respect of what is taken compulsorily from him'; and a little further on he adds that this maxim and another are 'doctrines of sound sense and obvious justice, to be borne in mind in dealing with legislation which cannot be supposed, unless it so explicitly states, to neglect what is . . . natural justice.'"

In the light of the practice of Parliament and the judicial interpretations of the general attitude on the subject, it is almost certain that a zoning proposal would almost certainly carry with it, in contradistinction to the American system, compensation to a large extent.

With regard to the application, in its simplest form, of the principles of user-zoning to substantial built-up areas, it might safely, I think, be stated that in London, as well as in other large towns, there are considerable areas practically limited to residential purposes, with premises, of course, for the necessary ancillary purposes, in the interests of which it would be desirable that the present unrestricted right of user should be controlled. This is, perhaps, eminently desirable just now when large estates are being broken up and numbers of owners substituted for one. I could quote a recent example where about 70 acres in London, almost entirely residential property, was offered for sale. The lessees or occupiers of the houses were given the first opportunity of purchase, and about two-thirds of the property was disposed of in that way. The result was that where there was one ground-owner, able to exercise control of user in the interests of the general estate, there are now some hundreds of owners, each free to use his particular property for the purpose he finds most advantageous, regardless of the effect on other property.

An examination of the prices obtained indicates that even in a comparatively central estate of this kind a town-planning scheme limiting user might have been made without compensation. The estate was originally built between 1840 and 1847; the leases of the existing houses had from eighteen to twenty-five years to run; and, generally, the prices obtained only represented the value of the property according to present use.

Since the date of the development of that estate a large part of the county of London has been built. In 1851 the population of the county was 2,363,341, or slightly more than one-half the present population of 4,484,523, while in area the proportion developed since 1851 is greater than one-half. It therefore seems probable that a large part of the built-up area of the county, perhaps much greater than one-half, could be zoned for user without involving payment of compensation.

In the rest of built-up areas, where the property has obtained a potential value for other purposes, restriction of user would be the subject for compensation, and if carried out extensively would involve considerable cost. On the other hand, such limitation of user would have some effect in increasing the value of other property; so that, while the town-planning authority would bear all the loss in respect of the injury inflicted, the private owners would reap the profit from the operation of the scheme without a very extensive scheme of betterment. In such areas it would therefore be necessary to proceed with caution.

It may be concluded from this that the possibilities of zoning in the control of even the built-up portions of large cities in this country are considerable, particularly in regard to user-zoning.

For user-zoning it is necessary to have full information of the present use of property, and for this purpose careful surveys are necessary to be made. In reading the American papers on the subject one is struck by the thoroughness with which the survey is carried out, and the completeness of the maps and studies which are prepared for the purpose of zoning ordinances.

In 1904 a user-survey of the central parts of London was made by the London County Council at the request of the Royal Commission on London traffic. This was before the question of zoning and town-planning came to be the subject of general discussion, and the categories of user under which the information was prepared were as follow :—

(1) Commercial and industrial (including private buildings);

(2) Residential;

(3) Commercial and residential mixed (including houses and shops and similar property);

(4) Railways and canals;

(5) Public open spaces;

(6) Land not built upon (including private squares, vacant building sites, etc.);

(7) Streets.

The information was condensed and indicated on a 6 in. map, which is shown on Plate CVI, sheets 1 and 2, in Volume 6 of the Report of the Royal Commission, while interesting statistics of the proportion of each class of property in the wards and parishes of the area dealt with and statistics under other heads are given on pages 758–779 of Volume 3 of the Report of the Royal Commission.

It is on the advantages of user-zoning that the American reports lay the greatest emphasis. They point to the disadvantages of uncontrolled development and to the results of the intrusion into choice residential districts of the "apartment house," the public garage, and even of industrial premises, possibly carrying on some noisy, dusty, or offensive process. By user-zoning this condition is obviated, and, it is claimed, great advantage is secured in the stabilization of property values, the protection of health and comfort, and the avoidance of waste by the scrapping of buildings in "blighted districts."

Our experience of uncontrolled development, subject to existing legislation as to height of buildings, width of way, etc., has resulted, in the case of London, in a dense mass of building intermixed without any regard to character, user, or suitability of position for the various purposes, extending over a distance of nearly 25 miles north and south and east and west, with inadequate provision for open spaces, recreation, or general amenities. Under a well-considered zoning scheme sites most suitable for industry would have been restricted for that purpose, the best sites for residences would have been used mainly for such purposes, and the creation of slums due to bad arrangements, narrowness and over-crowding of buildings on sites, would have been rendered impossible. All restrictions in the past to prohibit the growth of a town have failed, as witness the ineptitude of the attempts in the time of Elizabeth and Cromwell; and it would appear that the only hope of controlling the development of big cities in the future would be the careful and systematic town-planning and zoning of undeveloped areas and the application of the same procedure, as far as practicable, to built-up land, with the view of controlling its present use and its re-development in the future when it comes to be rebuilt.

## Northampton Polytechnic Institute

The annual distribution of prizes has taken place at the Northampton Polytechnic Institute before a large number of visitors. Dr. S. Z. de Ferranti, past-president of the Institution of Electrical Engineers, who gave a most stimulating address, presented the prizes and certificates. A vote of thanks to Dr. Ferranti was moved by Mr. Frank Gill, president of the Institution of Electrical Engineers, and seconded by the Mayor of the Borough of Finsbury. The vote of thanks to the chairman, Mr. L. B. Sebastian, the chairman of the Governing Body, was moved by Sir Frank Dyson, the Astronomer Royal.

## Town-Planning and Ideal Cities

Mr. William Haywood, F.R.I.B.A., in the course of a lecture on "Town-Planning and Public Opinion," at the Birmingham University, said: Town development tends to foster civic consciousness, but where the reverse of this obtains, and consciousness is precedent, better results in town development will usually be achieved. Where initiative lies with the local authority, as in England, the support of a keenly interested public will obviously add great strength to municipal enterprise, and on the sociological side the value of private effort is still more obvious.

Communities in other countries show more civic activity than we have yet exhibited. Dusseldorf is an example of great civic progress made largely upon the initiative of business men. Chicago is the best illustration of civic enterprise inspired by a community. America has passed no Town-Planning Act which resembles the English model, and she remains of opinion that the work is best dealt with in its early stages by private effort. The city plan (in its widest sense) is regarded as a business proposition, and best developed under the direction and control of business people. Political administration, whether by the city or the State, is felt to be subject to too frequent a change of personnel and policy, conditions which are largely discounted where the public itself can be brought to demand reforms with which they have been made familiar, and which have been effectively worked up to the point of acceptance.

Chicago has not been moved to civic consciousness without much disinterested labour and a considerable outlay of private money, but it is worthy of notice that those who have put forward her civic dreams as profitable possibilities, are men who are usually regarded as exclusively devoted to the acquisition of dollars. The cost of preparing her colossal schemes of improvement has been largely met by members of the Commercial Club, who have invested their money in these projects because they felt them to be for the good of their city. They have said that the improvement schemes put forward (and now largely realized) mean a practical city, and that dirt, grime, and sordid conditions are not a necessary part of industrial and commercial success; rather are they evidence of a failure to grasp the fundamental truth, that men whose lives are cast in pleasant places, who are clean of mind and body, are the men who best do things.

Mr. William Haywood, in another lecture, dealt with "Ideal Cities." He said: Ideas of this class are not new. Even omitting those of the ancient world, we have More and Campanella in the sixteenth century, Andreae and Swift in the seventeenth and eighteenth centuries, Bellamy, Butler, and Morris in the nineteenth, all writing of Utopias.

Robert Owen in 1818 bought 1,200 acres of land and actually began an ideal village, but accomplished little of importance, and in 1848 James S. Buckingham published a remarkable scheme for a small model city, which is curiously like that for an imaginary "Christianopolis" published in 1619 by Andreae, except for certain natural differences due to two centuries of change.

Sir Titus Salt carried to completion a notable experiment when he built Saltaire in 1853, but it is with the work of practical idealists like the late Mr. George Cadbury and Lord Leverhulme (whose ideas materialized in 1887-8) that we get the first practical results of earlier speculations and trials carried to a really convincing conclusion.

This is especially true of Bournville, which avoids the somewhat institutional character of Port Sunlight, and displays the free and untrammelled conditions under which it was conceived, conditions happily embodied in the design of the buildings and in the method of their arrangement.

These and similar "garden suburbs" are often described as "Garden Cities" or as of a "garden city" character, but it is important to remember that such suburbs are essentially unlike the fully detached and self-sustaining town of Letchworth, or that of Welwyn now building, to which communities alone the term "garden city" is properly applied.

The Letchworth type of town differs from all others by its adoption of Mr. Ebenezer Howard's teaching: (1) That all communities should own the land upon which they stand, in order to avoid the exploitation of land values; (2) that the size of a city should be strictly limited to something under 50,000 (Letchworth is to be 30,000); and (3) that it should be surrounded in perpetuity by a belt of agricultural land for health purposes, and for the mutual convenience of the grower and buyer of market produce. Letchworth, which was commenced in 1903, makes no special contribution to town-planning knowledge, but in policy and administration it is unique as the first experiment in a new form of town control.

## London County Westminster and Parr's Bank, Ltd.

The net profits of the London County Westminster and Parr's Bank, Ltd., for the past year, after providing for bad and doubtful debts, and all expenses, amount to £1,888,021. This sum, added to £519,708 brought forward from 1921, leaves available the sum of £2,407,729. The dividend of 10 per cent. paid in August last on the £20 shares and 6¼ per cent. on the £1 shares absorbs £600,224. A further dividend of 10 per cent. is now declared in respect of the £20 shares, making 20 per cent. for the year; and a further dividend of 6¼ per cent. on the £1 shares will be paid, making the maximum of 12½ per cent. for the year; £200,000 has been transferred to the bank premises account, £150,000 to the rebuilding account, and £300,000 has been placed to the contingent fund, leaving a balance of £536,585 to be carried forward.

Following are some interesting figures concerning the activities of the bank :—

| | 31 Dec. 1922. | 31 Dec. 1921. | 31 Dec. 1920. |
|---|---|---|---|
| Net Profit .. .. | £1,888,021 | £2,167,846 | £2,915,708 |
| Brought forward .. | 519,708 | 460,914 | 414,226 |
| Total available .. | 2,407,729 | 2,628,760 | 3,329,934 |
| Dividends .. .. | 1,221,144 | 1,159,052 | 1,115,302 |
| £20 shares .. | 20% | 20% | 20% |
| £1 shares .. | 12½% | 12½% | 12½% |
| Investment depreciation .. .. | Nil | Nil | 1,300,000 |
| Premises .. .. | 200,000 | 250,000 | 200,000 |
| Rebuilding account .. | 150,000 | 200,000 | Nil |
| Contingent fund .. | 300,000 | 500,000 | Nil |
| Reserve fund .. | Nil | Nil | 253,718 |
| Carried forward .. | 536,585 | 519,708 | 460,914 |

# THE ARCHITECTS' JOURNAL & Architectural Engineer

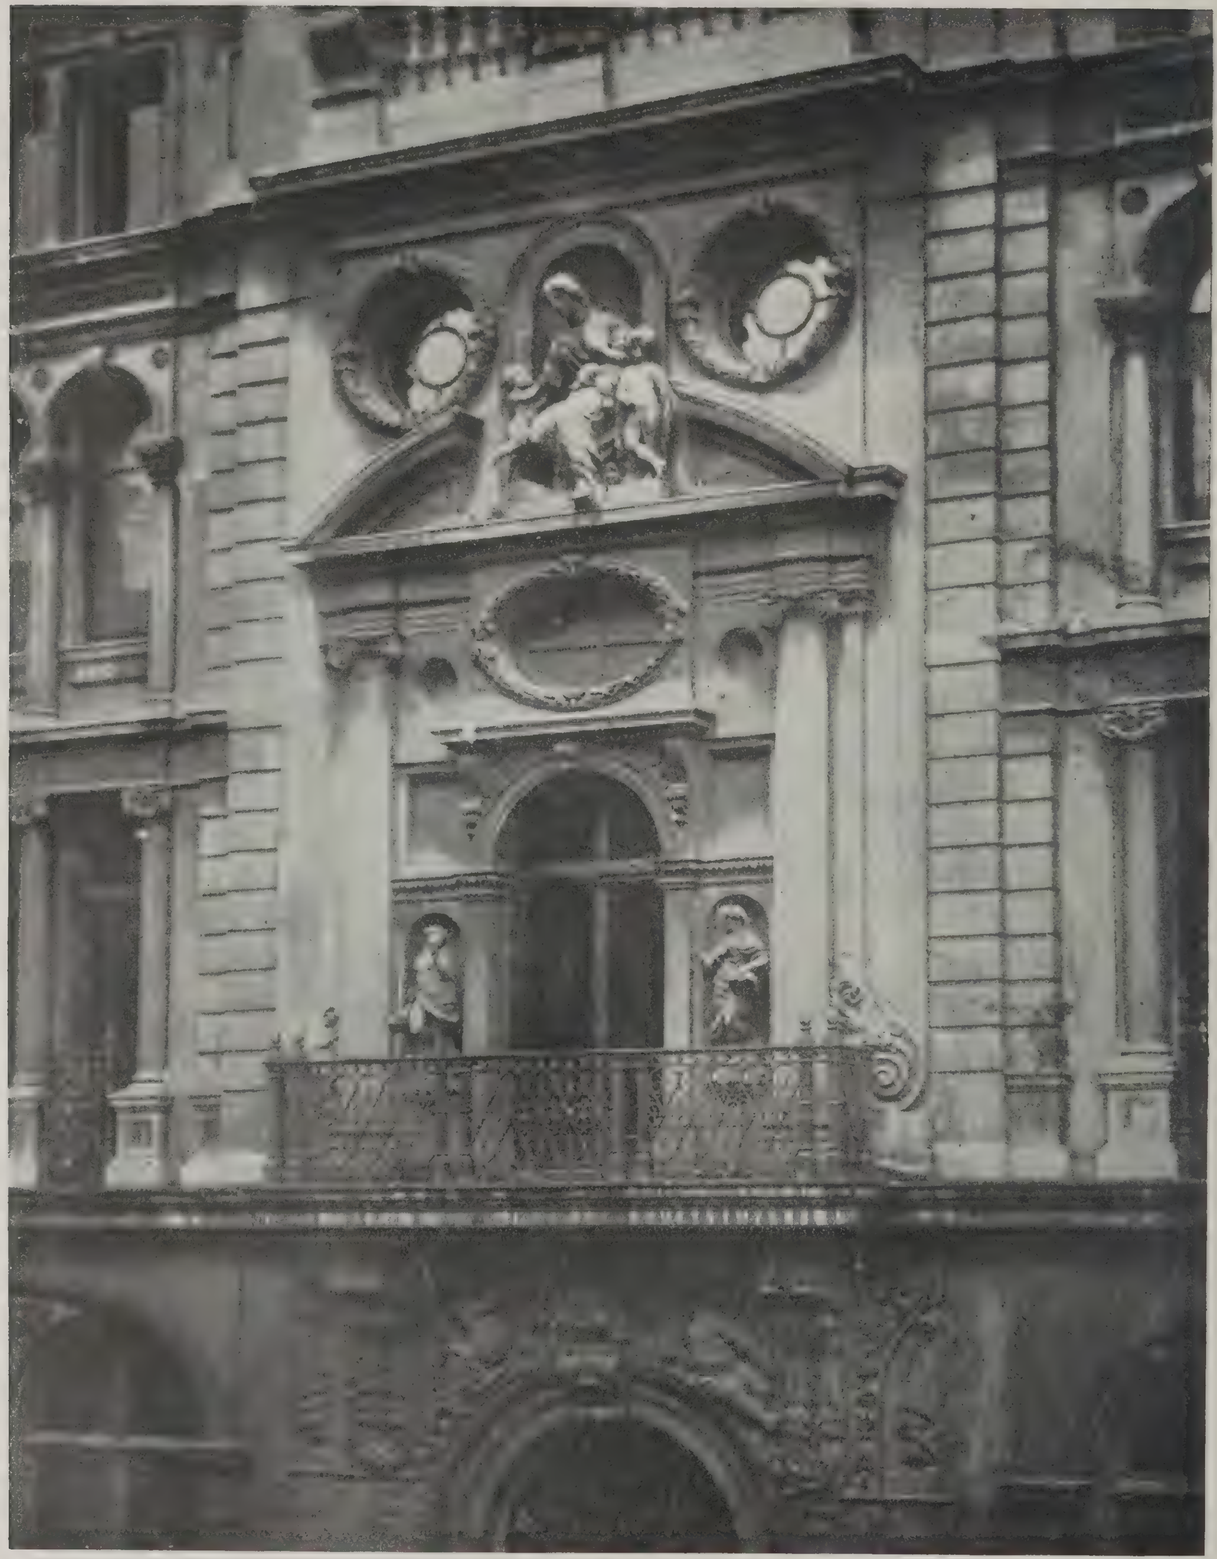
*With which is incorporated "The Builders' Journal."*

A PANEL IN THE ASSEMBLY ROOMS, BATH.
S. D. ADSHEAD, F.R.I.B.A., ARCHITECT.
ALFRED HAYWOOD, PAINTER.

27-29 Tothill Street, Westminster, S.W.1.

# Modern Architecture. 6.—Detail of the Entrance Front of the Mercers' Hall, Cheapside, London

The Late J. D. Crace, Architect



Among the myriad miles of undistinguished and smoke-grimed street façades of London an architectural feature will frequently arrest the attention by the quality of its design. A case in point is the entrance front of the Mercers' Hall in Cheapside, which in general character and in detail has much in common with modern French work. The building was actually erected in 1880 from the designs of the late J. D. Crace.

# The R.I.B.A. Registration Bill

THE Council of the R.I.B.A. have now published their draft proposals of a Bill to provide for the registration, and to regulate the qualification, of architects. It will be remembered that the last Institute elections were practically decided upon the political issue as to whether unification should precede or follow registration, and the present Council of the Institute was returned on the ticket of "registration first and unification second."

For the result of the elections the old Council had no one but themselves to thank. They had a strong case—in our opinion an unanswerable case—but they never put it before the electors, and it was not until Major Harry Barnes made his famous speech at Cardiff that we knew what the Institute really meant by its registration policy, and then, alas! it was too late.

The present Council were much more adroit in their manœuvres; they not only conducted a strong Press campaign, but they also circularized the members of the Institute—a course which the old Council, in its aloofness, disdained to follow. Had they even at the eleventh hour put their case properly before the members of the Institute, we believe the result of the elections would have been very different.

We have always regarded the results of the last elections as against the best interests of the profession as a whole, and we quite sympathize with the old Council in its desire to fight these elections on a "personal" rather than on a "political" issue. By "personal," of course, we mean that the names of those gentlemen standing for election for the Council and the Committees should be judged on their status as architects, rather than as to whether they would or would not support some one political move. That is, of course, the ideal way in which elections to a professional body such as the Institute should be made; but there may be from time to time political questions of such paramount importance as to swamp all other considerations, and it is then, in our opinion, essential that the case for and against any proposed measure should be put clearly and fairly before the members of the Institute.

We can hardly believe that the present Council are really serious in putting forward their Bill. We must, in all fairness, say that in their election propaganda they stated that they were in favour of registration, but not in favour of unification—at any rate, not in favour of unification as proposed by the old Council. But can they, or any reasonable body of men, really believe that they can force such a contentious measure through Parliament without in some manner preparing the way and conciliating the strong interests which will undoubtedly be opposed to them?

The strongest opposition of all will, in all probability, come from the Society of Architects, which society, it would appear, the present Institute Council have done all in their power to antagonize rather than to conciliate.

The Bill proposes that the Board which shall control the working of registration shall consist, as far as the members of the Institute and the members of the Society of Architects are concerned, of the President and fourteen members of the Council of the R.I.B.A., as compared with the President and two members of the Council of the Society of Architects—a proposal which it is not surprising to find has not been welcomed with acclamation by the Society of Architects!

There are, in addition, to be ten members of the Board of Architectural Education of the R.I.B.A., so that, in effect, the R.I.B.A. claims to determine and govern the conditions of all architects practising in this country.

With regard to the general conditions of the Bill, there is nothing which calls for any particular comment once admitting the claim that the R.I.B.A. shall be the controlling factor in the constitution of the Board to govern the architectural profession. The general clauses provided for the registration and the discipline of members seem, on the whole, to be fair and reasonable, though they will no doubt receive a good deal of critical scrutiny when they are laid before the general meeting of the Institute.

In the "Observer" for January 14 there was a very well-considered letter from a correspondent, which put the case very clearly for and against the Registration Bill as proposed by the Institute, and as these views are substantially our views, there is no need to elaborate them at greater length. (See article reproduced on page 190.)

As our readers know, we have always been in favour of registration, and for the fullest measure of registration possible; and, further, we feel that the Institute, as representing the largest and most important number of architects of any society in Great Britain, should have a corresponding representation on any Board which may be formed to control the profession. Should registration pass, we do not feel that the present Bill sufficiently provides for those professional interests outside the Institute, which it should do. In fact, the Bill as proposed is purely an Institute measure, and if every reputable architect practising in Great Britain were a member of the Institute we should have nothing to say against it and, in fact, should wish it all success; but it is no use refusing to face facts which are obvious to everyone and which will become more obvious during the progress of this Bill. Not only are there many architects of repute outside the fold of the Institute, but it is impossible to ignore the view of so important a society as the Society of Architects and to hope for the Bill's successful passage through Parliament in face of their opposition. If the whole profession, inside and outside the Institute, were solid for the measure, there would be a far greater chance of its success, in spite of the many important interests whose opposition it is in some measure bound to arouse; but with a divided profession, what chance can there possibly be of its success?

We hope we may be wrong in our views, and that, in spite of everything, the Society of Architects and the other professional societies outside the Institute will be sufficiently broad-minded and far-sighted to help this measure through, trusting to Parliament and to their own efforts to remedy the unfairness of the numerical representation on the Board. But this is asking rather much of human nature.

The present Institute Council immediately after its election did all in its power to destroy the careful spade work of years of hard and difficult toil in preparing the profession to accept some general measure of registration, and we cannot really believe that any of them has the slightest hope or belief that the proposed Bill will ever become part of the law of the land.

In conclusion, we should like to say one word to those members of the Institute who really believe in registration, and that is, that at the forthcoming elections they should not leave it to their opponents to do all the canvassing, but should have their own plan of campaign marked out and vigorously pursued.

The old lordly policy of "Wait and see," and "Leave it in our hands," is out of date. Whether one believes in registration or not, it is quite clear that in the future private members of the Institute intend to take a very much greater and more direct part in the control of the affairs of the Institute than in the past, and it is probably a feeling of resentment at the autocratic and dictatorial methods of the old Council that has led to the present *impasse.*

## Wage Rates and Industry

In a thoughtful letter to "The Times," Lord Weir draws attention to the danger to our national prosperity through the haphazard relativity of wage rates in different industries. "My firm," he writes, "have been anxious, for some time, to build a considerable number of new houses near their engineering works. They have allocated the necessary capital, but they have not placed the contracts for the following reasons: If the houses were gone on with, the bricklayers would start working in full view of the engineering workers. They would receive 72s. 6d. per week for forty-four hours' work, while the skilled engineering tradesmen would only receive 57s. for forty-seven hours' work. The bricklayer's labourer, carrying mortar, would receive 55s. 6d. for a forty-four hours week, a rate very little less than that paid to the skilled tradesman." Jealousy and friction must inevitably result from such a condition of things, with the probability of unsatisfactory output all round. It is no part of the architect's business to put the industrial house in order, but, seeing that building work is held up, and that the situation is full of dangerous possibilities, he cannot afford to remain aloof; as an interested third party he must take his share in the consideration and settlement of industrial affairs. The subject is too large to be dealt with in a note, and we propose to return to it in a leading article.

## The Building Guild Failure

The moral of the Building Guild failure is that an idealistic experiment must inevitably fail under adverse conditions. To carry on a great business successfully in these competitive days it is necessary to have not only a band of skilled and enthusiastic workers, but ample capital and an efficient organization. That the Guild has done amazingly well, notwithstanding its failure, is, however, shown by the fact that it secured contracts to the value of two million pounds, and this on a capital of £100, only £19 of which has been issued! There is some irony in the fact that the Guild business may possibly be saved by a capitalist, Mr. McTaggart, a successful Glasgow builder, having put forward a plan to run the Guild on accepted modern lines at his own risk. On this suggestion, we are glad to note, the winding-up application at Manchester has been adjourned.

## "Build Your Own House"

Much has appeared in the daily Press during the past few days on the intriguing subject of "Every Man his own House-builder." To build one's own house is apparently such an extremely simple thing, that to call in either architect or builder were an absurd extravagance; there is, of course, a pride, if not a pleasure, in doing for yourself something that is commonly done for you by others—sewing on a button, for example, or frying a steak; but it is most unwise for the amateur to attempt to go beyond these comparatively simple operations. House building is one of the things that is definitely beyond the capacity of anyone except an extremely practical man, and your practical man invariably has but the vaguest notion of design. "Build Your Own House" may be a profitable cry for the "stunt" Press, but to put the exhortation into effect is a difficult matter. The attempt must in most cases result in disillusion and financial loss.

## Decorative Art at Burlington House

The Winter Exhibition of the Royal Academy, which is noticed elsewhere in this issue, is remarkable inasmuch as it marks the first occasion upon which the Academy has held an exhibition of decorative and applied art on its own initiative, though it must not be forgotten that the Arts and Crafts Society were allowed to hold their exhibition at Burlington House in 1916. The purpose of the decorative art section is "to draw attention to the important part which the arts of painting and sculpture should take in architectural schemes . . . and to suggest to younger artists and students the great possibilities of decorative art." These purposes are, on the whole, well enough served, though it is doubtful whether the general public, upon whom the success of the exhibition mainly depends, will be able to appreciate the significance of these acreages of painted canvas. If small scale models showing the settings of these huge decorations could have been provided in every case, the exhibition would have been far more intelligible to the layman. The Arts and Crafts section will, we imagine, make a more intimate appeal to the general public. Here are some most delightful examples of modern craftsmanship—in furniture, fabrics, pottery, glassware, bookbindings, printing, and jewellery. But how expensive they all must be! The wealthy connoisseur will make a note of names and addresses for future purchases, while the man of small means notes only that the exhibits are completely beyond his purse. When shall we have an exhibition of good things capable of being provided at a reasonable cost?

## The Architecture Club Exhibition

If exhibitions can awake in the public a consciousness of the intimate relation of art, especially architectural art, to life, then one cherished aim of all well-disposed architects and other workers is well on towards achievement. Quite recently we have had the very successful exhibition of British architecture at the R.I.B.A.; at the present moment an exhibition of decorative art is being held at the Royal Academy; and now we are promised a "Twenty Years of British Architecture" exhibition by the Architecture Club. This is to be held at Grosvenor House (kindly lent by the Duke of Westminster), and will be open to the public from March 6 to 24 inclusive. The exhibits will consist of photographs and models of executed works, and a rather novel feature for an exhibition of this kind will be the projection of views of buildings by means of lantern slides. There will be a collection of models illustrating the development of the British house from the earliest times to the present day, and it is hoped to hold a series of lectures on architectural subjects. The exhibition promises to help considerably in the work of "Educating the Public."

# Architecture and Decoration

## Sir Reginald Blomfield at the Royal Academy

THE first of the public lectures in connection with the Exhibition of Decorative Art was held last Wednesday, when Sir Reginald Blomfield addressed a crowded audience on "Architecture and Decoration." He said:

I have been asked to address you on architecture and decoration, but I am not quite sure that I am the right man to say anything on this subject, because, in defence of architecture, I have sometimes found it necessary to maintain that it is an art complete in itself, not dependent for its impact on the emotions or anything external to itself, and that its highest appeal is made through the abstract qualities of rhythm and proportion, mass, and silhouette, and what the French call "Ordonnance."

The history of art shows that however content an architect may be with the completeness of his own art, mankind in general wants something more. When the cave man had found his cave, he decorated its surfaces with admirable drawings of the animals that he hunted; all the stages by which man has worked his way out of barbarism into civilization are marked by advances in the decorative arts, and we must take it as an axiom that, whether we want it or not, man will decorate his buildings somehow. The problem for the artist is, not only to draw well and paint or model or carve, but to use his brains in co-ordinating this with architecture, so that the two or more arts all pull together towards one pre-ordained end. The Parthenon in its completed state was probably the most perfect example that has ever existed of architecture and decoration, because the architect, the sculptor, and the painter worked with complete understanding of each other's resources and limitations.

Architecture, of course, touches every form of permanent decoration, the sculptor, the painter, the worker in metal, in stone, in marble, in wood, in glass, in mosaic, almost every art and craft; but I am going to limit my few remarks to the sculptor, the glass painter, and the painter proper. And first, of sculpture.

The first rule that comes to my mind is one of Aldrich, the famous Dean of Christchurch, who wrote a manual of civil architecture about 130 years ago. Aldrich's advice in regard to sculpture was, not to have too much of it. "Too much ornament crowds out beauty"; and this was what happened in the earlier Renaissance, when the sense of architecture was lost under the embroideries of the ornamentalist, and was not recovered till really competent architects took charge. Those interminable arabesques, panels, and pilasters, covered with ornament skilfully executed but destitute of meaning in relation to the organic structure of the building façades, such as the Cortosa at Pavia, or the Madonna dei Miracoli at Brescia, are not architecture at all, and few things have done more to retard the art than this misconception of ornament as architecture.

If sculpture is used at all on a building, it should be used with a definite meaning. If you look back on the history of architecture, you will find that the great periods of the art are precisely those in which sculpture has been most under restraint—Egypt and Assyria, for example, with their direct religious purpose; the Greek Temples of the finest period in which the sculpture was confined to the pediments and the metopes of the frieze, and did not invade structural members; thirteenth-century Gothic in a less degree, and in the architecture of the middle of the eighteenth century in France and England; the work for example of Chambers or the younger Gabriel. It is in the weaker and immature periods that sculpture got out of hand, breaking all measure, and degenerating into vulgarity and even nonsense.

This matter of the placing of ornament is of the first importance. Good ornament in the wrong place is worse than no ornament at all; and the architect is directly responsible for this. It is no use placing sculpture where it cannot be seen, or is seen under conditions which reverse its values, or where the space is so contracted that the sculptor has no room to let himself go. For example, the sculptor will not thank the architect if he finds the recess provided for his figure is too small, or the pedestal impossibly bad, as happened at Perpignan the other day.

Again, though it rests with the architect to allocate the work, he ought not to impose tasks on the sculptor which are wrong in principle, such as terminal figures clearly unequal to the work, or sculpture which stultifies the original intention of the architecture. The columns of the Third Temple of Artemis at Ephesus are a familiar example of fine sculpture in the wrong place, and the twisted columns of Bernini's Baldachino in S. Peter's are another instance of misapplied skill. In this matter of the determination of ornament the architect and the sculptor ought to pull together from the first, and having come to a working agreement, they have next to consider the purpose of the building and the all-important matter of scale. It is obvious that the purpose of a building, whether, for instance, it is a church or a gymnasium, must determine the general character of its decoration, and ordinary commonsense can deal with this, but the question of scale is far more difficult, and, indeed, it is in this matter of scale, more than anything else, that we are apt to go wrong. However great an artist's natural endowment, the sense of scale has to be painfully acquired by much study of buildings, and meditation on sculpture in relation to buildings; and no amount of designing on paper will build up this sense in the architect, nor will modelling in the studio, however accomplished, take its place for the sculptor. It is here that we are all so seriously handicapped by the want of tradition. Down to the end of the eighteenth century artists were saved from glaring faults by a well-recognized standard of technique and by accepted principles of design. All this was lost in the general upset of tradition, which finally crystallized in the rise of the Romantic school and the artistic anarchy that has prevailed ever since. Moreover, the training of architects, two or three generations back, had much to answer for. As a consequence of the unfortunate misconception of architecture generally known as the Gothic Revival, our attention used to be concentrated on detail, mouldings, capitals, and carvings. Nowadays the training in our schools seems to have gone to the opposite extreme, and to have become academic in the wrong sense, and, owing to a variety of reasons, there has grown up, in the last hundred years, an unfortunate division in the arts. The painter paints his easel picture, the sculptor models his figure or his bust, and the architect designs his building, each of them working in his own corner without thought or care of the other. We have among us excellent sculptors, and, may I say it, some not incompetent architects, but in our schools of art, and elsewhere the two arts are out of touch with each other, and they ought to be brought into much closer relationship than has been the case for many years. It was a fatal thing for sculpture when it left the builder's scaffold and retired into the studio, and when the architects forgot the heroic precedent of Greece. And in saying this I am not thinking of mediæval sculpture with all its rare beauty, because we at any rate can never get back to the emotional and intellectual standpoint of the Middle Ages; I have in my mind the example of two famous men, Bernini and Alfred Stevens. Bernini, both as a sculptor and as an architect, was a man of undoubted genius and profound knowledge, to whom modern sculpture, through French art, is indebted for some of its best, as well as some of its worst, qualities—its best in its freedom and revolt against pedantry, its worst in its failure in selection and constant tendency to bathos, on the one hand, and excessive emphasis on the other. Bernini prided himself on imparting the quality of painting to sculpture. In music, one has seen the disastrous result of this mixing up of the arts, and Bernini, who set himself to dissolve architecture into sculpture and to present both in terms of painting, was a pioneer on a very dangerous path.

That it is possible to *combine* architecture and sculpture with complete freedom, yet without sacrifice of the essential qualities of either of those arts, is shown by the work of Alfred Stevens. Other men may have been his equals in the technique of modelling, a very few may have possessed his immense knowledge of detail, but I doubt if any sculptor, since the greatest masters of the Renaissance, has approached him in the architectonic sense, in the power of thinking in terms of mass composition, and of sustaining his work at that high level of concentrated thought.

Stained glass occupies a curious, and in some ways anomalous, position in modern decorative art. In days when there was no printing-press, when the majority of people could neither read nor write, the glorious imagery of the windows of those great cathedrals, Chartres or Bourges, of churches such as Fairford, were as the very book of life, revelations by artists as convinced of their literal truth as were the people who worshipped below them. It was a genuine and sincere form of art. But however earnest the modern glass designer may be, it is almost impossible for him to maintain this level of complete conviction, and instead of the implicit faith on which the mediæval artist could rely, the modern artist has to reckon not with the implicit and child-like faith of a people as convinced as himself, but with a critical and even pedantic archæological opinion. There is another difficulty that he has to contend with. Unconsciously, he and the wall-painter are in direct antagonism, in that the one deprives the other of the light that is necessary for the effect of his work. It is very little use finding spaces for the wall-painter, if, as soon as he has finished his work, the light on which he reckoned is reduced by 50 per cent.; and it would seem that those who have the custody of our churches and cathedrals should make up their minds whether they want their decoration to go on their walls or in their windows.

If they elected for painted decoration on the walls they should, at least, allow the painter light enough to show his work. If they elected for windows they should limit the work on the walls to mosaics which, by the nature of their material and the necessarily abstract nature of their design and drawing, were able to tell their story in the half-light, half-shadow of a dimly lit church.

Some very beautiful modern stained glass-work has been done by English designers and craftsmen, far finer, in my opinion, and far more suitable to its purpose than any that I have seen on the Continent or elsewhere. That there is and will be a demand for it I have no doubt; all one asks of our artists in this regard is that in designing their windows they should think of them as elements in one great harmony.

Lastly, we come to the decorative painter. An architect must be allowed some voice in this matter, because after all it is his building, the creation of his brain, that is being decorated, and without his building there would be no painting at all, and the architect cannot be relegated to the position of the boy who blows the bellows. There have been, it is true, artists who have made it their business to create the illusion that there was really no building at all, and the perspective makers of the end of the seventeenth century did quite a large business in painting awkward pieces of wall to look as if they were vistas of magnificent architecture.

The interior of a building ought not to be considered as one gigantic picture; the two arts of painting and architecture are not really united when one of them has to be sacrificed entirely, and the better way is for the architect to endeavour to realize from the first the general problem of his scheme, the relation of plain to decorated surfaces, and to reserve in his design the spaces which he wishes to have painted, definitely marking these off from the constructional features of the building. Within the spaces so allocated he would leave the painter a free hand, and make no further protests on the score of illusionism.

One realizes that, in great decoration, the architect and the painter must go hand in hand, and there is one other matter in which the painter might with advantage work more closely with the architect, and that is, in the design of the architecture that he introduces into his painting.

It is sad to find imaginative visions spoilt by quite ignorant architectural drawing. Architects would readily place their technical knowledge at the disposal of their colleagues, and I suggest to students who contemplate decorative paintings that they should study the external forms of architecture more closely.

I believe it to be quite as important for architect and painter to work together in decorative schemes as it is for architect and sculptor, and I do not think our colleagues need be afraid of us. After all we are all out for the same thing, the quest of beauty, and when we architects have asked our colleagues to consider with us these points of scale, tone and character, we will wish them God-speed in their voyage to the Fortunate Isles.

We do not all live in palaces, and municipal buildings are not the only ones that cry out for decoration. There is still opportunity for decorating houses with something more interesting and individual than the latest thing in wallpaper. In the present exhibition there are some admirable examples of wall decorations designed for small interiors. I believe a future is opening out here for our painters, the signs of which are full of promise. Out of all the welter of experiment of the last twenty-five years there is emerging a definite tendency in one direction, a fresh ideal of the painter's work.

The Palace of Art is a building of many chambers, and my contention throughout has been that each of its chambers has its own appropriate treatment, waiting to be discovered by the artist, and that the right way to discover it is for the artists to come out of their hiding-holes, and to search for it together on the spot. At one time I was so fascinated by the magnificent achievement of Colbert in the reign of Louis XIV that I thought the State might organize this, but we have learnt our lesson in regard to State interference, and a very costly one it has been; and I am convinced that there are no short cuts, that if the arts are to recover their lost position it must be won back not by State organization, not even by the devoted labours of the critic and the journalist, but by the steady purpose of artists themselves. Perhaps architects have more opportunities than other artists of breaking through the cordon of the middle-men; and I would appeal to them to lose no chance of going direct to the individual artist and craftsman. It is only in this way that we can escape the insincerity of that "art by the mile," which makes some fastidious minds recoil from all idea of decorative art.

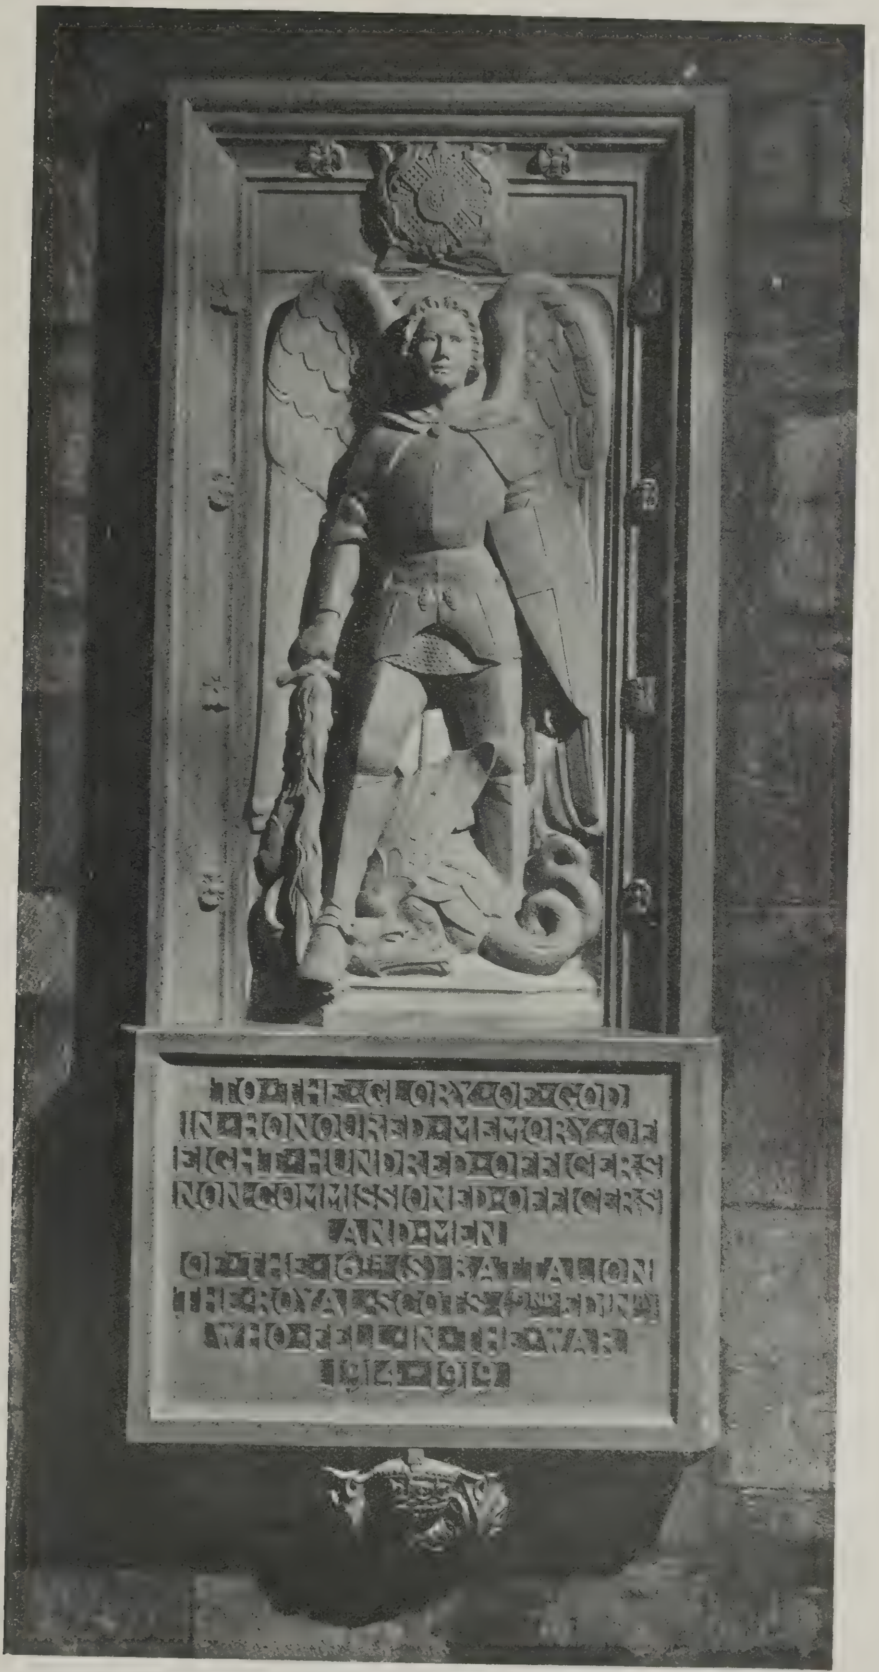
Proposing a vote of thanks to Sir Reginald Blomfield, the chairman, Sir Aston Webb, said that man had in primitive times begun by decorating first himself, then his shelters and habitations. The desire to decorate was not so marked now, but the object of the exhibition was to show how buildings and rooms could be decorated. Wren had been alive to the necessity of decorating buildings.

All the arts should associate together, and exchange of views would lead to unity of art. Students of painting might with advantage spend three months in architectural schools. The function of the arts and crafts was in part to supply articles to complete rooms and render them more beautiful.

[A critique of the Exhibition by Mr. W. W. Scott-Moncrieff begins on page 180.]

# War Memorials. 32.—The 16th Royal Scots Memorial, St. Giles Cathedral

Sir Robert Lorimer, A.R.A., R.S.A., Architect

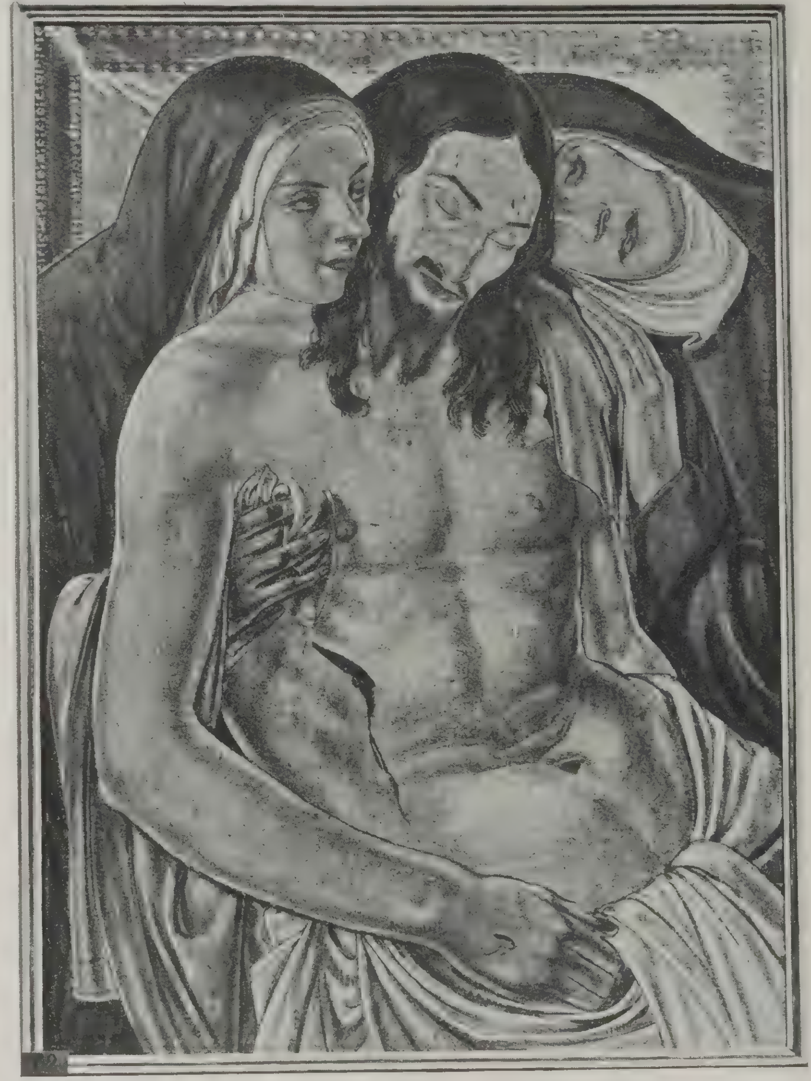


This Memorial is placed on the north wall of the Albany Aisle. It takes the form of a figure of St. Michael carved in rose-coloured limestone, surrounded by a moulded frame of Hoptonwood stone, bearing the regimental badge on the lintel, and supported by an inscribed corbel of the same material. The archangel, who symbolizes righteousness and courage, is shown advancing boldly, with wings spread, and is clad in armour. In his right hand he carries a flaming sword, on his left arm a shield blazoned with the cross, and under his feet lies the evil dragon he has slain. Mr. Pilkington Jackson, A.R.B.A., was the sculptor.

# The Royal Academy Winter Exhibition

## By W. W. SCOTT-MONCRIEFF

THIS exhibition may be considered as one of national importance, because it proves that in spite of the commercial ideal of the last eighty years there is still alive in this country the old desire and the old power to create fine things and to paint well. Now any community which attaches greater importance to the making of money than to the quality of the goods it produces is one which supports a system of dwindling wealth. Conversely, the community which holds to the ideal of the production of the finest quality of goods and workmanship is one which must build up a system of increasing wealth. To put workmanship first and profit second is to create real wealth, both mental and material, since the mind develops or degenerates according to the way in which it is occupied, and there must always be a market for the very best. To put profit first, and quality of goods and workmanship second, is to become gradually poorer and poorer, both mentally and materially; it is, in fact, to head straight for bankruptcy. It is easy to prove the truth of this. Our museums are full of the works of those whose first aim was not to make money, but to produce fine things. Those works are national assets, and if sold would probably wipe out our war debt. So valuable are they that we spend millions upon buildings to put them in, and hundreds of thousands on civil servants who keep them safe in glass cases. But these goods were not made for glass cases. They were made for use. Rich indeed was the community which used them as accessories to its daily life.



"PIETA" THE CENTRE PANEL OF A TRIPTYCH.
BY F ERNEST JACKSON.

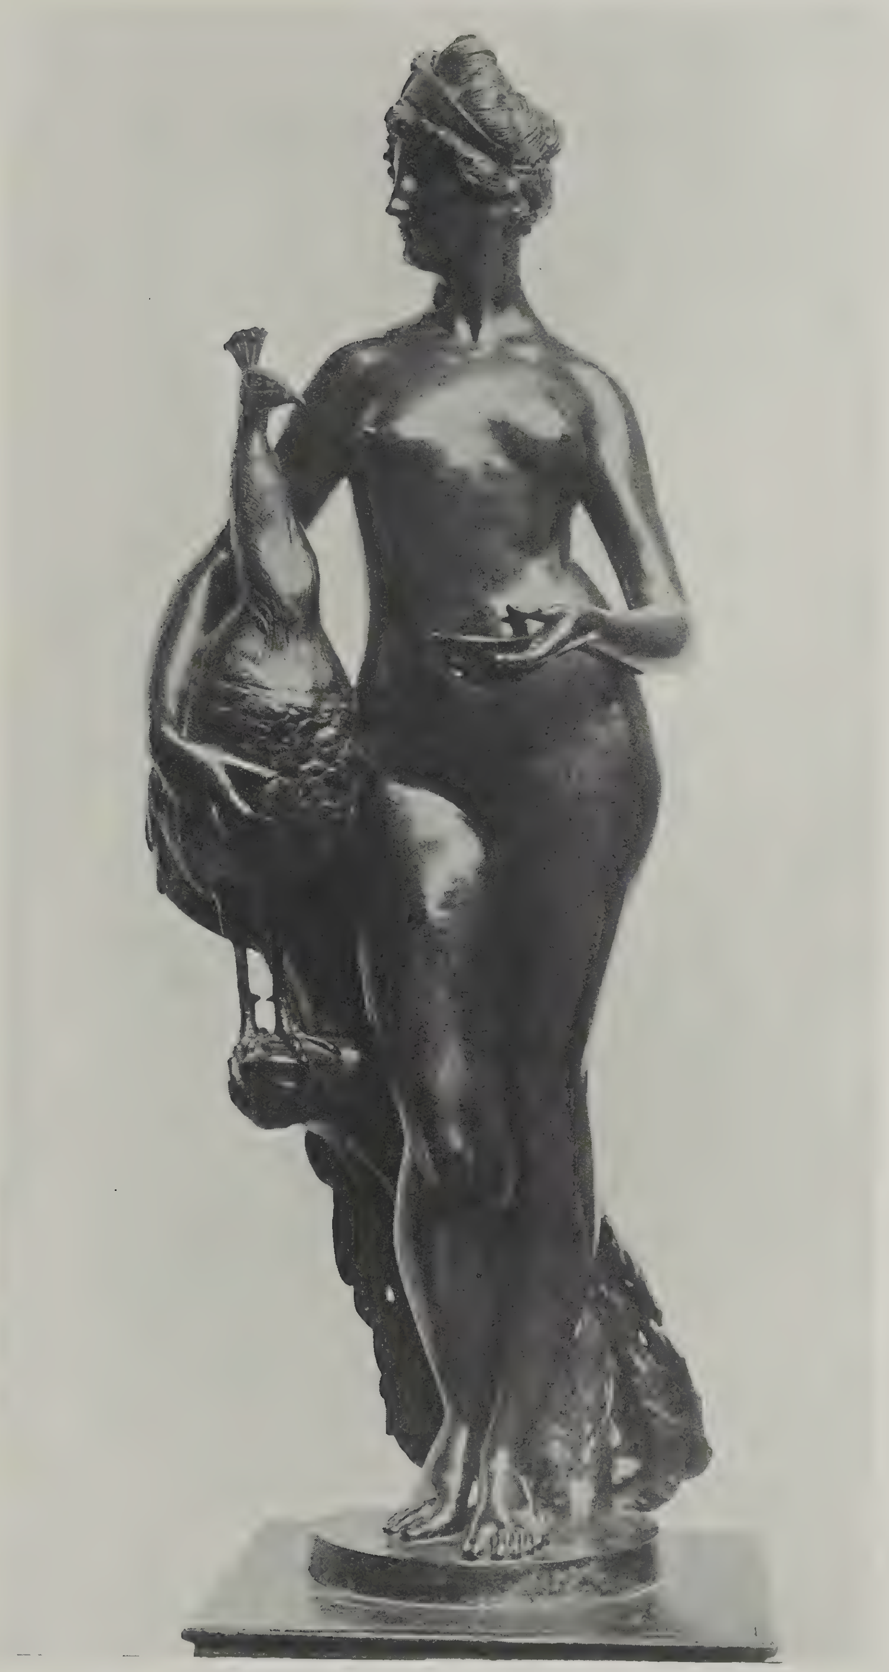
At the present moment we are a very poor country. We have a great number of unemployed, and those who are employed are busy producing in the main what either does not really matter or is rubbish. The houses we are building now are skimpy and mean, and, except for antiques, are filled with rubbish. Our food is manufactured in factories, and were it not for the law, would probably be poisonous. Our things are gimcrack and our ideas tawdry. In attempting to gain the world we are losing our soul.

Professor W. R. Lethaby, who is a prophet not without honour save in his own country, has defined art as "thoughtful workmanship." This is such an obviously true definition, and one which must have been held in every age and in every climate until the last hundred years, that one marvels how it is that the popular conception of art ever came to be twisted into meaning easel picture painting or so utterly divorced from life. Even now in this so-called civilization if you mention the word "art" to the ordinary intelligent *educated* man, he will immediately think of strange beings described in novels which he has read, who are members of a mysterious priesthood and who, in moments of inspiration, apply oils to canvas to get an "effect." In any case, art to him is something quite outside his ken, and has nothing whatever to do with his life.

It is to be hoped that the Royal Academy now sees the error of its way, for if it has not deliberately encouraged the doctrine that art is *really* easel picture painting—plus a little sculpture and still less architecture and nothing of anything else—it has certainly taken no steps, until the present moment, and for one briefer moment in 1916, to encourage the belief that art is the fine development of the creative spirit of man to the end that life may be made great, beautiful, and precious. Art is, in fact, not easel picture painting in particular, nor architecture in particular, nor sculpture, nor any particular art or craft; it is all these members combined to function as a complete body. This is the doctrine which must be preached and which must be accepted as a national belief. It is even a question for the consideration of Parliament and for our Education Ministry. Until this doctrine is accepted we shall, as a nation, continue to wallow in every conceivable form of vulgarity; we shall continue to struggle in the lower strata of competition among the rubbish markets and our minds will tend to be more and more rubbishy, and, morally and materially, we shall decline.

Where would the Greeks have landed themselves had the national belief been that art was something to be surrounded with a gilt frame and sent annually to a temple? But let us praise where praise is due. The Royal Academy has at last taken a step forward, and it is to be congratulated.

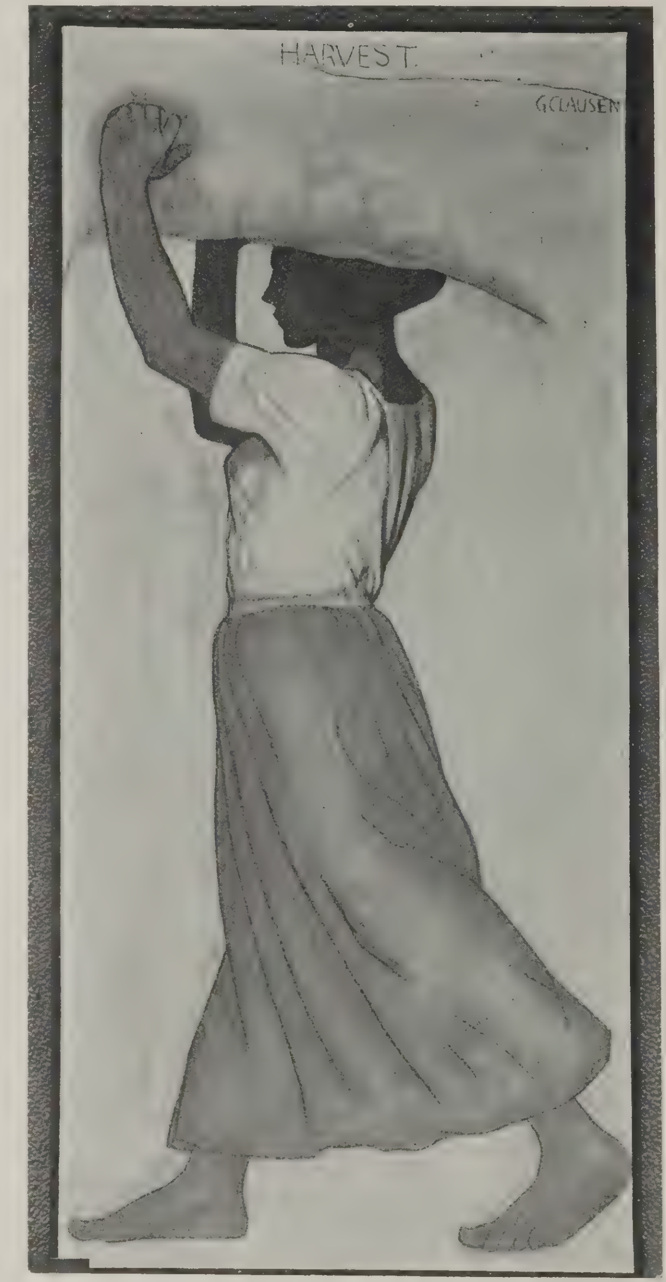
It is important to understand that although the exhibi-



"JUNO," A BRONZE NICHE FIGURE. BY F. DERWENT WOOD, R.A.
*(The Royal Academy Winter Exhibition.)*

tion as a whole has been arranged by the Royal Academy, it may be divided into two distinct parts. Galleries 1, 2, 3, 4, 5, and 6, with Central Hall and Vestibule are mainly devoted to decorative painting and sculpture arranged by the R.A., while galleries 7, 8, 9, 10, 11, and the little Architectural Room are devoted to exhibits of the Arts and Crafts Society, and have been arranged by them.

Let us enter the Vestibule and turn to the left to consider that part of the exhibition arranged by the R.A.; but before we begin, allow a short foreword upon decorative painting.



"HARVEST."
FROM A WORKING CARTOON BY GEORGE CLAUSEN, R.A.

Those of us who have been to the Pantheon in Paris and have seen the work of Puvis de Chavannes and Jean Paul Laurens will have seen examples of two great modern decorative painters. Of these two Puvis de Chavannes is undoubtedly the greater master. His work is part of the wall surface. It is of the same general tonality as the surrounding tone of the architecture, which is of natural light-coloured stone. His third dimensions or "recessions" are expressed by perspective lines. Except for an early work on the wall of the right aisle, there are no spots; there are no "holes" in the wall. The subjects treated lie flat upon the surface. They are not "views" or "scenes" framed with architectural mouldings. They form part of an harmonious and continuous scheme. His themes are strangely dignified and simple, and we follow the idyllic trend of his mind with instant sympathy and appreciation. They are the works of a master mind. Now, Jean Paul Laurens was of the opposite school. His work is of the realistic order. He makes "holes" in the wall. There are great masses of "darks," even "blacks," which alter the whole tone key of the wall surfaces, and although in themselves they show the highest achievement in a certain kind of technique, in our opinion they fail as decorations because they are not of the same tone as the architecture; they are not part of the architectural theme, but pictures painted on the wall. It is with the works of these men in our mind that we pass in review what is shown at this exhibition.

No. 71, "The Ancient Arts"—lunette painted in wax medium, by George Clausen, R.A., is even and light in tone, and is evidently designed as part of an architectural scheme. His working cartoons for the decoration of a hall, designed by Mr. Sellers, are quite beautiful. Mr. Clausen may not be a great draughtsman in a technical sense, but he has the same sympathy for labour as Jean François Millet, and he carries us to an idyllic country, which only the true artist mind could portray. Particularly beautiful is the female figure for "Harvest" (151). There are photographs and small scale drawings giving an idea of the whole scheme and which show clearly what a wide field is open to us if we go to the right men for mural decoration.

"Crafts" (116), by Charles Sims, R.A., and assistants, would doubtless harmonize with architecture of a baroque kind, but the modelling appears to us to have a photographic effect and seems a little feeble and indefinite in drawing. His types are those of very ordinary men and women—even a little common—but the whole lies flat on the wall, except for the doubtful introduction of black into the tone scheme. It is, of course, difficult to say how much of the work is due to Mr. Sims and how much to his four assistants—all of whom are women.

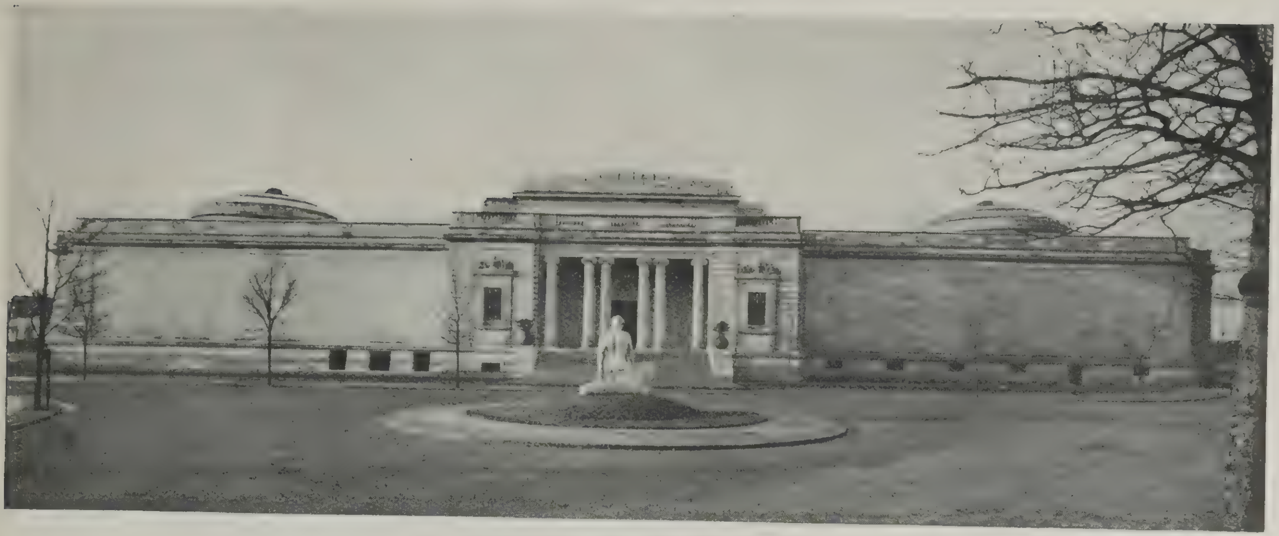
"Eve" (54)—painting in true fresco, by F. Ernest Jackson, is the finest fresco in the exhibition, and his "Pietà" (62)—central panel of triptych (incomplete), is a work of the highest order. It is a tempera painting on gesso over canvas, and represents the body of a Christ of character, supported by the two Marys. The three heads are silhouetted against a background of burnished and patterned gold. Mr. Jackson has a mind of delicate sensibility, for it will be noticed that the hands of the women supporting the dead Christ do not actually touch the body, but hold it with a piece of fine cloth upon which a suggestion of gold is introduced to indicate its precious character. This painting is a fine thing. It is drawn in a masterly fashion. There is a flowing harmony in the lines of the draperies, and its craftsmanship is excellent.

"The Night Passeth, the Day Cometh" (88), by Harry Morley, is more of an easel picture than a decorative painting, but it is worth close study as well for the contrasted movement of the two planes of figures as for the sentiment expressed.

"Sacrifice" and "Remembrance" (168 and 178 respectively) are rather poor examples of decorative painting by Mr. Frank O. Salisbury. These lunettes are destined for Liverpool Town Hall as part of a war memorial.

One regrets that Mr. Frank Brangwyn, perhaps the only living British artist who has devoted himself extensively to the decoration of public and private buildings (examples of his work are to be found in the Royal Exchange, London; Christ's Hospital, Horsham; and as far afield as Canada and Africa), does not exhibit anything. Without him, the exhibition is strikingly incomplete. No other artist in this country has achieved as much as has Mr. Brangwyn: none has attempted as much. In the hands of such a painter, decorative art in England has been brought definitely into the front rank, and in him we, and even more so the Latins, are prepared to recognize a master.

(*To be concluded.*)



THE EAST ELEVATION.

# The Lady Lever Art Gallery, Port Sunlight

WILLIAM and SEGAR OWEN, Architects

THIS building stands in the village of Port Sunlight, Cheshire, and has been erected by the Viscount Leverhulme to the memory of his wife, who died in July, 1913.

The foundation stone was laid by His Majesty King ieorge V on March 25, 1914, and the opening ceremony 'as performed by H.R.H. Princess Beatrice on Decem- er 16, 1922.

The gallery will house a nucleus of Lord Leverhulme's ollections of painting, sculpture, furniture, and china, and r that purpose comprises several types of rooms for their isplay. The general over-all measurements of the building 'e 330 ft. from north to south, and 140 ft. from east to est.

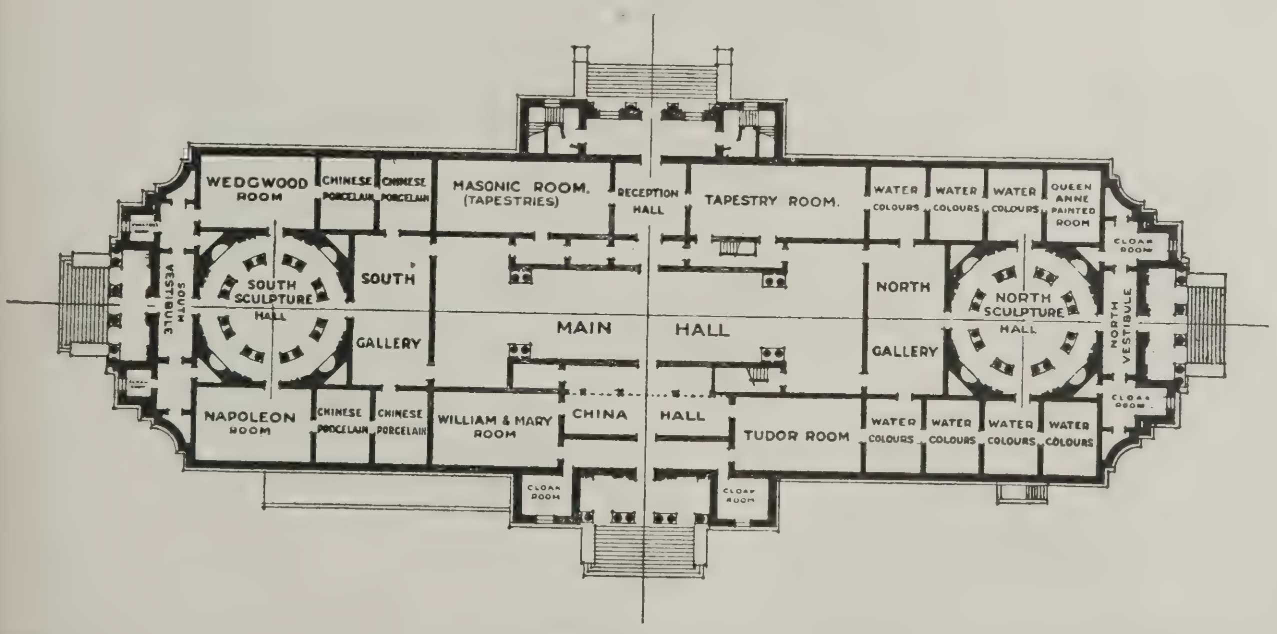
Four entrances give access to the galleries. That to be sed daily by the public being to the south; that to the est, on the occasion of special gatherings and entertain- ents; the north and east, although following the design id treatment of the others, being used mostly for the nvenience of the staff.

The galleries, generally speaking, are arranged around the central hall and the north and south sculpture halls, and include on the north-east side four small period galleries, the Tudor room and china hall, on the south-east the William and Mary room, china and Napoleon galleries; south-west side Wedgwood rooms, china galleries, and masonic hall; north-west tapestry room, four small picture galleries, and Kent room.

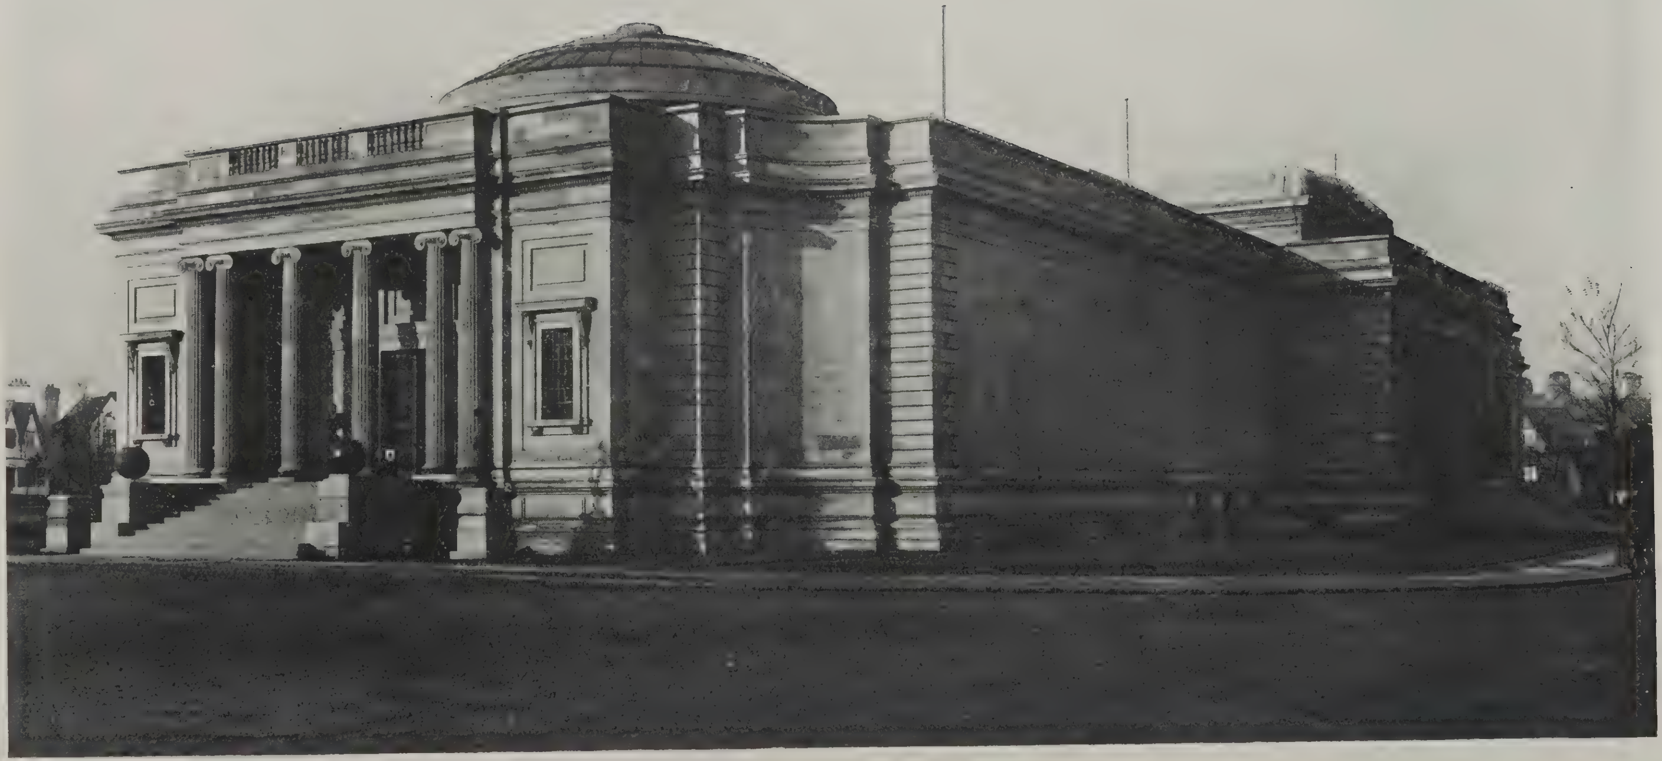
The sculpture halls are circular in plan, 42 ft. in diameter, the colonnade of twin columns carrying a domed light. North and south these lead into two galleries 42 ft. long and 22 ft. wide, and the space between these rooms is occupied by a large central hall 129 ft. long, of a central width of 25 ft., with galleries east and west on the higher level, the end portion having a width of 42 ft.

The reception hall to the west is 24 ft. 3 in. square, having a domed ceiling, and on the north leads to the tapestry room 46 ft. long by 21 ft. wide, and on the south to the masonic room, of equal size.

The four series of smaller galleries in which are displayed pictures, china, and furniture of different periods, are 21 ft. by 15 ft. 6 in.



PLAN OF THE GALLERY.



THE LADY LEVER ART GALLERY, PORT SUNLIGHT: A VIEW FROM THE SOUTH-EAST

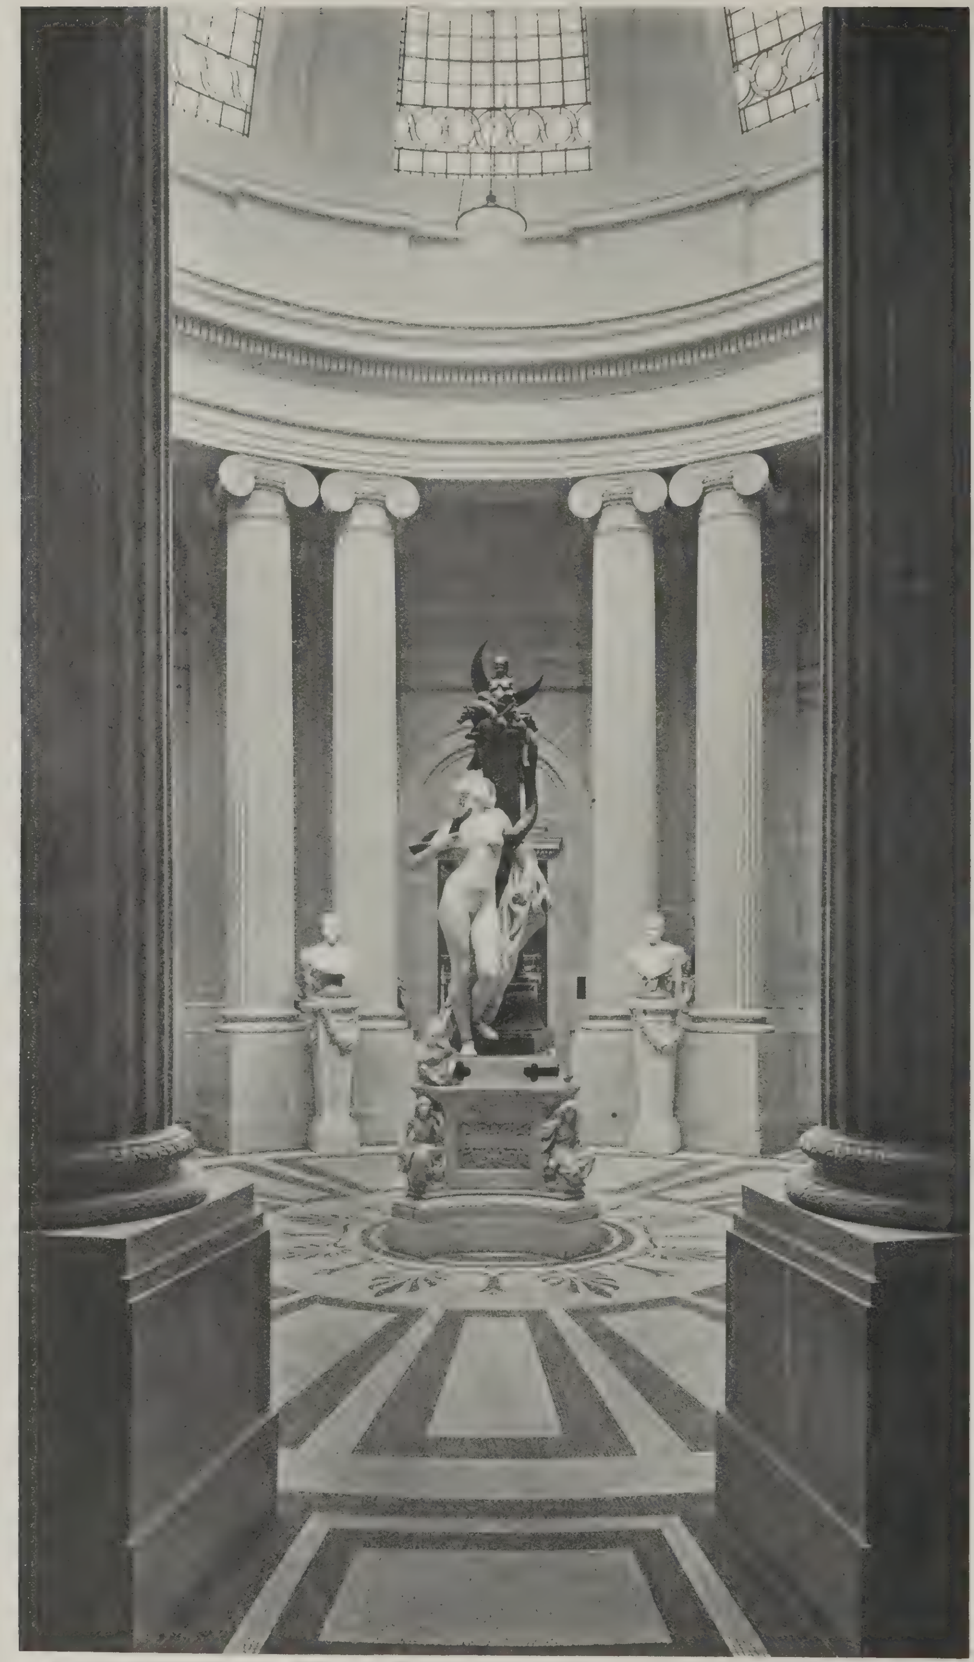
THE LADY LEVER ART GALLERY, PORT SUNLIGHT: THE EAST ENTRANCE.

WILLIAM AND SEGAR OWEN, ARCHITECTS.



THE LADY LEVER ART GALLERY, PORT SUNLIGHT: THE SOUTH SCULPTURE HALL.
WILLIAM AND SEGAR OWEN, ARCHITECTS.

The vestibule on the west side gives entrance to the usual retiring rooms, also the masonic banqueting room.

The above accommodation is on one level, which is reached from the roadway by four flights of steps. The raising of the structure in this way gives height for a semi-basement throughout the length of the entire building, providing accommodation for the storage of furniture, chairs, tables, pictures, books, etc., and also provides for banqueting hall, general kitchen accommodation, serveries, etc., heating apparatus, attendants' general stores, and retiring rooms for visitors.

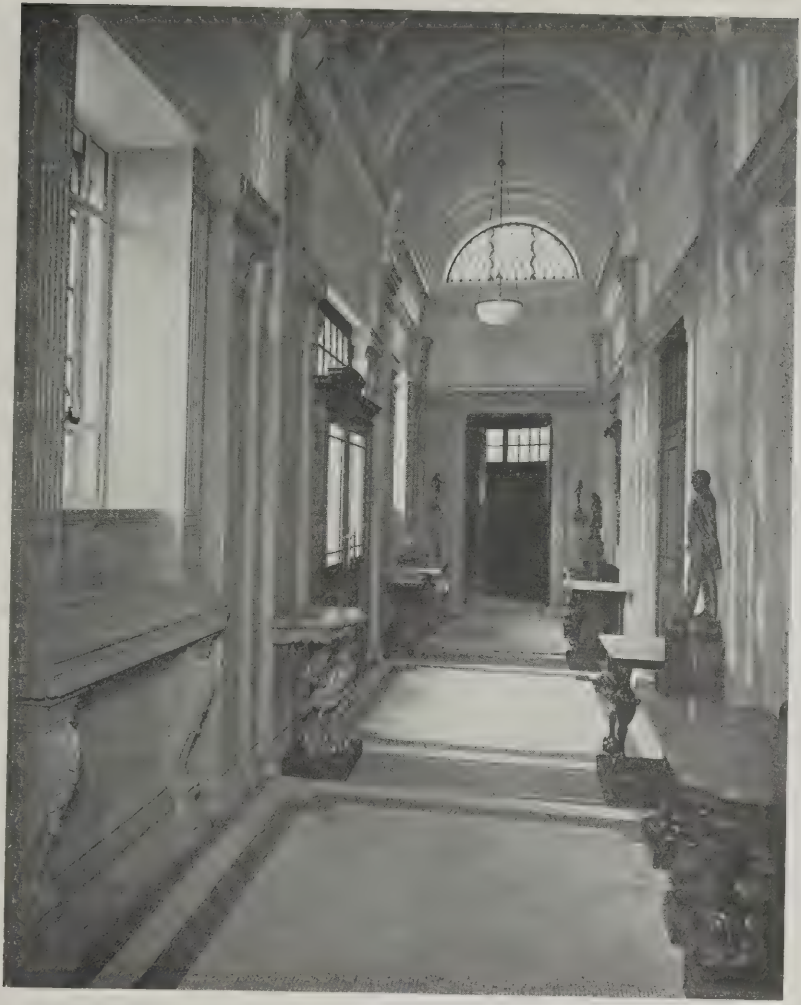
All galleries are lighted from the top—this has enabled the architects to leave the main walls unbroken, giving an effect of quiet dignity and strength, both qualities required in a building which is to house works of art.

The main walls are relieved by the four entrances which are detailed in happy relief to their quiet background. The carving on these features is indicative of the purpose of the building.

The domes of the sculpture halls rise above the entrances at either end, and in the centre the high wall protecting the large central gallery groups with and gives importance to the side entrances.

The Kent room, Tudor room, and William and Mary room are panelled in oakwork of the respective periods, and the Napoleon room is a reproduction of decorations as found at Malmaison. The general interior decoration of the walls of the greater number of galleries is a dull black paint, others are treated as walnut, the china galleries with silk hangings immediately behind the cabinet cases.

The walls of the reception hall and central hall are finished with a pilaster and panelled treatment in plaster. The sculpture halls are finished in French stuc plaster, and all vestibule walls in Hopton stone. The gallery floors are laid with oak blocks brought to a dull dark tone.



THE WEST VESTIBULE.

All the fibrous plasterwork is fixed entirely without wood bracketing to the ferro-concrete walls, ceilings, and beams. Even the picture mouldings are ferro-concrete, faced with Keene's cement, and tested to carry 10 cwts. to each picture hook.

## The Collections

In addition to the collections of tapestries, oil paintings and watercolours, the collection of Chinese pottery and porcelain has been described by experts as unique. In Wedgwood, too, a collection has been assembled of great variety and completeness.

Furniture is represented by the craftsmanship of all the great makers—the Chippendales, Robert and James Adam, Heppelwhite, and Sheraton. The tastes in art of different periods are represented in the Tudor Room, the William and Mary room, the Queen Anne painted room, and the Napoleon room, which is painted and stencilled in the manner of a room at Malmaison.

Sculpture is represented in two domed halls, the northern of which is devoted to the antique. In the southern hall is displayed work by Sir Francis Chantrey, Sir W. Goscombe John, Bertram Mackennal, F. Derwent Wood, W. Reynolds-Stephens, and E. Onslow Ford.

The foundation work and general wall construction was carried out by the British Reinforced Concrete Company; the contractors for the general trades being the Bromboro' Port Construction Company (Messrs. Lever Brothers Building Dept.), who employed as sub-contractors: Messrs. Byrom (masonry); the late J. J. Millson, Manchester, and Messrs. Earp Hobbs and Miller, Manchester (carvers); Messrs. J. B. Johnson & Co., Crown St., Liverpool (plaster work); Messrs. Williams Gamon & Co. Ltd., Chester (glass and metal work); Messrs. C. W. Williams & Co., Manchester (mosaic and marble work); Messrs. Lever Brothers Electrical Department (electric lighting); Messrs. Killick and Cochran, Liverpool (heating, hot water, and cooking apparatus). The ground around the building, and roads adjoining same, were carried out by the Estate Department.

# The Draft Registration Bill

ON Monday next at 5 p.m. a special general meeting of the R.I.B.A. is to be held to consider the Draft Bill for the Registration of Architects, which has been prepared by the Registration Committee and approved by the Council. The Act, the short title of which is cited as the Architects' (Registration) Act, 1923, will operate in England, Wales, and Scotland, and will empower the Council to keep and publish a "Register of Architects."

Appended are some of the more important provisions of the Act :—

The Board which shall be appointed immediately after the passing of this Act shall consist of the following (that is to say) :—

A person nominated by the Privy Council; a person nominated by the Board of Trade; a person nominated by the Board of Education.

The president and fourteen members of the Council nominated from time to time by the Council of the Institute.

The president and two members of the Council of the Society of Architects being architects nominated by the president of that Council.

The president or a member of the Council of the Incorporation of Architects in Scotland being an architect nominated by the president of that Council.

Eight persons being architects nominated by a conference of presidents of the allied societies of the Institute.

A person being an architect nominated by the president of the Architectural Association of London.

A person being an architect nominated by the president of the Royal Academy.

Ten members of the Board of Architectural Education of the Royal Institute of British Architects, nominated by the Board of Architectural Education.

A person nominated in rotation by the governing body of each university in the United Kingdom possessing a recognized school of architecture, the order of rotation being based upon the date of the foundation of such school and subsequently by such machinery as the Board shall set up. The total number not to exceed five.

The appointments to be made annually, members to be eligible for re-election.

Where the word architect occurs in this clause it shall mean a practising architect.

After considering the advice of the Board mentioned in Section 3 of this Act and also subject to the provisions of this Act the Council shall from time to time fix the qualifications for and hold examinations for the purpose of enabling persons to qualify for registration under this Act and the Council may subject as aforesaid fix and take such fees as the Council shall consider to be reasonable for candidates for any such examination and such annual registration fees as the Council shall consider to be reasonable and the Council may provide that such degrees or diplomas of Corporations or bodies (other than the Institute) as the Council may by regulations determine shall subject to such regulations be wholly or in part a qualification for registration under this Act.

5 (1). The following persons being British subjects shall subject to the approval of the Tribunal or, when it ceases to exist, of the Council be entitled to be registered in the register (that is to say) :—

(A) All persons who are in "bona fide" practice as architects at the time of the passing of this Act, or who have been in "bona fide" practice at any time within five years previous to the passing of this Act.

(B) All persons who have been "bona fide" architectural assistants for a period of five years previous to the passing of this Act.

(C) Every person who shall within three years from the passing of this Act apply to the Council to be registered and who shall satisfy the Tribunal that for the period of five years next before the passing thereof and thence up to the time of his applying to be registered he has (except during such time (if any) as he may have been serving in the Forces of the Crown or engaged on national service) either been continuously (providing he satisfies the Tribunal) :—

(i) In part in practice on his own account as an architect and in other part in a responsible position as a "bona fide" architectural assistant to an architect; or

(ii) In a responsible position as a "bona fide" architects' assistant to an architect.

(D) Subject to the intentions of this Act every person being a British subject who may hereafter be declared by the Tribunal, or, when it ceases to exist, by the Council to be entitled to be registered in the register.

(2) Subject to the provisions of this Act the Council shall forthwith cause to be entered in the register the name regular business address and qualifications or principal qualification or qualifications of every person who is a corporate Member or Licentiate or who shall hereafter become a corporate Member of the Institute or who is entitled to be registered therein under the provisions of this Act or who shall be hereafter declared by the Council to be entitled to be registered in the register.

For the purpose of dealing with applications for registration under this Act there shall be a Tribunal which shall have power to reject any application consisting of the following (that is to say) :—

A person nominated by the Privy Council.

A person nominated by the Board of Trade.

A person nominated by the Board of Education.

The president and ten members of the Council nominated from time to time by the Council of the Institute.

Four members of the Board of Architectural Education of the Institute nominated by the Council of the Institute.

The president and two members of the Council of the Society of Architects nominated by the president of that Society, the persons to be architects.

The president or a member of the Council of the Incorporation of Architects in Scotland nominated by the president of that Corporation, the person to be an architect.

Four persons being architects nominated by a conference of presidents of the allied societies.

Where the word architect occurs in the above clause it shall mean a practising architect.

For the purpose only of hearing any application for registration by a member of a society of association of architects existing at the passing of this Act and not being any Institution herein before in this section mentioned the president of or a person nominated by the president of such society or association being an architect shall be an additional and temporary member of the Tribunal.

The Council shall within two months after the passing of this Act request the Privy Council, the Board of Trade, the Board of Education, the presidents of the Society of Architects, the Incorporation of Architects in Scotland, and a conference of presidents of the allied societies to appoint the members of the Tribunal whom they are entitled to appoint under this Act and the Council shall from time to time as occasion may require cause the president of any other society or association of architects who may be entitled to act as or to appoint a member of the Tribunal for the consideration of any particular application to be requested to so act or to appoint and the Council shall take any other steps which they may consider desirable to secure the formation of the Tribunal as soon as may be after the passing of this Act.

It shall be the duty of the Council to summon the members of the Tribunal as occasion may require and to refer to them all applications for registration under paragraphs (B) and (C) of sub-section (1) of the section 5 of this Act.

The Council shall cause any entries to be made in the register which may be necessary to give effect to any decisions of the Tribunal or any such application.

The Tribunal shall charge such fees as may be necessary to cover the expense of its work.

Any member of the Tribunal may be removed therefrom by the body or person appointing such member thereon and any such body or person may appoint another member of the Tribunal in the place of any member appointed by them or him who may die, resign or cease from any other cause to be a member of the Tribunal.

Eight members of the Tribunal shall constitute a quorum and may act notwithstanding any neglect or failure to appoint any other member or members of or any vacancy on the Tribunal and the decision of the Tribunal on any application referred to them under this Act shall be final and conclusive and that notwithstanding any informality or defect in the appointment of any of the members of the Tribunal.

The Tribunal may regulate their own procedure and proper records shall be kept of the proceedings of the Tribunal.

Four years after the passing of this Act the Tribunal shall be wound up and its powers cease.

The Council shall not permit the name of any person who has been convicted of felony to be entered in the register and shall cause to be struck off the register the name of any registered person who shall be convicted of felony* and the Council may refuse to allow the registration of any person or may cause to be struck off the register the name of any registered person who shall after due enquiry be judged by the Council to have been guilty of grave professional misconduct. The Council may also cause to be removed from the register the name of any person who has been declared by a competent court to be a lunatic. The Council shall have the power to suspend any person from the register for any stated time or to reinstate any person who has been removed from the register.

After the expiration of one year from the passing of this Act no person who is registered thereunder shall practise as an architect under the style of an architect or under any style containing the words "Architect," "Architecture," or "Architectural" in partnership or association with or as an employé of any person who is not so registered, but this clause shall not apply to any registered architect who is or may be in partnership with any person or persons following the profession of surveyor or engineer who is a member of The Surveyors' Institution, the Institution of Civil Engineers, and is not engaged in trade and who is approved by the board.

From and after the expiration of three years from the passing of this Act any unregistered person or persons, associations, or companies, who shall wilfully practise as an architect under the style of "Architect" or under any style containing the words "Architect," "Architecture," or "Architectural" shall be liable on summary conviction for each offence to a penalty not exceeding fifty pounds for a first offence and one hundred pounds for any subsequent offence.

After the expiration of three years from the passing of this Act no certificate required to be given by an architect in his professional capacity shall be valid unless the person giving the same is registered under this Act.

After the expiration of three years from the passing of this Act no person shall be entitled to recover any charge in any court of law for any professional services rendered as an architect unless he is registered under this Act.

The fees or charges charged and taken in respect of examinations held under this Act and in respect of entries on the register thereunder and the sale of copies of the register shall as far as possible be not more than are sufficient to meet the expenses of the Council in the execution of this Act.

---

The following article appeared in "The Observer" :—

A committee of the Royal Institute of British Architects have published in their official journal a draft Registration Bill to be presented to Parliament next month. The main object of this Bill is to place the profession of architecture on the same standing as doctors and lawyers by entering upon a register the names of architects who have fulfilled certain conditions.

The proposals put forward by the committee will certainly not obtain the unanimous support of the architectural profession. In fact, they represent the views of a small minority of the R.I.B.A., and some of the most prominent and farsighted of their colleagues consider that the proposal is preposterous which makes the Institute the sole and final authority for deciding whether architects have the qualifications that entitle them to be placed on the suggested register. Any such final authority would have to be supported by all the architectural societies, and apparently the committee responsible for this latest Bill have not troubled to obtain unity in their own profession before launching their project. There are at least 2,000 architects in allied societies who are not members of the R.I.B.A. The views of such an influential body as the Society of Architects were bluntly expressed at a recent meeting, and it was made clear that there is deep cleavage between the two principal architectural societies in this country.

Until there is unity within, it is vain to expect that Parliament will agree to a Registration Bill. If it was an agreed measure, there might be some slight chance on a private members' day. But if Members of Parliament are faced with a number of protests from other architectural societies putting forward different claims from those set up by the R.I.B.A., it is inevitable that they will reply that the architectural profession must make up its own mind before it comes to the House of Commons.

In fact, the whole question of registration is allied with that of unification. So long as architects are engaged in fratricidal conflicts they cannot expect Parliament to sanction proposals made by only one section of the profession. The abortive efforts of the past eighteen years ought to have impressed this truth upon the committee responsible for the proposed legislation. Ever since 1905 the R.I.B.A. has been pledged to a policy of statutory registration, and the professional societies generally have expressed their anxiety to further this policy. In July, 1920, a committee of sixty-six members, the most completely representative body of architects of the Empire that has ever come together, began their study of the subject.

Eventually two statements were issued, as a result of a meeting of the committee, which was attended by less than 50 per cent. of the members. The majority statement was to the effect that the interests of the profession would be best served by the grouping of architects into a organic whole under the name of the Institute, but insisted that unification should come before registration. The statement of the minority was to the effect that registration should be obtained first and it was hoped that afterwards the profession would then be unified. The present Bill represents the views of the minority.

In this particular case a further mistake has been made owing to the fact that apparently the committee has not officially consulted either surveyors or engineers, two professions vitally interested in building. To ignore these two classes of professional men was to invite disaster. It may, in fact, be taken for granted that the Bill now published will arouse strong protests from those interested in these matters.

Mr. McArthur Butler, the secretary of the Society of Architects, in a letter published in "The Morning Post" on January 18, says :—

"In your issue of January 15 there is a reference to the R.I.B.A. registration proposals, which it is suggested mean a cleavage in the profession, and it is stated that the history of the proceedings dates from 1905. That may be so so far as the R.I.B.A. is concerned, but the history of the registration movement is that the Society was founded in 1884 for the purpose of obtaining statutory registration of architects, and has from time to time presented Bills in Parliament to that end. While the Society has not yet succeeded in placing a Registration Act upon the Statute Book, its persistent efforts resulted years ago in consolidating professional opinion in favour of the principle of registration, and in 1905 the R.I.B.A., hitherto in antagonism, could no longer resist the pressure, and was converted. In 1911 the Council of the R.I.B.A. approached the Society with a suggestion for amalgamation, and the Society, in redemption of its frequently expressed offer to stand aside if the Institute would seriously tackle the problem, agreed, and was on the eve of dissolution, when the Institute Council discovered that it had not the power to enter into the proposed agreement."

Mr. Butler then proceeds to give some details of the history of the Unification and Registration Committee since its formation in 1920, and says: "The activities of the minority were reflected in the Institute Council elections of June, 1922, when practically the whole of the old Council were turned out, and one of the first acts of the new body was to pass a resolution purporting to dissolve the Unification and Registration Committee and to disband its members, although the committee has not yet completed the work with which it was entrusted on behalf of the whole profession.

"Many of us think and hope that a way may be found out of the present difficulty and that we may accomplish by joint action that which cannot possibly be undertaken successfully by separate units. This would not necessarily entail the absorption of one body by the other. Registration could in my opinion be accomplished very much more quickly and effectively if the whole of the architectural bodies were united in a federation for the promotion of statutory registration, each retaining its autonomy in other matters. This was the proposal which I made before the Unification Committee was constituted, and which I was afterwards asked to elaborate. The majority of the committee, however, preferred a scheme for bringing all architects into one body as a preliminary to registration, and for the sake of unity the Society threw in its lot with the majority although it foresaw from past experience that negotiations on these lines would inevitably result in the situation which has arisen.

"Any cleavage, therefore, is not between the Society and the Institute, but between the Institute's own members, a domestic difference in which the Society is not concerned, but which it greatly deplores as a hindrance to unity of action."

* The Parliamentary draftsman to advise on the inclusion of "misdemeanour."

# Types and Materials of Houses in England

## By HARRY BATSFORD

MR. HARRY BATSFORD read the following paper before a meeting of the Geographical Association:

At the outset we have to decide whether we will follow in the main a time or place classification. This is a distinction which is always cropping up, and I think you will all agree that it is far preferable, at a meeting of the Geographical Association, to try and study the varying characteristics of buildings in different parts of England, rather than to trace the evolution of style as the centuries pass by, an aspect which has been tackled in a number of text-books.

We all know that there are well-marked styles of building in different parts of England; let me give you an excellent instance. When you stand by Broadway Tower, on the steep northern escarpment of the Cotswolds, and look over the "coloured counties," as Laurence Housman described them, you see the valley of Evesham laid out at your feet, from that commanding height of 1,100 ft. Behind you all the villages are built wholly of limestone. Broadway village tself, on the lower slopes of the hills, is the last outpost of the Cotswold style. The Worcestershire villages in the valley ire totally different, and constitute very harming examples of half-timber and rick.

The local manners of building in England depend largely on the materials vailable, and these again are chiefly onditioned by the geology of the district. Often one particular material or com-ination is predominant in a district, but the raftsmen generally used all the materials hey could, usually with a very keen ense of their qualities and limitations, nd often in more than one manner. Thus you get main and subsidiary types. Shropshire, for instance, is usually described as a half-timber county, but there are a number of houses in stone, and some very interesting productions in brick. The chief exception to this is in Norfolk and Suffolk, and some other chalk districts, where a rather restricted use is made of flint for house building, both in methods and extent, although the mediæval church builders in East Anglia carried their craftsmanship in this refractory material to an extraordinary pitch.

There is, however, a distinctly local school of construction in flint in Wiltshire, in the river valleys round Salisbury. Some houses are built with a chequer of flint and stone, as is often seen in East Anglian churches. Others have a mixture of flint, bricks, and lumps of stone, as in the curious subject shown from Sandwich. The villages of the Bourne Valley, near Andover, have a filling, in the half-timber cottages, of alternate layers of flint and brick, a treatment which it is curious was not adopted more often. Flint is also used to a considerable extent, but with duller and less varied methods, in the cottages of the Chilterns.

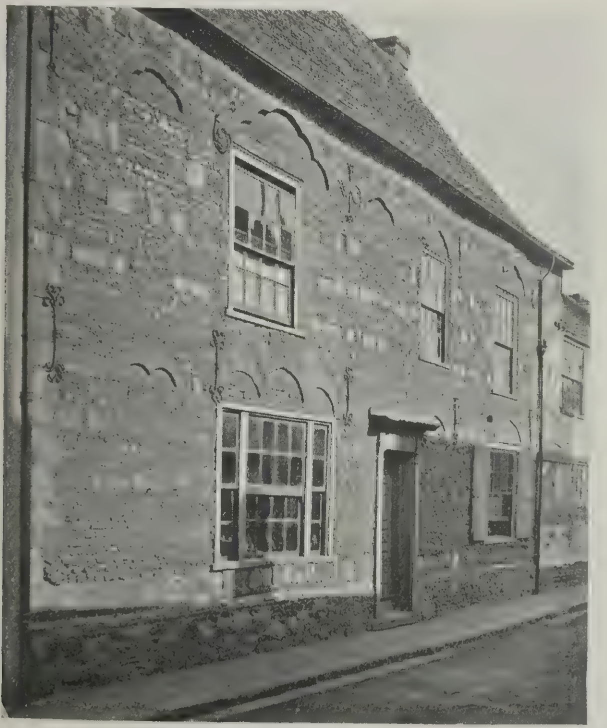
Again, in a clay or brick district patches of rough stone will occur, as round Godalming and in Kent, and give rise to little islanded areas of stone buildings.

But, like everything else, the effort towards the differentiation of local house types can easily be carried too far, for, building in a free tradition, the old craftsmen did not consider themselves bound by any rigid canons of style.

The types of house building vary most in different parts in the case of the humble everyday house: cottages, farmhouses, stables, barns, small manors, and so on, rather than in the bigger houses, which were often designed by special surveyors or architects, and erected by craftsmen imported from a distance. Occasionally, indeed, they used special materials, like terra-cotta, in the days of Henry VIII. Sometimes, especially at the commencement of a new period, the influence of style predominates over that of material or locality, and it is often difficult to tell at a glance from what district come the stone-built houses of Elizabethan and Jacobean times. That does not mean that some large houses do not manifest local characteristics in a high degree. In the same way it is, of course, among the peasant classes that local types of costume and dialects of speech are most marked; education, unfortunately, seems to have a levelling effect.

It is very interesting to try and work out the influence, not only of material and climate, but also try and see how far the buildings express the psychology of the district.

There are often little district mannerisms which are of distinct interest, and much can be done to record them. In Surrey the wide mortar joints in masonry have often pressed into them a number of small bits of local ironstone. In Wiltshire, Hampshire, and elsewhere, farm walls are frequently built of clay, chalk, or rough flint, and as a protection against the weather they have their own little thatched or tile roof. In Northamptonshire is the custom of building with a colour difference obtained by using in alternate layers red ironstone and the yellow-white limestone. Round chimneys of farms and cottages are found in West Somerset, in Pembrokeshire, and in Cumberland. You can also notice many other features, such as the custom in Kent and



A FLINT, BRICK, AND STONE HOUSE AT SANDWICH.

THE MARKET HALL, LEDBURY.

Sussex, of having a little gablet on the roof where the hips join the main ridge.

Following the track of the two chief invasions of England, it is well to look first at the south-east district. In Kent, in which there is a well-marked building manner, many of the larger cottages have hipped roofs, often with little gablets, already mentioned. The cottage at Broad Street, Kent, is an excellent typical example. The roofs are usually tiled, and exhibit in a marked degree the slight wavy effect, due to the use of irregular timbers. The half-timbering, as a rule, is closely spaced, with panels of equal width to the timbers.

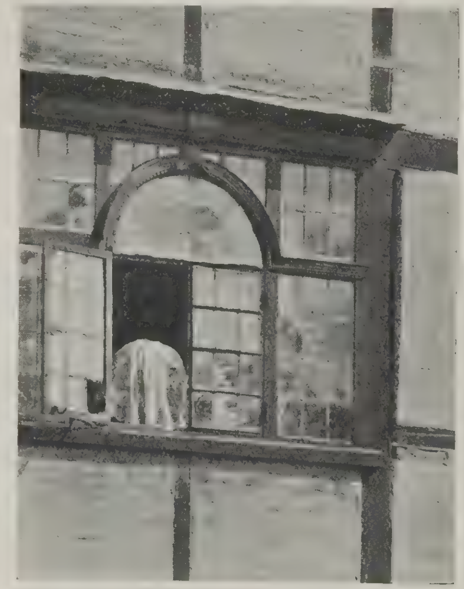
When the oak timbers shrank it became a problem how to make the walls weatherproof. This was carried out in several ways. Tile hanging was very frequently resorted to, and this method, though found in all the south-east counties and in Berkshire, was most extensively used, and reached its highest development in Surrey, where a variety of patterns are frequently used ornamentally on the same house. Houses were often partially or wholly weather-boarded, and there are also Georgian houses completely constructed in this material from the first, as at Dorking. Riverside mills also are frequently weather-boarded in a number of counties. Some houses in Kent have been completely plastered, as at Charlton and Canterbury. Round Midhurst and Petworth groups of cottages are built of rubble masonry, the lower portions of the chimneys being of stone, but the shafts being carried up in brick. Chimneys, though not exhibiting the elaborate brick patterns of East Anglia, are frequently imposing and well-proportioned examples of solid construction, with the stacks either square, octagonal, or set diagonally on the shaft; towards the end of the seventeenth century they are of large rectangular form, and panelled. The lower portions are frequently of great size, finished with crow steps or bricks set diagonally in diminishing stages.

Thatch was frequently used for cottages, but tends to be replaced by tiles. In various parts of Sussex, especially near Horsham, roofs are covered with the local stone slates, the pitch of the roof being kept fairly flat, to take their weight. These stone slates have a particular attraction for moss and lichens which grow on them abundantly. In the more western counties we find small dormers in the roof are characteristic of the Chilterns, and are often set on a small piece of tiling surrounded by the thatch. In Berkshire mention may specially be made of the group of villages round Didcot, which are remarkable for the charm and variety of their houses, carried out in half timber, plaster, and brick, with tile hanging and thatch. There are local types of rounded or canted bays, abundantly glazed, and oriels very often appear, having small roofs of their own, projecting in a greater or less degree from the main gables. East and West Hagbourne, Harwell, Blewbury, and Aston Tirrold must be mentioned, and especially Steventon, where some simple examples of pargetting are found. The window with a central circle also occurs in this district, as seen at Sutton Courtney. It is doubtful if there is a more beautiful group of villages anywhere than these. It is wonderful to come upon them after a long day spent in wandering over the bare empty downs, and one is tempted with little or no exaggeration to use about them the language of the Song of Solomon, and say that they are the chiefest among ten thousand and altogether lovely.

In the Welsh border counties there is, in the abundant half-timber work, every gradation from the plainest panel of "post and pan" work reminiscent of the south-eastern counties, to the most elaborate curved bracing. Probably the largest half-timber house is that of Pitchford Hall, Shropshire, which has only straight and diagonal timbers.

In Kent and Surrey the brick houses are, as a rule, studiously plain, though frequently well proportioned and showing admirable craftsmanship, especially in chimneys, as already mentioned. A custom which came later in the seventeenth and eighteenth centuries is to use headers of a darker brick, and effective use was made of pilasters, cornices, pediments, etc., in the late Renaissance houses from 1660 to 1720.

In East Anglia brickwork has always been prevalent from the close of mediæval days, and the influx of Flemish craftsmen has had much influence on the character and extent of the brickwork, and has helped to bring it to a very high pitch of development.



A WINDOW OF A HOUSE AT SUTTON COURTNEY.

The East Anglian craftsmen delighted in elaborately patterned chimneys. Frequently Tudor houses have been remodelled and plastered in Georgian times, and the panelled stack, as at Clare, Suffolk, is the only reminder of its original date. A very complete style was worked out in brick with finials, windows, and everything carried out consistently in the same material, as, for instance, at Little Hautbois Hall, Norfolk.

In East Anglia many half-timber houses have been plastered all over, and such villages as Lavenham and Kersey are full of these examples. If Norfolk shows the highest evolution of brickwork, it is to Essex and the Cambridgeshire and Suffolk border that we must turn for the most numerous examples of the craft of exterior plasterwork, or pargetting. Even comparatively small cottages are adorned with panels, often carried out in rough cued plaster between smooth or ornamental divisions, and having a central device in each panel. An alternative treatment is to have impressed patterns, such as the basket, looped, diagonal, or radiating fan types. These occur in such villages as Great Chesterford, Newport, etc. More elaborate examples are covered with coarsely modelled ornament which, though its details can be adversely criticized, has, nevertheless, a good general effect.

The well-known examples at Saffron Walden have been severely restored, but one of the most effective of the Early Renaissance is the cottage at Wyvenhoe, scheduled as specially worthy of preservation by the Historical Monuments Commission. There are other examples at Clare, and the so-called Nell Gwynne house at Newport, Essex. This treatment continued during the first years of the later Renaissance, and examples at Shopland and Wakes' Colne show that it was used in the seventeenth and beginning of the eighteenth century. Occasionally in the Southern Cotswolds the occurrence of a rather porous variety of stone has led the builders to plaster the houses as a protection against the driving rain, and the result simulates an East Anglian example in a curious way, as at Yelford.

These cottages are many of them thatched, and it is interesting to attempt to note the different local varieties of treatment in this material.

In Norfolk the supply of reeds has led to an excellent tradition in thatching, and a number of churches are still roofed in this way. In Essex and Cambridgeshire the roofs are high pitched, and the thatch over the gables and dormer windows is carried up to a high peak and finished at a point with an interlacing pattern of twigs. This differs from the rounded treatment of Berkshire and Buckinghamshire, where the thatch is brought down a good way over the hip of the roof. The valleys on thatched roofs are frequently carried out in tiles. The thatch of the cob-walled cottages of Devon and Dorset is again different. It is not easy to describe in a few words the difference in character. The West Country thatchers seem sometimes to aim at a peculiarly smooth velvet finish of their work. But the thatch, like the cottages, is rambling and casual, and wanders picturesquely round corners and on different levels.

As already mentioned, a number of the larger Jacobean houses in Shropshire are carried out in stone, such as the big house at Wilderhope, now a farm, Shipton Court, Corvedale, and Madeley Court, now ruined and dilapidated. In Wilderhope the chimneys, according to local custom, are finished with the stacks in brickwork, parallel to the south-eastern treatment of the rough stone in Sussex. Some Cheshire farms and houses are also built roughly of stone, and roofed with large stone slates.

It is lamentable to think what we have lost within the last hundred years. A collection of 600 wash drawings made by John Buckler about 1830 shows that Hertfordshire towns which are now commonplace or slummy were once picturesque with delightful gabled buildings; the amount of beautiful domestic architecture in the county was amazing; Bristol and Exeter also must have been fairy places before the nineteenth century put its blighting hand on them.

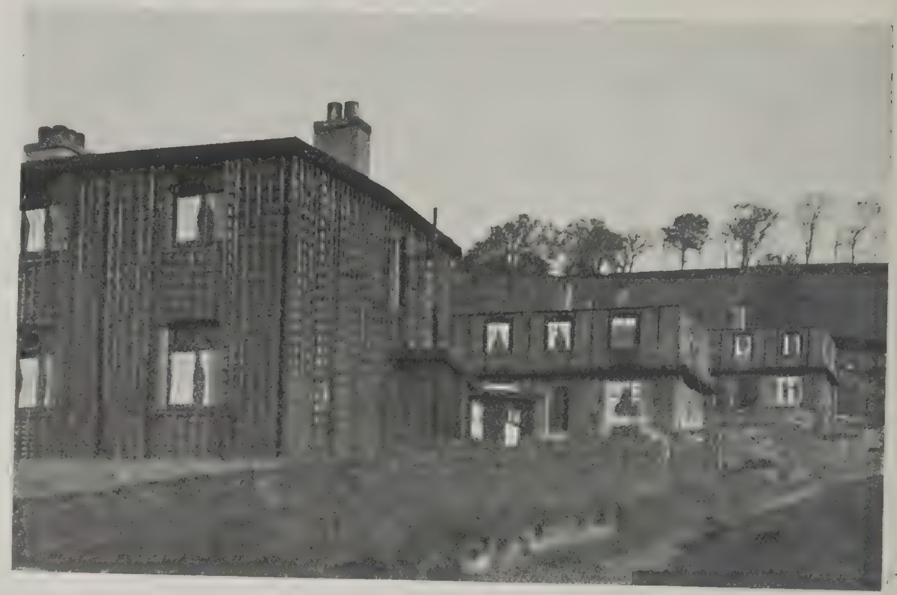
# Houses at Riddlesden, Keighley

## MOORE and CRABTREE, Architects



TYPES A AND B HOUSES.

THE great rise in the cost of building at the conclusion of the war almost stopped the Yorkshire custom of building a "house for yourself and one to let." At this time rents were on a very low cost basis, and local authorities in some districts were in no haste to involve their ratepayers in the expenditure needed to make up lost time in housing. The opportunity to deviate from the model by-laws, the £260 subsidy, the desire to produce good roomy houses by private enterprise, these and other reasons led to the building of the houses illustrated.

The first pair (type A) were built with 9 in. solid walls rough-casted; and these were later covered with trellis to check the action of frost. The second and third pairs (type B) had a wood-framed upper story lathed and plastered inside and boarded outside, the whole being covered with two thicknesses of two-ply Ruberoid.

The fourth, fifth, and sixth pairs were built with 11 in. hollow walls, and the roofs were covered with two layers of rock asphalt. The economy in the roofs is obvious, the party walls and chimney breasts are dispensed with, and Ruberoid and asphalt form the eaves' spouts. The maintenance of roofs of this character compares very well with the slate or tile in general use.

The houses are on land sloping to due south, and the view from each pair, front or side, is uninterrupted, the ground floor of the rear blocks being on a level with the roofs of the houses in front. An ordinary pitched roof would have cut off the view to the south of the Worth Valley and Bronte country. Those who live on the side of hills can appreciate what this means in the lives of the occupants. The view east and west was preserved as far as the limits of the site made possible. Crittalls' Standard windows were used, and fencing made by Rural Industries, Ltd.

On the opposite page are reproduced drawings of two of the types of houses which have been erected. Similar accommodation has been provided in each type, but the planning has been undertaken in a somewhat different manner. On the ground floor of each house is the living-room, parlour, kitchen, coals, and the pantry, and on the first floor are four bedrooms, a bathroom, and a w.c. In one type the entrance lobby gives direct access to the parlour, living-room, and kitchen, and in the other to the parlour and living-room only, the kitchen being reached through the living-room. The staircase in each type leads to a landing around which the bedrooms are compactly arranged.

With regard to the Rent Restriction Act it seems to be agreed that some protection is still needed as between landlord and tenant. It is suggested by many that in all cases where tenants are taking advantage of the law they ought to be required to prove not only that they cannot find suitable accommodation, but that they are not in a position to provide it for themselves.

There is no justification for the State doing the housing work that individuals could do for themselves with all the resources of the building societies of the country available, especially with the present rate of interest to borrowers. Millions of pounds are daily advertised as being available to lend on mortgage, and especially favoured terms are given to "occupying owners." These funds are also available for use by employers of labour who could, if they would, employ architects and builders and build in scores or hundreds, and sell to their workpeople, and thus do good work in their own interest and that of the State without advancing very much of their own capital.

The work was done by local contractors, each trade being let separately, which is a local custom. These and the other contractors were as follows: Thomas Moore, Keighley (bricklayer and mason); Greenherd and Murgatroyd, Ltd. (carpenter and joiner); Wright Harris, Keighley (plasterer); James Harrison, Keighley (plumber and glazier); The Ruberoid Co., Newcastle (Ruberoid); Ingham Asphalte Co., Leeds (rock asphalt roofs and footpaths); Crittalls, of Braintree (steel windows); Rural Industries, Ltd., Cheltenham (garden fencing).

The whole of the gardens were trenched and prepared for planting, and about thirty fruit trees per house supplied. The site is specially suitable for the growing of apples and pears.

# Architecture in the Lay Press

## Registration of Architects

The Bill for the registration of architects, which is to be presented to Parliament next month, is not likely to make much headway. The reason for this, it is understood, is want of unanimity in the ranks of the profession. There are quite a number of architectural societies in existence, but the Bill apparently has been drafted by a committee of the Royal Institute of British Architects without the concurrence of other societies, who hold that the idea that the Royal Institute of British Architects should be the final arbiters in deciding whether an architect had the necessary qualifications to entitle him to a place on the proposed register is preposterous. There appears to be a good deal of inter-society rivalry in the matter, and if a day is ever given by Parliament for discussion of the Bill there will be much opposition. While the majority of the profession agree that registration is desirable, it is not thought that this can be brought about until there is unification within the profession itself.—"The Glasgow Herald."

## Mantelpieces at the Royal Academy

The Royal Academy cannot be accused of lack of enterprise in its Winter Exhibition, which opened on Monday.

It has done something which no one has attempted, so we are told, since 1841, when the question of decorating the Houses of Parliament was urgent.

The exhibition of designs sent in then gave a great impetus, the preface to the catalogue tells us, and it is hoped that the exhibition of decorative art now being held will have equally happy results.

The organizers of the exhibition interpret the words "decorative art" in a generous way. We see everything from vast mural paintings to tiny sketches; from iron gates to tables, looking glasses, mantelpieces, and cups and saucers.

It is only right that the public should realize anew the importance of the decorative arts to architecture, and reflect that in the past the greatest artists did not disdain to devote their art to the beautifying of buildings destined for the most prosaic purposes.

There is no reason why even the offices of a Main Drainage Commission should be an eyesore.—"The Star."

## Modern Architecture

Is the public more interested in architecture than it used to be? That is a question which architects are asking. Personally I think it is, and for a very good reason. There is more interesting architecture about than there used to be.

Moreover, there is a quickening of interest in art generally, and it is beginning to be understood that architecture is by way of being an art and not a mere business.

I notice that the editor of "Architecture," in the prefatory notes to the first issue of the new venture, has a playful dig at the lay Press for its neglect of architects and architecture.

Possibly the gibe is justified, but it has to be remembered that, with rare exceptions, the Victorian architect and his architecture were negligible.

To-day on every hand buildings are going up that really do express their time, and, subject to criticism as they may be in details, do show a recognition of the world we live in, and are not mere slavish copies of styles that, once appropriate to the national sentiment, have long been demodé.—"The Pall Mall and Globe."

## The New Hotel for Manchester

Everybody must feel sorry for all the Manchester business men who will have to find new quarters because of the Corporation's sale of Victoria Buildings. But the Corporation could hardly have done anything but what it has done. We cannot take very seriously the plea of one speaker for the preservation of the Victoria Hotel and Victoria Buildings on account of their beauty. They are certainly no Parthenon. At the same time, unless drawings which have appeared in the Press are misleading, the soul is far from likely to be ravished by the charms of their proposed successor. It will be grievous if this gloomy apprehension is to be fulfilled. A big hotel block of the quality of the Piccadilly Hotel in London, on the Victoria Hotel and Buildings site, would give a memorable first impression of Manchester to the stranger arriving from Liverpool or the North. And such things have their value, even in business. — "The Manchester Guardian."

## An Architect's Dress

Last year I ate more than one dinner in company with famous architects. It might not be easy to say how an architect should be dressed, but it is certain that his garments should have an architectural cut. At this moment I can call up in my memory but two portraits of architects; I give you my word that among those with whom I ate and drank not one had any resemblance to Mr. Inigo Jones or to Mr. Pecksniff.—A LONDONER, in "The Evening News."

## The Adornment of Cities

Sir,—Slowly, but perceptibly, modern civilization is struggling free from the Victorian dogma that business and beauty are incompatible. The latest evidence of this tendency is found in Doncaster, where the local authorities have seriously taken in hand the æsthetic possibilities of the industrial developments of the town.

At the base of all sound town-planning lie broad and dignified thoroughfares and wide open spaces, beautified by tree planting. Doubtless these fundamentals, in the instance under notice, are well in mind.

But I should like to put in a plea for the consideration of two other points, not so immediately obvious, but none the less vitally affecting the æsthetic values of urban planning and building.

First, I would plead for an adequate use of the curve in the laying out of streets. Victorian city architects, and those of the same period in the United States, were obsessed by the rectangular idea, to the serious detriment of the cities they planned. How much of the dignified and pleasing impression created by a gem like Bath may be traced to the careful employment of the curve in crescent and circus!

My second point is the æsthetic and moral value of colour in buildings. Modern processes in the production of terra-cotta and vitreous brick have placed at the disposal of architect and builder a wide variety of colours for external decoration. Why should not our town-planners take into account for their new streets not only structural harmony, but also pleasing colour schemes?

One can picture the delightful effect of a whole thoroughfare in which the dominating tints should be blues and greens, or greys and yellows, relieved by ivory white. Such schemes would bring to the lives and outlook of the inhabitants a new zest, and sub-consciously remove the standing reproach that English towns and English folk are equally drab and dreary. —Yours, etc.,

J. M. HOGGE.
House of Commons.
—"The Times."

## The Problem of the Noisy Office

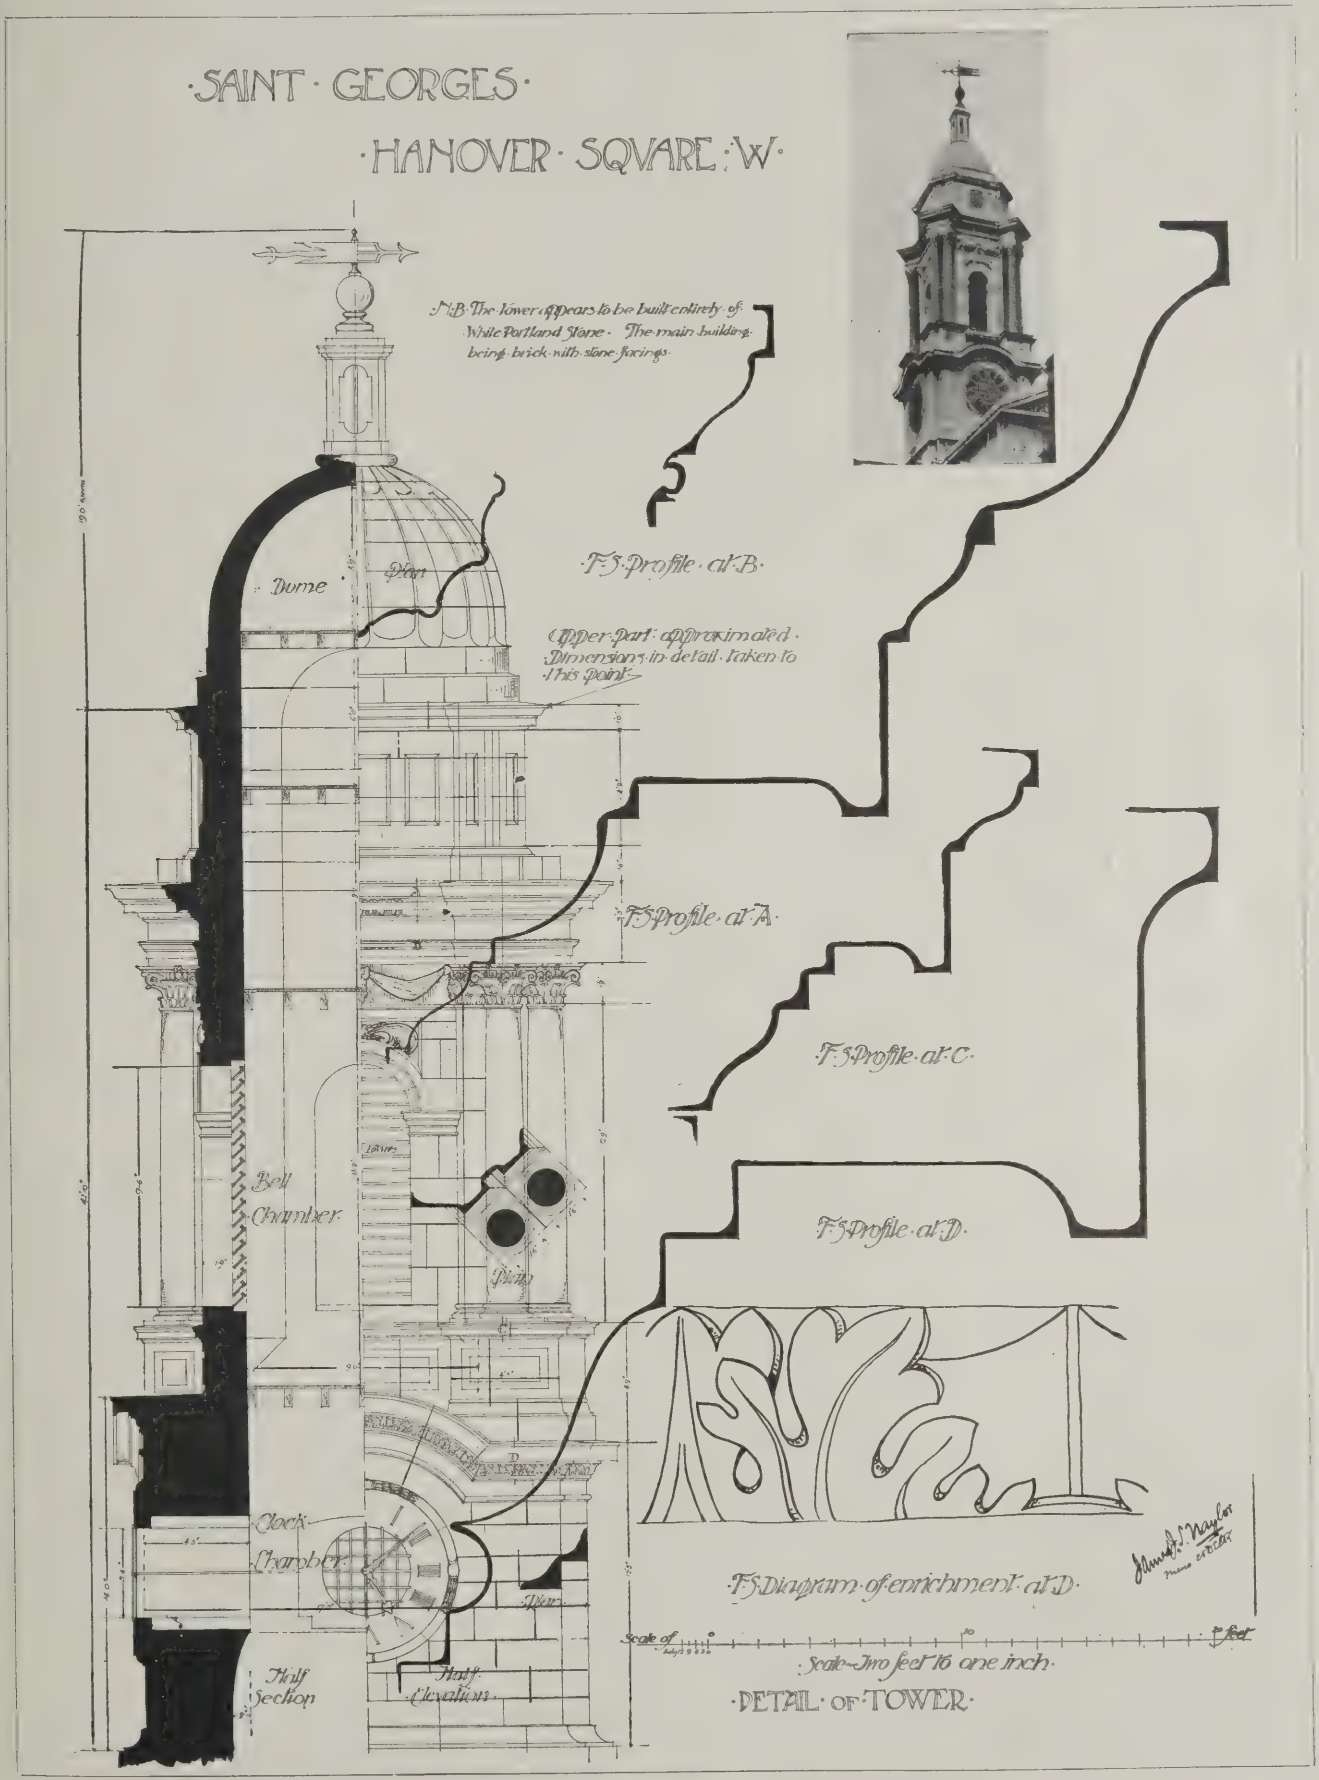
I know a case in the City of London where two buildings side by side vary considerably in their comfort, owing to the volume of sound reaching them from the street. One building has opposite it an office block having a granite base pierced with few windows; and this hard surface acts as a reflector, nearly doubling the noise of the traffic. The other building has opposite it a city church set some feet back from the street, covered with ivy and reflecting by comparison very little. In both cases the direct sounds from vehicles are equal, but in the first case the reflected sounds added to the direct sounds are sufficient to cause a noticeably greater annoyance.

In the States, where offices are frequently planned in a single large hall without partitions between departments, it has been proved that an absorbent upon the ceiling, such as a fireproof felt, covered by canvas, will tranquilize a building and increase staff efficiency to an extent able, in a few years, to cover initial expenditure. The same principles are being applied to school buildings. In a modern fireproof classroom an ordinary scrape of the foot is reflected between floor and ceiling at least a hundred times. This causes unrestful conditions.

It is quite possible to plot the curve of irritability and reverberation, and it is an instructive one. A 70 per cent. absorbent in the form of a panel upon the ceiling of classrooms has produced results in the comfort of students and teachers exceeding all expectations. An absorbent plaster has also been tested. In England successful acoustic experiments are handicapped by the absence of anything corresponding to the American acoustic felts, plasters and tiles. It is to be hoped that the Royal Institute of British Architects and the Board of Scientific Research will be able together to arrive at some useful results.—HOPE BAGENAL, A.R.I.B.A., in "The Daily News."

# Measured Drawings. 21.—The Tower of Saint George's Church, Hanover Square, London

Measured and Drawn by James J. S. Naylor



St. George's, Hanover Square, is regarded as the finest of the many buildings designed by John James. Much of the work of James bears a close resemblance to that of Hawksmoor, whom he succeeded in 1705 as clerk of works at Greenwich. In 1711 he became master carpenter of St. Paul's, after Jennings, and in 1716 was appointed assistant surveyor to St. Paul's, and surveyor to the commissioners for building new churches. St. George's Church was erected during 1713–24.

# Book Reviews

## "Architectural Building Construction"

It is hardly possible to speak too highly of such a book as Messrs. Walter R. Jaggard, F.R.I.B.A., and Francis E. Drury, F.I.S.E., have—with infinite care and an unusual perception of what constitutes a true guide to the science of building construction—recently added to the literature of the subject under the title "Architectural Building Construction." Of the two volumes now included in this notice, the first has already reached its second edition, while the second comprises Part I of Volume II, Part II of which, when published, will complete the work.

In glancing through the profusely illustrated pages, one is constantly impressed by the very high standard of draughtsmanship the authors have set themselves, and consistently maintained throughout. The drawings, however, possess other qualities besides intrinsic excellence of technique, for they reveal in the well-chosen examples presented to the student just that sense of architectural culture which is so lamentably absent from the majority of text-books dealing with the same subject. This observation is deliberately made, for it touches upon an aspect of the matter which the writer has long regarded as of vital importance to the interests of the young architect.

Most works on building construction completely fail in their illustrations. These may be, and often are, quite neatly drawn, and are generally accurate as regards the precise constructional facts they essay to impart to the reader. But it is rare, indeed, to discover in the hundred and one examples they exhibit for the student's instruction anything which—æsthetically considered—rises above mediocrity.

One can recall—in this particular connection—illustrations in otherwise excellent works, which are positively harmfu in their immediate and ultimate effects or the student. He is confronted in such circumstances with a carefully enough drawn illustration—let us suppose—of a French casement with a centre-hung fanlight above it, which bears every indication of having been inspired by a working joiner. The general design is commonplace, the panes ill-proportioned, and the mouldings of the most vulgar description.

These are faults which can never be atoned for by an accompanying precision in delineating the position of the water bar, or meticulous care in drawing the hinges.

There can be no manner of doubt that such illustrations as are here referred to are responsible for a great deal of harm to those students who are pre-disposed to accept, without question or the experience to discriminate, whatever they see in their text-books. Feeling, as they very naturally do, that the authors are to be trusted for their technical knowledge, they are unconsciously influenced by the form in which that knowledge is presented. And if this is unscholarly and unrefined, a lowering of standards must result.

Methods of assembling materials of various kinds into separate constructional units are comparable with the letters of the alphabet, and, like them, may be ungrammatically combined. And for the same reason that a correct knowledge of their order does not of necessity imply the capacity to write polished English, a profound acquaintance with tusk-tenons, wiped joints, and Flemish bond, offers no guarantee that it will inevitably lead those who possess it to design with real architectural expression.

The great merit of "Architectural Building Construction" lies in the fact that it combines authentic practical data with well-designed examples of their application, which is a distinction that entitles the work to take a high place among text-books on this important subject.

By its aid students will not only be able to master all its practical essentials, but be placed in a position to develop along logical lines a cultured sense of their architectural possibilities.

Much use has been made by the authors of dissociated isometric and oblique sketches, and by the system employed of fully figuring the parts; the student is afforded the opportunity of preparing from the examples thus illustrated, complete detail drawings to scale.

Vol. I, which, as previously mentioned, is now in its second edition, comprises seventeen chapters, and deals with brickwork, masonry, carpentry, joinery, steel sections, and roof coverings and finishings. In the pocket of the binding are included general contract drawings, a cottage, and a workshop.

Part I of Vol. II, in addition to a more advanced consideration of the subjects contained in the elementary treatise, and further contract drawings in the cover, devotes approximately half of its 380 pages to calculations. Even these, thanks largely to the attractively drawn

diagrams with which they are interspersed, possess a lure not often associated with them.

Taken as a whole the work is a scholarly production, and its excellences are so manifest and numerous as to cause regret on the writer's part that it was not available when he was a student.

FREDERICK CHATTERTON, F.R.I.B.A.

"Architectural Building Construction." By Walter R. Jaggard, F.R.I.B.A., and Francis E. Drury, F.Inst. of Sanitary Engineers. Vol. I, 15s.; Vol. II, 20s. Cambridge University Press, Fetter Lane, E.C.4.

## Reinforced Concrete

The author of this interesting book has spared no pains to produce matter which shall be of practical use to designers in reinforced concrete, and it is presented in a particularly attractive form, in which the value of clear description is enhanced by ample and well-drawn illustrations.

It should be particularly helpful to those who are only occasionally called upon to design in that material. To such the L.C.C. regulations are a good general guide, and the author has given prominence to them throughout; and even (page 82) limits the scope of the book to compliance with them. In this he does less than justice to portions of the book which are clearly outside the limited range of the Regulations; and it is open to question whether he has not in many instances accepted them somewhat too readily as the last word on the subject.

In their present form the Regulations were submitted to the Local Government Board for approval during the War, when members of the four professional institutions who had statutory facilities for criticism were largely engaged on unusual duties.

Reinforced concrete building in London scarcely seems to have flourished under them. They insist upon an important variation from ordinary practice which very seriously affects economy in design, the effect of which appears to be reflected in the comparative numbers of steel-frame and of reinforced concrete buildings which have been erected in London since they came into force.

Regulation 54 alters the usually accepted figure of fifteen for the modular ratio, $m\left(\frac{Es}{Ec}\right)$, to 9,000 divided by either the compressive stress on the concrete or by the compressive stress as enhanced by hooping, viz., twelve instead of fifteen for 750 lb. concrete, ten for 900 lb., and about eight to ten in columns.

The object of this was obviously to increase the theoretical share taken by the concrete of any load or bending moment jointly resisted by the concrete and the steel. But this it can only do by reducing the theoretical share taken by the steel.

When it is applied to beam sections economically deep, in which the stress on the steel is the criterion of strength, it permits slightly less steel to be used; which scarcely adds to the factor of safety. When, however, it is used in proportioning columns to the critical stress on the concrete, it forces the designer to choose between sacrificing the economical advantages of rich or of adequately hooped concrete, or paying for considerably more steel.

The very severe and even prohibitive handicap which this imposes on reinforced concrete when in competition with steel-frame construction was pointed out in the technical press (*vide* "Engineering," July 9 and 16, 1915); but unfortunately the warning was disregarded.

The present volume throws no light upon this not unimportant point, the author having apparently overlooked this particular Regulation altogether. On page 103 it is stated that the stress in the steel reinforcement of columns of 2 : 2 : 4 concrete may be raised to $m{\cdot}c = 15 \times 750$ lb.; and on pages 105 and 106, he similarly disregards Regulation 54 when calculating the strength of a hooped column. The omission is doubtless accidental; otherwise the author's painless extinction of this unfortunate Regulation might be generally accepted with advantage.

The author rightly attaches considerable importance to the use of standard notation, and a carefully compiled index of notation, instantly found by an inserted stiff page of coloured paper, is an excellent feature; although only one out of many thoughtful precautions for assisting the reader. But neither the author nor Mr. Etchells, who has contributed a foreword on Notation, explains why the familiar symbols of ds and $s_1$ denoting depth of slab in tee beams in the published L.C.C. Regulations, in the R.I.B.A. reports and in the majority of British textbooks, should have been altered to th and $th_1$, letters which are commonly used for height and tensile stress.

The variation of symbols which have passed into general use is apt to be irritating, even when very desirable. When they have been incorporated by legal regulations they should certainly not be varied.

The subject of continuous beams is treated clearly and exhaustively. Rigidly connected columns and beams are dealt with by a novel and ingenious method, which is a really valuable contribution to the means of studying an intricate and important subject. In a future edition, it might perhaps be as well to emphasize that the method presupposes a rigidity in the joint not less than that of the beam or column. Joints in structural steelwork do not always fulfil this condition, and require different methods.

The claim made in the title that this is a practical handbook is by no means undeserved. The general treatment of the subject is simple, straightforward and thorough; and the time of the reader is saved by good indices and copious cross references. The type and printing are excellent, and the illustrations are clearly drawn and admirably reproduced. The book gives good value for the purchase price.

[In view of the great importance of our contributor's remarks with regard to Article 54 of the L.C.C. Regulations, we give below the opinions of several of the leading reinforced concrete firms :—

Messrs. Peter Lind & Co., of Westminster.—"There is no doubt that the L.C.C. Regulations dealing with reinforced concrete require a larger section of column than any other set of Regulations on the Continent or in America. This is unfortunate, in that the increased costs of a column designed to L.C.C. Regulations, and designed in accordance with Regulations ruling elsewhere, amount to as mu as 20 per cent. It is not, howe Article 54 which is responsible for t increased cost. This article is providi for the fact that as the percentage of st increases the efficiency of the co-ope tion between steel and concrete becom less. Practically all Regulations provi for this by not allowing steel above certain percentage to be taken in account to the same extent as the steel lightly reinforced concrete columns. T cause of the heavier columns of t L.C.C. Regulations is to be found in t rule requiring a cover of 1½ in. outside t bars, together with the rule that preven any portion of this cover to be taken in account for carrying purposes. Co tinental rules require 1 cm., or less th and ½ in. cover for internal colum 2 cm., or less that 1 in., for colum in the open. Further, they permit t cover to be taken fully into account f carrying purposes for *lightly reinforc* columns. If the cover required by t L.C.C. Regulations was corresponding reduced the design of these importa members would be brought into line wi established practice everywhere else the world."

The Trussed Concrete Steel Co., Lt of South Kensington.—"The same i dictment has been made by most peo who dealt with the L.C.C. Regulations reinforced concrete, and most of them a agreed that Regulation 54 needs amen ment. The amendment is still the su ject of controversy. Under these circu stances the remarks on Regulation 54 a in my opinion quite in order, althoug perhaps, a little out of place in a bo review."

Messrs. D. G. Somerville & Co., Ltd.- "Reinforced concrete columns, as d signed strictly according to the L.C. Regulations, involve a ridiculous waste money. At a time when utmost econom is essential this regulation should be in mediately amended."

The British Reinforced Concrete E gineering Co., Ltd., of Manchester.- "We are quite in agreement with yo contributor's remarks concerning Reg lation 54 of the L.C.C. Regulations f reinforced concrete."]

# Craft Guilds

## By EDWARD WARREN, F.R.I.B.A.

CORPORATIONS, or "Guilds," for protecting the rights and privileges of traders, whether in merchandise or in the work of their hands and brains, were of great antiquity all over Europe. The Mercantile Guilds, or "Gilds Merchant," as they were called in England, were apparently of earlier origin than the Craft Guilds, and were very naturally of early formation in seaports, where, before the establishment of a national customs organization in the name of the Crown, and especially in ports where the Hansa League had no domination, dues were collected upon goods exported or imported, and the Crown, or the nearest local power, the borough or the overlord, took their share.

We find plenty of instances of the establishment of Gilds Merchant by Royal Charter, notably at Cardiff in the reign of Edward II.

The Gilds Merchant were frequently wealthy and powerful organizations, and came next in town governance to the borough council, presided over by the mayor or chief officer of a corporate town.

These Merchants' Guilds dealing in, and collecting dues upon, merchandise of all sorts, by right of Charter, powerful financially and economically, looked down upon, and kept as far as possible in abeyance, the Craft Guilds of mere workers with their hands at any trade or craft, whether those concerned with the building and decorative arts, or the innumerable handicrafts necessary to civilized life, all the crafts connected with the manufacture of cloth, leather, clothes, or shoes, or the provision of food, drink, or other conveniences, "butchers, bakers, and candlestick makers."

From the earliest times the merchants who dealt in goods which they neither made nor handled, who did not demean themselves by working with their own hands, have constituted a sort of trading aristocracy distinct from that of the military lords and their descendants, who had seized and held, or been given by kings, or overlords, for services rendered, strong places and great tracts of desirable land, and who constituted the feudal and non-trading aristocracy which is still to some extent in evidence here, and still more in Germany, Austria, Spain, and Portugal, and in titular rank all over Europe with the exception of those parts which were invaded by and subjected to the Turks.

The craftsmen, doubly overlorded, naturally created organizations to protect such privileges as they had won, to regulate their wages, to prevent undercutting, and to establish and improve the crafts they professed, in fact, real trades unions.

These guilds seem to have existed in Great Britain at any rate in the second half of the twelfth century. They were well established and important in the thirteenth century, and extremely flourishing in the mid-fourteenth, when they received a great blow in the awful visitation of the Black Death, about 1348–68, as to which more anon.

It is very probable that there were Saxon trading and craft guilds before that fortunate event, for British arts and crafts, the Norman invasion.

The word "Guild" is of German origin (in this country of Saxon, of course,) —"Gilde." The "U" in guild being due to Norman French spelling.

In Saxon times the word was certainly used extensively to signify, primarily family groups or clans, and later corporations. We have the word in town names such as Guildford, and probably Gilling and Gillingham, and we preserve it in the word Guildhall, signifying the official home of a corporation. The Frith Gilds were defensive companies.

Merchant and Craft Guilds in their early days were generally, if not invariably, placed under the patronage of a saint, and had a chapel, or the use of one, allotted to them in a parish or cathedral church. But they must not be confused with the Parish Guilds which were definitely religious and charitable organizations, and not Craft Guilds. The Craft Guilds certainly shared chapels often with one another, and, very likely, with Parish Guilds.

At Chichester the Gild Merchant reconstituted in the twenty-fourth year of Henry VI's reign, i.e., as the Gild of St. George, the mayor being the master. A Gild Merchant, still in name, subsists at Preston (the only town in England), and is celebrated once every twenty years by festivities and processions. (Dr. Cross.)

It is stated, in Kitchen's "Winchester," that the first Gild Merchant in England was established there. Dr. Cross, "The Gild Merchant," states that "During and anterior to the fourteenth century it is probable that a charter of the King was necessary for the founding of a fraternity, but in the succeeding centuries we meet with numerous examples of the establishment and incorporation of Craft Gilds and trading companies by the town authorities."

The system of mother and daughter towns in regard to Gilds Merchant may have applied also to Craft Guilds. "Mothers" were the great towns and seaports, or important central towns such as London, Bristol, and Oxford. Many Irish towns were "daughters" of Bristol.

The early French Guilds, "*confrèries*" or "corporations," closely resembled the British in organization, and probably the French system was copied here.

In both cases the guild was governed by a master elected by its members from their own body, and generally a highly skilled craftsman of considerable repute, variously known as master, maitre, or warden, and a treasurer, bursar, or boursier, probably also a scribe or secretary.

In the ninth year of King Henry V, according to an entry in the Brewer's records, there existed in London 111 craft confraternities, but these were not necessarily distinct gilds or companies, as weak trades or poor confraternities sometimes united for mutual assistance. Amongst them are "writers of texts," pouchmakers, piemakers, whittawyers sheders, malemakers, hurers, galochemakers, leches, writers of court letters, and orglemakers. And a list, dated in 1518, of the companies keeping the watch, which seems to have implied providing a stated number of bowmen to attend in the mayor's service on the vigils of St. John and St. Peter, and keep the watch.

Forty-seven companies undertook this honourable task, the blacksmiths sending two bowmen, the carpenters six, and the goldmsiths, mercers, drapers, fishmongers, and one or two other rich companies eight apiece.

The Gilds Merchant, of course, included various trades, and in a small, fairly thriving town like Wallingford, where we find in 1227 all sorts of small trades included in the gild—glovers, "ferrons" ironworkers, "fabri," i.e., smiths carpenters, wheelers, coopers, weavers, fullers, and bakers.

Our interest as artists and craftsmen is naturally with the workers in the trades concerned with building, and its many accessories, and in the various minor crafts in which the element of design is prominent.

It must be remembered, however, that in mediæval times and, indeed, much later, except, perhaps, in Italy, no craft was in any way distinguished, unless those of the gold and silversmiths.

The weaker of the crafts were in small towns, presumably too poor to form separate guilds, and it was only in large and rich towns that small crafts had distinct corporations. Incorporation was expensive. The weavers of Oxford paid two gold marks to obtain their right to a guild.

The constitution of Craft Guilds seems to have been practically identical in all, and identical or closely similar in France and England.

Legitimate and recognized guilds were incorporated, not apparently always by the Crown, but always with the consent of the borough.

There were, however, irregular guilds, at any rate in London, non-incorporated, and known as "adulterine" guilds.

Here and there, where locality fostered special trades, and where the numbers of the craftsmen were considerable, properly constituted and chartered guilds were established.

At Oxford the cordwainers had an important guild. A great and wealthy town like Bristol had, of course, many flourishing guilds, and it has to this day the Society of Merchant Venturers.

The firmly established custom of three grades in all the trades coincided with that of military life; you had in the trades apprentices, journeymen, and masters, as you had pages, esquires, and knights.

The fully developed guild, in a prosperous corporate town, consisted of men all following one craft or "mystery," and jealously protecting the secrets and the privileges of their society, but further it was watchful of the workmanship of its members, admitting none not supposed to be competent workmen, and it was also a social and charitable society. It had its hall, its coat of arms or badge, its liveries for ceremonial occasions, and its furniture, plate, and crockery.

Apprentices were not admitted, the craftsman must be at least a journeyman, and the masters formed a distinct upper grade, from whom the master or warden was elected.

All questions affecting the craft or mystery professed were debated in the guild, the prices for work, wages of workmen, materials, and craftsmanship.

The guilds did not teach their craft, but they were most exacting in examination of the work of candidates for admission, frequently, indeed, denying admission until a candidate had satisfactorily performed a definite piece of difficult work.

They were examining not teaching bodies, and their examinations were formidable. Their great utility to their crafts was the very high standard they maintained, and, naturally, example, rivalry, and ambition infected the general body of their members, with the results in the very high average of skill we find in the mediæval handicrafts.

The sense, and love, and cult of beauty obtaining in these Craft Guilds, any time, say, from 1150 to 1450, are more than remarkable. The immense, whole-hearted concentration upon the production of beautiful things, not only in architecture and its contributory and dependent crafts, but in all objects of use, in religious, civic, and military ceremonial, in all the appurtenances of daily life, is the salient fact, the obvious lesson of mediæval craftsmanship, of which the guilds were the great social mainstay. If they were not training schools, if they did not directly undertake teaching, they taught by their mere human contacts, by their rivalries, and by the productions of their members. They obeyed, they exacted obedience to a great rule.

Everything had to be handsome. There was no fuss about it, it was the great unconscious rule, universally accepted.

Men being what they were, that is to say, much what they are, and are like to be, this splendid concentration upon and demand for beauty may to some extent be explained by the fortunate absence of too many other interests.

Nowadays the interests are of such an enormous number and variety, outside of a man's home, that many men don't stop at home, and outside of a man's trade, that many men following a trade or craft are only interested in it as a means of living, not for itself. Fortunately there are still craftsmen who are interested, who do care, who live in and for their crafts.

It is very obvious, however, that the skilled mediæval craftsmen who carved, who modelled, who painted, who wove tapestry, and could give themselves expression, got immense pleasure and fun out of their work, or it wouldn't be so pleasing to us moderns.

William Morris, our great past-master, said once something like this: "If you don't put pleasure into your job nobody's going to get much out of it." That's as true as most things he said.

They loved larks, these dead and gone guildsmen, just as much as we do; their guilds gave them social opportunities and feasts. When a master was elected he had to give the guild a dinner, or pay a fine of a mark or more. Sometimes they exceeded, and took a drop or so too much. Sometimes they quarrelled and drew knives, and were suppressed and fined. They were unquestionably religious, they all had to pay for the upkeep of their altar, and the candle. They were devoutly proud to walk in religious processions, in their liveries, with their craft emblems and banners, and disputed the honour of bearing lights.

They were subject to various penalties for the infraction of rules, and had many guild dues to pay. But if they fell into ill-health, poverty or misfortune, the guild was prompt to help them. If they died poor, their guilds frequently cared for the widow and children.

The craftsman's guild was not only a closely protectionist trade corporation—jealous of pay and privileges, striving always for the creation of a lucrative monopoly, but honestly jealous for its standard of workmanship, its good repute, and that of all its members—but the members' social and benefit club. It did pretty well all that the various more or less modern associations, such as the Oddfellows, the Shepherds, the Druids, and the Foresters do now.

What chiefly concerns us is that these guilds in their best days (which ended for most of them at any rate before the middle of the sixteenth century, and in beauty and charm, for most of the crafts long before that) did steadily maintain the highest standards of workmanship, and the fine traditions of their craft.

By the end of the thirteenth century the Craft Guilds had attained a very secure position in the social hierarchy, and were thoroughly recognized as stable and most useful elements in the social order of municipalities. They could be, and were counted upon as supports of the State, as loyal adherents of Church and Crown, and as unofficial training schools, through their incorporations of respectable and knowledgeable citizens in the highly skilled masters of the crafts, with whom the apprentices lived and served. They turned out a constant stream of well-trained craftsmen, law abiding, trained to obedience, for the most part decent living, good, useful citizens in time of peace, good, useful soldiers if need were in time of war.

The guildsmen were immensely attached to their guilds, immensely proud of their craft or "Mystery." They showed their affection for the one and their pride in the other, by frequent bequests to their guild or "Company," with the result that in time they became considerable property holders in houses and lands. The larger guilds or companies, in the larger and richer cities, especially, of course, in London, became immensely wealthy, and this accumulation of wealth helped their undoing and final dissolution as real active craft guilds. The survivors, in the London City Companies, are rich landlord associations, administering a good deal of benevolent work, making frequent and liberal contributions to useful causes, educational and other, and maintaining a kindly traditional contact with their nominal crafts, observing the form of apprenticeship and service for their members, and generally keeping up the names and shells of things and customs, but containing few or none of genuine craftsmen, and only exercising, which they do with great splendou and most genial hospitality, the excellen custom of occasional communal eating and drinking.

The causes of change during the centuries of their existence were many There was the inevitable gradual change with the social changes of those centuries in accordance with the constant rule o change which optimists, mostly youthful always call Progress, and pessimists mostly elderly, bewail as subversion or retrogression.

One sudden, unexpected, and awful cause of change in the guilds and in the crafts was the terrible visitation of the Black Death, a hideous form of plague, that seems to have made its first appearance in Dorset, some authorities say Southampton, in 1348 or thereabouts, and which rapidly spread westward and northward. We find records of its frightful devastation in the great and thriving towns of Bristol in 1349.

The case of Bristol was the case of many, if not most, of the thriving, crowded commercial towns of narrow streets and dense population, and is therefore typical. Craft Guilds in Bristol were of very early origin. Mr. Hunt, in his "Bristol," one of the historic towns series, says "there can be no doubt that these institutions existed here before the Conquest," and he further says of the Guild of Kalendars, one of the most ancient in England, that "besides performing the ordinary guild functions of mutual help, of visiting the sick, and providing masses for the dead, it undertook works of education and learning"; further, "The Guild meetings are said to have been held on the Kalends of each month." The latter statement, I should think, is a modern pedant's guess derived from the name, which signifies calenderers or hot pressers of linen, and has nothing to do with the kalends, which were not much thought or known about in the eleventh or twelfth centuries.

A Charter of John, while Count of Mortain, in 1188, "to his burgesses within and without the walls" of Bristol, says, "They may have all their reasonable Guilds as well or better than they had them in the time of Robert and his son William, each of Gloucester."

There were many craft guilds in Bristol, amongst the richest the weavers and the tailors, and of the building and kindred crafts as many probably as in any English town but London.

There was also the Fellowship of Merchants, subject to and receiving the support and confirmation of the municipal government, and still existing as the Merchant Venturers, and occupying its hall. Its regulations made under the celebrated Canynges, then mayor, were established in 1467 and became part of the law of the town. All foreign trade was carried on under its direction, and all merchants were bound, under a penalty of a pound of wax, to appear before the Master and Fellowship and hear their decrees.

It seems to have had an internal or affiliated guild, the Fraternity of the Merchants and Mariners of Bristol, which was dedicated to God, our Lady, St. Clement, and St. George, and maintained a priest and twelve poor sailors. All masters and mariners had to pay a contribution to this guild, on the completion of a homeward voyage.

# Correspondence

## American Methods in English Architecture

*To the Editors of* THE ARCHITECTS' JOURNAL.

Sirs,—In your issue for January 10 ttention is drawn to Mr. Alfred C. ossom's scheme for the improvement of mmercial architecture in England by e offer of an educational travelling udentship to the United States, the st of which, it is understood, is to be enerously defrayed by Mr. Bossom imself.

Such a valuable and practical educa onal scheme will undoubtedly receive e hearty support of the architectural dies in this country, and the Society of rchitects, whose establishment of a holarship to provide facilities for the udy on the spot of American architec re and methods was announced in the ovember issue of "Architecture," will atch its development with the greatest terest.

The two schemes differ mainly in the ethod by which the holder of the student ip is to be selected. Mr. Bossom ap rently proposes to institute an open chitectural design competition on lines hich are similar to those of the Society Architects' Victory Scholarship com tition.

The conditions of the Society's Ameri n scholarship, which is restricted to ritish subjects, are calculated to attract e type of architect who has followed a successful student's career by gaining rther knowledge and experience, which is intended this scholarship shall crown. will be awarded to the architect whose tainments and personality recommend m to the jury as the candidate best ted, in their opinion, to benefit by the ward and to enable the Society to pass that benefit to others.

The details of the Society's American holarship scheme are in the hands of a mmittee, and a further announcement the subject will be made in due urse.

C. MCARTHUR BUTLER.
The Secretary of the Society of Architects.

## nification & Registration

We publish below a letter which has en sent to the R.I.B.A. We under and that a deputation concerning this being received at the Institute as we to Press.

*o the President and Council of the*
*yal Institute of British Architects,*
*9 Conduit Street, W.1*

Gentlemen,—In April 1920 the so eties allied to the R.I.B.A. and other chitectural bodies were invited by the I.B.A. Council to appoint representa ves to serve upon a Committee repre ntative of the whole profession, cluding unattached architects, for the rpose of considering and reporting on the subject of Unification and egistration. These societies appointed their representatives, and the Committee was duly constituted. For upwards of two years the Committee and its individual members devoted a great deal of time and trouble in getting together information for the preparation of a report upon the matter which had been referred to it.

In July 1922, before any report by the General Committee was issued, the Council of the R.I.B.A. passed a resolution purporting to dissolve and discharge the members of this Committee which was appointed, jointly with the R.I.B.A., by the Society of Architects, the Allied or other Societies, and by those architects who were not attached to any of these Societies.

This action of the Council of the R.I.B.A. did not commend itself to many representatives who had been appointed by their own societies, and others, to serve on the Committee; and the members of the Committee were invited to be present at a conference of Presidents of the Allied Societies held at the Royal Institute on July 21 last to discuss the position which had arisen.

This meeting held the view that the action of the Institute Council in purporting to dissolve the Committee was unconstitutional, and it was considered desirable that the Committee should complete its work, and prepare a report suggesting the outline of a definite scheme for further general consideration.

At a meeting of the Committee held on October 5, 1922, those present reaffirmed the decision of July 1922, and requested the undersigned to communicate with all the members of the Committee, inviting them to express their opinion on the proposal that the Committee should continue its work and complete and present its report to the various bodies represented upon it, intimating that, in the event of there being a general consensus of opinion in favour of proceeding, it was proposed to invite the Institute Council to reconsider its decision of July 1922 and to co-operate with the Committee in completing the work it has undertaken on behalf of the profession as a whole.

The replies show an overwhelming majority in favour of this proposal, there being no dissentients. We therefore, on behalf of the other representatives on the Unification Committee, request the Council of the R.I.B.A. to receive us as a deputation so that we may personally present our case.

With great respect it is pointed out that by extending this courtesy to the representatives of the Committee, the Council of the R.I.B.A. will not pledge itself to any course of action but will at least serve the useful purpose of ascertaining if there is some means of reconciling conflicting views on questions of policy and principle and of achieving, by co-operation, the end we all have in view, and which, at present, we are seeking to reach by different methods.

We are, Gentlemen,
Yours faithfully,
(*Signed*) HERBERT T. BUCKLAND.
E. J. SADGROVE.
H. C. CORLETTE.

## Housing and Resident Ownership

*To the Editors of* THE ARCHITECTS' JOURNAL.

Sirs,—If the Government could bring forward a scheme whereby it could make possible and induce the working classes and others to own their houses, among the many social and economic advantages of such a scheme would be a saving in repairs, amounting in the aggregate possibly to millions per annum.

Why should not the Government encourage resident ownership by agreeing to advance, by way of mortgage, practically the whole cost, less a deposit of, say, £20, at a low rate of interest? The capital sum repayable by means of a sinking fund, based on the 4 per cent. tables, spread over forty years, would amount to about £5 per annum.

Take, as an example, a freehold or long leasehold house costing £500; the interest at 4 per cent. would be £20 a year, plus the sinking fund of £5, a sum which the working classes could afford to pay, i.e., £25; added to which would be maintenance, repairs and insurance, and also the rates and taxes, unless it was found possible to remit these temporarily either wholly or in part.

A difficulty which might arise is that a man, losing his work in a particular neighbourhood, would be compelled to move and vacate his house. To solve this problem he might be given Housing Bonds to the value of this property at that time, and thus be able to obtain possession of another house in the required district.

Such a scheme might be worked by approved Building Societies, with their existing organization and the necessary Government backing.

A long lease would probably be better than freehold, as it would be possible to enforce proper maintenance and repairs.

PERCY B. TUBBS.

## Tutankhamen's Tomb

*To the Editors of* THE ARCHITECTS' JOURNAL.

Sirs,—One remembers Wilde's poem upon the sale of Keats's love-letters, and the expressions of opinion upon the publication of the Browning love-letters some years ago, but not one word seems to have been uttered against the rifling of an ancient Egyptian's tomb. Yet who would care for his father's or mother's grave to be opened and the poor body brought forth just in order that the wedding-ring upon a finger might be subjected to expert examination by archæologists, historians, architects, and the like? R. K. W.

Can the passing of time excuse the intrusion into any tomb?—there to find the ornaments and jewels of some other age, the burial garments, and a spray of flowers. What was laid to rest with so much tenderness and care, should not be dragged into the light of day by the curious people of another age.

## Building Trade Crisis

Another stage was reached last week in the threatened dispute in the building industry arising out of the employers' proposals for the extension of the forty-four-hour working week to forty-seven hours for eight months of the year, with forty-four hours for two months and forty-one and a half hours for the remaining two months, and a reduction in the wages of all operatives by 20 per cent.

The following official statement was made by Mr. George Hicks and Mr. R. Coppock at the close of last Friday's meeting :—

A Central Committee has been set up, consisting of the Emergency Committee of the National Federation, with one representative from each affiliated union, to deal with all matters arising in the event of a dispute, and to arrange propaganda and deal with other matters which it will be necessary to place before the affiliated membership. The unions have decided to pool the whole of their national organizers to be at the disposal of this committee and to be utilized in any area where their services are most required.

A deputation has been appointed to meet the General Council of the Trade Union Congress next Wednesday to place the full facts of the situation before that body. We believe that the Federation of British Industries is behind this suggestion of longer hours, and we consider that the whole of the trade union movement should be made aware of the demands in order that support of the trade union movement may be enlisted. We believe it is only part of a general attack on trade union standards. Other industries are being attacked in different ways and at different times.

On the resumption of Parliament a meeting will be requested between the Labour members of Parliament and the representatives of the building operatives, in order that the Labour members may be made fully aware of the position. While this Central Committee has been set up, it does not in any way interfere with the functions of the elected representatives of the Federation on the Wages and Conditions Council, but will at all times be the negotiating medium between the operatives and the employers. We are still hoping that the position is capable of being negotiated without any disturbance taking place in the industry.

We understand that the employers are meeting, and there may be a suggestion put forward from that meeting which will lead to further negotiations. That, of course, we shall entertain.

---

## Wilberforce Museum, Hull

A fine oak-panelled room has recently been restored in the Wilberforce Museum (originally the home of the Lister family), Hull, by the generosity of Messrs. James and Charles Downs. The oak panelling was stripped from the walls in order that slight repairs might be carried out, and during this process the fine old arched fireplace shown in the photograph was revealed. The room was probably the original kitchen for the mansion, the chimney being open to the sky. Wilberforce House was built by the Lister family about 1590, and Charles I was entertained there in 1639. It is now a public museum devoted to the history of Hull, and the recent restorations have been carried out under the supervision of the Curator, Mr. T. Sheppard, M.Sc., F.G.S.

[We are obliged to the editor of "The Connoisseur" for permission to use the illustration.]

## R.I.B.A. Prizes and Studentships

At the meeting of the R.I.B.A., held on Monday evening last, the awards of prizes and studentships for 1922–23 were announced as follows :—

R.I.B.A. Essay Medal and 25 guineas :

Lionel B. Budden, M.A., A.R.I.B.A., Withinfield, Heswall, Cheshire.

Owen Jones Studentship (£100) :

Cyril Forbes Filbey, 123 Crystal Palace Road East Dulwich.

Grissell Gold Medal and £50 :

Percy Morrey, M.B.E., A.R.I.B.A., Wynhill Bramhall, Cheshire.

Ashpital Prize (books value £10) :

Alexander Simpson Reid, 221 Clifden Road Aberdeen.

Measured Drawings Medal and £50 :

Wesley Dougill, B.A., Liverpool, The Lees, 58 Colthorpe Road, Edgbaston.

Pugin Studentship (Medal and £75) :

A. Newton Thorpe, Cemetery Lodge, Fulford, York.

Godwin Bursary and Wimperis Bequest (Medal and £130) :

William Thomas Benslyn, A.R.I.B.A., 42 Wes Side, Wandsworth Common, S.W.

Tite Prize (£100) :

John Chane Shepherd, A.R.I.B.A., 51 Torrington Square, W.C.

Honourable Mention :

Miss Isabel Maud Chambers, The Priory Roehampton.

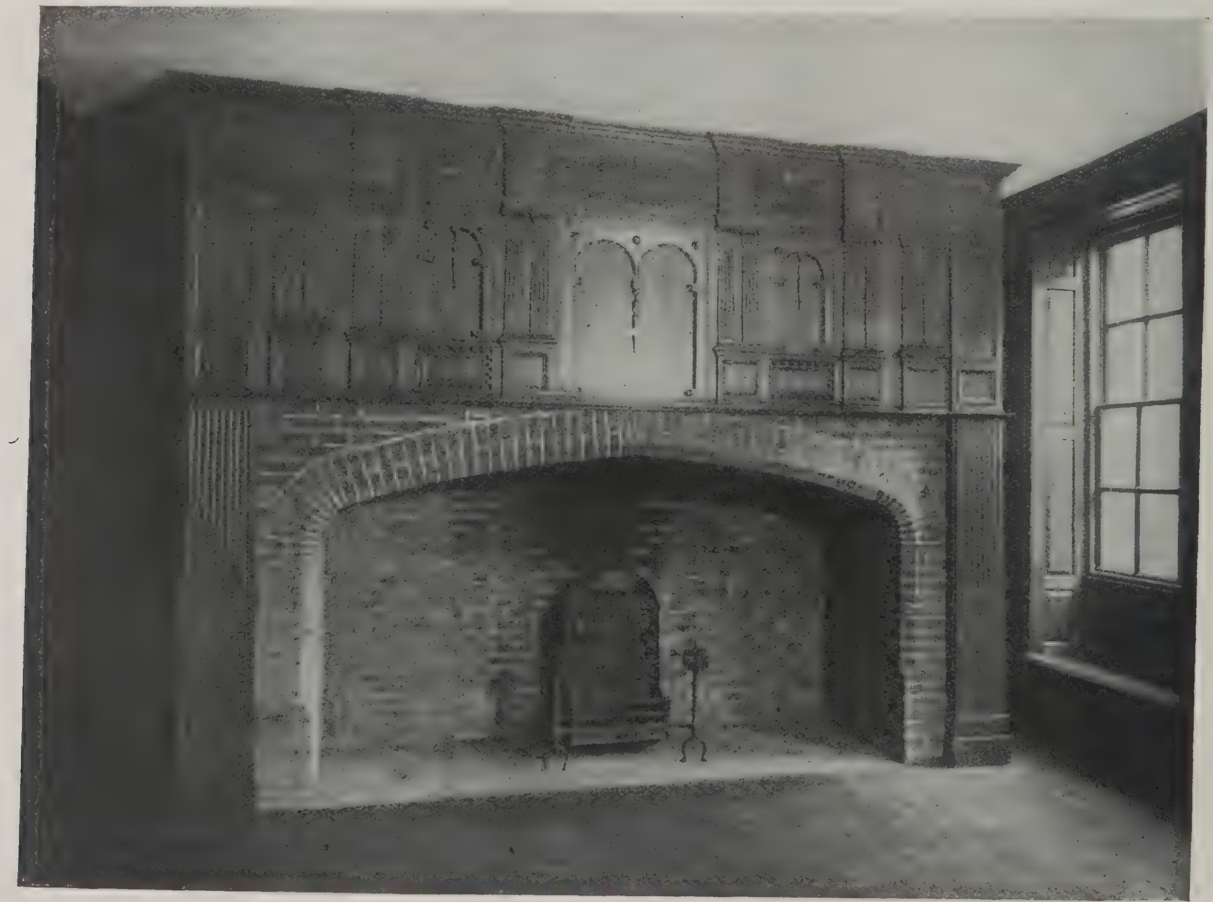
Henry Saxon Snell Prize and £60 :

Ernest G. Theakston, F.R.I.B.A., 12 New Court, Lincoln's Inn, W.C.

Honourable Mention :

George Bertram Edward Norburn, A.R.I.B.A The Crossways, Northwood, Ramsgate.

Alfred John Brown, A.R.I.B.A., 35 Handside Lane, Welwyn, Herts.



ROOM IN THE WILBERFORCE MUSEUM, HULL, SHOWING A RECENTLY DISCOVERED FIREPLACE.

## Competition News

*The "Chicago Tribune" Competition.*

The accompanying illustrations show the design of Messrs. W. J. H. Gregory and B. R. Saunders, AA.R.I.B.A., which obtained honourable mention in the "Chicago Tribune" competition for their new administration building. Representatives of twenty-two nations sent in designs. The site is 100 ft. frontage, by 135 ft. deep, and the height allowed by the by-laws is 400 ft., the area being limited to 3,600 sq. ft. at a height above 260 ft. The plan shows a central entrance for the "Tribune" offices and a subsidiary entrance for the offices over. The main entrance leads to a central domed hall lit on three sides. This hall gives direct communication to the public space. The circulation gives access to offices, elevators, and staircases. Future extensions on the remainder of the site were allowed for in the design. It was taken into consideration that the building should be treated as a tower and the vertical lines emphasized. The winning design was illustrated in our issue for January 3.

*Durham School Memorial Chapel.*

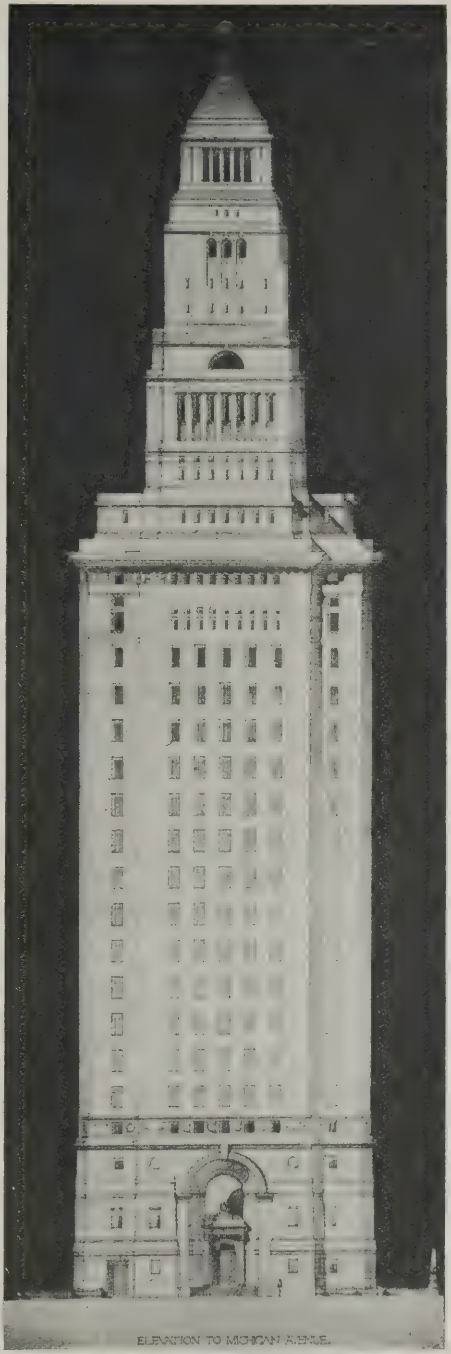
The Memorial Committee is inviting a number of selected architects to submit plans for this building, and Sir Charles Nicholson has been appointed assessor. Architects wishing to compete should apply to Mr. H. S. Harrison, 19 Western Hill, Durham.

*Brechin War Memorial Competition.*

The R.I.B.A. have issued the following notice: "Members and Licentiates of the R.I.B.A. must not take part in the above competition because the conditions are not in accordance with the published regulations of the Royal Institute for architectural competitions." A similar notice has been issued by the Society of Architects to their members.

*Old Cranleighans' War Memorial Competition.*

The winner of the above competition is Mr. W. S. Masters, of Messrs. Trehearne and Norman, Windsor House, Kingsway, W.C. Mr. Shepherd was the assessor.



## The College of Hygiene

The Council of the R.I.B.A. have made representations to the Ministry of Health pointing out the desirability of holding an open architectural competition for the design of the new College of Hygiene in London, which is to be built with funds provided by the Rockefeller Foundation of New York. This course would give to American architects an opportunity of taking part in the competition.

## List of Competitions Open

| Date of Delivery. | COMPETITION. |
|---|---|
| Feb. 1 | War Memorial to be erected in the Public Park, Brechin, adjacent to the Gleneadam Railway Bridge. Cost not to exceed £1,200. Apply Mr. F. A. Ferguson, Town Clerk, Brechin. |
| Feb. 28 | Scheme for the distribution of drinking water for the town of Mantes-sur-Seine. Apply Mairie, Mantes, or at the offices of La Renaissance des Cités, 23 Rue Louis le Grand (11c). Premiums: 4,000, 3,000, and 2,000 francs. |
| March 31 | War Memorial for Port Said, Egypt, to the memory of the soldiers of the Australian and New Zealand Forces who fell in Egypt, Palestine, and Syria during 1916, 1917, and 1918. Premiums: 250 guineas, 100 guineas, and 50 guineas. Apply High Commissioner for Australia, Australia House, Strand, W.C. |
| March 31 | War Memorial in Crow Nest Park, Dewsbury. Assessor, Professor C. H. Reilly, O.B.E., M.A., F.R.I.B.A. A copy of the conditions together with plans of the site may be obtained on application to Mr. H. Dearden, A.R.I.B.A., Borough Surveyor, Town Hall, Dewsbury, on payment of one shilling. |
| No date | New Town Hall for Cork. Limited to Architects living or practising in Ireland. |

## London Master Builders Sports Association

*League table up to and including January 20th.*

THE "CHICAGO TRIBUNE" COMPETITION

THE HONOURABLE MENTION DESIGN OF W. G. H. GREGORY AND B. R. SAUNDERS, AA.R.I.B.A.

# Enquiries Answered

*The Editors cordially invite enquiries from readers who require information on architectural, constructional, or legal matters. Answers to enquiries are in all cases the work of experts; and while every care is taken to make the replies thoroughly reliable, the Editors cannot hold themselves responsible for any inaccuracies that may inadvertently occur. Correspondents whose difficulties involve possible legal proceedings are strongly urged to consult their solicitors before taking action on any advice that may be given. Examination questions cannot be answered. It must be understood that, as a rule, both question and answer will be published in these columns. The name and address of the querist must always be given, not necessarily for publication. Correspondents are requested to be as brief as possible, and to write on one side of the paper only.*

### *Raised Footpath.*

"Footpath" writes: "The landlord adjoining my property has made up a footpath 18 in. above the previous level, consequently it is above the dampcourse of my house, and the damp is penetrating through the wall and causing me a great deal of inconvenience. Can I compel the landlord to lower this path below our dampcourse, or put a channel, or plaster the wall up to the level of the path? My house has been built for twenty years, but the path has only recently been made up. I have no 'right of way' through this path whatever."

—I am of opinion that if the dampness caused by the raising of your neighbour's back-entrance path above the level of the dampcourse is serious, and not merely sentimental, you may certainly call upon him to remedy the injury caused to your property, and an action would lie against him for damages. Upon the evidence of the sketch plan sent, it would appear that the amount of rainwater falling on the path is quite an inconsiderable quantity and not at all likely to cause any real injury. Have you proper rainwater guttering, or does the nuisance arise from adjacent and higher ground?

F. S. I.

### *Building Foundations.*

F. C. writes:—"The Ministry of Health in their journal 'Housing' for May 24, 1920, recommended for clay soils a type of foundation as accompanying sketch, consisting of reinforced concrete beams supported on 'stumps' of concrete, the holes for the latter being bored with the earth auger. I used this type of foundation for my own house, where the subsoil gives a lot of trouble, but I had a slight settlement after the dry summer last year. I do not, however, consider this settlement conclusive proof that the type of foundation is faulty, as I found on examination that the builder had not carried down the concrete stumps as deep as specified at the point where the settlement occurred, the stumps being, in fact, only about 2 ft. 6 in. deep, instead of 3 ft. 6 in. I have since used the same type of foundation in building three more small houses, but modified to this extent, that I carried down the stumps 4 ft. deep from the surface concrete, and used 1 ft. 6 in. square piers at all corners and under all chimneys. These have not been long enough built to contribute anything to my experience as to the reliability of the foundation. I should be glad if you could give me any information as to the reliability of this kind of foundation. Enquiries I have made from the Ministry of Health have not elicited anything, as they say they know of no housing schemes where this foundation has been used."

—The depth of a foundation affects the safe load upon it. Rankine's formula is

$$W = wd\left(\frac{1+\sin\theta}{1-\sin\theta}\right)^2$$

where W = maximum vertical load lb. sq. ft., $w$ = weight of a cubic foot of soil in lb., $d$ = depth of base of foundation below the immediately surrounding surface in ft., $\theta$ = angle of repose of soil. Assuming $w$ = 100 lb., $\theta$ = 40°, then for a depth of 2 ft. 6 in.

$$W = 100 \times 2{\cdot}5\left(\frac{1+{\cdot}643}{1-{\cdot}643}\right)^2$$
$$= 100 \times 2{\cdot}5 \times 21{\cdot}152 = 5{,}288 \text{ lb. sq. ft.}$$

For 3 ft. 6 in. deep the figures would be 7,403 lb. sq. ft., and for 4 ft. deep 8,461 lb. sq. ft. As the actual load on an ordinary foundation is generally limited to about 1½ ton sq. ft. = 3,360 lb. sq. ft., it will be seen that 2 ft. 6 in. deep should be sufficient, unless the soil is clay, in which case other considerations come in, and 5 ft. should in general be the minimum depth for such soil.

The reinforcement shown for the longitudinal concrete under the walls takes no account of the negative bending moment over the piers so that if any deflection took place the concrete would crack across and possibly let moisture reach the reinforcement. In calculating this as a reinforced concrete beam carried by the piers 6 ft. apart one would have to make allowance for the fact that it also rests on the soil; perhaps this might be considered worth ½ ton per foot super. Then the calculations would be as follows: the beam being 12 in. by 9 in. with three ½ in. diameter rods giving an effective depth of 7½ in. the ratio of steel to concrete will be $\frac{3 \times {\cdot}2}{12 \times 7{\cdot}5} = {\cdot}0067$, and the distance from the neutral axis to the compressed edge will be

$$k = \sqrt{r^2m^2 + 2rm} - rm$$
$$= \sqrt{({\cdot}0067^2 \times 15^2) + 2 \times {\cdot}0067 \times 15} - {\cdot}0067 \times 15$$
$$= \sqrt{{\cdot}01 + {\cdot}2} - {\cdot}1 = {\cdot}36.$$

The arm of the resistance moment in terms of the depth, say $a = 1 - \frac{1}{3}k = 1 - \frac{1}{3} \times {\cdot}36 = {\cdot}88$. Allowing a tensile stress in the steel of 16,000 lb. sq. in., the resistance moment will be $trbd^2a = 16{,}000 \times {\cdot}0067 \times 12 \times 7{\cdot}5^2 \times {\cdot}88 = 63{,}677$ lb. in. Again, allowing a compressive stress on the concrete of 600 lb. sq. in., the resistance moment will be $\frac{1}{2}ckbd^2a = \frac{1}{2} \times 600 \times {\cdot}36 \times 12 \times 7{\cdot}5^2 \times {\cdot}88 = 64{,}152$ lb. in. The lower of the two values must be taken. The bending moment being $\frac{WL}{8}$ we have for the 6 ft. span from pier to pier $W = \frac{63{,}677 \times 8}{6 \times 12} = 7{,}075$ lb. or per foot run $\frac{7{,}075}{6} = 1{,}179$ lb. Add to this the assumed value of the reaction of the earth 1,179 + 1,120 = 2,299 lb. per ft. run. This is equivalent to a height of brickwork in the two half brick walls of

$$\frac{2{,}299}{\frac{2 \times 4{\cdot}5}{12} \times 112} = 27{\cdot}4 \text{ ft.}$$

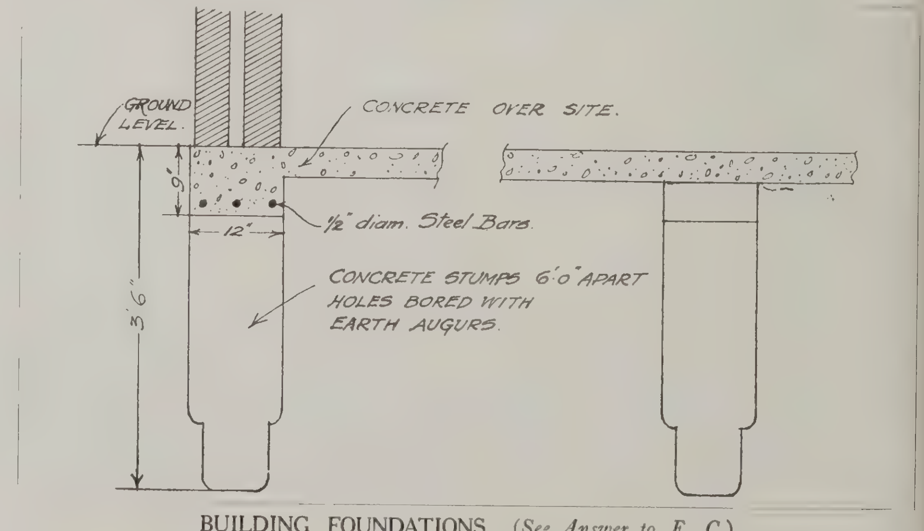
without the weight of floors or roofs, but as the brickwork will be of less height the remainder will allow for the loads it carries. Hence the type of foundation may be considered suitable.

HENRY ADAMS.

### *Oregon Pine.*

A correspondent writes: "Thank you for your reply regarding my enquiry concerning the treatment of Oregon Pine.

"I have been making enquiries in other directions, and think that the result of these may be of interest to you or your readers. I therefore enclose a sample of this wood treated as follows: To the finished surface apply a solution of six parts of water by weight to one part by weight of caustic soda. A white efflorescence will appear when the work is thoroughly dry; this can be removed with vigorous brushing with a hard brush; no wax has been applied to the enclosed sample." This treatment, judging from the sample enclosed by our correspondent, appears to be satisfactory.



BUILDING FOUNDATIONS. (*See Answer to F. C.*)

# Societies and Institutions

### *R.I.B.A.*

The paper on "Tradition and Originality in Italian Renaissance Architecture," which was to have been read by Mr. Geoffry Scott on May 28, has had to be postponed until next Session. Mr. Delissa Joseph, F.R.I.B.A., has accepted the Council's invitation to read a paper entitled "Building Heights and Ancient Lights," on the vacant date.

The Council of the R.I.B.A. have resolved that candidates who have sat for and failed to pass the Special War Examination shall be allowed to sit for the Special Final Examination (without the submission of probationary work) at any time before the end of 1925. Candidates who have failed in the Special War Examination on only one occasion will not be required to pay a further fee for one attempt at the Special Final Examination, but candidates who have failed at the Special War Examination on more than one occasion will be required to pay the ordinary fee for the Special Final Examination, viz., £10 10s.

### *The Melting Pot.*

"The Architectural Melting Pot" was the title of a lecture delivered by Mr. John S. M'Kay to the members of the Royal Technical College Architectural Craftsmen's Society in the College, George Street, Glasgow. The lecturer made a survey of the conditions under which architects and craftsmen were now working, and indicated how the spirit of the old styles might be recreated.

### *Mediæval Building in Belgium.*

Mr. James A. Swan, F.R.I.B.A., in delivering a lecture on the above subject before the Wolverhampton Building Students' Association gave some interesting particulars of the Cloth Hall and the Cathedral, Ypres, and the Skippers' House, Ghent. He drew particular attention to the construction of timber roofs, and described the work of the craft guilds in the use of brick, stone, and wrought iron. The lecture was illustrated by drawings and lantern slides.

### *The Notable Houses of Northamptonshire.*

Mr. J. Alfred Gotch, in the course of a lecture on "The Notable Houses of Northamptonshire," delivered before the Sheffield, South Yorkshire and District Society of Architects and Surveyors, said that Northamptonshire, as a county, was particularly rich in noble buildings. It showed how new churches were built and existing ones added to until the Reformation. On the dissolution of the monasteries, church building practically ceased, and a great period of house building began, which lasted from the middle of the sixteenth century till the Civil Wars of the next century. Northamptonshire shared to the full in the building activities of the time, and some of the largest private houses in the county were erected during these years—Holdenby, Kirby, and Burleigh, for example—whilst many were considerably enlarged including Rockingham Castle, Drayton, Rushton, Apthorpe, and Canons Ashby. In addition, Dingley Hall was built, as well as many smaller manor houses. Among the other buildings of interest mentioned were the market-house at Rothwell, which was never finished; the very curious triangular lodge, and the new building at Lyveden; all of which were built by Sir Thomas Tresham. The triangular lodge sets forth in stone the mystery of the Trinity, everything being in threes; there are three sides, three floors, three windows in each side on each floor, and three legends, each with thirty-three letters. Sir Thomas, who was a deeply religious as well as a superstitious man, further emphasizes these characteristics in the "new building," evidently built for a dwelling-house, in that it is in the shape of a cross, with equal arms, on plan, the cornices being decorated with carved symbols of the passion, the crown of thorns, the hammer and nails, pincers, sword, spear, lantern, and the sword of St. Peter with the ear of Malchus adhering to it. The lecture was illustrated with a series of excellent slides. A hearty vote of thanks to the lecturer was proposed by Mr. A. F. Watson, and seconded by Major C. B. Flockton.

### *Birmingham Architectural Association.*

Mr. C. Grant Robertson, M.A., C.V.O., Principal of the Birmingham University, has delivered a lecture on "Provincial Universities and the Study of Architecture" before the Birmingham Architectural Association. The lecturer remarked that he would welcome a department of architecture in the University of Birmingham. Such a department would have to start in a small way, and be built up as experience and application dictated.

Members of the profession would have to be consulted, and arrangements made, which would enable the students to spend part of their time in offices, for there were parts of an architect's education which could only be learnt by practical experience. One fact which was not always realized was that an architect, like any other professional man, must have a good general education before commencing to study for his profession, and unless students could satisfy the authorities that they had a sufficient groundwork, they should not be admitted to the University.

* * *

Mr. S. H. Meteyard, in reading a paper before the Birmingham Architectural Association on "Stained Glass," said that a stained glass window called for as much care and thought as any decorative painting on an opaque ground. The colouring was very much a matter of personal taste, and depended largely on the amount of light to be admitted. For instance, in the east window of a church, a dark window was an advantage, and that darkness should wherever possible be obtained by dark-coloured glass rather than by brown paint. The scale of the work, the regulation of the size of the figures, and the fineness of the detail to the distance from which they were going to be seen was very important. It was worse than useless to put a lot of fine detail in a position where it could not be seen properly.

Speaking of the material production of a window, Mr. Meteyard said that in the old days, owing to the smallness of the pieces of glass used, a very considerable part of the work was covered with lead. As the craftsmen became more expert the sheets got larger and the artists relied more on the paint; however, they always got a glassy appearance until the introduction of enamel colours, when all look of glass disappeared. The best system of leading was, after the main forms had been outlined, to make the subsequent divisions more or less horizontal with perhaps a few that could not be so arranged vertical, or nearly so.

The lecturer then described the processes to which the glass was subjected, and stated that there was sometimes a tendency not to fire the painting sufficiently, which resulted in the paint disappearing in a very few days.

### *The Institution of Heating and Ventilating Engineers.*

Those interested in the increasing use of central heating in this country were given information which would lead to economy in working, and also in fuel, by Mr. B. R. Wingfield, Ph.D., M.I.E.E., in a paper read before a meeting of the Institution of Heating and Ventilating Engineers. After describing various types of regulators he remarked that he was convinced that overheating would be avoided and that there would be a saving in fuel to the ultimate benefit of the community if temperature regulation was made a regular part of every central heating installation, whether large or small. Increased numbers of installations would bring down first costs, and the reputation of central heating of being a costly and, therefore, a luxurious method of warming, which only the wealthy could afford, would disappear. This question of reliably regulated and simple central heating was very important at the present time, when on account of the difficulty of getting domestic help, the question of the "labour-saving house" was again a subject of frequent discussion. There was no reason why a carefully planned hot-water heating installation should materially add to the cost of, say, a five or six roomed house if the saving in chimneys and fire places were taken into account.

### *Engineers' Surveyors' Association.*

At the monthly meeting of the Engineers' Surveyors' Association, held at the Institute of Marine Engineers, London, a well-attended assembly was able to listen to a paper on "The Cast Iron Sectional Water and Steam Boiler," a subject with which the majority of the engineers present were in daily contact. Through the courtesy of the National Radiator Co., Ltd., of Hull and London, lantern slides of the most modern heating appliances were shown, and also a two-reel film depicting the "Ideal" Boiler in manufacture from start to finish. These views proved most interesting and instructive, and were followed by a lengthy discussion, numerous questions being dealt with by Mr. J. A. Peacock on behalf of the manufacturers. Captain W. H. Raven was in the chair.

## Lectures on Sixteenth-century Art

A course of ten public lectures on Sixteenth-century Art is to be given by Professor Percy Dearmer in the Great Hall of King's College, London. The lectures, which will be illustrated by lantern slides, will be given at 5.30 p.m. on the following Tuesdays. (The first lecture, entitled: Architecture. Renaissance: (i) Vitruvian; (ii) Palladian, was given yesterday.)

January 30.—Architecture. English Tudor, and Early French Renaissance.

February 6.—Sculpture. Fifteenth- and Sixteenth-century Sculpture outside Florence (Italian, French, and German).

February 13.—Painting. Netherlands, Middle Period: Quinten Massys, Patinir, Mabuse, L. van der Leyden, Pieter Bruegel.

February 20. — Painting. German: Dürer.

February 27. — Painting. Italian: Leonardo and his followers.

March 6.—Painting. Italian: Correggio and Michelangelo.

March 13.—Painting. Venetian: Giorgione.

March 20.—Painting. Venetian: Cima, Carpaccio, Catena.

March 27.—Painting. Summary.

Tickets for the lectures can be obtained before each lecture outside the Great Hall, or between 10 and 4 at the College Office. Fee: 1s. for one lecture, 7s. 6d. for the course of ten.

## The Work of the Architects' Assistant

Mr. John Mitchell, general secretary of the Architects' and Surveyors' Assistants' Professional Union, has drawn our attention to an interesting paragraph which appeared in "The Daily Telegraph" in the course of a descriptive article of a new building. In the course of this article it is stated: "It would be interesting to know the number of drawings which have been prepared in order to supply the builders with information necessary to enable them to complete their work. In addition to general plans, &c., to a scale of 8 ft. to 1 in., there are portions of the building to be illustrated in detail to a scale of ½ in. to 1 ft., and these again are augmented by drawings showing mouldings and enrichments full size. The architect, no doubt, has had an energetic and enthusiastic band of architectural assistants to help with this tremendous task, and, as their zealous help contributes, in large measure, to the despatch and progress of the work, they undoubtedly share with the designer a just pride in his completed masterpiece."

Mr. Mitchell says: "In my experience this is the first time that the work and existence of architectural assistants have been cited in the public press as being a contributing element to the completion of an actual building. Usually the services of the architect, contractors, clerk of works, etc., are described, and rightly so; but why the important work commonly entrusted to architects' assistants is entirely ignored may be attributed to the obsolete and unjust assumption that they are permanently learners and can never enter the ranks of workers and producers. They are presumed, regardless of age and experience, to be serving a life sentence to elementary study. In the instance quoted they are admitted to be live workers actually helping, in no unimportant way, the production of artistic and utilitarian matter of first merit. They are described as having contributed 'in large measure to the despatch and progress of the work,' even as the sanitary engineer and others. A notable honour this for men whose rank and status is usually deemed unworthy of public notice. I presume that the architect was aware of this publication, and venture to express appreciation of his sense of justice and my opinion that to the laurels won by architectural achievement has been added an additional lustre by this disinterested and gracious act."

## Coming Events

*Wednesday, January 24.*

Royal Academy.—Lecture on Decorative Painting. By George Clausen, R.A. 3.30 p.m.

Northern Architectural Association.—"The Rise and Decline of English House Design" (lantern). By Nathaniel Lloyd, O.B.E.

*Thursday, January 25.*

Birmingham University.—Lecture on Town Planning. By H. H. Humphries, M.Inst.C.E.

Institute of Structural Engineers.—"The Relations between the Architect and the Engineer." By W. J. H. Leverton, F.S.Arc.

*Friday, January 26.*

Royal Technical College Architectural Craftsmen's Society, Glasgow.—"Modern Sanitary Ware and its Manufacture." By Henry S. Brown.

*Monday, January 29.*

R.I.B.A.—Special general meeting to consider Draft Registration Bill. 5 p.m.

Royal Sanitary Institute.—Introductory Lecture. By Louis C. Parkes, M.D.

Architectural Association.—"The Artist Craftsman in the Theatre of To-day." By Albert Rutherston.

## The Cardiff School of Architecture's Dance

The third annual dance of the School of Architecture has been held in the Cardiff Technical College. The Assembly Hall was tastefully decorated for the purpose. Moreton's Orchestra maintained its excellent reputation, and a large number of students and their friends spent a thoroughly enjoyable evening. Amongst those present were Mr. Ivor Jones, A.R.I.B.A. (secretary of the South Wales Institute of Architects), and Mrs. Jones, Dr. D. J. Roberts (of the Ministry of Health), Dr. Magra, Mr. T. Lewis, Ph.C., Mr. F. C. Highfield, Ph.C., and Mrs. Highfield, Mr. R. H. Winder, M.A., A.R.I.B.A. (assistant lecturer in Architecture), and Mrs. Winder, and Mr. W. S. Purchon, M.A., A.R.I.B.A., head of the Department of Architecture and Civic Design. The Students' Committee and its secretary, Mr. Brian Thomas, are to be highly congratulated on the success which attended their efforts.

## Street Lighting

The last meeting of the Illuminating Engineering Society was devoted to the discussion of street lighting. Mr. A. P. Trotter presided. Mr. Haydn T. Harrison, in his introductory paper, emphasized the importance of adequate public lighting in the interests of health and safety, and the increasing demands made by the greater speed of modern motor traffic. Dealing with the specification of public lighting, Mr. Harrison endorsed the method based on measurement of minimum horizontal illumination, approved by a Joint Committee in 1913, and quoted the classifications of streets on this basis proposed by this Committee, and also in the United States. He also discussed the spacing of lamps, pointing out the advantage of a lower ratio between distance apart and height of suspension, and described various methods of getting improved distribution of light and more uniform illumination between lamps.

Mr. L. Gaster, in a second supplementary paper, dealt chiefly with street-lighting in relation to safety, and pointed out how the reduced lighting in the streets of London during the war had led to increased accidents. He laid stress on the need for avoiding unduly sharp contrasts and for obtaining uniformity. He suggested that the supervision of the lighting of London under one central authority would prove beneficial in this respect. In these days of fast-driven motor traffic adequate public lighting was not merely a parochial matter, but one of national importance. A series of lantern slides were shown, some illustrating actual conditions in wartime, showing the very "patchy" effect produced by the methods of screening adopted. Other illustrations showed some pleasing designs of posts and lanterns in American cities. The standards in St. James's Park, on the main way leading to the Victoria Memorial, were mentioned as examples of good constructive design. Street lighting formed an essential part of town planning, and in securing illumination that was both useful and pleasing the co-operation of architects would be valuable.

The discussion was opened by Dr. Clayton Sharp, who gave a striking account of the thorough methods of testing adopted in certain American cities, complete stretches of roadway being allotted for practical experiments before decisions were taken.

Public lighting inspectors from Glasgow, Newcastle-on-Tyne, and other cities joined in the discussion, and a useful contribution was made by Mr. H. L. Thomson, Chairman of the Lighting Committee to the City of Westminster, who referred to the decorative effects of street lighting. Mr. Thomson remarked that all light which passed upwards and did not fall on the roadway or pavement was not necessarily wasted. Such light fulfilled a useful purpose in illuminating the exteriors of important buildings which ought to be visible at night as well as by day. He also suggested that useful supplementary illumination might often be obtained from ornamental brackets of pleasing design attached to the frontages of such buildings, and remarked that public lighting authorities might often derive benefit by consulting architects in connection with questions of this nature.

# Town Planning and Amenity

INASMUCH as our Government is one which rests ultimately upon public consent, so, too, must the renewed interest in the town, as evidenced by town planning and all that is therein included, be a manifestation of popular feeling. Town planning, in fact, represents to-day the highest form of voluntary co-operative enterprise on the part of the individual towards improving our cities for the benefit of the community. It represents a revival of that civic consciousness, of that pride n city, which was the greatness of Athens in times of peace no less than in times of war. Of the magnitude of the sacrifices that the individual will unhesitatingly make for his country in war we have recently had ample enough evidence, but in times of peace the inspiration seems lacking. May not this interest in town planning be indicative of a changed attitude? It is not, however, sacrifice in the big sense that s wanted, for the most part, although here and there must be individuals whose personal interests are in conflict with those of the community, as in the development of a new district or the formation of a new road which interfere with certain personal privileges or advantages; but rather in small matters of daily life, and nowhere, perhaps, are these small sacrifices more urgent than in the alleviation of the dirt and untidiness which is a characteristic of all our cities.

It is both a blessing and a curse that man adapts himself to his surroundings and learns to accept them without question. How else could the discomforts of the war have been faced with such comparative equanimity, but how else, too, can we account for the silent acquiescence to the constant outrage on our senses which the state of our streets inflicts? Let us only walk along an important thoroughfare and take conscious note of all that offends, leaving aside a possible ugly and heterogeneous assortment of buildings. What do we find? On the ground a pavement partially littered with tramway or omnibus tickets; springing from the kerb a series of badly designed lamp-posts and tramway standards; on the fronts of buildings ugly lettering and offensive signs; pasted to their flanks hideous paper advertisements; wherever there is a vacant space a wooden hoarding aggressively impinging upon our thoughts with a diversity of useless information; and from the tops of the buildings are slung great bunches of wires crossing and recrossing the street, hitched up to coping or chimney with utter disregard.

An impartial student of our organization might well wonder why we silently tolerate these things, why we do not legislate for self-protection, and why, since the law controls —to some extent—noises and smells, it yet leaves our eyes at the mercy of the unscrupulous and the disorderly. An inquiry into these things, interesting as it might be in revealing odd human inconsistencies, cannot now be undertaken; our concern is rather with a means of remedy.

For the realization of any reform it is necessary for the public imagination to be roused. There are many methods by which this may be done: through the art of the novelist, by the efforts of a popular preacher, by constant reiteration in the Press, by a demonstration on the part of a few enthusiasts, by the medium of the kinematograph, or by a political campaign. Town-planning organizations and town-planning enthusiasts should make it part of their work to arouse the public imagination until there is a general revulsion against the dirt, untidiness, and disorder which surrounds the life of our cities. That municipal authorities are, to some extent, alive to the evils of untidiness is seen by the provision in public parks of rubbish baskets, and in the streets and trams of boxes for used tickets, and the recent "keep-to-the-left" campaign for pedestrians is symptomatic of a desire for orderliness in place of chaos, which is one of the underlying motives for tidiness. The slight success, however, which these efforts attained shows how little the public imagination has been touched. The small sacrifice entailed in throwing a ticket into a special box, rather than on the ground, or in walking on one side of the pavement is rarely made. And these things are only the beginnings. They must be extended until our cities are altogether beautiful, for orderliness is the first essential of beauty; until we have neat lettering over our shops; until we have shapely and efficient lamp standards; until we have well-arranged and decorative hoardings (for advertising in itself is a legitimate pursuit); until we relegate our electric signs to special places, just as we relegate cabs to certain ranks and do not allow public vehicles to stand all over the street and disorganize the traffic; until we bury our cables of communication; until we have pleasant, unoffending street illumination by night; until our public buildings, our underground stations, our cab-shelters, and our telephone boxes soothe and satisfy the eye, and the mind through the eye, instead of hurting and wearying; and, finally, until we cease to tolerate the individual desire at the expense of public comfort.

Town planning, if it is to be a vital force in national life, must take cognizance of these things. It is already beginning to arouse interest in the town just as it is itself the outcome of an interest, but it must stimulate that interest to sacrifice. It is not enough that citizens should read in their morning paper and discuss at their evening dinner the proposals of the town council to construct a new road here, to clear a slum there, or to develop this or that area; they must feel that they have their contribution to make towards the shaping of their city, and the appearance of its streets must be a matter of personal pride. Toleration of unnecessary disorder must cease, for ugliness and disorder have as direct an effect upon mental health as bad drains have upon the physical health, although the sufferer may be as unconscious of the presence of the one as of the other.

How is the public imagination to be aroused so that it may no longer accept this state of affairs with such complacency? There are surely many ways: by means of public lectures with illustrations of the towns in other countries which are already alive to the menace of untidiness; by means of exhibitions, showing plans and drawings of the city as it was, as it is, and as it will be, again with pictures of other cities; by means of competitions for the design of lamp standards, street name-plates, and the like; by means of contributed and editorial articles in the local Press; and by means of personal influence. This and much more must be included in the next few years' preparatory town-planning work, so that gradually a loyalty for the city will arise, which will cleanse the streets of their discordant sights, and beget a love of order and a spirit of communal sacrifice which will be reflected in the entire national life.

---

## "The Best Building of the Year"

How to interest the public in architecture is a question that has been so often debated that it threatens to become tedious. There is good reason to believe, however, that an effective scheme has at last been devised—we refer to the decision of the R.I.B.A. to award every year a bronze medal to the best modern building in London. This proposal has been welcomed with much enthusiasm by the daily Press, than which there is no better index of popular opinion. There is no reason why the "medal" idea should be confined to London. Let all the provincial societies offer a similar award for their own areas, and it should not be long before a distinct improvement in public taste becomes generally perceptible. May we add a suggestion? To label a building "good" is excellent; but the uninitiated require to be told why it is good. Would it not be possible to set forth, very briefly, preferably on the plaque itself, the principal reasons for the award? We learn, by the way, that no plaque is to be awarded this year, though the architect of the selected building will get his medal. We hope that this decision concerning the plaque will be rescinded. The label for the building appears to us to be the most important part of the scheme.

## The Whitgift Hospital

By a majority of 1,865, Croydon electors have voted for the promotion of a Bill in Parliament which will mean the destruction of the Whitgift Hospital. We had hoped for better things from the inhabitants of Croydon after their recent very spirited protest against this threatened act of vandalism. Of course, local sanction does not necessarily mean Parliamentary sanction, and we must hope that the good sense of the national assembly will prevent the destruction of what is essentially a national possession. It is not as though there were no alternative to demolition. We, ourselves, have published a scheme for moving the building bodily back upon its site (the idea of Mr. H. V. Milnes Emerson, A.R.I.B.A.), and thus overcoming the traffic difficulty; and several other equally feasible suggestions, mostly of a town-planning nature, have been put forward. We understand that there is a feeling in Croydon that if Parliament would sanction payment from national funds for the extra cost of an alternative widening scheme the building might yet be saved. Parliamentary grant or not, the building must be preserved. There are many rich men in this country to whom the few extra thousands of pounds required to carry out an alternative scheme would be a mere bagatelle. If, in the event, it should prove necessary, there can be no doubt that they will come forward.

## Improving the Strand

Long ago it was decided to bring the Strand alignment between Wellington Street and Charing Cross back to the present line of the Savoy and Cecil Hotels. This improvement, we note, is now in process of realization so far as it relates to the site of the old Tivoli Theatre, whereon a huge cinema theatre is in course of erection. By the summer a stretch of frontage from the Tivoli site to a point in front of Agar Street will also be aligned. This will necessitate the pulling down of a number of old shops sentimentally dear to the Londoner, but architecturally worthless. The improvement will leave in the widened part an ugly little promontory between the Hotel Cecil and Adam Street, and apparently it is not intended to demolish this for some time to come. We hope that steps will be taken to remove it as quickly as possible, for besides its unsightliness it will be an obstacle to traffic. And while the authorities are considering this matter, they might very well give attention to the growing uglification of the Strand as a result of the licence permitted to the shopkeepers who, in many instances, have almost entirely obscured their frontages with giant placards and other advertising signs. Upon one building there is an enormous screen upon which lantern views of advertisements are projected from the other side of the street. Personal liberty, when it means the degradation of an important thoroughfare, should be firmly repressed.

## Registration

We publish on a later page the correspondence which has passed between the R.I.B.A. and the Society of Architects on the Draft Registration Bill. As we anticipated, the Society refuses to support the Bill in its present form. No other consequence could have been expected. This document was still-born. Yet before it is decently buried it must needs suffer a coroner's inquest in Parliament. The verdict, we believe, is a foregone conclusion. It is inconceivable that Registration can be reared without a united profession behind the demand.

## Rebuilding Westminster Abbey

"Rebuilding" rather than "restoration" would appear to be the description best applied to the work that is now in progress on the Henry VII Chapel at Westminster. The whole exterior of the chapel is being renewed stone by stone. In conversation with a Press representative Mr. Knapp-Fisher recalled that exactly the same work was carried out 110 years ago. It is to be hoped that the special lime-work which is being applied to the new work will ensure to the fabric a much longer lease of life. That rebuilding is necessary we may be assured, seeing that the work is in the hands of Professor Lethaby. Yet it is melancholy to reflect that in course of time not one stone of the original building will remain. Does any still exist? No matter how careful man's precautions, change and decay must ever have the last word. The mightiest buildings of Babylon are mingled with the dust, and "to this sad complexion must we all come, Horatio."

## Trees in Streets

The resolution of Bermondsey Borough Council to spend £500 on tree-planting in the streets can hardly have been prompted by a desire to reduce unemployment; the amount being infinitesimal for that object. No doubt the councillors have absorbed so much of the garden-suburb idea as to realize the unique power of trees to redeem mean streets from squalor. If the jaded inhabitants of those streets cannot get into the country, the next best thing is to bring a touch of the country to them. Yet trees in streets are not all joy. They are an item of considerable expense and of some little danger. Unless they are constantly trimmed, they shut out too much light; the drippings from them in moist or even foggy weather are rather a nuisance in one way or another. Dry they are hardly less of a menace to health, as they form so many vehicles for accumulating and distributing dust that irritates eyes and lungs. There is, of course, much to be said on the other side. No doubt a very good case could be made out for tree-planting in streets; but much depends on whether the streets and pathways are wide or narrow. If they are narrow, tree-planting had better be omitted.

*MONTHLY CAUSERIE*

# Joking Apart

## A Man's View of Domestic Architecture

As duly reported in the Journal, a woman lately addressed the Architectural Association on the subject of "A Woman's View of Domestic Architecture." Those who attended the meeting in the mischievous hope that they were to be introduced to yet another aspect of the Sex War were perhaps disappointed; but the conditions of strife were, nevertheless, present—the implacable divergence of masculine and feminine mentalities. Owing, however, to the charm which women can exercise upon all men who are not their husbands, brothers, or fathers, the modesty with which the speaker presented her views, and the good humour with which she met the rather heavy-handed raillery of some who took part in the debate, nothing occurred to disturb that condition of digestive ecstasy which is the foundation upon which the learned deliberations of the Architectural Association are built. It was, perhaps, to be expected that a woman's view of domestic architecture should have no bearing on any single aspect of architecture whatever. The size and pattern of scullery sinks, of cupboards, of cookers, of boilers, of cleaners, of scrapers; the best place to keep pots and pans, the worst place to keep coal—these matters, although they may be restrictive of architecture, have little more bearing on the art of designing buildings than the quality, texture and surface of canvases has on painting pictures—as was brought home to the meeting by one particularly horrid man, who opened his remarks by saying that he could claim to be a first-class architect, as he always put a nail beside the scullery sink to hang a dish-cloth on. The subject discussed was, in fact, our old friend, "Labour Saving," and as a mere man I should like to offer the result of my reflections on the matter.

In approaching a stale subject it is well to do so from a fresh direction, like the bachelor living alone, who, years ago, disposed of the annoyance of continual work at the sink by buying six dozen plates and having a wash-up once a fortnight—(no woman, by the way, would have thought of that!). The whole ground of "Labour Saving" is already trampled flat along numerous paths by previous explorers, who have followed one another in some cases far beyond the boundaries of common sense into the domain of folly.

"The Daily Mail" has organized drag-hunts over the familiar ground which have fixed in the public mind that the more intricate the working scheme and complicated the fittings of a house, the greater is its comfort and convenience; and which have also established certain wholly fallacious first principles of householdry (to coin a much-needed word), such, for instance, as that one of the first cares and most laborious duties attendant on domesticity is dusting the balusters!

Recently, in my capacity as eminent architect, I have been called upon to meet the requirements of a family, the members of which had taken this idea into their blood like a microbe, so that, had I been able to slip a clinical thermometer successively into their mouths, I have no doubt I should have found a general condition of actual fever. The question cropped up with the sketch plans and snapped at my heels for six months, so that I feel no little pride at having equipped that house with the most completely undustable balusters I have ever designed. Of what account is it whether the balusters are easy to dust or difficult to dust, so long as the stairs are beautiful to contemplate and convenient to use? We may be certain of one thing—that whether the balusters are easy to dust or difficult to dust, they certainly will not be much dusted, and that no normal, healthy person will care whether they are dusted or not. I cannot, however, conscientiously leave the matter there: it is right that I should say that the only occasion in my life in which I was confronted by this great problem of architecture, before "The Daily Mail" called attention to it, was when I broke in upon the routine of my own house by forbidding the housemaid to dust the balusters. The dear girl had discovered that she could make a display of activity without exerting herself and without disturbing her native apathy by reclining on the stairs and flapping negligently with a cloth!

In scheming the domestic machinery of a house to be run by servants the two leading characteristics of some of them, dishonesty and callous stupidity, must be borne in mind. This is not to impute personal dishonesty to those servants, but that dishonesty only which is a tradition of domestic service. Servants are human beings, and it is probable that if masters fare ill at their hands it is because they deserve ill: certainly the attitude of the master to the servant has changed for the worse since the days of Pepys and Swift. The reason for the existing state of affairs does not, however, concern us, nor are we concerned with the nefarious system known in the servants' hall as "perks." What we have to reckon with is the servant's consistent disloyalty to the interests of her employer.

A house, therefore, which is to be run by some servants ought, in the first place, not to pursue any fetish of saving the servant trouble, for the servant will save herself all possible trouble without any help or suggestions from the architect: it is, on the contrary, necessary, in order to keep her from langour and boredom, that she should have plenty to do, and a firm mistress (preferably one armed with a hatpin) to see that she does it. In the second place, the house should not be equipped with any intricate or complex contrivances for quick and efficient performance, for that servant's stupidity, contempt for her work and indifference or almost hostility to the wishes and interests of her employer will lead to the patent teak sluice sink becoming caked with filth and the floor continually drenched with greasy water, and to the electric cooker involving criminal waste of current; the vacuum cleaners will be misused and broken and the plugs shorted, and gas cookers will be availed of to satisfy a passion for wasting gas and accumulating a thick crust of carbonized dirt and food-splashings.

It is now the fashion to make the modern kitchen rival in its niceties the operating room at a hospital. The idea seems to be to circumvent the slovenly, wasteful, disorderly and incompetent methods of the servants who will use it. Everyone will agree that, in spite of the great cost of the installation, with its tiled walls, nickel-plated gunmetal taps, dust-proof dressers and power plugs for freezers and whippers, the result is only in part effected, and that this partial success depends in great measure upon the extravagance of the equipment flattering the cook with an idea of her importance and so revitalizing her self-esteem and respect for her calling. It is, in fact, only because of the shortcomings of servants that these costly devices for checkmating them have come into existence. In my experience the kitchens which it has given me particular pleasure to view—and a well-ordered kitchen is a delightful spectacle—have not been those that reflected the ingenuity of the sanitary expert and recalled a laboratory for biological research, but those which have reflected the industry, orderliness, cheerfulness and capacity of their users and recalled the realities of homely English life.

Karsish.

# The R.I.B.A. Prizes and Studentships

## A Criticism of the Designs

THE exhibition of drawings at the R.I.B.A. Galleries shows that there is no falling off in the number of competitors for the Institute prizes. The level of draughtsmanship improves each year, and has this time reached quite a high standard. The Tite and the Saxon Snell prizes in particular have been keenly contested.

The subject for the Tite prize was an Italian Embassy The design of the winner, Mr. J. C. Shepherd, is shown by a most competent set of drawings. He has adopted a simple solution, making a monumental flight of steps the central motive, with the ballroom at the top, and with two fine suites of rooms arranged along the front and back of his building. The section shows a skilful disposition of terrace gardens. The ballroom opens on to the garden, and the ambassador's apartments are set back to allow for his separate roof garden above. The planning of the garden is admirable, although it might not be considered to be in scale with the house. The elevation, in common with those of all the other competitors, is probably the least successful part of the design. The detail of the central window of the principal floor is out of keeping with the loggia below, but the worst feature of the façade is the recess above the central window. The whole shows a good sense of scale not to be found in the other designs.

Miss Isabel M. Chambers receives a well-deserved honourable mention. The plan is distinctly graceful, and she unites the ballroom to the other rooms successfully, making a three-sided court — an arrangement which presents itself well on the garden side. The "parti" is similar to that of the winner, but by comparison the design fails in section. Miss Chambers does not get the maximum effect out of the fall of the land. The staircase rises rather steeply, and the service area is deep and not well lit or ventilated. The garden plan is not worthy of the building, but the skill shown in handling the plan of the latter deserves strong commendation. The elevation has character, is not forced, and is quite appropriate for a street façade.

"B.O." evidently remembers Genoa, and his blue sky is most appropriate. He gets a good effect by his central "cortile," but the general plan suffers in consequence. The ballroom is side-tracked, and the lighting of both it and the drawing-room partly by windows on to the staircase is inadequate. The elevation suffers through being cut by the superimposed order into two almost, but not quite, equal parts.

"Tishy's" design bears a family resemblance to the first two, but places the ballroom on the street, and the dining- and drawing-rooms at the head of the staircase. This is an equally good arrangement. The semi-circular projection on the garden side has little justification. Furthermore, the scheme is extravagant, for it entails an excavation of some 80 ft., as shown on the section, and finally, the elevation has more the character of a library than an Embassy. The design is well studied in its detail, and is probably next in merit to those of Mr. Shepherd and Miss Chambers.

"European" lacks imagination. His plan is poor and he has divided the garden into a monotonous succession of equal terraces. This design has no distinctive quality.

"Geneva" has an extravagant section. His scheme shows a lack of proportion between the cortile and the building proper. The elevation, though carefully drawn, looks like a fire station.

"Sebastian" has underestimated the importance of size in dealing with the reception rooms. The plan and elevation are lacking in a right sense of scale, and his garden is rather haphazard in design. His solution results in two courts which are too small and deep.

"Blue Square's" colour-scheme is so distressing that it is difficult to distinguish any merit that there may be in the design. One notices lavatories opening directly off the ballroom! The staircase is small, and he has cut away the ground too much.

"Utinam" has produced a plan with few good points. The kitchen and staff rooms are placed so as to overlook the ballroom garden court. The elevation is a disappointing piece of work. It shows no restraint and little understanding of composition, and is overloaded with heavy and inappropriate detail.

The measured drawings medal has been easily won by Mr. W. Dougill. He has chosen as his subject the Campidoglio, Rome, and has illustrated it by a large and careful set of drawings. These are well worth study, and are almost faultless in execution. His surveys show the conscientious way in which he has worked.

"Diligente" and "Cheddar" are not so fortunate in their subjects. In both cases the draughtsmanship is good, though they have not the finish of the winner.

The Owen Jones studentship has been awarded to the only competitor—Mr. Cyril F. Filbey. He has done the usual prodigious amount of work, but we are doubtful as to its being a guarantee of his having any real appreciation of colour and its application to modern building. We fail to see the use of this realistic and laborious presentation of tiles and carved decoration. Moreover, the Shah Sham's house, apart from its archæological interest, has very little to commend it either in its design or for its treatment of colour. Why do not students study the polychromy of those civilizations which have influenced European art and architecture? We would suggest that much valuable time might be saved to the student by strictly limiting the number and size of drawings to be submitted. It would render the task of competing for this prize less formidable.

The Pugin studentship attracted two competitors. Mr. A. N. Thorpe has been placed first. His drawings are careful and well executed. Mr. Heritage must learn that poor draughtsmanship is a definite disqualification for this prize.

There is a good entry for the Grissell gold medal, and we notice with pleasure that the subject set this year (a warehouse) gave definite scope for architectural knowledge. Apart from conversance shown with the details of construction in steel the designs are not exciting. They lack imagination, and most of the competitors would profit by the study of contemporary examples on the Continent and in America. Mr. P. Morrey is placed first with a good design, and that of "Bluzz" is also interesting. "Syntithemi" and "Fleur-de-lis" have poor elevations.

There has been a record entry for the Henry Saxon Snell prize, probably due to the really sensible subject chosen (a maternity home). The jury has rightly been generous in its award of two honourable mentions as well as the prize. Mr. E. G. Theakston wins with the most centralized plan. We are doubtful about these long central corridors in many cases with borrowed light. Mr. A. J. Brown, (hon. mention), whose drawings are the best, suffers perhaps by having a less centralized plan, but it has to our mind many good points. Mr. G. Norburn (hon. mention) shows by elevations that it is not impossible to give charm to a building of this sort. "Knype," "Compass and Square," and "Solomon," are to be congratulated on the chance given to them to compare their designs with really good work.

The full list of awards appears on page 240.

# The Royal Academy Winter Exhibition

By W. W. SCOTT-MONCRIEFF

(*Concluded*)

PRESUMABLY a very important factor in decorative painting is the materials used. In the exhibition are frescoes by Messrs. F. E. Jackson, J. D. Batten, and Mrs. Sargant Florence. It will be noticed that the works shown by these painters have a clarity and texture such as can never be obtained with oil temperas or mediums, even including egg oil or what is known as "tempera" painting. In the South Kensington Museum are two pictures by Richard Evans painted about a hundred years ago. They are identical in subject and size, but one was painted with linseed oil tempera and the other is colour diluted with water (not "water colour," which has gum arabic in it) painted on to plaster *in secco*, i.e., after the plaster has dried. These two pictures are placed side by side for the purpose that one may be compared with the other. The linseed oil edition is nearly black, and the *in secco* looks as fresh as on the day it was painted. This is a most important point. That the frescoes, i.e., water and colour painted upon *wet* plaster, in the Houses of Parliament have proved a failure does not, to our mind, prove that frescoes will not stand in this climate or even in the soot-laden atmosphere of our cities. We feel sure that if the purest old run putty is mixed properly with clean sharp washed sand in the right proportions and applied to expanded metal or some sort of lathing so that the plaster does not come in contact with the wall behind, that fresco would stand for centuries in this climate. It has never been given a proper trial. For decorative purposes it is certain that fresco is far superior to oil painting on canvas stuck to the wall. This method allows the painter to do the job comfortably in his studio, but fresco must be done *in situ;* careful cartoons must be prepared, so that the painter must know how to draw, an accomplishment which few modern painters have taken the pains to acquire. The cartoon must be pricked through on to the wet plaster and the subject must be divided up into "day's work" areas, the new wet plaster being joined on to the previous day's work. These joins often show, but are constructional features, like lead in stained glass (see the joins in Mr. Batten's and Mrs. Florence's work. Mr. Jackson's is evidently done in a single day, because there are no joins). The work must be done upon a scaffold, often under trying circumstances.

A ROUND DISH, PAINTED IN BLACK AND SILVER LUSTRE AND COLOURS. BY LOUISE POWELL. POTTING BY J. SHAW

Now unless we are mistaken, easel picture painting and what we might describe as "fireside" decorative painting can be done by indifferent draughtsmen. An eye for tone matching may be a substitute for draughtsmanship, but it *is* a substitute, and one which cannot be indulged in by the fresco painter. Fresco painting demands more knowledge, more skill, more craftsmanship, and more love; it must be done on the wall itself next to the architecture it is to adorn. Fresco, in fact, cannot be humbugged, and some bold spirits might attempt to revive this ancient art.

We will now pass on to notice, briefly, some of the other exhibits of decorative painting and sculpture.

"Decoration for an Altar of the Sacred Heart" (283), Glyn Philpot, A.R.A., is the vista-piece opposite the staircase. Here we have fresh thought, and so must remember that Millet, Cézanne, Turner, Rembrandt, and a score of others were laughed at in their day. Because a thing is strange to our particular trend is no reason why it should be condemned offhand. On the contrary, like a guest travelled from a far country, we must get to know him before we jump to the conclusion that he is of evil character.

The L.C.C. decorations submitted by the Westminster School of Art are disappointing. The idea is, we suppose, that the L.C.C. corridors should be decorated with scenes from L.C.C. parks, but when the parks are filled with pseudo-John gipsies, and the whole treated rather like posters, a sense of lost opportunity is conveyed.

"Model of Council Room in a Ministry of Fine Arts" (440), showing the paintings in true fresco, by A. K. Lawrence, is a serious work treated seriously. This method of showing a decorative scheme is excellent and one which might be adopted in preliminary schemes and competitions. It is a mistake to have a continuous scheme of figures and landscape broken up by architectural pilasters, but otherwise this is a most interesting exhibit.

"War Memorial, St. Stephen's Church, Avenue Road, N.W." (453), by Sigismund Goetze, shows heads of modern-looking ladies, painted in oils. Some of them have real mother-o'-pearl halos inlaid in the paint; there is a great number of them, and they are surmounted by a very theatrical Christ.

"Model of Grand Staircase of H.M. Foreign Office" (426), showing frescoes and decorations, is by the same painter.

Rodin, some time ago, when he was asked what he thought of British sculpture, replied : "But you haven't got any." He was not far wrong then, and he would not have been far wrong now. The sculpture dotted about in this exhibition is good enough, we suppose, of its kind, but it is dead, dull, and disappointing. It is not the fault of the sculptors any more than some of the bad painting is the fault of the painters, or bad architecture is the architects' fault. The trouble is that people don't want good stuff—there is no national desire for these things, and so the nation doesn't get them. If the nation *really* wanted fine sculpture, painting, and architecture, it would soon have it; but no! cinemas, motors, and what is known as "a good time" is what is wanted, and so they have their "good time," and the arts dwindle—but the day of reckoning must come sooner or later.

The writer of this notice, during a misdirected holiday, spent days seated opposite statues on the pavements of Paris, with the idea that he would complete a series of drawings of Parisian sculpture. He had no idea that the sculpture in the French capital was so bad until he sat down to draw it, but he carried on, until one day, being an admirer of Maupassant, he went in search of his memorial. In the Park Monceau he found that awful thing, "Hommage à Maupassant." The great Guy is represented by a small bust stuck on a pedestal, while, below, sprawls a lady in mutton-chop sleeves fiddling with a fan. The whole is executed in best funeral marble. This was too much for him, and the rest of his holiday was spent in profound gloom and idleness.

No. 316, by Alfred Drury, R.A., "Even"—model for lamp standard, City Square, Leeds—strikes one as being on a par with the best sculpture of 1880–90 of Paris: it is sculpture of the Opéra type; it is like the work of Octobre and the older living Beaux Arts and Prix de Rome men, and we must say we do not care for this kind of thing.

"Diana" (6), "Juno" (19), "Venus" (31), "Ceres" (48), bronze niche figures, by F. Derwent Wood, R.A., are excellent in form and craftsmanship. With the exception of "Juno" (19) the faces are a trifle ordinary in expression, but "Juno" is a little beauty. As a suggestion we would say that the bronze is rather too highly polished.

"Figure Group," alabaster (323), Benjamin Clemens, gives a sense of repose, but it is too realistic in treatment to be quite successful. Mr. Fagan's "Startled Fawn" (324), garden statuette in lead, is a most excellent piece of work for its purpose. The coloured faïence of Mr. and Mrs. Stabler is well done with good colour blends and pleasing glazes, but with little or no soul in it; in fact, the sculpture part of the exhibition is very disappointing.

We cannot pass to the Arts and Crafts Section without a word upon Alfred Stevens. When we enter Gallery No. IV, which is entirely devoted to his work, we enter a different world. His manner may be a fusion of the manners of Raphael and of Michelangelo; his ideas of life may not have coincided with the particular code in fashion during the Victorian régime; red chalk may always look better than black chalk or lead pencil—it does not matter—he stands in this exhibition in splendid isolation. A great mind, whether he bases himself on Raphael or no, cannot help producing great work; a common mind may base itself on Raphael for three score years and ten with nothing but a common result. We look at these Beings by Stevens—they are not mortals but gods. They pose before us with the dignity of superior creatures belonging to a more superior hierarchy than any in this sphere of twisted activity. His bambini are age-old souls in comparison with our wiseacres, and most of the eyes in his heads appear to be gazing at wonderful visions, and to be reflecting the light from a faraway and most beautiful country—the country of his own mind.

COVERED POTPOURRI BOWL. BY ALFRED H. POWELL. POTTING BY J DURRANT.

SILVER TEAPOT. BY J. PAUL COOPER.

The Arts and Crafts Society are to be congratulated for the arrangement of their section of the exhibition, which must have meant days of arduous labour for the individuals who gave up their time to it. Quite frankly we feel that there is far more art in their section than in the other. Such a society as the Arts and Crafts, which, in effect, exists to keep alive the creative spirit of man, deserves far more respect from the community.

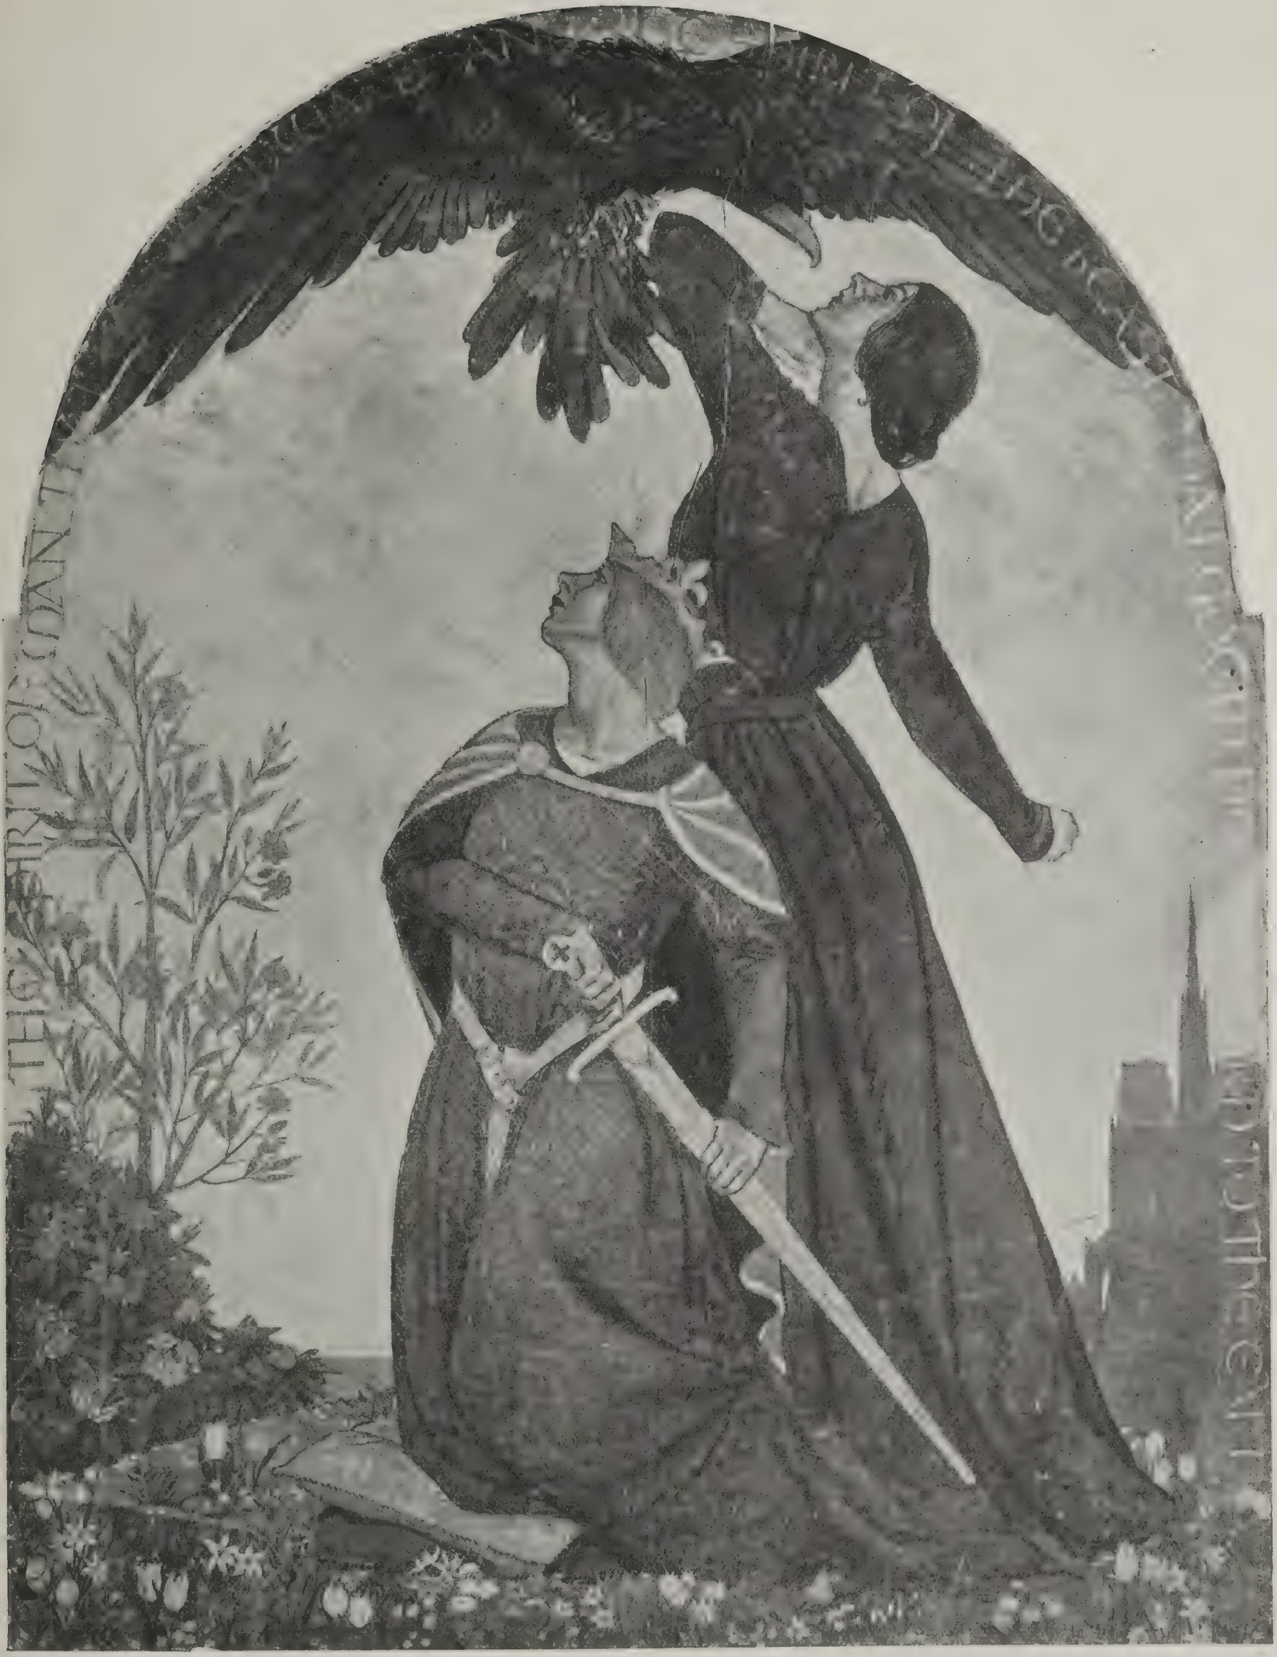
We do not think we are exaggerating when we say that a selection from these exhibits would make a collection of things as fine as has ever been made by the hand of man. The works of Mr. Paul Cooper, Mr. and Mrs. Powell, Mr. W. Moss, Mr. William G. Simmonds, the late William de Morgan and Ernest Gimson, to name only a few, are superb pieces of craftsmanship and fit to rank with anything in the South Kensington Museum. To see their work and then to walk up some of the London streets is an object lesson, for by comparison the modern work in many of the shops is rubbish. The lesson is one which we pointed out at the beginning of this notice. The aim of such men is, or was, to make fine things; the aim of some shops is to "produce" showy, shiny stuff to put in the windows and to sell at exorbitant profits. The result of the two ideals is painfully apparent. We understand that Mr. Gimson's furniture is not to be had at any price. Some of the papers have already started the cry that he was a second Chippendale. Such men as he are a national pride and a national glory, for, against every possible disability, they have held fast to their creed, and their work lives to cry shame upon their commercial compatriots. By their sacrifice they have given real wealth to their country. They have left the love of their life in the things which they have made with their hands—a love which shall be a joy as long as their work remains to us.

Here, in these galleries, we realize who are the most intelligent class in the community. Beside these craftsmen, politicians, lawyers, "business men," Trust magnates, and the "cultured" are people of the third order.

At the present moment the world is paying homage, not to the body of a dead king, but to the works of humble men found in his tomb, and there is much chatter about cash values.

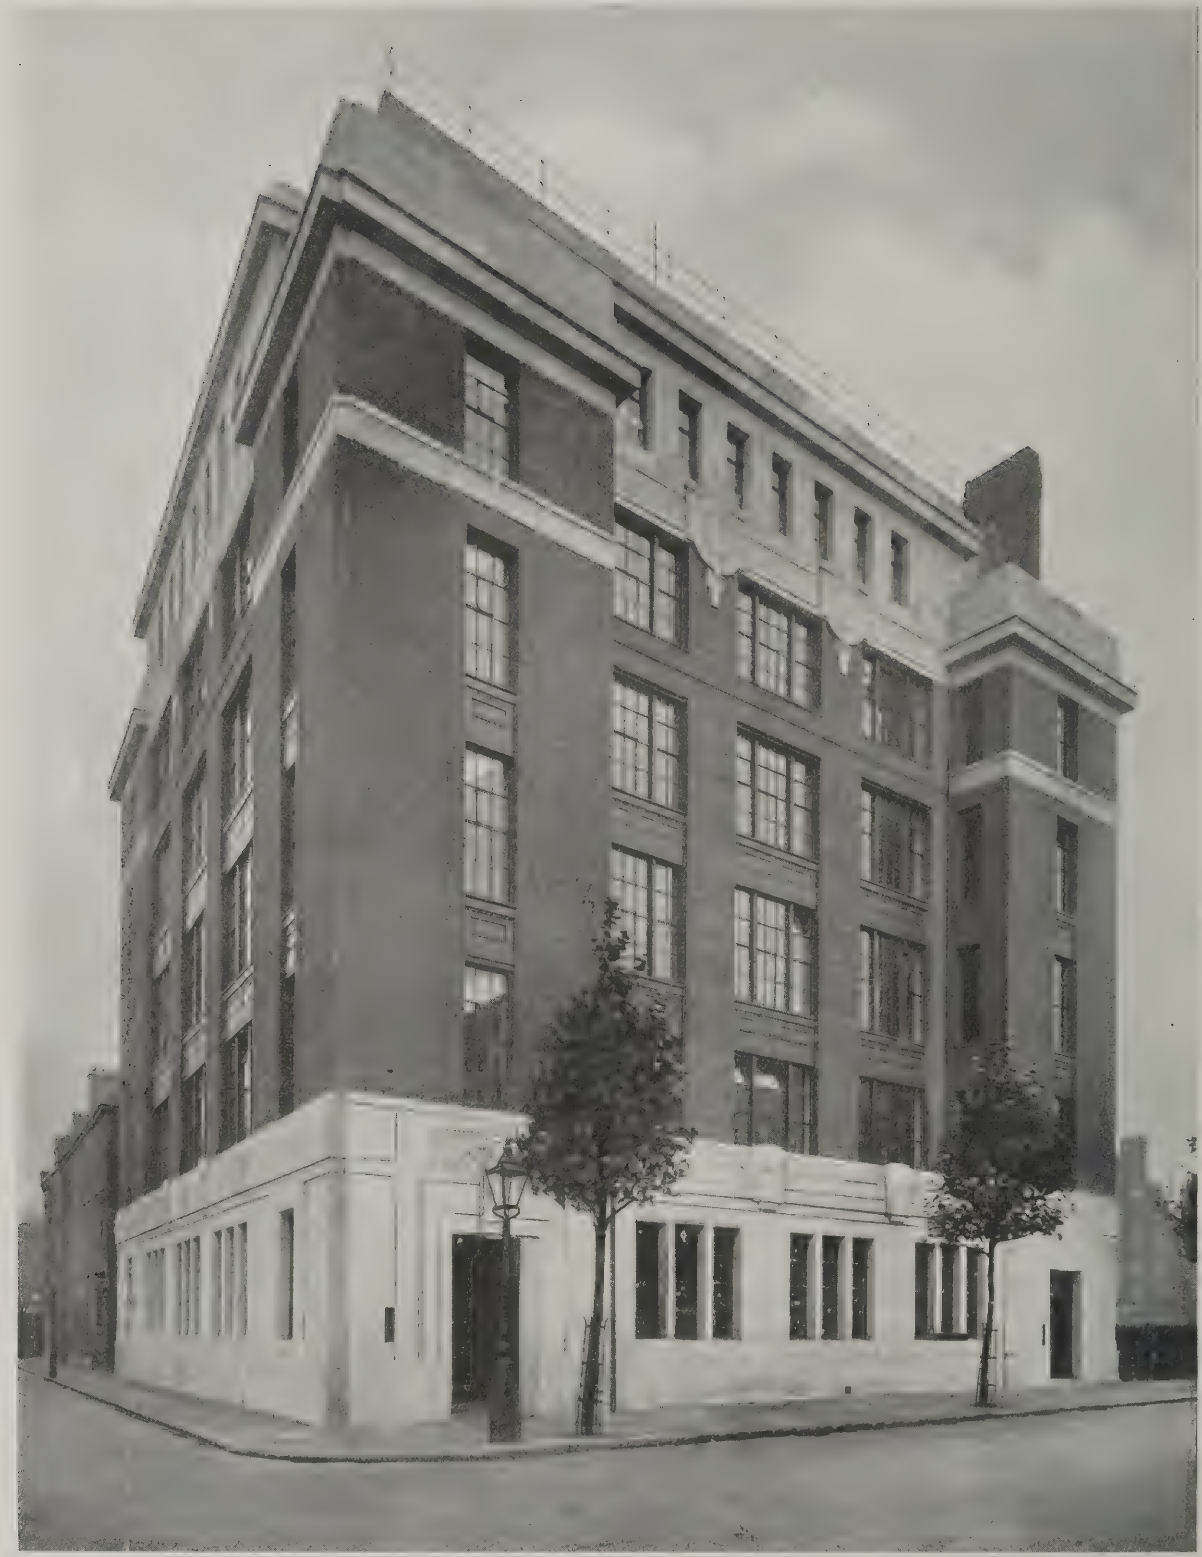
---

[We should like to point out that the final paragraph of the first part of Mr. Scott Moncrieff's article (published in our last issue) was an editorial addendum, and should have been printed as such. The fact that it appeared as part of Mr. Scott Moncrieff's contribution was due to a regrettable oversight.—Eds.]



"ENGLAND AND FRANCE." A DECORATIVE PAINTING BY F. ERNEST JACKSON.

*(R.A. Exhibition of Decorative Art.)*



THORNYCROFT HOUSE, SMITH SQUARE, WESTMINSTER.
A. ALBAN H. SCOTT, ARCHITECT.

# Thornycroft House, Westminster

## A. ALBAN H. SCOTT, Architect

THE above building contains eight floors, all of which with the exception of the basement and sixth floor are used for office purposes. These latter are utilized respectively for filing purposes and canteen. In addition to this canteen on the sixth floor provision has been made for a photographic department, including dark rooms, enlarging rooms, etc. The caretaker's quarters are also provided on this floor.

By means of areas on the north and west sides and large window spaces, it has been possible to obtain an exceptionally good distribution of light and air.

Lavatory blocks for male and female staffs are arranged alternately on all floors next the main staircase, this method when considered from all points of view being found to give the easiest and most direct means of access.

The building has been provided with an electrically operated vacuum cleaning nstallation which serves all parts of each ndividual floor.

The first floor being considered of premier importance contains the board room, private office, waiting-rooms, etc.

The walls to the board room are divided up with plaster panelling and the floor is of teak blocks.

The floor of the private office is treated in a similar way as the walls, which are panelled out, and the attached fittings are executed in specially selected walnut.

The main staircase, counters, waiting-hall fittings, and all fire-resisting doors and lobbies have been executed in Moulmein teak finished in oil, as have also the main doors, screens, revolving doors, etc., at the entrance.

The flooring to the main entrance hall, in addition to that of the first floor landing and corridors, is finished in Ruboleum tiling and laid out in architectural patterns coloured in green, black, and white.

Generally speaking the floors are covered with linoleum on a specially prepared surface.

Fire-resisting materials have been used throughout in the general construction.

With regard to the external elevations a brick and stone treatment on broad lines has been employed. The roof is covered with Westmoreland green slating, the facing bricks are "Lawrences" sand-faced bricks of a purple tint, and the masonry is executed in best Whitbed Portland stone.

Window openings on all fronts are fitted with steel casements. On the main elevations the lights are grouped together vertically with metal panels between each. The stonework is carried through horizontally at top and bottom.

The stone panels appearing over the entrance doorways are carved and symbolize the business activities of Messrs. J. I. Thornycroft & Co., Ltd., who are the owners and occupiers.

Messrs. Patman and Fotheringham were the contractors, and the sub-contractors were as follows: La Brea Asphalte Co. (asphalt lining work); T. Lawrence and Sons, Bracknell, Berks (bricks, red facings); Mr. Frith (carved stonework); Drew, Bear, Perks & Co., Ltd. (steelwork); H.W. Cullum & Co. (fireproof floors, partitions); Carter & Co. (wall and floor tiles and Terrazzo floors); Nethercot and Sons, Stratford (slates); H. Pontifex and Sons (sanitary ware and fittings); Korkoid and Ruboleum Tile Co., Ltd. (Ruboleum floors); G. W. Franklin and Sons (electric wiring); T. B. Colman and Sons, Brighton (special doors, revolving); Wilmer & Co. (art metal work (special designs), cast metal panels); Yanedis & Co. (Locks); Waygood-Otis & Co. (lifts); J. Slater & Co. (heating and ventilating, heating apparatus and boilers); C. Isler & Co. (wells and well-sinking); Scammell and Nephew (Vacuum cleaning installation).

The floors, flat roofs, mansard slopes, dormer tops and sides, were all carried out by Horace W. Cullum & Co., Ltd., 50–2 Britannia Street, King's Cross, W.C.1.

A description of the electrical switchboard appears on page 244.

# Birkenhead War Memorial Competition

## Mr. LIONEL B. BUDDEN'S WINNING DESIGN

MR. GILBERT FRASER, F.R.I.B.A., the assessor in the Birkenhead War Memorial Competition, has awarded first place to the design (No. 17) of Mr. Lionel B. Budden, M.A., A.R.I.B.A. Twenty-one designs were submitted. The designs are of great merit and disclose a great amount of thought and work on the part of the authors.

Mr. Fraser, in his report, says design number 17 provides a memorial in the form of a cenotaph, being a rectangular stone monument with battered sides set upon a heavily moulded base and crowned with a sarcophagus top. The six panels with the names of the fallen are placed upon the north-east and south-west sides respectively, and are surmounted by carved laurel swags. These panels are to be carried out in green Westmorland stone, and provision is made for 210 names in each panel, making a total provision for 1,260 names in all.

The space allowed for each name is, in my opinion, sufficient, and the lettering should be easily decipherable at a distance of 15 ft. and at a height of 8 ft. above the eye-level.

Above the panels on the north-east side is the inscription, "In Memory of the Men of Birkenhead who gave their lives in the Great War." On the south-west side this inscription is balanced by the legend, taken from the Apocrypha (Ecclesiasticus xliv, 7): "All these were honoured in their generations, and were the glory of their times." Below the panels, on each of the two fronts, are the four shields of the Empire, representing the Army, Navy, Air Force, and Merchant Service, each one being depicted by symbolic crests mounted on the shields. On the south-east and north-west sides the monument is marked by two mourning figures carved in relief, above which the civic arms of Birkenhead are embossed upon oval escutcheons, and below which the dates 1914–1919 are incised.

In order to meet the occasion of commemorative ceremonial which at various periods will concentrate about the memorial the author has provided an adequate platform to meet this demand, and flag standards with bronze bases have been introduced as appropriate features.

The monument itself rests upon three broad steps, giving an impression of stability and affording a suitable place on which wreaths and floral tributes may be laid without obscuring the monument.

The general lay-out of the surround is low in character and does not in any way compete with the present character of Hamilton Square. The height of the monument has been kept relatively low and is developed in a classic form which will harmonize with the environment the square provides.

The work is to be carried out in Portland stone with panels in relief of green Westmorland stone, with the steps and pavings in Yorkshire stone and the bases of flag standards in cast iron treated in a bronze finish.

The drawings submitted by this author are splendid examples of draughtsmanship and design, and show a sound appreciation of the subject. A great liberty, however, has been taken with the perspective drawing in making the memorial appear to a larger scale than is the case. This drawing so ably illustrates the scheme that this liberty must be overlooked. The author estimates the cost of this scheme at £3,932.

Other designs worthy of mention are Nos. 2, 9, 12, 15 and 19.

Mr. Lionel B. Budden, M.A., A.R.I.B.A., in his report says: "As the site chosen for the memorial is an ope one, the memorial will in consequenc be seen from all sides, both by person walking along the enclosing streets o Hamilton Square and by those who dail cross the square on the diagonal footwalks which bisect it. It has, therefore been considered essential to prepare scheme that does not face on to on street only, but is presentable from ever point of view, since all points are o nearly equal value in the case of such site. The two longer sides of the memorial receive the same treatment and the shorter ends also echo each other in thei design.

"On the block-plan a new footwalk ha been indicated by dotted lines, connecting the platform on which the memoria stands with the centre of the square This would necessitate a break in the parapet-wall and the provision of three steps with ramps at the junction of the footwalk with the platform, so that persons approaching the memorial along the walk could have direct access to the monument. As the proposal is merely tentative—an additional and optional suggestion—it is not included in the estimate.

"It is felt that under existing conditions the ideal position for a war memorial in Hamilton Square would be on the side of the square immediately facing the Town Hall. The design herewith submitted would fit this latter position as well as the one for which it has been specifically prepared; and for that reason it has been alternatively indicated by dotted lines on the block plan opposite the Town Hall. Its erection in such a position would involve the removal of the Laird Statue, which might either be placed to the right or left of its present station or be transferred to the site already prospectively allocated to the war memorial."

# The New London County Hall

MR. W. E. RILEY, F.R.I.B.A., R.B.A., in the course of a paper on the new London County Hall, read before the R.I.B.A., said: It can well be imagined that the discharge of all the multifarious responsibilities that are borne by the London County Council involves the employment of a large staff, and that if these functions are to be efficiently and conveniently discharged it is almost a necessity that such a staff should be suitably housed in one building, which would also include proper provision for the civic representatives.

The L.C.C., many years ago, set itself to deal with the problem of accommodation, and considered the suitability of various sites for the building of a new County Hall that would accommodate representatives and official staff in a suitable way. Sites were considered in Parliament Street, Trafalgar Square and the Adelphi, all eventually abandoned in favour of one adjacent to the Thames and the southern approach to Westminster Bridge. This site was acquired in April, 1905, at an approximate cost of £600,000, and as its area—including 2½ acres of reclaimed foreshore—was about 6½ acres, such cost works out at a figure approaching £100,000 an acre—a relatively cheap price as compared with the cost of other sites considered.

A good deal of credit attaches to Mr. J. D. Gilbert for the acquisition of the river site, for as far back as the year 1898 he advocated—as a part of his proposal for a southern river embankment between Westminster and Blackfriars Bridges—the erection of a new County Hall and offices on land that would become surplus from such an improvement if carried out.

A site having been acquired in 1906, steps were taken to hold, in the following year, an international competition for designs for the new building. Mr. Ralph Knott was the author of the successful design, which was described as being a forcible and artistic suggestion which conveyed the purpose for which it was to be erected.

In order to fix a reasonable standard of accommodation, much attention was paid to the amount of floor space which should be allowed for officials of the various classes, and with this object several large blocks of modern offices, both public and commercial, were inspected. Although the standard varies slightly in the different departments, the undermentioned approximate areas generally obtain :—

| | Square ft. |
|---|---|
| Heads of departments.. .. | 400 |
| Chief assistants .. .. | 250 |
| Heads of sections .. .. | 150 |
| Draughtsmen .. .. .. | 120 |
| Clerks engaged on committee work and clerks dealing with plans .. .. .. | 100 |
| Ordinary clerks .. .. | 80 |
| Typists and assistants engaged on routine work .. .. | 50 |

These superficial areas in a well-lighted and ventilated building will be quite adequate for the efficiency of the work and the health of the staff.

Another question which the Council had to consider was whether a completed building should be erected on the portion of the new site excluding Messrs. Holloway's premises, or whether so much of Mr. Knott's whole design, with any necessary modifications, as would extend from Westminster Bridge to those premises should be erected. Accommodation was required for a minimum of 137 members and a staff of 2,100. On the site—less Messrs. Holloway's premises—accommodation could be provided for 200 members and a staff of 2,270, and on the whole site for 200 members and a staff of 2,850. The Council was advised that not less than seven years would elapse before the whole of the staff could be housed in the new building. By that time the Council would be in a position to take over Messrs. Holloway's premises if it so desired, and the Council would have the choice—according as the experience gained in the construction of the new building and the variation in its work dictated—either of holding its hand or of proceeding with the building on the rest of the site. It was accordingly decided to proceed with so much of Mr. Knott's scheme as related to the portion of the site excluding Messrs. Holloway's premises.

Tenders were invited from selected firms for the construction of the embankment wall, and the lowest, which was submitted by Messrs. Price and Reeves, was accepted. The engineering work was designed by and executed under the supervision of the Council's chief engineer, Mr. (now Sir) Maurice Fitzmaurice, C.M.G. The architectural features of the central part of the wall were designed by the architects. The construction of the wall was started in January, 1909, and completed in September, 1910. The total cost amounted to £58,000.

As soon as practicable, arrangements were made for the construction of the substructure of the new building, viz., from the top of the concrete raft to the ground floor level, a height of 24 ft. 6 in. Tenders were invited from selected firms, and the lowest, amounting to £47,738, which was submitted by Messrs. Chas. Wall, Ltd., was accepted. For convenience of construction the building was divided into three sections: A, central; B, southern; C, northern. The tender comprised the construction of the substructure of the first section, A, and the completion of the raft foundation work and retaining wall in Belvedere Road to the north of Guildford Street. The Council decided, in accordance with the conditions of tender, to require Messrs. Wall to construct the remaining two sections, B and C, at the schedule of prices included in the original contract. Messrs. Wall's contract was completed in March, 1913.

The plan adopted for the building embodies various features that were subsequently considered desirable to produce a satisfactory arrangement of plan, including the straightening up of the old irregular Belvedere Road frontage to a new improvement line.

The accommodation, after full consideration, was arranged as follows: the representatives have accommodation assigned to them around the Council Chamber. It was, therefore, necessary to decide where the main entrance could be most conveniently arranged, and Westminster Bridge Road was fixed upon as the principal business entrance, and Belvedere Road for the ceremonial entrance. The accommodation required for the representatives comprises cloak rooms, committee rooms and private rooms for the chairmen of committees, and in the centre of the crescent are placed the chairman, the vice-chairman, the deputy chairman of the Council, and the whips of the parties. The reading room, library and refreshment rooms are also on the river front.

It was found essential that certain chief officers (with their personnel) should be on the same floor, and this formed a key for placing the staff of each department, which is either below or superimposed, having ready access from the head of the department.

On completion of the substructure the main contract for the superstructure commenced in August of 1913, and was timed to be completed in three years, the contractors being Messrs. Holland and Hannen and Cubitts, Ltd., of Gray's Inn Road. As will be readily understood, the intervention of the war upset all calculations of time, and otherwise, with this as with other undertakings of a similar kind. Work was eventually stopped, and only resumed in the summer of 1919.

The walling generally is of London stock bricks, strengthened where unusual loads are encountered with blue brickwork in cement. Floor and flat roofs generally are of the usual steel joist and concrete construction. The structural work includes built-up steel stanchions where required by the planning of the building; and the steel framing for the roof, which includes two floors of offices, has required special treatment, owing to its somewhat unusual form and the heavy loads to be carried.

Mr. F. R. Anderton, chairman of the London County Council, moved a vote of thanks to the architects. He said that Londoners were proud of the Hall and owed a debt of gratitude to its designers and to the men who had carried out the building. With regard to complaints that had been made of the acoustic qualities of the council chamber the same thing had happened before when the Council had moved to new quarters. It was a matter that would right itself with time. The size of the building was justified, there was no space wasted, and nothing unworthy of London.

Mr. Andrew Taylor seconding, said that the County Hall was a triumph for unlimited competitions, for the architecture of the building was expressive of its civic and municipal purpose. Massiveness and strength were the great qualities of Mr. Knott's work, and they were symbolical of London. The County Hall was an incentive to administer the services of London better than before.

Mr. Knott, who received an enthusiastic ovation, expressed his gratitude to Mr. Riley and to Mr. Collins for their support and assistance.

# The Roman Point of View in Architecture

MR. W. G. NEWTON, M.C., A.R.I.B.A., in the course of a lecture on "The Roman Point of View in Architecture," at Oxford (the Provost of Oxford in the chair), said: In this learned city, largely devoted, and rightly so, to the study of Greek and Roman literature, philosophy, and history, the word "architecture" connotes mediæval building. Such is the power of John Ruskin. But if there is one thing more certain than any other, it is that building was a cardinal expression of the Roman genius. Their armies might be recruited more and more from foreigners, their language fade into the "pidgin-Roman" of Gaul and Spaniard, even the throne itself of the Cæsars be occupied by an Arab, a Thracian peasant, or a priest from Asia, yet everywhere and all the time, whenever occasion served or materials were obtainable, whether in Mesopotamia, or Africa, or Spain, or Gaul, they were building great aqueducts and amphitheatres, ordered towns and porticoes, baths and bridges and temples, to the same tremendous pattern. The most jealously guarded title of the imperial master himself was "Pontifex maximus," the "chief of the builders of bridges." No view of the Roman genius can be complete which leaves this manifestation on one side; and no view of architectural development can even begin to be held.

The only contemporary account we have of the Roman architectural point of view is to be found in the ten books "De Architectura" of Vitruvius, round whose name is ranged all the architectural inspiration of the Italian Renaissance. But the prophet of the Reisoni was of little account in his own country. In the whole of Latin literature there is hardly a reference to him. The design of but one building, and that a provincial basilica, can with certainty be ascribed to him. His system of proportions for the orders of architecture was in his own day disregarded. He complains in his preface to Book III that Rome is overrun with a crowd of amateur architects and advertising charlatans. For such a field his own inconspicuous gifts are little fitted. He can only hope to be known by his writings to posterity. And no one can surely have achieved so markedly the esteem of a later age and the neglect of his own. But the secret of his impotence is largely that he stands between the old and the new. With the supremacy of Augustus, to whom Vitruvius dedicates his work, Rome gradually ceased to be a city and became a civilization. The ten books of Vitruvius are, in the words of M. Choisy, the last will and testament of the Hellenic world.

And the world of Imperial Rome was a very different one. Athens, it is true, was an imperial city, the centre of the commerce of her day, the school of Hellas, the champion of the west against the east, the despotic mistress of those she liberated. And yet, in spite of the great intellectual and artistic achievements of historic Greece, it is sometimes difficult to feel that it was ever more than the nursery of Europe, a nursery where the finest thoughts of Europe were matured, but where the actors themselves were little more than children.

But our estimate of Greece can never be quantitative. Small as was her sphere, she contributed something of undying value to the development of art, and this was a spontaneity, a natural and unselfconscious joy in creating. In the report of the building committee on the state of the Erechtheum in 409 B.C., there are no high-flown phrases about the aims of art, the glory of the achievement: "to Antiphane, who carved the chariot, and the young man, and the pair of horses, 240 drachmæ." Art was never spelt by the Greeks with a capital A.

In architecture their aim seems to have been the rigorous following out to an ever greater perfection of the lintel motive, the grove of columns fencing a simple cell. They refine on the proportions of the columns, on their spacing, on the apparent droop of the horizontal lines, on the sculpture that lies in direct light and the sculpture that catches reflected light. "They alone have seen how much pleasure might be called forth by perfectly defined strength exerted upon an exactly adequate burden." And no less does this hard-thinking Greek spirit in after years follow up and work out the principle of arched construction into the full and balanced perfection of Sta. Sophia.

It was more than two centuries after the building of the Parthenon that the Romans came into touch with the Greek genius. Plutarch tells us that it was after the capture of Syracuse in 212 B.C. that the consul Marcelius first taught the Romans to admire the exquisite performances of Greece, which were hitherto unknown to them. With all the eager insincerity of the man of action who sees in art the criterion of a culture which is not his, but which he determines to assume, the Roman becomes a collector of curios, a connoisseur of Greek marbles and Corinthian bronzes, a patron of art. The Roman treatment of Greek beauty is neatly summarized in a sentence of Plutarch's description of the Temple of Jupiter Capitolinus, when he saw it after its opulent rebuilding by the Emperor Domitian about the year A.D. 80: "The Pillars are of Pentelic marble, and the thickness was in excellent proportion to their length when we saw them at Athens; but when they were cut and polished anew at Rome, they gained not so much in polish as they lost in proportion."

Art, in a word, is no longer spontaneous; it has become self-conscious. "Architecture" is distinguished from "building" by Vitruvius. Design has tabulated rules and elaborate systems of proportion.

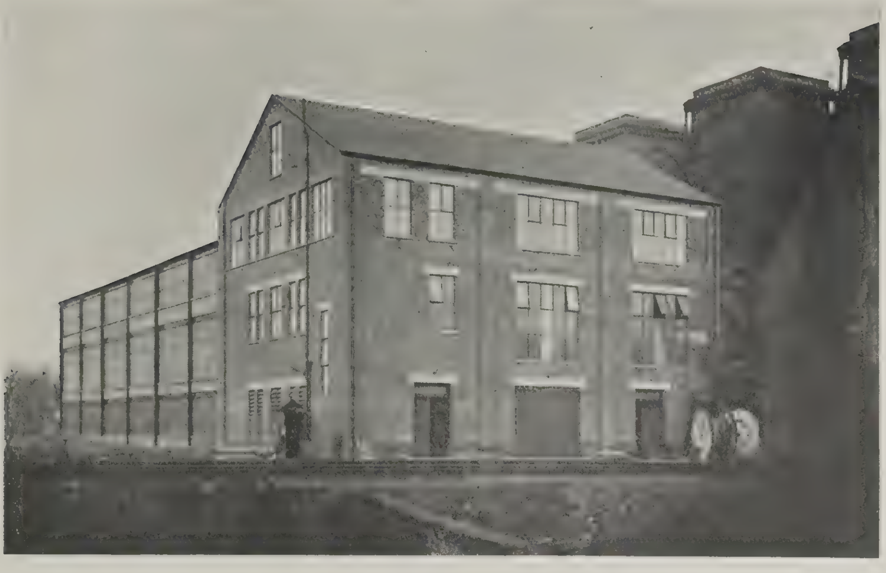
But this is only true of the part which was the Greek heritage. There is another side of Roman architecture. It is not all self-conscious and unreal. "The Romans built like the bees," says Viollet le Duc. And M. Guadet, in an illuminating passage which is worth quoting in full, writes: "Ancient architecture is a single verity. And nowhere will you find this characteristic more striking than in the Baths. Ancient architecture has two constituent elements: the colonnade or entablature with the architecture of th orders, the arcade or vault with the architecture of the great monuments of Rome. The colonnade, the older form, consecrated by tradition, finds its perfec expression in the temples; here it i diverted from its original use, and in the Roman monuments we often find the orders purely decorative. . . . But in the Baths, in view of the demand fo public utility, with proportions of bays and vaults passing the accepted dimensions, there was nothing to appeal to bu reason, logic, and truth. . . . The Baths have the definiteness, the frankness, the rigorous candour of a Doric temple."

And not the Baths only. What we are first of all struck with in considering the Roman contribution to the development of architecture is the astonishing mass of Roman building work. For three centuries and more the system of civilization which was the Roman Empire enjoyed, apart from frontier wars, profound peace. Everywhere cities grew and flourished, built on similar plans, governed on similar lines. It has been calculated that there were more than two thousand of them. The Pax Romana and the increasing ease and even luxury of travel drew all parts of the civilized world together. It was a social obligation, understood and accepted, that the wealthy should spend their wealth in glorifying their own town, especially by building. Countless inscriptions have been found all over the empire recording gifts and bequests, and the greatest part of them are objects of public utility—baths, theatres, aqueducts, roads, and market-places. As Professor Dill says: "There was in those days an immense civic ardour, an almost passionate rivalry, to make the mother city a more pleasant and more splendid home. . . . There is an almost monotonous sameness in the stiff conventional record of this vast mass of lavish generosity."

The perfection of the Roman system of centralization diffused a uniformity of design and construction everywhere. The aqueducts of the Campagna are repeated at Segovia, the colonnades of Baalbek in the streets of Milan.

And so this great system of the past life of man has, like some perished mammoth, left everywhere its bones, which we may see and handle and reconstruct. A vast deal has perished in the earthquakes and wars and spoliation of 1,700 years. But so solidly and universally did they build that we can still study over most of Europe, and much of Asia and Africa, what manner of men they were and what they made of life. When I look at the great remains of the Roman Empire I am reminded of Watts's picture of the minotaur. A great hand seems to be laid, almost unconscious of its weight, on the peoples. The individual sinks out of sight. The remains are the remains of cities then built, and armies. Not here is the simple freshness of the Greek, chiselling his marble in the sunshine, or the exuberance of the mediæval builder, balancing vault against buttress. As we stand by a Roman ruin we seem to hear a sound of many voices, the

"Smoke and wealth and roar of Rome."



A GENERAL VIEW.

# A New Switch House, at Neasden

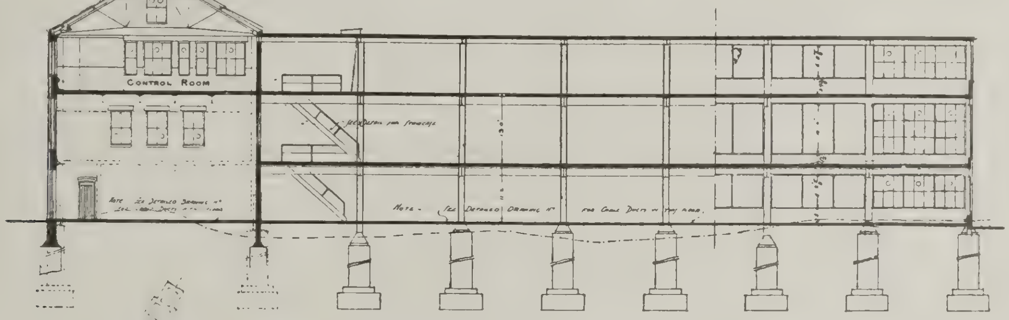
THE accompanying plans illustrate what is a novel building to many engineers and architects. The letropolitan Railway Company are xtending their power-house at Neasden, nd are taking the opportunity to ouse all their switch gear in a eparate building in which all apparatus onnected to the main high-tension lectricity supply is to be kept entirely solated from the occupied chambers, hus ensuring the safety of the staff under ll conditions.

This apparatus has been designed to distribute an ultimate station capacity of 60,000 kva.; the system being a three-phase alternating current, operating at 11,000 volts with a periodicity of 33⅓ cycles per second.

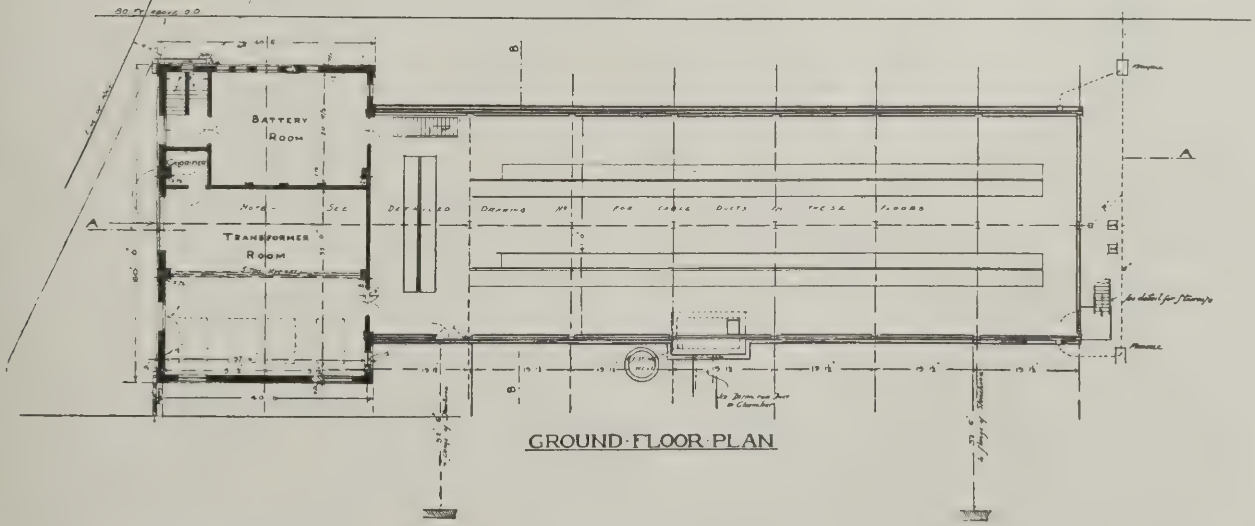
Special brickwork cubicles are provided for each incoming and outgoing cable, and these cubicles are divided vertically by brickwork phase barriers, and again horizontally by moulded stone slabs into compartments, entirely isolating each item of apparatus, the entire cubicles being closed when "alive" by steel plate doors.

The dimensions and equipment of these cubicles have, of course, very largely governed the size and shape of the building, but a separate control room from which the various switches can be suitably controlled has also been provided.

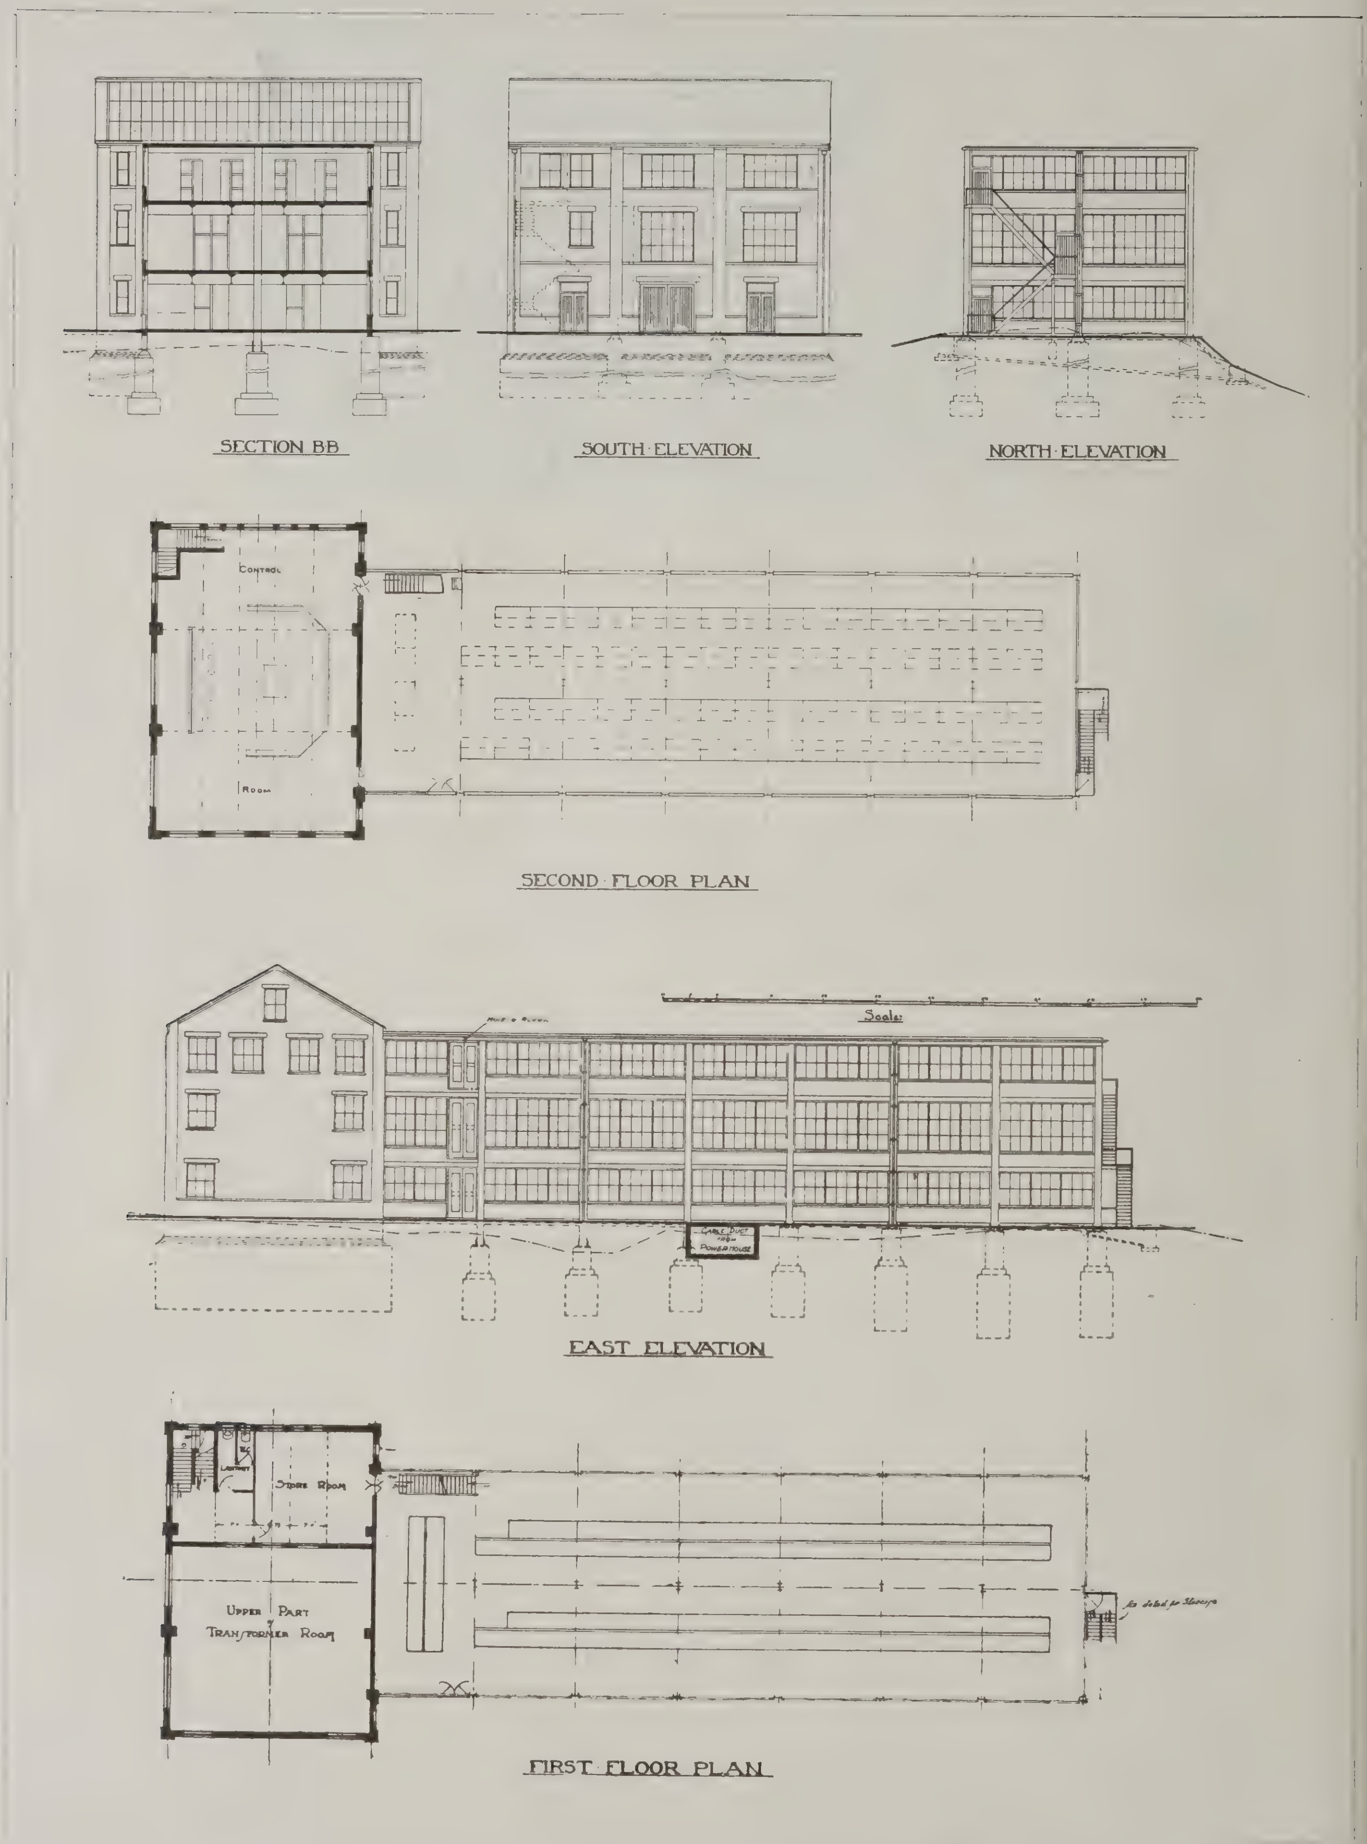
This contains only the low-tension switch operating panels and battery controls, and is equipped with a complete installation of "ships'" telegraphs and loud-speaking telephones in order that communication between the turbine drivers and switchboard operators shall be as simple as possible.



SECTION. A.A.



GROUND·FLOOR·PLAN



PLANS, ELEVATIONS, AND SECTION OF THE SWITCH HOUSE AT NEASDEN.

The turbine governor and all electrical controls are also installed in the control room so that the operator is unaffected in any way by the distance separating him from the machines.

The building, which is **T** shape on plan, the cross line of which represents the south front of the building, contains on the second floor the control room and on the ground floor the transformer and battery rooms, with lavatories and store room on the mezzanine floor. The back wing, which is the switch house proper, contains on the ground floor the distributing ducts, cable trifurcating boxes, isolating switches and potential transformers; the first floor contains the automatic oil switches, series transformers, and busbar isolators, while the top floor is occupied by the busbar chambers. The cables are brought from the power-house between the cooling towers in a series of waterproof ducts into a large manhole on the east side of the new building underneath the ground floor—from this point they radiate under the floor to the various cubicles and rise vertically through the floors to the busbar chambers.

The site is a difficult one, being composed for a depth of 20 ft. of made ground, the building is therefore carried on a series of piers on which is erected the steel-framed building with reinforced concrete floors, and as ample light is essential for examination of the gear the steelwork is filled in with iron-glazed sashes.

The work has been carried out by Messrs. Perry & Co., of Bow, as contractors, to the design and under the supervision of Mr. E. A. Wilson, the chief engineer of the Railway Company.

The electrical installation is being carried out by the General Electric Company, of Witton, Birmingham, to the design and under the supervision of Mr. C. Jones, the chief electrical engineer of the Railway Company.

The steelwork is being supplied by Messrs. Lambourne & Co., sub-contractors to Messrs. Perry & Co.; the steel windows by Messrs. Williams Gamon & Co., of Chester; the patent glazing by the British Challenge Glazing Co.; the glazed bricks by Messrs. Brookes & Co., of Halifax; the electrical conduits by Messrs. Doulton. The general bricks are Ibstocks, and the facings Southwaters, manufactured by the Sussex Brick and Tile Co. The heating installation has been carried out by Messrs. Comyn Ching & Co., and is a low-pressure natural circulation worked from a calorifier heated by steam supplied from the power-house.

# The Architect and Engineer

## By W. J. H. LEVERTON, F.S.Arc., Licentiate R.I.B.A.

MR. W. J. H. LEVERTON, addressing a meeting of the Institution of Structural Engineers on Thursday evening last week, took as his subject " The Architect and Engineer."

The engineer, said Mr. Leverton, is utilitarian; his sole object generally is efficient construction. Science is his mistress. If he pays any court to Art it is by applying ornament after the form of his structure has been settled, for good or ill, merely by the claims of construction.

The architect in designing his building endeavours to gain a satisfactory effect by means of good grouping, a fine outline, and a proper disposition of the parts. He then adds ornament if the purpose of the building and the purse permit. The ornament, which is an accessory—a desirable one frequently—is not, of course, applied indiscriminately, but in the best works emphasizes the construction and the important lines of the building.

To give an erection architectural character does not by any means involve making it more ornate or costly. It is important to emphasize this, because there is an idea that an architect is only necessary when an ornate building is required; that he is an individual who playfully peppers a façade with pilasters and adds carving *ad libitum*, possibly *ad nauseam*. There is a fine passage in Viollet-le-duc's lectures, in which he shows that the smallest buildings in Pompeii, built of the cheapest materials, were, owing to their treatment, quite as much works of art as the ornate public buildings of the city.

As architectural treatment does not necessarily involve additional expense, there is no reason why every erection should not possess it, and give delight to the beholder; instead of having a similar effect on a man, or woman, of taste as a rough channel passage. A writer on design said one of its qualities was politeness. He said when a building was erected it blocked out a certain amount of light and air (some advocates of higher buildings would block it all out), and, possibly, a view, so out of common politeness to the passer-by he ought to make it presentable and pleasing.

Granting that architectural treatment should be given to all erections, how is it to be obtained? By referring to the methods of Sir Christopher Wren, healing the unnatural divorce between architecture and construction, now called engineering, placing the architect in his proper position as general director, and to avoid the troubles that previously occurred through the architect being overburdened with work, he should depute to others such duties of detail as can be devolved without upsetting the success of the scheme.

What an impetus it would give to the advancement of architecture if all new methods of construction were handled by men who had been artistically trained. A cry goes up at times for a new style. If architectural design was once more based on construction and full advantage taken of new methods, something fresh might result.

Many of the men of old would have gloried in reinforced concrete. What would the builders of Beauvais have given for such a material? It would have enabled them to erect a central tower a thousand feet high! Few of the larger French Cathedrals have a central tower that dominates the church like the towers of Canterbury, York and Lincoln. The fleche of Amiens, although higher than the spire of Salisbury, is a mere turret compared with the great height of the nave. A central spire for Amiens to hold its own would have to be at least 700 feet high. It could be constructed in reinforced concrete with ease, but anything of that height in stone would require supporting piers so enormously large that the centre of the church, the most useful part, would be practically blocked up.

Westminster Abbey badly wants a central tower; this is particularly noticeable as you approach it from the east. I suggested some time since that one might be erected in reinforced concrete. It was at a dinner of the London Society. I was afterwards asked what specialist firm I represented!

Seriously speaking, a design modelled on the much abused Western Towers would be very suitable for erection in reinforced concrete. The existing piers would probably take the additional weight; they are considered to be too slight for the weight of a stone tower.

It is most certainly a mistake to hide the concrete construction behind a veneer of anything. The concrete building should not be a frame building, that is a mere skeleton put up and cased afterwards with something or other. The piers, instead of being bald squares, should be treated as architectural columns or piers, and the beams as entablatures with cornices cast on properly designed for concrete, not simply stone imitations.

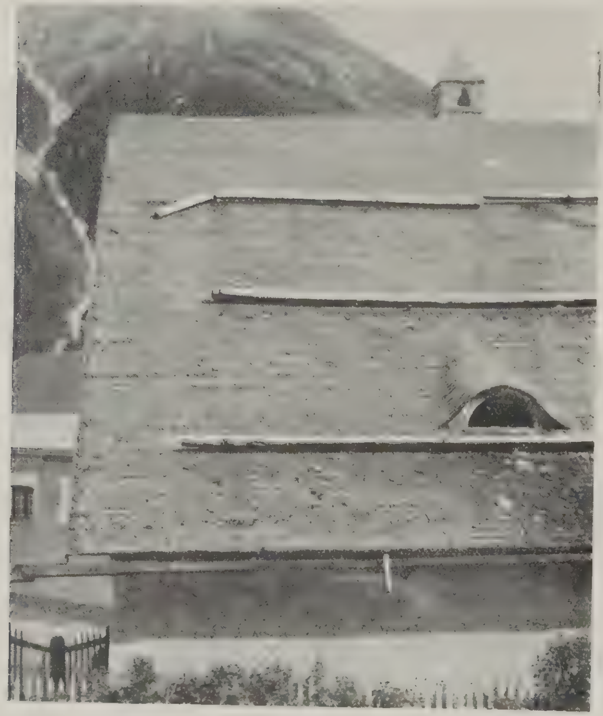
A very fine building, one of the most magnificent designs of the age, was recently described in a paper before the Royal Institute of British Architects. It has a cornice in stone of Corinthian type. The modillions, it appeared, were suspended to conceal reinforced concrete cantilevers by dovetailed plugs. The effect was fine, but one does not feel happy when one knows how it has been obtained.

Some may possibly consider I have laid too much stress on the artistic side of the relations and unduly magnified the importance of architecture. We are all, engineers and architects alike, I think, citizens first and professional men afterwards; and are therefore fully agreed that everything erected should be, at least, unobjectionable in appearance. The only way to achieve that desirable result is to have some one in charge who has had proper training in architectural matters. Many of the earlier engineering works were of a high standard—any age might be proud of them. The divorce between engineering and architecture had not fully taken place—Sir John Rennie was a Fellow of the Royal Institute of British Architects. Some later works, alas, are blots on the fair face of city and country alike. Two Thames bridges may be instanced, Hampton Court and Charing Cross: the former is by far the worst. It is assumed in some quarters that because the latter is not what it might be a railway bridge is necessarily ugly; but that, of course, is a ridiculous heresy. A railway bridge might be as fine a structure as a Roman aqueduct, and what could be grander?

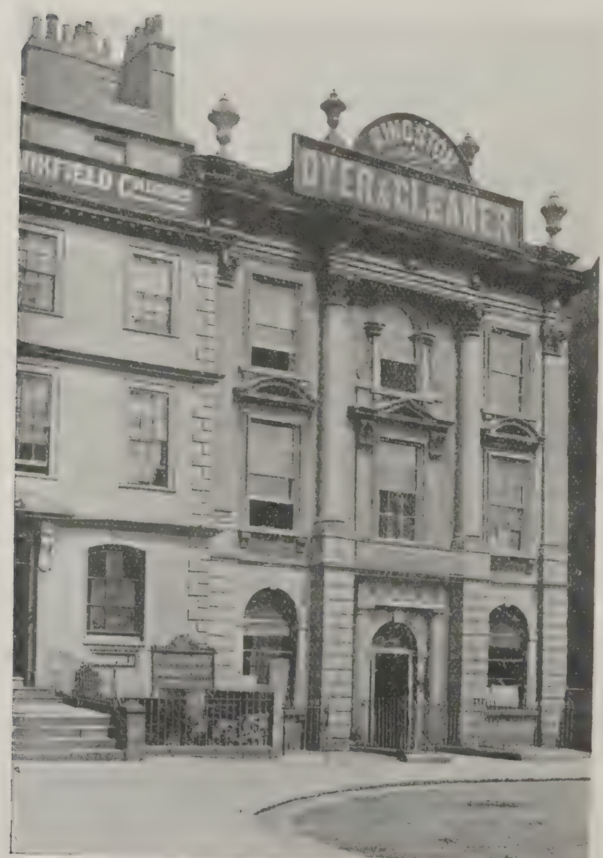
# A Pictorial Review

## Illustrations of Topical, Practical, or Curious Interest

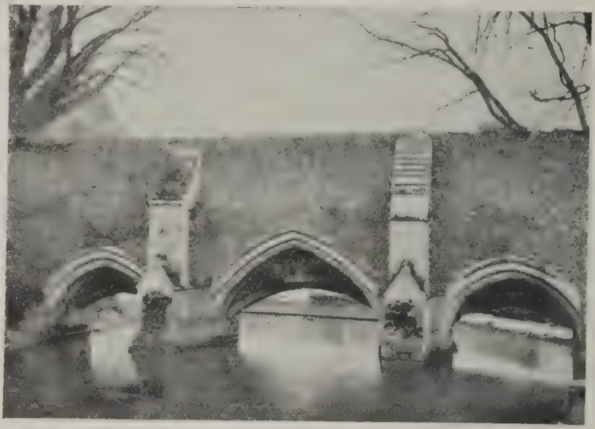
*Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.*



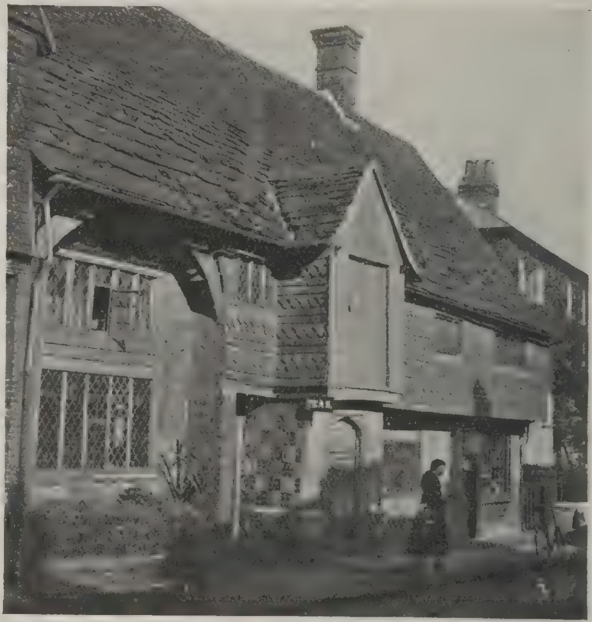
A curious dormer on a house at Maduleine, Lower Ingledene, Switzerland. The roof is constructed of shingles, and is fitted with snow-guards, which can be clearly seen in the accompanying snapshot.—H. A. J. L.



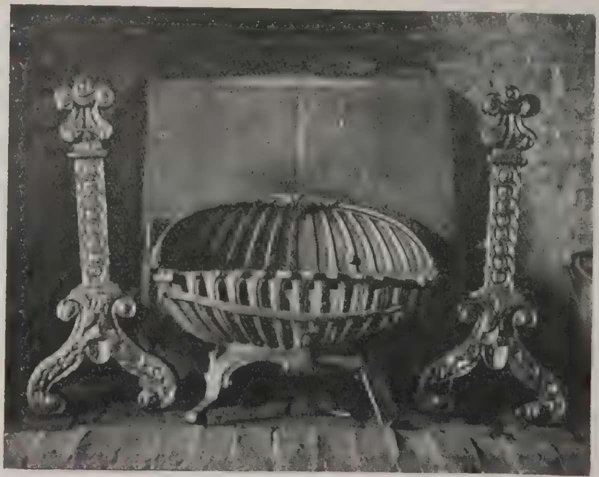
Nassau House (now demolished), Orange Grove, Bath. The house was designed and built about 1730 by the Earl of Cork and Burlington.—E. M. H.



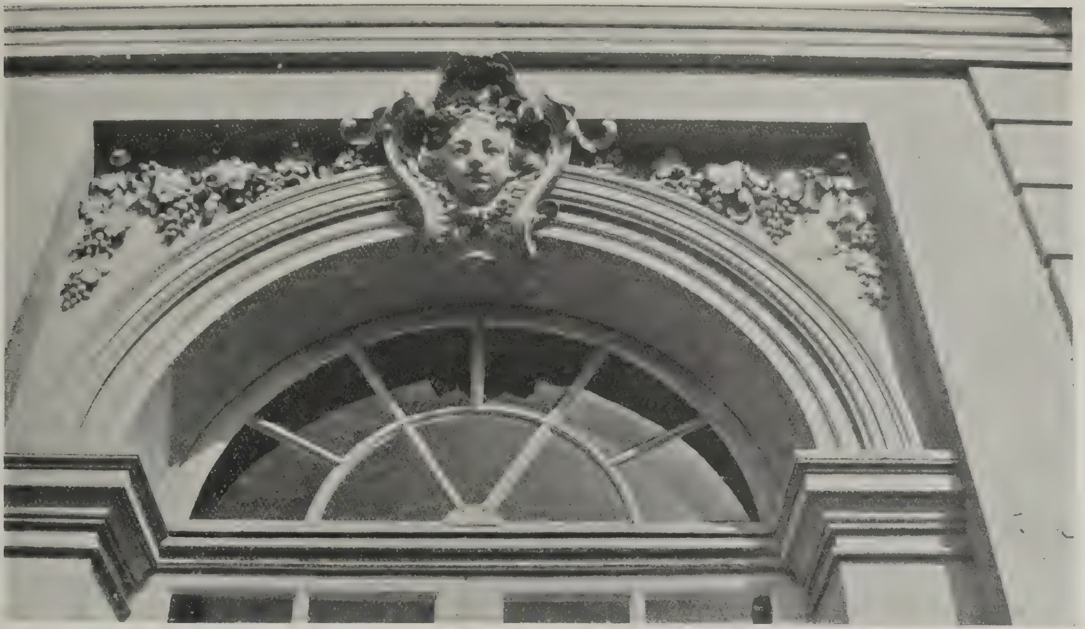
Abbot's Bridge over the Lark at Bury St. Edmunds. It dates from the twelfth century, and is so narrow that its builders could not have known of, or anticipated, wheeled vehicles.—J. B. T.



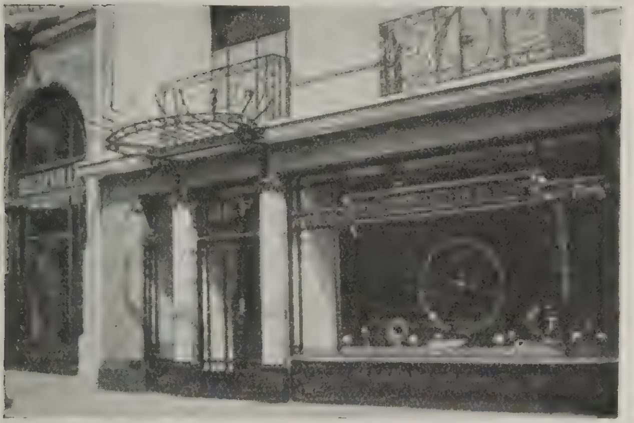
The "Old House" near Southover Church, Lewes. It is reputed to have been the residence of Anne of Cleves.—J. B. T.

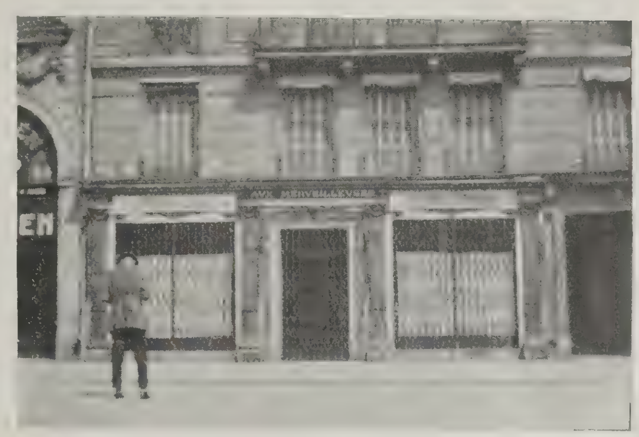


Old Sussex iron cradle grate (or nest) and dogs in the village Institute at Heyshott. Near by lies Dunford House, the birthplace of Richard Cobden, the free trader.—J. H.

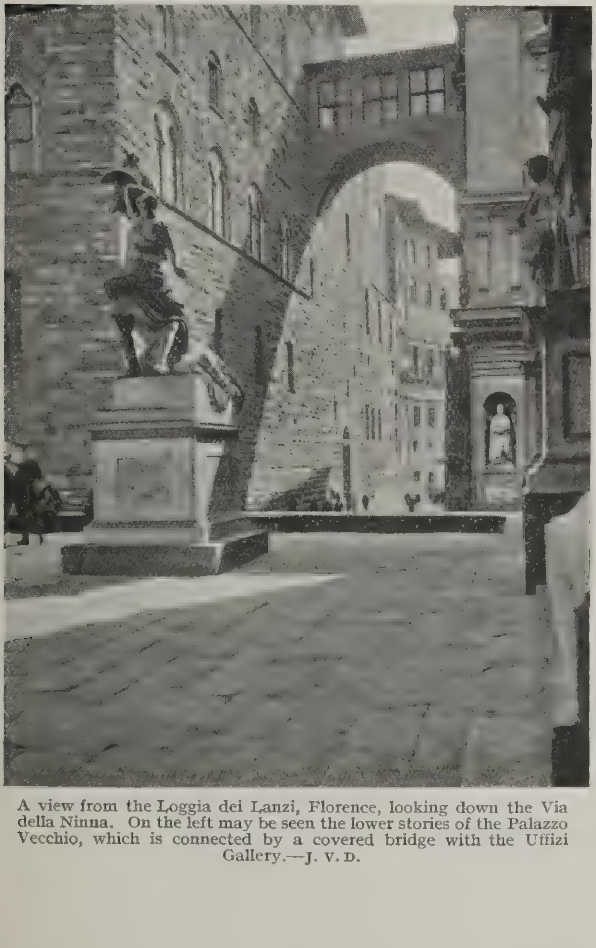


This semi-circular-headed window forms part of the Pavillon Français—a small summer dining-room in the Gardens of the Petit-Trianon, Versailles. The Pavillon was built by Gabriel in 1766 for Louis XV.—B.

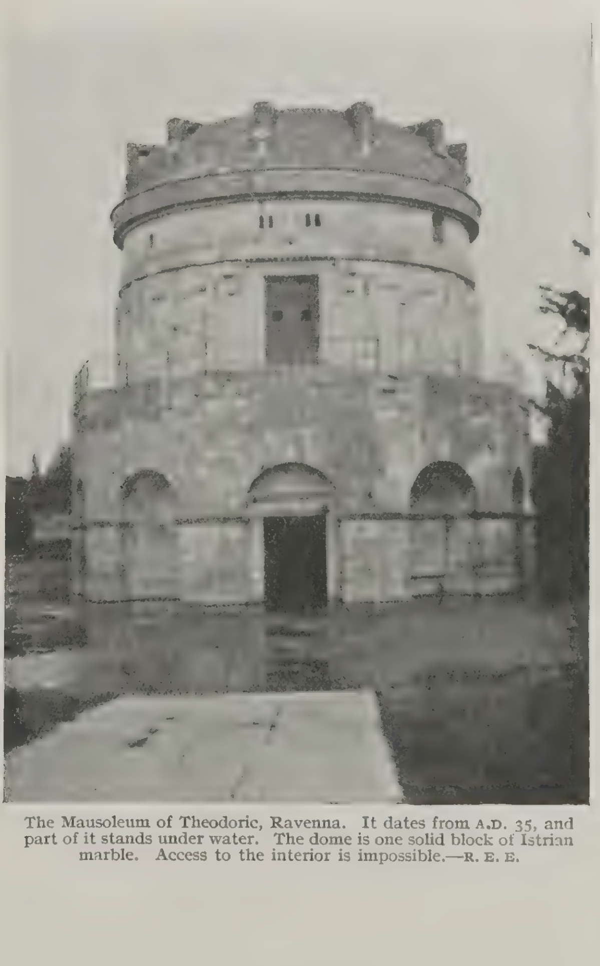




These two shop-fronts are in the Champs Elysées, Paris. The pilaster caps, window frame, and ornament of that shown on the left are of bronze. Ball-bearing wheels are exhibited in the window and repeated as an ornamental motif in the caps of the two pilasters and in the window base. In the other window the pilasters are of yellow marble and have bronze caps and polished brass bases. The shop-facing is of white marble, and all the ornament is of bronze.—E. D. A.



A view from the Loggia dei Lanzi, Florence, looking down the Via della Ninna. On the left may be seen the lower stories of the Palazzo Vecchio, which is connected by a covered bridge with the Uffizi Gallery.—J. V. D.



The Mausoleum of Theodoric, Ravenna. It dates from A.D. 35, and part of it stands under water. The dome is one solid block of Istrian marble. Access to the interior is impossible.—R. E. E.

# The Housing Problem

## A Suggested National Programme

SOME interesting suggestions for a National Housing Programme have been made by the National Federation of House Builders. In putting forward the suggestions the object of the Federation is to outline a practicable solution of the housing difficulty which can be put into operation and produce the largest possible number of houses with the minimum of expense to the country. The Federation, in putting forward their suggestions, state : The house building trade has been suspended because investors have ceased to buy cottage property, and until houses can be sold to the investor the house builder cannot build and the great and growing shortage will continue. The main object of any national policy, therefore, should be to restore economic conditions in housing, in other words to restore such a position that the rent and cost shall bear an economic relation to each other. A revival of the housing industry would operate as a powerful stimulus to employment, not only in the actual building trades but in all allied trades, and in such trades as furniture making, etc. The amount saved in unemployment doles would go far towards meeting any expenses incurred in granting aid for housing. No heroic measures of wholesale building with public money will meet the difficulty; experience has already shown that such a line of action only intensifies the shortage. We consider that the only way is to restore house building as an industry, and this can be accomplished by a National Housing Programme on the following lines.

### The Withdrawal of Legislation

1. All legislation which unduly penalizes the owners of house property should be withdrawn at the earliest possible date. The first step towards a resumption of building is to restore the confidence of investors in house property, and this can only be restored when house property is free from the onerous and exacting restrictions which are now imposed by the Rents Restriction Act. The withdrawal of the Act would not lead to unduly high rents, for the resumption of buying by the public would cause activity in building, and the free competition would rapidly restore an economic position of rents and costs. The Rents Restriction Act has intensified the housing shortage.

### Investment in Property

2. Every endeavour should be made to encourage the people to invest their savings once more in house property. An active market for the sale of cottage property in small lots existed before the war. In this way the people were supplied with houses. House property still remains the soundest form of investment if it is secure from political attacks. The confidence of investors will be restored when a strong Government declares its intention of fostering and encouraging the investment of the people's savings in house property. When investors buy houses they can be built in great numbers.

### Economic Rents

3. All local authorities which build houses in the future should be required to charge economic rents except where the houses are erected for the clearing of congested areas. If the local authorities can build houses and let them at any rent which the council think fit, it means a loss to the general tax-payer and ratepayer, it pauperizes the tenants, it encourages jobbery in local elections, and it prevents private enterprise from building similar houses in the same district.

### State Assistance for All

4. If any State assistance is granted for housing it should be granted equally to municipalities and to private enterprise building houses of a good type. Some form of assistance is absolutely necessary to build houses for the working classes. The considered opinion of the Federation is that the most efficient and economical method of affording the necessary assistance is by a cash subsidy to the owner of all new houses of an approved type. An alternative method in some districts might be found by exemption of new houses from local rates for a period of years. Unless State assistance is extended equally to all agencies private enterprise cannot compete on equal terms with local authorities, the house builder will not be able to build, and the whole burden of finding the houses will be thrown on to the rates and taxes. The system of cash subsidies has already proved to be the best and most economical method of granting assistance. A cash subsidy will reduce the cost to the investor and by drawing capital to the industry it will rapidly bring cottage property to its proper position as one of the most desirable investments in the country.

The exemption of new houses from local rates has been tried in other countries with great success. There need be no additional expense thrown on the existing ratepayer by this method of assistance. No increase in the education and poor rate need be anticipated by a distribution of the population through the reduction of over-crowding, and the inevitable expense of cleansing and lighting could be covered by a grant from the national exchequer to the local authorities of an amount equal to the property tax received from the new houses. This would not cause any additional expense to the national exchequer. The profits from the public supply of gas, electricity and water should also tend to defray any small expenses caused through the exemption of new houses from local rates.

### Encouragement to Purchase

5. Every method of encouraging the citizen to purchase his own house should be examined and adopted if it promises to increase the available housing accommodation. The following matters will assist those who desire to buy their own houses :—

(*a*) The further revision of the Small Dwellings Acquisition Act, 1899, as amended by the Housing, etc., Act, 1919, and the liberal working of that Act.

(*b*) The extension of assistance to building societies to enable them to lend a larger proportion of th cost of a house than they ar willing to do at present. Thi would enable those with sma capital to secure a house of thei own.

(*c*) The exemption of new propert from local rates for a period o years. This could be applied wit equal advantage to encourage th owner occupier as to induce th investment of capital in houses t rent.

### Revision of By-Laws

6. Local authorities should revise thei by-laws in order to cheapen the cost o building and roadmaking so that houses can be let or sold at a reasonable figure The building regulations in many districts are out of date and increase the cost of houses and rents unnecessarily They should be made uniform throughout the country as far as possible and the most economical standard should be adopted consistent with sound construction. A wide discretion should be given to local authorities to permit of building by new methods, and to do this the provisions of Section 25 of the Housing, etc., Act, 1919, enabling local authorities to permit building by new methods, could be made permanent.

### Advancing of Capital

7. Local authorities should be empowered to lend money on mortgage to responsible builders developing estates and erecting houses of approved types.

Under this system the local authorities could advance capital to builders developing estates which would be repaid on the completion and sale of the houses, or transferred to the purchaser as a repayment mortgage. Local authorities would thus control the development of their areas without expense and builders would be enabled to undertake large schemes. This system has been worked with great success by one or two local authorities in the country under private Acts of Parliament.

### No Trusts and Combines

8. Prompt and decided action should be taken by the Government to counteract the operations of the trusts and combines in building materials.

The cost of building is being maintained at an unduly high figure largely by the unreasonably high prices of building materials. Light iron castings, lime, earthenware goods, white lead, bricks and other materials are controlled by combines of manufacturers.

Following are the signatories for the National Federation of House Builders to the suggestions : J. Squires, Nottingham, president; H. R. Selley, London, vice-president; G. F. Darbyshire, Manchester, vice-president; C. H. Oldham, Manchester, past-president; Geo. Sadler, Nottingham, past-president; R. A. Costain, Liverpool, past-president; A. Waddington, Sheffield, past-president; H. M. Grant, Birmingham, past-president; G. H. Brown, Manchester, treasurer; Norman McKellen, secretary.

## The R.I.B.A. Registration Bill

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—I am afraid the gentleman who wrote your leading article, published on the 24th inst., does not read the R.I.B.A. Journal, or else he has a very short memory. He states "the old Council . . . had a strong case . . . but they never put it before the electors, and it was not until Major Harry Barnes made his famous speech at Cardiff that we knew what the Institute really meant by its registration policy."

You really are very unkind to the late Council and to the late President (Mr. Simpson) in particular. Major Barnes's address is reported in the "Journal" of July, 1922, and Mr. Simpson chose the subject of the scheme for his Presidential address at the Liverpool Congress in June, 1921 ("Journal," Vol. xxviii, p. 497). Then, again, we had the advantage of reading very many letters from Mr. Keen, our Hon. Secretary, who explained so lucidly that "all the architects" did not mean "all the architects." There were also many articles and letters in the professional Press explaining the policy of the scheme.

You also state that, in your opinion, if the late Council had "put their case properly before the members of the Institute, we believe the result of the elections would have been very different." Come, come! Is that really fair to the late Council? Surely you know that at least one very important member visited the provinces and spoke on several occasions in favour of the scheme, and that there were many meetings in and out of London conducted by Associates at the expense of the Institute to further the scheme; and, finally, the late Council issued an official statement in the "Journal" of May 6th, 1922, in many eye-catching varieties of electioneering type. By an extraordinary coincidence that number of the "Journal" also contained the nominations for the Council election.

I submit that no scheme ever had more advertisement or more support from the Press, and surely no scheme was ever so enthusiastically rejected by the general body of the R.I.B.A. At, I believe, the largest poll ever recorded, twenty-five men out of twenty-eight were elected pledged to oppose the scheme to the utmost of their power; but it was the general body that called it, and the present Council was elected to bury it! R.I.P. SIDNEY PERKS.

## "Architect and Engineer" in Collaboration

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—I have read the article in your issue for Jan. 17 on the above subject with the greatest interest. It has been my contention for a long time that this subject requires urgent and serious consideration, and during my editorship of a monthly illustrated journal devoted to architecture and the allied arts, I advocated not only the collaboration of architects and engineers, but architects and sculptors, and, further, architects and building contractors. The latter may appear an anomaly, but seriously I advance such a contention. Architects may be considered the masters of the building contractors, and to a great extent, of course, they are. The architect's conception is on behalf of a third party, undertaken to be carried to fruition and completion by the building contractor, faithfully and in accordance with ideas preconceived, and expressed in the architect's drawings, details, and specifications. A hard and fast binding contract is made to this end, and, if possible, such contract is so framed that it shall not be possible for the building contractor to deviate from his agreed course of procedure. This is all right, and so far is as it should be, but in many cases the building contractor does not trouble himself to look further than to do as he is told. For a successful building to be evolved the contractor must have far more sympathetic views. For proof of this we need go no further than the times of our great-grandfathers when collaboration was perfect. The results and the legacies left us from these times are subjects for our admiration and envy.

I cannot but feel that a system or mode of working should be established whereby the building contractor is in closer touch and harmony with the architect. The American has solved this in his own direct commercial method by reason of the fact that an architect's office of any importance in America is organized and run upon a scale much as is a large commercial business. The departments are defined and conducted by a skilled head who is absolutely responsible for all the departments' transactions. The establishment, in fact, is a veritable "sausage machine," the whole process from raw material to the finished article being produced in order of sequence. I am unable to admit that such a system is possible in this country, but I do contend that something to take its place is every year more in evidence, and that this is brought about by the ever-increasing size, magnificence, and importance of modern edifices.

The modern building contractor of any importance is, or should be, or should have as an integral part of his establishment, a man of matured knowledge and experience, educated and brought up as an architect, and holding in that firm or business a position of directorship. He should, if possible, have practical architectural knowledge, gained by practising and having carried out works of importance. A building contractor having this knowledge would be more conversant with the architect's drawings, details, and the multitudinous ideas and conceptions he wishes carried out, and the contractor would be able to read these in the spirit in which they were conceived. He would have a sympathetic influence over the entire work, he would be in a better position to decide points of doubt and to discuss these with the architect to advantage. He would undoubtedly bring an atmosphere of greater confidence and reliability which would all tend for the betterment of workmanship, satisfactory working conditions to the firms' employés, harmony of business associations, and complete satisfaction to all concerned, with the consequent prosperity to follow. CECIL A. SHARP.

## Architects and Colour

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—At a recent conference of public men, called to consider a rebuilding scheme, it was affirmed with general agreement that architects are less susceptible to public opinion than the members of other professions, and that more than any other they impose their judgments, whether right or wrong, upon their clients.

The occasion of the remark was a proposal to embody in the scheme certain frontages in dull-glazed coloured terra-cotta, with a view to brightening a dull locality—as Mr. J. M. Hogge, M.P., in a letter to the Press, has since advocated.

It was objected that the architects would lack the courage to depart from the brick and stone convention and, notwithstanding the admirable use of such material in various buildings up and down the country, would succeed in overruling their clients' preference.

A friend connected with the building trade assures me that many architects fail to keep abreast of the times and are ignorant of the properties and uses of new materials. Thus, one, when supplying formal data on London buildings, described Pagani's restaurant as built of "coloured tiles," and the popular restaurants known as the Corner Houses as of "glazed tiles"; whereas the former is of constructional faïence and terra-cotta, and the latter of terra-cotta ashlars with a matt vitreous surface.

Is this general accusation justified? *Do* architects neglect to acquaint themselves with new methods and materials? *Are* they indifferent to what Mr. Hogge describes as the "æsthetic and moral value of colour in buildings"? The views of your readers would be interesting. NOËL INCHCAPE.

## R.I.B.A. Code of Professional Conduct and Practice

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—As questions have been asked with reference to the omission of the Code from the Kalendar, your readers might like to know the facts. It has been assumed that the code printed in the Kalendar for 1920–21 was omitted from the present Kalendar by order of the present Council. That is not so; it was omitted by order of the late Council.

When the draft of the code was submitted to the Practice Standing Committee in 1920, it passed resolutions on April 7 and April 28 that "the publication of any such document would not be in the interests of the Institute" and "they fear it would be liable to be made use of adversely to Architects in Courts of Law," but the Council of that date did not accept the advice of the Committee.

In October of last year the Practice Standing Committee submitted a resolution to the Council as follows :—

"The Committee note with satisfaction the decision of the Council not to publish the existing Code in the Kalendar for the coming year. It is the opinion of the Committee that the Code of Professional Conduct and Practice as at present published should not again be printed in the Kalendar. Further, the Council are recommended to rescind the present Code as an official document of the R.I.B.A."

The Council accepted the advice and resolved accordingly.

At the present moment the Practice Standing Committee is considering whether a code should be printed in the Kalendar, and if so, what that code should be.

It is interesting to note that as f back as 1916 the Practice Standing Co mittee resolved that the previous co should be omitted from the Kalendar, tl resolution was as follows :—

"The Committee are of opinion th with a view to strengthening the pow of the Council to deal with all matters Professional Conduct it would be advi able to omit the contents of page 70 of tl Kalendar from all future publications."

SYDNEY PERKS.

# R.I.B.A. Prizes and Studentships

## The Awards

As briefly announced last week the prizes and studentships of the R.I.B.A. were awarded as follows :—

### *The Tite Prize and £100 for Design.*

The subject set for this year was "An Italian Embassy in a European Capital." The prize was awarded to: Mr. John Chiene Shepherd, A.R.I.B.A., of 51 Torrington Square, London, W.C.1, and a certificate of honourable mention was awarded to Miss Isabel Maud Chambers, of "The Priory," Roehampton, S.W.15.

Nine designs were submitted under the following mottoes :—

(1) "B.O.": three strainers; (2) "Utinam": three strainers; (3) "Sebastian": three strainers; (4) "Poffergy": four strainers; (5) "Geneva": three strainers; (6) "European": three strainers; (7) "Tishy": five strainers; (8) "Blue Square": four strainers; (9) "Tujja": four strainers.

The Council have awarded the certificate, and, subject to the specified conditions, the sum of £100 to the author of the design submitted under the motto "Tujja"; and a certificate of hon. mention to the author of the design submitted under the motto "Poffergy."

### *The Owen Jones Studentship.*

A certificate and £100 for ornament and coloured decoration: awarded to Mr. Cyril Forbes Filbey, of 123 Crystal Palace Road, E. Dulwich, S.E.22.

One application was received from the following gentleman: C. F. Filbey: six strainers.

### *The Godwin Bursary and Wimperis Bequest.*

A silver medal and £130 for the study of works of modern architecture abroad: awarded to Mr. William Thomas Benslyn, A.R.I.B.A., of 42 West Side, Wandsworth Common, S.W.

Six applications were received for the Bequest from the following gentlemen :—

(1) W. T. Benslyn (A); (2) L. H. Bucknell (A); (3) S. W. Milburn (A); (4) W. S. Purchon (A); (5) E. W. B. Scott (A); (6) A. F. Wickenden (A).

### *The Pugin Studentship—A Silver Medal and £75.*

For the study of the mediæval architecture of Great Britain and Ireland: awarded to Mr. A. Newton Thorpe, of Cemetery Lodge, Fulford, York.

Two applications were received for the Studentship from the following gentlemen :—

(1) G. W. R. Heritage: four strainers; (2) A. Newton Thorpe: four strainers.

### *The Henry Saxon Snell Prize and £50.*

Increased on this occasion to £60 owing to the generosity of Mr. A. Saxon Snell, for the study of the design and construction of hospitals, convalescent homes and asylums. "A Maternity Home and Infant Welfare Centre" for an industrial town was the design subject for this year. The prize was awarded to Mr. Ernest G. Theakston, F.R.I.B.A., of 12 New Court, Lincoln's Inn, London, W.C., and certificates of honourable mention were awarded to Mr. George Bertram Edward Norburn, A.R.I.B.A., of "The Crossways," Northwood, Ramsgate, Kent, and to Mr. Alfred John Brown, A.R.I.B.A., of 35 Handside Lane, Welwyn Garden City, Herts.

Eight designs for a maternity home and infant welfare centre were submitted under the following mottoes :—

(1) "Ad Rem": one strainer; (2) "Roona": one strainer; (3) Crane (device): two strainers; (4) Three Diamonds (device): two sheets; (5) "Knype": four sheets; (6) "Solomon": two strainers; (7) Square and Compass (device): three strainers; (8) "Ursa": four strainers.

The Council have awarded, subject to the specified conditions, the prize of £60 to the author of the design submitted under the motto "Ad Rem," and certificates of hon. mention to the authors of the designs submitted under the motto of "Roona" and the device of a crane.

### *The Grissell Gold Medal and £50.*

For the encouragement of the study of construction. The subject set for this year was "A Warehouse," and the prize was awarded to Mr. Percy Morrey, M.B.E., A.R.I.B.A., of Wynhill, Bramhall, Cheshire.

Four designs for a warehouse were submitted under the following mottoes :—

(1) "Rivet": two strainers; (2) "Syntithemi": six strainers; (3) Fleur de Lys (device): five strainers; (4) "Bluzz": two strainers.

The Council have awarded the medal and £50 to the author of the design submitted under the motto "Rivet."

### *The R.I.B.A. Essay Silver Medal and Twenty-five Guineas.*

This is awarded for the best essay on a subject of architectural interest which may be chosen by each competitor: Awarded to Mr. Lionel B. Budden, M.A A.R.I.B.A., of Withinfield, Heswal Cheshire, for his essay on "An Introdu tion to the Theory of Architecture."

Five essays were received for the silve medal under the following mottoes :—

(1) "Argumentum ad Judicium" "The Architectural Problem of th Modern Shop"; (2) "Aristus": "A Introduction to the Theory of Architec ture"; (3) "Korea": "The Study o Sound in its relation to the Design o Buildings"; (4) "Petivi": "The Mos Genial Artist of his time: Pirro Ligorio of Naples, Rome, and Ferrara"; (5 "Poffergy": "Flats."

The Council have awarded the silve medal and twenty-five guineas to th author of the essay submitted under th motto "Aristus."

### *The R.I.B.A. Measured Drawings Silve Medal and £50.*

This is awarded for the best set o measured drawings of an existing building which may be chosen by each competitor: Awarded to Mr. Wesley Dougill, B.Arch. Liverpool, of "The Lees," 58 Calthorpe Road, Edgbaston, Birmingham, for his measured drawings of "The Campidoglio," Rome.

Three sets of drawings were sent in of the several buildings enumerated under mottoes as follows :—

(1) "Cheddar": two strainers (Chapel of St. Anselm, Chester); (2) "Diligente": four strainers (the Palazzo Horne, Firenze); (3) "Oxnop": eight strainers (Campidoglio, Rome).

The Council have awarded the silver medal and £50 to the delineator of the drawings submitted under the motto "Oxnop."

### *The Ashpitel Prize.*

The Council have, on the recommendation of the Board of Architectural Education, awarded the Ashpitel Prize (which is a prize of books value £10, awarded to the candidate who has most highly distinguished himself among the candidates in the final examinations of the year) to Mr. Alexander Simpson Reid (A), of 221 Clifton Road, Aberdeen, probationer, 1921; student, 1921; and who passed the final examination July 1922.

The competition drawings are on exhibition in the Galleries of the Royal Institute of British Architects, 9 Conduit Street, W.1, until February 5, 1923, between the hours of 10 a.m. and 8 p.m. (Saturdays 10 a.m.–5 p.m.)

[A specially contributed critique of the Prizes and Scholarships appears on page 214.]

# The Draft Registration Bill

The following correspondence has passed between the Councils of the R.I.B.A. and of the Society of Architects:

*From the R.I.B.A.*

January 23, 1923.

The Secretary,
The Society of Architects.

REGISTRATION OF ARCHITECTS.

Dear Sir,—I am directed by the Council of the Royal Institute of British Architects to send you the enclosed copy of a Bill for the Registration of Architects, which will be introduced in the House of Lords next month.

Faithfully yours,
(Signed) IAN MACALISTER,
Secretary.

*From the Society of Architects.*

January 26, 1923.

The Secretary,
The Royal Institute of British Architects, 9 Conduit Street, W.1.

*Re* REGISTRATION OF ARCHITECTS.

Dear Sir,—I am desired by my Council to acknowledge the receipt of your letter of January 23 enclosing on behalf of the Council of the Royal Institute of British Architects a copy of a Bill for the Registration of Architects which will be introduced into the House of Lords next month. In reply I am directed to ask you to be so kind as to convey to your Council the intimation that the Council of the Society of Architects is unable to support the R.I.B.A. Registration Bill in its present form.

Yours faithfully,
(Signed) C. MCARTHUR BUTLER.
Secretary.

---

We have received the following copy of a letter sent on behalf of the Executive Council of the Architects' and Surveyors' Assistants' Professional Union to the Secretary of the Royal Institute of British Architects, in reference to the above Bill.

In forwarding the correspondence to us it is pointed out that the Council are not opposed to the principle of Registration, but are determined that no measure which proposes to legislate for Architectural Assistants, their status, their conditions of employment, their existence as a body within the profession, and which does withhold from them adequate and just representation on the bodies (i.e. the Tribunal and the Board) set up under this Draft Bill, shall receive its support, but will, on the contrary, be strenuously opposed at every stage until the amendments herein proposed are incorporated in the Bill.

Dear Mr. MacAlister,—My Executive Council had before it at its meeting last Monday the above Draft Bill for consideration, and I am directed to ask you to put the following before your Council at its next meeting, and, if possible, before the General Meeting of the Institute called to consider it on the 29th inst.

At the beginning of 1920 the then Council of the Institute on its own initiative invited the Architects' and Surveyors' Assistants' Professional Union to send a representative to a Committee which it had set up to consider the question of Unification of Architects. Later in the same year this committee was remodelled on a larger scale with the President of the Institute as its chairman, and was known as the Unification and Registration Committee. To this the Architects' and Surveyors' Assistants' Professional Union was invited to send two representatives. A sub-committee was formed, and a representative of the Union was elected to this. It is assumed that the policy of the Institute was then to recognize that the body of assistant architects in the profession had its place in the profession as well as the body of practising architects.

My Executive Council observes with regret that the present Council, in the Draft Bill now before us, has completely overlooked the rights of assistant architects. The Bill, in fact, is a measure for the protection of architects in their capacity as practitioners on their own account, but it allows bona fide architects' assistants of certain qualifications to be registered as architects. It follows that every architect's assistant so qualified must in his own interests apply for registration, and that such assistants will probably form a majority of architects registered, and the total amount of fees accruing from such registration will be in like proportion. However, the tribunal which is to be set up to examine the applications for registration, and the Board which is to advise the Council of the Institute as to all future qualifications for registration, are to have no representation from any organized body representing assistant architects, and, moreover, it is specifically laid down that all architects who are members of either body representing different societies must be practising architects.

It is true that the word "practising" has not been defined in the bill, but the term "practising architect" is usually understood in the profession to mean an architect in practice on his own account; moreover, if it were meant to be inclusive of the assistant architect in this case, there would not appear to be any reason for this qualification of the term "Architect." It seems doubtful, indeed, whether the term "practising architect," as ordinarily understood in the profession, can be meant to include any salaried official architect, even although employed as principal. The Draft Bill, therefore, proposes that fees should be taken from a large body of assistant architects without allowing them any chance of saying how such sums shall be expended, which is the antithesis of all democratic principle. My Executive Council will therefore demand before it can give any support to the measure, that the Union which it represents shall be given adequate representation on both the Board and the Tribunal, and that the qualification of an architect being a practising architect in order to enable him to hold a seat on either of these bodies be eliminated from the Bill.

My Executive Council further notices that the Bill does not propose to set up any Register of Architectural Assistants supplementary to the Register of Architects, and must insist that such is also included. It proposes that all persons at present bona fide employed as architects' assistants, but not qualified to be registered under the Bill as architects, all students in recognized schools of architecture on completing their courses, and all pupils in the offices of architects on completing their period of indenture, shall, on application and subject to their qualifications being approved by the tribunal, have their names entered on the register of architectural assistants, and that no person shall be employed by any registered architect except his name be on the register.

I am sending a copy of this letter to each of the members of the Council of the Royal Institute, to the Press, and to the branches of the union throughout the country.

Yours faithfully,
(Signed) JOHN MITCHELL,
General Secretary.

---

# R.I.B.A.

## *Council Meeting.*

The following notes are from the minutes of the last meeting of the Council of the R.I.B.A.:—

Congress on Architectural Education.—On the recommendation of the Board of Architectural Education it was decided that an International Congress on Architectural Education should be held in London in 1924.

R.I.B.A. Conference at Edinburgh.—The provisional programme of the conference to be held at Edinburgh, June 13 to 16, 1923, was approved.

Board of Architectural Education.—Mr. Rodney H. Alsop (F.) was appointed to represent Victoria, Australia, as Advisory Member of the Board of Architectural Education.

Reinstatements.—The following reinstatements were made: As Fellow, T. Butler Wilson; as Associate, Harry Thomas Bill; as Licentiate, Hugh Campbell.

## *The R.I.B.A. Kalendar.*

The R.I.B.A. Kalendar for 1922–1923, of which we have received a copy, is an indispensable handbook for all who have an interest in the practice of architecture. No other year-book contains so full and so varied a mass of information on matters of professional interest at home and abroad. It is thoroughly up-to-date, and reflects great credit upon the compilers. The omission from the current number of the Code of Professional Ethics is explained by Mr. Sydney Perks in a letter which we publish in this issue.

---

# The Fate of the Registration Bill

On Monday evening the Registration Bill was considered by a Special General Meeting of the R.I.B.A.

Mr. Sydney Perks proposed the adoption of the Bill, and a heated discussion took place.

Mr. Guy Dawber moved as an amendment that the Bill be not considered until the other professional societies and other interests affected be consulted, and a general consensus of professional opinion obtained in favour of the Bill. This was carried by 149 to 74.

Put again as a substantive motion, it was carried by 166 to 83, the necessary two-thirds majority being just obtained.

## Leicester Society of Architects

Splendid tributes and hearty congratulations were accorded the Leicester and Leicestershire Society of Architects at their jubilee celebration dinner, held at Leicester. Mr. Paul Waterhouse, M.A. Oxon, P.R.I.B.A., was the chief guest. Mr. Wm. Keay (President of the local Society) occupied the chair, and among the guests present were Sir Arthur and Lady Wheeler, Mr. R. Savage, F.R.I.B.A. (President, Birmingham Society of Architects), Mr. Stimpson (President, Building Trade Employers), Mr. J. Alfred Hopps (representing the accountants), Mr. Robert Holt (representing insurance societies) and Mrs. Holt, Mr. Ian MacAlister, B.A. Oxon (Secretary, R.I.B.A.), Mr. and Mrs. Chas. Bennion, Mr. and Mrs. C. Geoffrey Barradale, Mrs. Robert Harvey, Mr. J. Russell Gimson, Mr. and Mrs. W. M. Robinson, and Mr. Higginson (Nottingham).

Following the loyal toast the President extended words of warm welcome to all, and in doing so asked to be permitted to mention the names of their guests. At their jubilee celebration they could not help but recall those who had gone before and who had served them well. They thought of such men as Ordish, Pick, Thompson and Tait, architects who were with them in spirit though not in the flesh. In passing, he also mentioned Mr. Everard and Alderman Sawday, both of whom were held in great esteem, but who were unable to join with them in their celebrations owing to illness. In the name of those present he would send a message of sympathy from that gathering.

Mr. W. K. Bedingfield submitted the toast of "The Royal Institute of British Architects," and in doing so in the absence of Alderman A. E. Sawday—who, he said, was a man deeply respected among architects and one who, as a citizen of Leicester, had given more self-sacrificing time to the benefit of the city than any other man—said that it gave him especial pleasure because he had to couple with it the name of Mr. Paul Waterhouse, a man honoured by the profession. In submitting this toast, the speaker said it gave him an opportunity of a little friendly criticism. The R.I.B.A. was a powerful body, and it was doing a wonderful work towards consolidating the business and profession of an architect. One thing, however, it had not done; it had not, for the want of a better expression, taken up the trade union side of the movement. There was the question of registration. The Institute did not represent the whole of the profession, for there were 40 per cent. outside. He said that the Institute would not be able to rise to the height of its influence, until it embraced the whole of that profession. Another point, the Institute was centred in London. They were apt to make London a fetish and were suffering from centralization.

Mr. Paul Waterhouse, in responding, congratulated the society on attaining its jubilee, and said that if any society ought to celebrate a jubilee it should certainly be an architects' society. There were great factors about their Institute, factors they were apt to forget. One was education. The architects' education and its growth during the past two generations was one of the most remarkable things in England. This had been brought about by the generosity of their forefathers. Another thing was affection. It had an enormous value to the architect. More than that, he had learned the love and affection for architects all over the world. No architect in their so-called centre of London thought that the work of the architect in the provinces was not as good as that in London, or that their societies were not as good as in London. There was a growing feeling in their institution that they owed an immense debt to those in non-metropolitan districts. He hoped no one would think London was diminutive in its esteem.

The toast of "Leicester City and Trade" was submitted by Mr. R. Savage, F.R.I.B.A. (President of the Birmingham Society). He said that Leicester ranked very high among provincial cities as a progressive city, not only in its manufactures, but it had a reputation of turning out good architects and good architecture. Leicester architects stood high in the esteem of their professional brethren in the rest of the country.

Mr. Charles Bennion, in responding, congratulated the Association on having attained its jubilee, and expressed the wish that their organization would not only help to lift up the status of the architect, but that of the work being done by the members of the Association.

Mr. Stockdale Harrison, A.R.I.B.A., proposed the toast of "The Guests," which was responded to by Sir Arthur Wheeler. The toast of "The President," submitted by Mr. W. M. Cowdell, F.R.I.B.A., was responded to by Mr. William Keay.

---

## The New English Art Club

Mr. Robin C. Guthrie's "Sermon on the Mount," in the present New English Art Club's exhibition, is a remarkable painting. The artist has literally flung figures into this canvas; he seems to have set himself a difficult figure problem to solve, and he has tackled it with imagination and daring. The tones throughout the painting are low, yet it is a brilliant piece of colour; and there is a certain detached glow of poetry in the treatment of it which is delicate and beautiful. This sort of painting provokes a good deal of criticism because it is rather obscure in its meaning. The "every-picture-tells-a-story" people complain that they cannot follow the action of the characters; they are unable to comprehend what everyone in the picture is doing. One cannot argue about this. One can only say that a certain mystery in the action of a picture is rather stimulating than otherwise. Indeed, the people who complain that they cannot understand what a picture means might just as well complain, as some of them do, that they cannot penetrate the inner mysteries of "Alice in Wonderland."

"But what does it mean?" they say. "It seems mere nonsense." You cannot talk or argue with those sort of people.

There are many other interesting paintings in this exhibition. Of portraiture there is the very best by Augustus John, W. Rothenstein, Wilson Steer, Neville Lewis, and Henry Tonks ("The Unknown God," 86).

The water-colours and drawings are especially interesting; in fact, there are so many very good ones that one finds it impossible to look at them all. Mention must be made, however, of two by Miss S. M. Adshead—"The Kitchen Garden" (189) and "Grands Bains de Mer de Marseilles" (187). Here we have a particular kind of art at its best. Victor Hugo says somewhere that at one time or another we have all had in our lives a "delightful attic." Miss Adshead draws as if her life were spent in a delightful attic amongst boxes and books of adventure—a combination which makes the most monstrous impossibilities possible. In her "Grands Bains de Mer de Marseilles" everything is gayer and more grotesque than life; "curiouser and curiouser." The creatures plunging in the water are human by courtesy only. They are really fantastic attic-livers whose little boxes can be seen perched on absurd promontories climbing into the sky. Washing blows on lines before the front doors of the houses; and trams dash up and down hills like the scenic railway at the White City. It is full of colour, and there is an abandon about it.

This gift of spontaneous fantastic humour is rare, and, one would say, very English. For that reason it is always welcome. If Miss Adshead will do us some more pictures of a similar nature we will promise to applaud. H. DE C.

---

## Competition News

### *Cranleigh Pavilion Competition.*

Messrs. Hendry and Schooling, AA.R.I.B.A., have been awarded second premium in the Cranleigh Pavilion Competition. Sixty-nine designs were submitted. The winning design, as announced last week, was that of Mr. W. S. Masters.

### *The International Labour Office, Geneva.*

Owing to the extreme urgency of the matter the competition for the International Labour Office at Geneva will be limited to Swiss architects and to those already established in Switzerland. The plans, however, will be assessed by an international jury. The premises now leased by the International Labour Office have become quite inadequate, and various proposals were made to the Third Assembly of the League of Nations last September. The question was referred to the Fourth (Finance) Commission of the Assembly, and during the discussions the Swiss Government offered, through their representative on the Commission, to give a site, subject to ratification by the two Swiss Chambers. The Commission recommended to the Assembly the acceptance of this offer, and stated their opinion that for a building of this importance an architects' competition was desirable. Owing to the urgency of the matter the Commission were forced to recommend that the competition should be limited as above, but that the jury which was to judge the plans submitted should be of an international character. All these recommendations were accepted by the Assembly, and immediate steps were taken to get nominations for the jury. The latter is now complete, the British representative being Mr. E. P. Warren, F.S.A., F.R.I.B.A.

[*For List of Competitions Open see page* xxxii.]

## Coming Events

*Wednesday, January* 31.

Royal Academy.—"The Rise, Aims, nd Early Days of the Arts and rafts Movement." By Selwyn Image, .30 p.m.

Liverpool Architectural Society.—'Some Byzantine Churches in Central Syria." Professor A. C. Dickie, M.A. A.R.I.B.A.

Institute of Mechanical Engineers, Midland Branch.—Annual Dinner.

Institute of Heating and Ventilating Engineers.—Annual General Meeting.

## The Status of the American Architect

Mr. Moritz Kahn has some interesting comments on the status of the American architect in the January-February issue of "Kahncrete Engineering."

Because architecture is considered to be a great influence in the education and refinement of the public, writes Mr. Kahn, the profession receives much encouragement.

For evidence of this fact one need only point out the manner in which philanthropists lavishly spend their wealth on architectural monuments. Or let us refer to so prosaic a man as a practical manufacturer. He will erect a factory which is planned for the greatest productive efficiency, but at the same time he will instruct his architect to design it with a pleasing elevation. He appreciates the beneficial effect it will have on his employees and consequently on their work.

It must be admitted that this careful attention to the subject of architecture in America is somewhat of a recent development. The profession has come to the forefront very much during the past twenty years, but the hold which it has already taken on the public is greater than we in this country generally realize.

A visitor to the States will be impressed by the interest taken in architecture by the American lay public. It is no unusual experience to be shown around a city by a host who will, with pride, point out the more important buildings of his city and name the architects who designed those buildings.

One day when crossing 42nd Street, New York, in a street car with Mrs. Kahn, I pointed out to her, as we passed 5th Avenue, that stately building, the new Public Library. A man sitting next to us, a total stranger, leaned over and said to me, "Yes, that is one of our best buildings. It was designed by Carrère and Hastings." Merely to confirm my impression of the layman's interest in architecture, I asked him whether he was connected with the profession, and I was not surprised when he replied that he had no connection with it whatsoever.

I believe that the important architects in America, as professional men, are lionized even as we in this country lionize popular authors or artists of the day. Men like McKim, Hastings, Goodhue, or Willis Polk are looked upon with as much deference and respect as we here pay to Meredith, Hardy, and Kipling; Orpen, Sargent or Brangwyn. The names of important American architects are as a rule very well known to the public.

## Age in Architecture

Lecturing on "Modern Building" at the Manchester University, Mr. H. S. Goodhart-Rendel declared that at the Renaissance the living art of architecture had looked back and had become a pillar of salt. Tradition in technique we English had lost altogether, but tradition strongly ruled our tastes and our prejudices. We could, however, contribute something valuable to the architecture of Europe which could be contributed by us alone. We had, in fact, done so already in the small domestic architecture upon which other nations had bestowed so much of the sincerest form of flattery.

In the course of further remarks the lecturer said that he thought he could undertake to guess correctly within ten years or so the date of almost any nineteenth-century building. He asked his audience to look in Manchester at the marked difference between the Assize Courts and the Town Hall, both works of the same designer, though some years elapsed between their construction. He also instanced the difference in the architectural "idiom" between the old and the new parts of the Royal Exchange, and to differences in style between certain well-known Manchester warehouses. The sovereign remedy for the architectural ills to which we were more subject than some other nations, said Mr. Goodhart-Rendel, was the acquisition of good technique. It was unnecessary to give instances of our lack of this quality, since the thing was notorious. The mere application of columns and pilasters to a building of broken plan was to the average English architect a perilous adventure of doubtful issue. We were no longer satisfied with the grand gesture with which the school of Norman Shaw, having made a mistake somewhere, made it again on purpose in several places, and called it a free variation of detail. In the technique which was necessary for the expressive design of small houses we had little to learn. In ecclesiastical design we had apparently come to the end of our course, and must embark on a new. In those fields we were confronted constantly with the need for choice of "style." In making this choice we would run no risk if we determined to be sincere at all costs, to learn all that we could of the pleasure-giving power of architecture, and then to pursue that which pleased us most. In doing this we should leave faithful records of ourselves, our creeds, and our hopes, and perhaps among those records there might be some which the future would hail as imperishable works of art.

The lecture, which was presided over by Mr. Francis Jones, president of the Manchester Society of Architects, was the second of a series arranged by the extra-mural department of the University in conjunction with the Institute of Builders, the Manchester Society of Architects, and the Manchester Royal Institution.

## London County Westminster and Parr's Bank, Ltd.

An extraordinary general meeting of the above company will be held at the head office of the Bank, 41 Lothbury, London, E.C., on Thursday, February 1, at 12.45 p.m., when the following resolution will be submitted as an extraordinary resolution: "Resolved that the name of the Company be and is hereby changed to 'Westminster Bank, Limited.'"

Should the above resolution be passed by the requisite majority it will be submitted for confirmation as a special resolution to a further extraordinary general meeting of the company which will be held at the same place on Friday, February 16, at 1 o'clock p.m.

## Builders' Hours and Wages

The dispute in the building trade on the question of hours and wages has reached an acute stage. Last week the General Council of the Trades Union Congress issued a manifesto calling upon "the workers to offer united resistance to the attempts which are now being made to degrade a labour standard intimately affecting the physical and general welfare of the workers."

At the recent meeting of the National Federation of Building Trade Operatives, called to consider the situation which had arisen through the workmen's representatives on the Wages and Conditions Council for the industry having refused to concede the employers' demands for an extension of working hours from forty-four to forty-seven per week during eight months of the year, and a reduction of 20 per cent. in wages, it was arranged that a deputation from the Federation should place the case of the operatives before the Trades Union General Council. The interview took place last week, and the following official statement was afterwards issued :—

The Trades Union Congress General Council having considered a report from a deputation representing building trade workers relating to the attempt now being made to increase the hours of labour, declares its approval of the resistance now being offered by the trade unions representing the building industry. The Council view with deep concern the attempt on the part of the federated employers in the building trades to abolish the most vital of all labour standards, namely, a reasonable, normal, working day or week. We declare that the reduction in the hours of labour obtained during the last sixty years of trade union activity is the most important change in the conditions of employment secured by trade union effort, and the Council therefore pledges its support to the building trade workers in their efforts to prevent any increase in the hours of labour.

The Council also urges all the organizations affiliated to the Trades Union Congress to render to the building trade workers all the assistance available in support of their efforts to protect a condition of employment of vital importance to the entire wage-earning community, and calls upon the workers to offer united resistance to the attempts which are now being made to degrade a labour standard intimately affecting the physical and general welfare of the workers.

The National Federation of Building Trades Employers of Great Britain and Ireland, at a largely-attended annual general meeting last week, completed their consideration of the position which has arisen in regard to hours of labour and rates of wages and unanimously adopted the following resolution :—

That this meeting, having heard the various opinions of representatives from all parts of the Federation, hereby expresses its entire confidence in its representatives upon the National Wages and Conditions Council, and places the negotiations unreservedly in their hands, with the hope that a speedy and definite decision may be arrived at.

Commenting upon the employers' decision, Mr. R. Coppock, the secretary of the Federation of Building Trade Operatives, said to a Press representative last week, "The terms of the employers' resolution seem to render the position more hopeful. The Wages and Conditions Council will probably resume negotiations very shortly."

## "Modern Transport"

"O.K.ed a Catena of Confirmation" is the title of an interesting brochure which has just been issued to give in brief some corroboration of the claims of "Modern Transport," as the leading journal dealing with transportation. "Modern Transport" is a weekly journal for all interested in travel by land, sea, and air. It has now reached its fourth year of publication. In the brochure there are many highly coloured illustrations, and congratulatory letters are reprinted from the pages of the journal from eminent men concerned with transportation, together with some of the many favourable notices of important newspapers.

## Trade and Craft

### *"Atlas White" Cement.*

We learn that Mr. Frederic Coleman has been appointed sole authorized representative of the Atlas Portland Cement Company's "Atlas White" for this country. Mr. Coleman has done much to promote the use of stucco in modern building; and a good deal of his success is undoubtedly due to an ably conducted advertising campaign. His announcements strike a strong personal note, and are uniform only in their typography, variety, and interest.

## The Switchboard in Thornycroft House

In Thornycroft House, Westminster (an illustrated description of which appears on page 223) the electrical switchboard is built up with Welconstruct patent slotted mild-steel bars. By means of this ingenious system any required framework can be readily constructed from standard slotted steel bars, angle and channel pieces, and any necessary switchgear, instruments or other apparatus attached by bolts. Alterations and additions to the framework can be carried out with the greatest ease, the only tool required being a spanner. This type of framework marks an entirely new development in steel construction and entirely eliminates the need for accurately setting out, drilling, tapping and forging the work, thus bringing the cost of labour to a minimum. The switchboard in Thornycroft House was carried out by Messrs. G. W. Franklin & Son, electrical contractors, of 45 Buchanan Gardens, Willesden, N.W.10, and is shown in the accompanying illustration. Welconstruct patent slotted mild-steel bars are manufactured by Messrs. Constructors (Trading Company), Ltd., of 4 Brook Street, St. Paul's, Birmingham. In addition to their electrical application the bars can be used for the construction of transformer chambers, fireproof partitions, sheds, bungalows, racks, bins and signs—in fact, for anything where a sound framework is required to withstand weight and strain.

# Waste

SURVEYING the field of architectural activity to-day, the impartial observer will see waste in every direction. With the waste of materials, due to bad design, we are not at the moment concerned (that is a subject for separate consideration); it is the waste of architectural talent that arouses apprehension. The tendency of the time is more and more to eliminate the general practitioner. Government itself has shown a bad example by setting up its own architectural departments; an example that has been followed by municipal authorities, who make the additional mistake of placing the direction of architectural work in the hands of the local surveyor—an excellent man at his own job, but often enough knowing little or nothing of architecture. Railway companies, owners of big estates, banking corporations, insurance companies and other important commercial undertakings mostly have their own architectural (should we say "building"?) departments, and seldom invite the services of outside architects. This tendency to eliminate the general practitioner cannot be for the good of architecture, and certainly it involves the waste of much first-rate talent.

We do not mean to imply that official architecture is necessarily bad; some of it, indeed, is very good. But official architecture, by the very fact of its being "official," must inevitably tend towards stereotyped design. Having established a satisfactory type of building, the official architect is loth to depart from it. Conservatism soon claims him for its own, and he may be generally expected to "play for safety." The conditions of his work obviously cannot conduce to the production of the best architecture, and in this sense the interests of the community are not so well served as they would be if the different architectural problems arising were tackled by different men.

Of course, among the small army of official architects up and down the country there are some men of exceptional ability who are doing excellent work. From them credit is not withheld. But as one swallow does not make a summer, neither do a few able men justify an unsatisfactory system. Official departments are so firmly established, however, that no useful purpose would be served by discussing the matter further at the present moment.

Then, over and above the complication of official and semi-official departments, we have what may be called the architectural "factory," presided over by one man (often enough an indifferent architect), who, by some means or other, manages to effect a "corner" in some particular class of building. The private practitioner who is unable to pull strings finds that his chance of designing certain kinds of building is exactly *nil*.

We have no grievance against the specialist; specialization in some particular branch of activity is more or less compulsory upon everybody in these highly competitive days. But when specialization degenerates into the wholesale production of inferior designs it is time to see whether better results may not be obtained by a more even distribution of work.

The conditions of architectural practice to-day are such as to fill the thoughtful with misgiving. It is a striking commentary upon the wastefulness and inefficiency of our methods that, at a time when the standard of architectural design is remarkably low, there should be a surplus of highly skilled ability in this country such as we have never had before. Many first-rate firms of architects are to-day either unemployed or running their offices at a loss; and year by year the schools are adding hundreds of well-qualified men to the professional army. How is advantage best to be taken of this wealth of talent?

It is economically bad, as well as bad for art, that a mere handful of men (especially men of indifferent ability) should have a superabundance of work while many others (some of very high ability) have little or nothing at all.

What is the cause of this most unsatisfactory condition of affairs, and what the remedy?

The root cause is undoubtedly the inability of building owners to select the right architect. In the main they have an extraordinary knack of selecting the wrong one. This is not entirely their fault. The ordinary layman knows very little about architecture, and is often quite unable to tell a good building from a bad one. Primarily, therefore, it is a matter of education; and here we must sound a note of hope. The public is undoubtedly taking a far more intelligent interest in architecture than has been the case for years past, and for this we have in large measure to thank the Press (especially the daily newspapers and certain of the monthly magazines) and the Architecture Club. All are doing excellent work and deserve the best thanks of those who have the interests of architecture at heart. May they continue their good work!

We are convinced that improvement, not only in architecture, but in the professional prospects of architects, will come about mainly by the effort of the general public itself. It is unreasonable to expect architects to improve taste by their own effort; with architecture, as with shoes and ships and sealing-wax, supply is conditioned by demand. Then, too, the architect has a sense of professional dignity, and must not be blamed for a disinclination to cry his wares in the market-place. For all this, we are strongly opposed to a policy of inaction, dictated by too acute a sense of refinement. We do not charge the R.I.B.A. or any other organized body of architects with over-coyness in the matter of their own interests; but we do feel that much may still be done for architecture by way of publicity and propaganda. Let the public be told as frequently and as clearly as possible who the architect is, why his services are indispensable to the community, and why it is essential that a good man should be employed for every job.

The future of architecture is ultimately in the hands of the public. When the public is at last fully alive to the importance of good architecture, then shall we find the right men getting the work; and for this consummation the auguries are by no means unfavourable.

# Notes and Comments

## Unification by Federation?

All who have thought for the true welfare of the architectural profession will approve the decision of last Monday week's Special General Meeting of the R.I.B.A.—to defer taking Parliamentary action in the matter of the Registration Bill until other professional societies and affected interests have been consulted. The Bill was far too much an Institute measure to receive the united support of the profession, or to stand any chance of becoming a Statute of the Realm. The primary requirement is unanimity within the profession, with or without Unification. Some solution of this very difficult problem may come, as Mr. McArthur Butler has frequently urged, on the lines of federation; for to achieve unanimity on a question of principle it is not necessary to band all architects within a single organization: such a step, indeed, would have serious disadvantages, not the least of which would be the loss of that spirit of independence and healthy rivalry which the present order of things most certainly preserves. "Unification by Federation" seems destined to become the password that will open the portals of Parliament to a measure of Registration.

## Buckfast Abbey

The partial completion of the rebuilding of Buckfast Abbey (concerning which an illustrated article appears in this issue) is a unique event in modern building history. At a time when the generality of mankind have lost touch with the most humane of the arts, it has been left to a community of Benedictine monks to recapture its spirit in the true manner of the great cathedral builders of mediæval times. Every stone has been wrought and put in place by the monks themselves, under the direction, for the most part, of a distinguished architect, Mr. Frederick A. Walters, F.S.A. The whole work is remarkable—as much as an archæological study as an achievement in building.

## The Press and the Architect

In spite of the recent very marked improvement in the treatment of architecture by the popular Press, one cause of dissatisfaction still persists: that is, the failure to give architects' names in connection with buildings dealt with. It would be an interesting study in psychology to trace the cause of this peculiar omission. Painting, sculpture, music, the drama—all are consistently identified with persons; but architecture, to the average journalist, is apparently a sort of vague abstraction that happens of its own accord. We take it that the subject of architecture has so long been regarded by the journalist as having no interest for the general public that the omission of architects' names has become a habit. Can it be that journalists, despite their hold upon the pulse of public opinion, have not yet realized that architecture has definitely become a matter of interest for the man-in-the-street? Perhaps Mr. Squire, in his capacity of Chairman of the Architecture Club, could have a discreet word with erring editors.

## "The Surrey Side"

The grouping of the L. & S.W. Rly., the S.E. & C. Rly. and the L.B. & S.C. Rly. has brought a step nearer the possibility of fulfilment of that cherished dream of architects and town-planners—the abolition of Charing Cross railway bridge and the remodelling of the "Surrey Side." The Southern Railway Company (as the southern group is now known) may find it a very definite advantage to dispense with its assorted stations on the northern side and combine them in a new central terminus on the southern side, Waterloo Station forming the nucleus. As Mr. John Murray has pointed out in "The Daily News," it is likely that enough capital would be realized by the sale of sites and property on the northern side to cover the cost of extensions and developments on the other side of the water. The Southern Railway Company has now an excellent opportunity to effect, or cause to be effected, two very desirable improvements—one private, one public—namely, the centralization and co-ordination of their three systems at the London end, and the creation of a new embankment roadway on the southern side of the Thames, with a bridge for vehicular traffic and pedestrians at Charing Cross. Such an opportunity should not be lost.

## Town Planning on the Cheap

We note that the East Barnet Valley Urban District Council is advertising for a town-planning assistant at a salary of £5 per week. What sort of an assistant does it expect to get for such a salary? And what sort of town planning does it expect of such an assistant? The East Barnet Valley U.D.C. apparently fails to realize that town planning is a highly specialized subject, and one, it is fairly safe to assert, that is beyond the capacity of "an assistant at a salary of £5 per week." Cheapness never has been synonymous with efficiency, as the East Barnet Valley U.D.C. will find to its cost unless it has the good sense to abandon its £5 a week project and get into touch with a qualified expert.

## The City Churches

The National Assembly of the Church of England has just given general approval to the Union of Benefices and Disposal of Churches (Metropolis) Measure, 1923, which cumbrous title, being interpreted, meaneth: "How to demolish a number of the City churches for the sake of the money that can be got for their sites." The main reason advanced by the clergy for the destruction of these churches is that for thousands of people in the suburbs there are no churches at all. Here in the City, it is remarked, are many old buildings attended by few worshippers, but occupying sites to the value of hundreds of thousands of pounds. Obviously, Peter must be robbed to pay Paul. But why? If new parishes need new churches why should not the parishioners find the money themselves? If they are not prepared to find the money, then let them do without the churches. Lord Phillimore's commission, it may be recalled, recommended the removal of nineteen City churches, the capital value of whose sites was estimated at £1,695,000. Quite a respectable sum of money, of course, but of trifling account in the wealthiest city of the world. But surely the financial aspect of the question is over-emphasized. What should be remembered above all other considerations is that these churches are national monuments, of historic interest and æsthetic value, and for these reasons alone they should be retained. Far too many of our rarest national possessions, including City churches, have been already destroyed. Instead of planning the destruction of still more, let us direct our efforts to seeing how they may best be preserved. And let the leaders of the Church be on their guard in this matter of the demolition of old buildings. To grow indignant over the threat to the Whitgift Hospital one day, and calmly to decree the obliteration of a score of venerable churches the next, is to lay themselves open to the charge of inconsistency.

## Rents and Houses

If the forecasts of the rent-decontrol proposals are correct, householders will be entirely at the mercy of landlords within the space of a couple of years—that is, unless enough houses are built in the meantime to enable tenants to have an alternative choice of residence. Obviously housing must be got on with at once if a situation full of ugly possibilities is to be avoided. The Government must be urged to produce their scheme with the least possible delay.

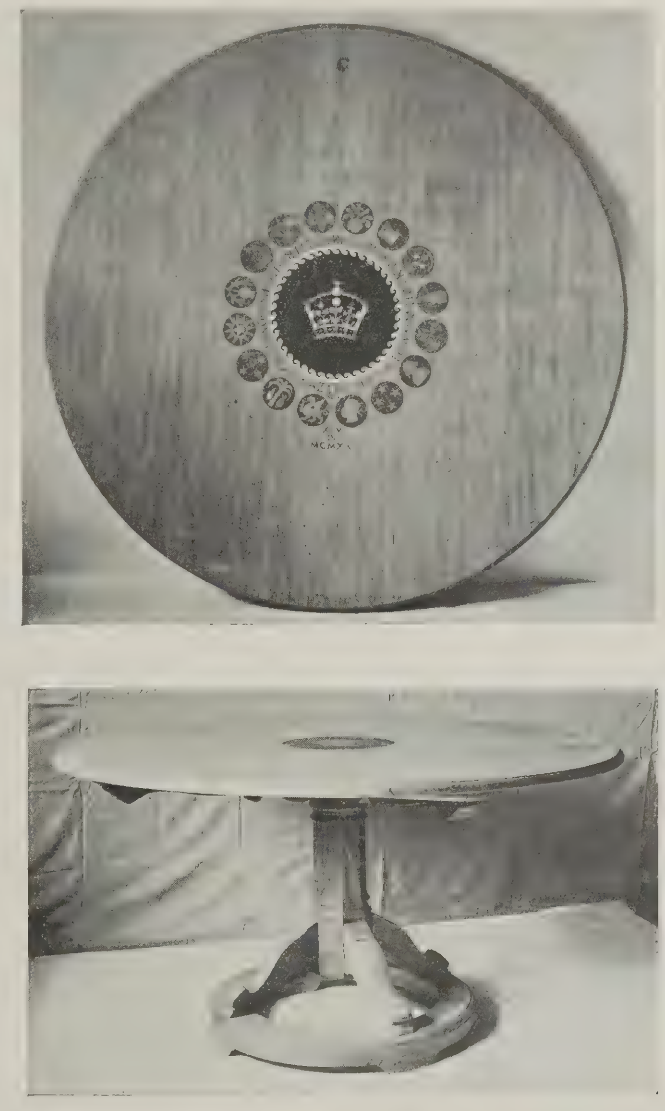
# Modern Craftsmanship. 2.–Furniture

### By JOSEPH ARMITAGE

An eminent but adventurous architect told me many years ago that modern furniture was not suitable for the Gentleman's House. Being young and full of that strange mass of virtues we loosely called "Arts and Crafts," I did not take the remark seriously. Obviously the fault lay with the gentleman's house. There was, however, a good deal of sound criticism in the remark. Taken in conjunction with the charges of vulgarity and crudeness so often made against modern furniture, it is some explanation of its comparative failure to find a market.

By modern furniture I suppose we mean furniture designed by the men of to-day to serve the needs of to-day. The reproduction of an antique model is not modern furniture, however closely its uses may approximate to our necessities; but the introduction of forms, moulds, or decorations used in previous periods does not necessarily prevent the furniture being modern—it all depends on the accent. Some of us love to use quotations and, though few of us need quote like parrots, fewer still can claim to be really original; most of us have a very reasonable fear of such a calamity. The important thing is that the furniture should be and appear to be fit for its purpose, furniture for present-day use.

There is a very close parallel between furniture and clothes, both have approximately the same qualities if good, their design and production are governed by approximately the same conditions. Development is slow and in detail only; the well-dressed man differs very little from the average. It is all in the cut; given certain common essentials, everything depends on fitness and proportion. We must "live with" our clothes and our furniture, and they represent the two arts in which most people resent the unusual and the unexpected—a very proper attitude which limits the demand for modern furniture in any degree experimental.



AN ENGLISH OAK PRESENTATION TABLE.
BY HERBERT BAKER, A.R.A., F.R.I.B.A.

The present generation of advanced thinkers furnish with antiques or reproductions of antiques in the main, with an odd piece of modern furniture here and there, chosen rather as an indication of devilry "with difficulty kept under," than for its beauty. That I think explains much of the wildness of certain modern furniture. No one would dream of furnishing a house throughout with it, and no one is expected to do so.

With regard to the crudeness of modern furniture, imagine the result if some revolutionary designed his clothes on strictly "constructional" and utilitarian lines, refusing all superfluous buttons and the numerous survivals from previous periods still embodied in the modern clothes, with nothing added and very little conceded to grace. That, in terms of furniture and speaking broadly, describes much of the early arts and crafts furniture. Obviously it was not suitable for the "Gentleman's House." It was inclined to be stark and uncouth, but it was a very definite and sincere attempt to tackle a difficult problem by getting it down to its essentials—a refusal to accept as necessary the customary ornaments and accretions—a refusal to accept as gospel all the parrot said. When the crowd of imitators started work they copied the obvious, giving us a type of furniture infinitely worse in taste than the Victorian furniture. Fortunately it looks cheap and isn't.

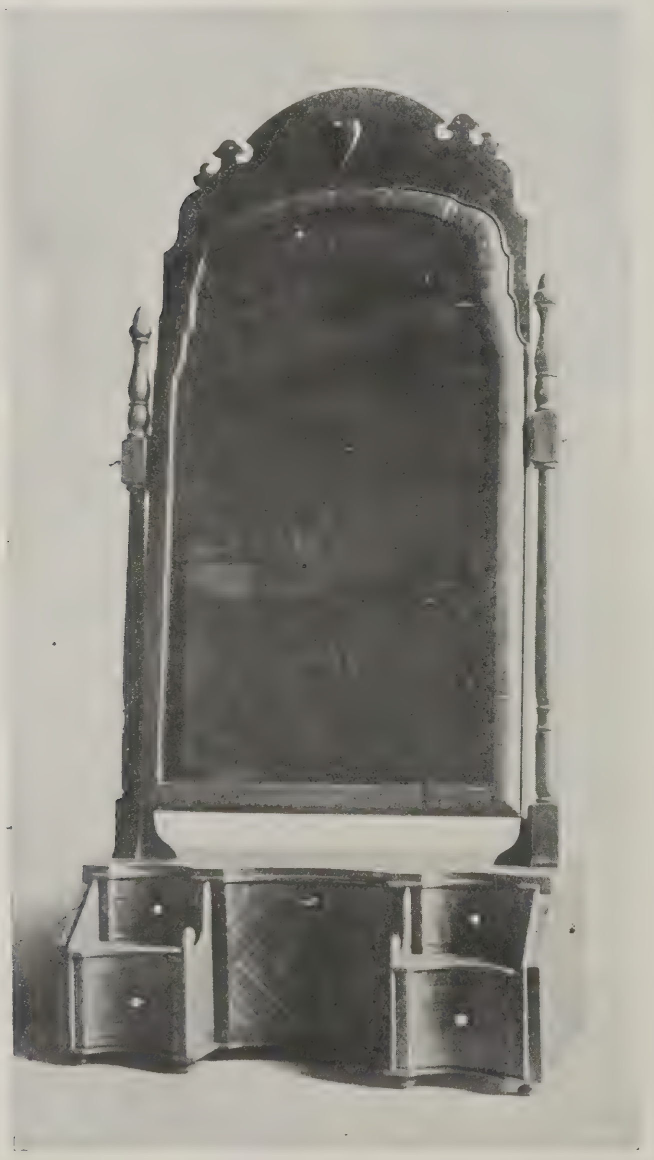
There is some justification for the attacks so often made on the attempts to design and make furniture which shall be modern in inspiration and designed to serve present-day needs and conditions, but when one takes into account the terribly low level which furniture production and design had reached, and the horrible stuff still being put on the market, the attempt to improve it would have been worth while had we only failures to show. During the past twenty years modern furniture has been made in England which will compare favourably with any furniture yet produced so far as workmanship is concerned, at times a little self-conscious in design perhaps—that is inevitable until a sound tradition has had time to develop—but a gentleman can furnish his house with it and not lose caste. Our best modern English furniture is equal to any that the world has produced for the past hundred years, and is an attempt to fit the clothes to the man, which is surely better than leaving him to do the best he can with his great-grandfather's breeches.

The comparatively small amount of good modern furniture is accounted for by the limited demand due to the conservatism of the public complicated by the salesman's estimate of the fashionable, and by the limitations imposed on supply by modern methods of production.

The salesman is mainly responsible for what the average person buys. In furniture and some other things people buy what they are expected to buy. Tell them often enough and definitely enough what is the correct thing and they will buy it. The correct thing from the salesman's point of view is not necessarily the best thing. Selling is a fine art to-day, and we have produced men who would sell you a mangle if you went into the shop to buy a baby's rattle.

Modern methods of production affect the supply of modern furniture, because the great bulk of the furniture sold to-day is made under conditions which tend towards a standardization of parts. Made in factories or small East End workshops, the work amounts to little more than the assembly of standardized parts. The design is bad in the main, but tends towards a closer and more intelligent copy of antique models varied by sporadic outbursts of some phase of garden city culture. The result is cheap furniture in every sense of the word, perhaps cheaper in actual exchange value than at any previous period of production.

The smaller, more experimental, and adventurous designer and maker cannot possibly approach the price, his charges appear ridiculous by comparison. Only those who have tried to do sound work in a small workshop can estimate the difference of cost entailed as against factory production for sale to a public with no technical knowledge. Most of the men have to be watched very carefully for habits and customs of the trade which cheapen production at too great a cost in durability and soundness of construction. To many of them the average sound job of, say, a hundred years ago, when much furniture was made to use as well as to sell, is sheer lunacy in the light of their experience. They often think it is their duty to protect the "Guv'nor" against his will.



A DRESSING GLASS.

BY SIR ROBERT LORIMER, A.R.A., R.S.A., F.R.I.B.A.

AN OAK SIDE-TABLE.

BY SIR EDWIN LUTYENS, R.A., F.R.I.B.A.

The problem of the production and sale of good modern furniture has been attacked from most sides by able men, but, so far as I know, not one of them has received an adequate return for his labour and the capital expended. The more or less successful men have had independent means or some other source of profit to enable them to carry on until the expensive business of launching it on the market has made some return. Many firms are producing most excellent reproductions of antique, and most people of culture either buy antiques or reproductions of them. Furniture modern in design and honestly made, which the average person can afford to buy, or is willing to buy, scarcely exists in the shops, although many men have attempted to supply it.

To pursue the analogy with clothes still further, furniture making, like tailoring, seems to be one of the trades which depend for their health on comparatively small workshops, or workshops where small things are of importance. It is significant that we date furniture not so much by kings or shapes as by makers during the eighteenth century—and if we had sufficiently detailed history before then it would, I think, be found that particular types were named after the workshops or individuals producing them, certainly they are named by localities.

The tradition of fine cabinet-making was, perhaps, one of the last to die. Cabinet-makers of great skill and fineness of perception who had direct descent from the workshops of the seventeenth or eighteenth century could be found in small workshops up and down the country a generation or so ago. They made their neighbours' furniture soundly and well—like the rest of the craftsmen their designs had suffered as a result of the conflicting demands of their customers' tastes—still they had a lingering conviction of what was good design; they had certainly fought every attempt to change the customary way of doing things, for they were the grandfathers and fathers of the workmen all architects know. Mass production under the control of expert salesmen put them out of business, but we have been fortunate in retaining much of their traditional skill. We need small workshops now. The work of building a tradition of sound design and workmanship in cabinet-making must necessarily be experimental, and there must be failures. The accepted practice is so far removed from right lines that no formula can be given to correct the errors, and machine production can only exist on formulæ.

Perhaps the first serious attempt to supply sound modern furniture was that made by Kenton & Co. The company included Prof. Lethaby, the late Ernest Gimson, Sidney and Ernest Barnsley, Sir Reginald Blomfield, Gerald Horsley, and, I think, one or two others, all then young architects. Although the venture was not a success commercially, and was short lived, it is to the first three of these men and their

disciples that we owe most of our best furniture. The influence of Prof. Lethaby cannot be estimated. The late Ernest Gimson and Messrs. Sidney and Ernest Barnsley settled in Gloucestershire, and Gimson eventually established the workshop at Daneway House, where most of the furniture he designed was made under ideal conditions. He produced a lot of work, and a monograph on it is now being written and fully illustrated by photographs. Until that appears it is difficult to convey any idea of the strength, delicacy, and charm of the work he produced to those who have only seen it in single pieces. He and Mr. Sidney Barnsley have certainly produced a higher quality of furniture, both in design and workmanship, than has been produced in either Europe or America during the past 100 years, and it is modern in every real sense of the word. English furniture owes a great deal to them, perhaps most of all for their sound and sufficient workmanship, for "workmanship" can be redundant, or be applied to wrong purposes.

Both have worked chiefly in English woods, of which there is a remarkable range not easily obtainable as timber. As in the case of many other building materials, conditions of transport and sale make it easier to supply imported materials — and the native material is starved out.

These workers and others have shown us how to use the wood and treat the surface so that the full beauty of the grain is brought out. Much good wood has been spoilt and bad wood camouflaged by stain and polish. Mr. Sidney Barnsley works alone as a practical cabinet-maker, and is making the best furniture of our time, but he takes no photographs. These two are, perhaps, sufficient to represent the attack on the problem from one side. On the other side are Mr. Ambrose Heal and others. Mr. Heal learnt the trade of cabinet-making, and on taking charge of his firm experimented with modern furniture commercially

possible, and the result has been a lot of very interesting furniture: in particular he has experimented successfully with painted furniture.

I suppose architects have always been interested in the designing of furniture—certainly many modern architects have designed excellent work. Coming from men working in such different keys as say, Sir Edwin Lutyens, Sir Robert Lorimer, Messrs. Baker, Voysey, Spooner, Sellars, Penty, and Palmer-Jones, to name a few only, it has been especially valuable at this stage when furniture, like architecture, is seeking its formula. Agreement on the rational use of material appears to be almost within sight, but beyond that "design" seems to be rather a matter of fashion than conviction.

Mr. Spooner at the Central School of Arts and Crafts, and Mr. Percy Wells at the Shoreditch Technical Institute, have done a lot of valuable work in teaching rational furniture design, and Mr. Wells's experiments toward presentable factory production are especially valuable and commendable.

After all, the machine and the factory (perhaps under another name) must be regarded as permanent for all practical purposes. In more enlightened hands many of their evils would die, meantime they (and their evils) are in being, they produce most of the things we use and a few of the things we need. There is a very definite quality which belongs to all properly produced machine work which is, perhaps, best described as "direct"—a quality which is becoming a distinctly modern characteristic. On the whole I think I would admit machinery to Utopia, but I would put the best and most enlightened men that could be found in charge of it. Its proper control and use would be one of the most important jobs in the State.

I have been struck recently by the distinctly rectangular character of most of the modern furniture being produced. In form and construction it seems to suggest that the designers are obsessed by the idea that wood comes from thin boards and "Three by Twos." I suppose it is due in part to designing for easy production by machinery, a faulty conception of what the machine can do, but chiefly perhaps to the ease with which the rectangular can be full-sized.

Much of the best old furniture would never have been produced if a careful and accurate full-size detail had been a necessary part of its conception. So many of the lines in old furniture are too good for conception on paper—they could only "grow" under the hands of a skilful workman, as most of the best details of craftsmanship have done at one time or another.

The first article of this series appeared in our issue of January 10th.

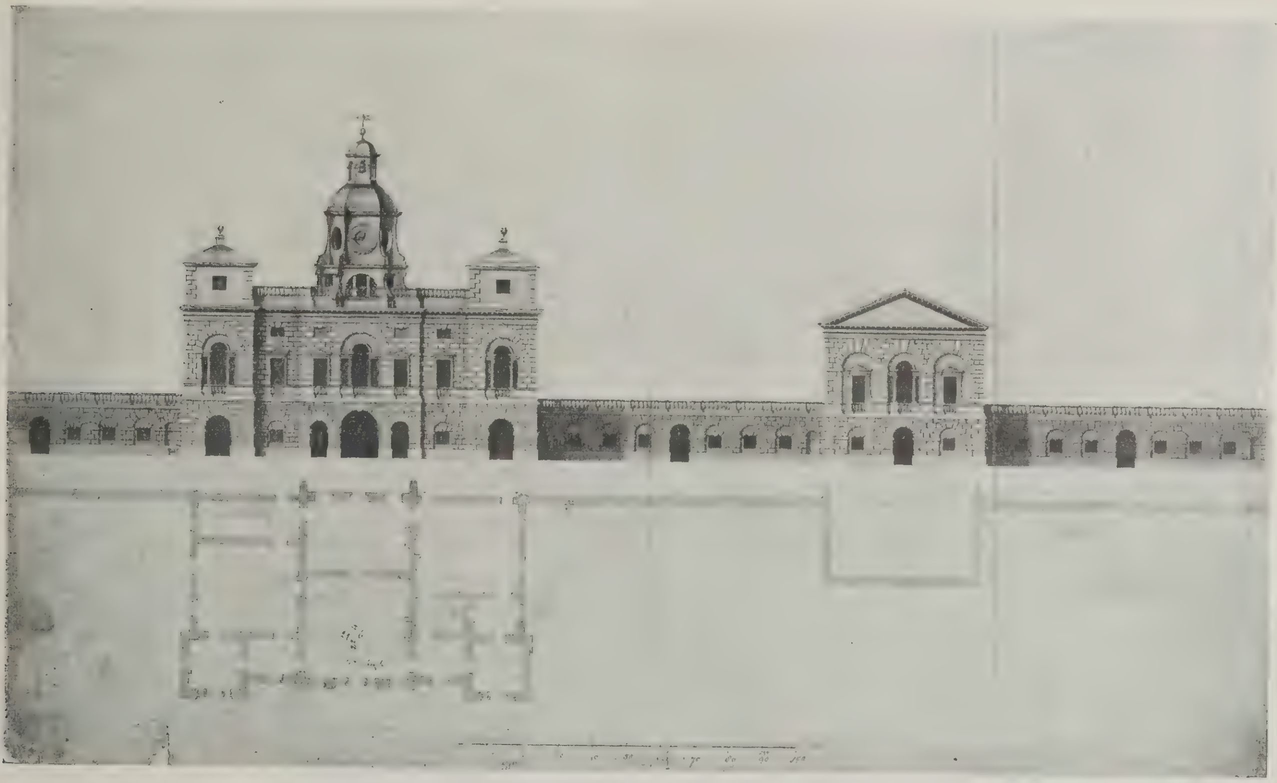
# An Exhibition of Old Drawings at the Architectural Association

WREN'S final monument will be, not St. Paul's, but the drawings of it. As it began, so will it end. Among the exhibition of old drawings at the Architectural Association are one or two plans—not on particularly stout paper—that have outlived the buildings themselves. Were it not for one's memory, and the histories, no other record of them would remain.

Among the names attached to some of the original drawings on show are William Kent, Sir Charles Barry, Robert Smirke, Greek Thomson, Chambers, and Cockerell. One is shocked to find that such treasures are not kept under a glass case instead of being exposed on a wall. But perhaps our museums are already too full.

And the present age has been rather more insistent than most that drawings are only a means to an end. But here are the drawings of the two most important buildings of the nineteenth century—a bird's-eye view of the Law Courts, and an elevation of the Houses of Parliament. And there are a preliminary sketch elevation of the Horse Guards, and one or two drawings of Somerset House. Well, however dead one's soul may be, here is at least a thrill. You cannot stare at these yellowed sheets bearing faded lines of Indian ink, even though the drawings were prepared only in the great men's outer office, without feeling in touch with the dim beginnings of buildings that were household words in your youth. And these drawings were very important once — very important. Imagine the rage and muddle into which some of these great men would have been cast had they been torn up or stolen fifty or a hundred years ago. You might have altered the skyline of the Strand or Whitehall! And now (almost) you could tear them all up without occasioning more than a mild "I say!" from the gentleman who has lent the drawings—Mr. V. O. Rees.

The large aerial view of the Law Courts was obviously prepared to put before some committee. The buildings actually erected reveal that many amendments were made. And so this, no doubt, was the actual drawing put forward for approval by George Street. One can imagine the controversy that raged in some committee room over it—the expressings of opinion by gentlemen who knew nothing at all about it, and the despair at heart of the poor architect. Somewhere, perhaps, there are diaries which would throw a flood of light upon all these things: "Saw Mr. G. to-day. He told me that the building in its present form could not go on. Received instructions later as to the amending of all my plans." "Mr. W. called. Told me that money was wanting, and that in all likelihood the building would have to be abandoned. My staff and I have expended fifteen months of constant thought and work upon it, and for which no adequate reward, save that of seeing the building actually completed, can be made."—Yes; somewhere, perhaps, there are diaries . . . or the hair of the architect turned a little whiter and he took all these troubles down to the grave.



THE HORSE GUARDS, WHITEHALL.
From an original drawing by William Kent.
(*The A.A. Exhibition of Old Drawings.*)

We reproduce Kent's elevation for the Horse Guards. It will be seen that one or two amendments have been made. The right-hand portion was never carried out, and an upper story was added to the portion between the two pavilions.

It is curious how old-fashioned old drawings can make a building look. Buildings which are passed by without remark day after day here look as ancient as mutton-chop whiskers and wide trousers. But there was a wonderful quality of draughtsmanship in those days. H. JOHNSON.

# The Rebuilding of Buckfast Abbey

## FREDERICK A. WALTERS, F.S.A., Architect

IN 1882 a community of Benedictine monks acquired the site and what little remained of the once rich and powerful Abbey of Buckfast, situated on the border of Dartmoor. Founded in remote Saxon times as a Benedictine House, it passed into the hands of the Cistercians, and was rebuilt by them in the twelfth century, and appears to have been, as usual, added to and altered from time to time up to the early part of the sixteenth century. The abbey was surrendered to the Royal Commissioner in 1539, and although inhabited for some time after it was eventually left to ruin and decay, and like so many others became a stone quarry for the countryside.

In 1806 a Mr. Berry levelled what remained standing of the church and most of the other buildings, out of the materials of which he built a modern house. As at this time he carefully covered all the foundations of the old walls, with the sole exception of certain fifteenth-century additions to the original buildings, the disposition of the latter had become quite unknown.

In 1883 it was determined to discover, if possible, the old foundations, and with completely successful results—the whole plan being laid bare with the exception of the position on which the modern house stands. The buildings forming the south side of the quadrangle were at once re-erected, and since then the western side has been completed, as well as the east and north cloisters.

At the end of 1906 it was determined to commence the rebuilding of the abbey church, and the work was begun with as little delay as possible, the whole work being carried out by the monks themselves under the direction of Mr. Frederick A. Walters, F.S.A., architect, and in the earlier stages by a clerk of works.

The total length of the church (according to the twelfth-century foundations) is 240 ft., but there had evidently been an extension of the choir eastwards at a later date. As far as can be ascertained the plan and character of the twelfth-century church has been followed with the exception of the probably low Cistercian tower, which by special desire has been replaced by one more in accordance with Benedictine traditions.

The plan of the church is cruciform, the eastern arm being short (as was the usual early Cistercian arrangement), with a range of six chapels at the end. The transepts only project one bay, and have each a chapel on the east side.

The eastern arm comprises all the presbytery, or sanctuary, of three bays, westward of which is the crossing, 25 ft. wide, westward of which again is the structural nave of nine bays, three of which form the monks' choir and will be furnished with two rows of stalls and separated from the actual nave by a rood screen.

The north and south aisles are carried round the presbytery forming an ambulatory behind the high altar, and beyond this are six eastern chapels forming a species of eastern transept as at Fountains Abbey and Durham Cathedral where, however, the number of chapels is nine. These chapels are dedicated respectively to the Blessed Sacrament, St. Benedict, St. Joseph, St. Michael, the Holy Souls, and the Guardian Angels.

There are two more chapels opening from the north and south transepts respectively, that on the north side dedicated to Our Lady, and containing the restored statue of Our Lady of Buckfast; and that on the south dedicated to the Holy Cross.

It is intended also to have small altars facing eastward

BUCKFAST ABBEY, DEVON: A DETAIL OF THE NAVE.

FREDERICK A. WALTERS, F.S.A., ARCHITECT.

against each of the nave piers, as was formerly the case at St. Alban's Abbey and elsewhere; one of these, dedicated to St. Edith, is already given and is in position.

The high altar stands in the eastern bay of the presbytery, and is raised three steps above the floor. It consists of a marble slab 11 ft. long by 3 ft. wide, and is 6 in. thick. In front it is supported on four marble columns with carved capitals, and attached at the back to a stone wall supporting the retable with panels carved with the Instruments of the Passion. It is surrounded by six columns which will support golden angels, and the ornamental ironwork connected with the columns will support rich silk hangings at the back and sides.

The abbot's throne in the N.W. bay of the presbytery is constructed from late-fifteenth-century carved oak work which came from a manor house not far distant, which belonged to the abbey in former days, and which was built by one of the later abbots before the dissolution.

The windows are glazed with lead glazing of early design, and the lady chapel has already its three windows filled with stained glass; the two eastern lights have the subject of the Annunciation, and on the north side, the Assumption.

At the crossing of the presbytery, nave, and transepts there is a lofty lantern and gallery round, 51 ft. from the floor, and above rises the central tower, incomplete at present, but carried sufficiently high to accommodate a peal of fourteen bells, which are hung from the gallery round the lantern.

The height from the floor to the crown of the vaulting is 49 ft., and to the ridge of the roof 64 ft.

Internally the church is entirely constructed of Bath stone, the filling in of the vaulting between the ribs being of red sandstone from the locality.

Externally, the walls, including quoins, are of random-coursed dark-grey local limestone, Ham Hill stone being used for the windows and other freestone work.

Mr. Walters has designed and superintended the work from the commencement in 1883, including the tracing and uncovering of the foundations of the whole of the original buildings. Three more bays, together with the west front, remain to be built.

At first the actual building was done by a single monk-mason with one assistant. At no time have there been more than six monks at work, and so the building has been carried on as money came.

The whole building, when complete, will consist of nave of nine bays with aisles, transepts with eastern chapels, and choir with an eastern square-ended projection or transept of six chapels, the whole surmounted by a square central tower and spire. Its internal dimensions will be: length, 240 ft.; width, 62 ft.; length of transept, 85 ft.; height, 49 ft. The whole of the eastern portion, the transepts and crossing, and two bays of the nave are completed, and four more bays of the nave are finished to the clerestory.

A fourteenth-century statue of Our Lady, recovered (in fragments) from the ruins, has been restored and placed in the north transept chapel.

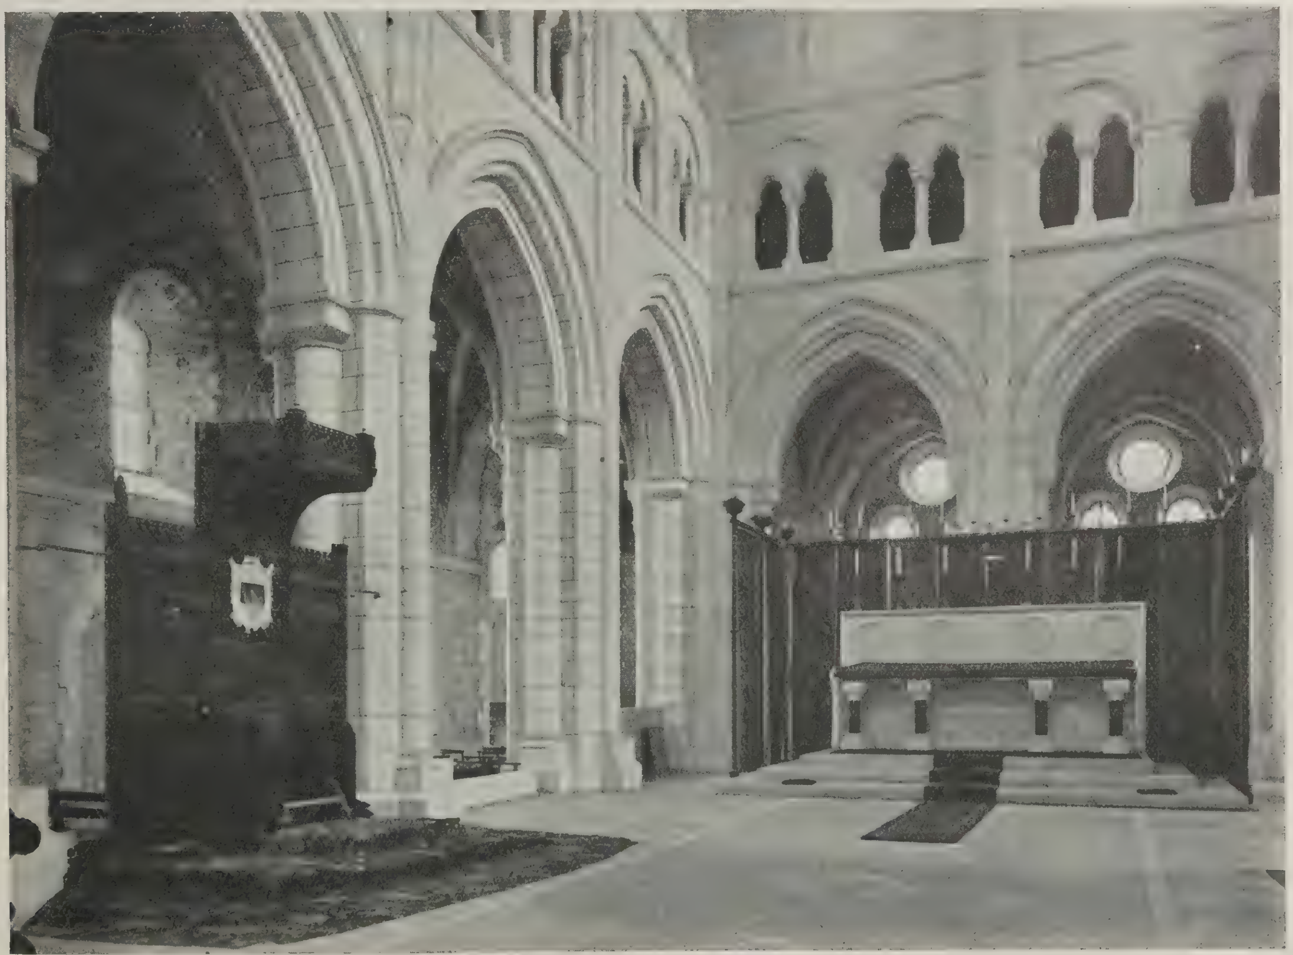
The building occupies an exquisitely beautiful situation in the valley of the Dart, near to Herrick's Dean Prior, and to Dartington, where Froude spent his childhood.

The site forms the foreground of one of Turner's wonderful drawings of the great gorge of the Dart, and, as seen from the elevated churchyard of Buckfastleigh, forms as choice a setting as that of any abbey in England.

The church which has now risen is unique as the only rebuilding of any ancient English abbey, and it forms one of the most important ecclesiastical buildings of modern times.

No existing church in the Home Counties outside London, except the cathedrals, is so large, and it may be regarded as approximately of the original dimensions of the great church at New Shoreham.

Mr. Walters has also designed the Church of Our Lady of Ransom at Eastbourne (notable for the extreme beauty of the colouring of the stonework) and the Franciscan Friary at Chilworth, in Surrey.



A DETAIL IN THE PRESBYTERY.

# A Mediæval Tavern Rebuilt

## JOSEPH HILL, F.R.I.B.A., Architect

"THE WHEATSHEAF INN," which occupies a prominent position in the picturesque Market Place of Kingston, has been rebuilt from the designs of Mr. Joseph Hill, F.R.I.B.A. It is designed in the style of architecture which originally surrounded the Market Place, and of which some charming examples still exist. The old inn was of great age, the timber framing and "daub and wattle" infilling spoke of the early seventeenth and probably late sixteenth centuries, but the original front had been replaced by a late Georgian or early Victorian cement face of but small artistic merit and poor construction.

The ravages of time and the demands of local authorities made it clear that it was essential that an entirely new building be provided. A restoration was impossible, as the height and arrangement of rooms were unsuited to the requirements of the licensing justices, and the entire structure had in fact become insanitary. Messrs. Hodgsons' Kingston Brewery Co., Ltd., the owners, had plans prepared by Mr. Hill, of the firm of Messrs. Yetts, Sturdy, and Usher, architects. The plans were approved by the licensing bench and the borough surveyor, and the work has been carried out under Mr. Hill's supervision.

Whilst in planning and construction the building is thoroughly up-to-date, the uses to which the old material could be put were given careful thought. The old oak beams and posts from the early building have been carefully treated and re-used in the old manner, whilst all the brickwork and the plasterwork speak of careful and traditional craftsmanship.

FIRST FLOOR PLAN.

SECOND FLOOR PLAN.

"THE WHEATSHEAF INN," KINGSTON-ON-THAMES.
JOSEPH HILL, F.R.I.B.A., ARCHITECT.

In designing the Market Place front, the architect was guided by the outline of the original building. This bore a charming relationship to the busy thoroughfare which, on market days, is such a blaze of colour and hive of commerce.

The site is a long and narrow one, and the difficulty of obtaining light has been overcome by the formation of a well in the centre of the building. This terminates in a glazed dome over the serving space, which forms the central feature between the public and saloon bars on the ground floor. A spacious and attractive tea and luncheon room is provided on the first floor, with direct access from the Market Place. The kitchen service is on the second floor, and is connected with the bars and public rooms by a lift. In planning the bars careful attention has been given to the modern requirements of the licensing authorities, and the result is open, well-lighted, and efficiently supervised public rooms.

The general contractors were Messrs. W. H. Gaze and Son, Ltd., of Conduit Street, W.1, and Kingston-on-Thames; the sub-contractors being as follows: The Aston Construction Co. (steelwork); the Crittall Manufacturing Co. (metal casements and dome); Kelley & Co. (lead glazing); O'Brien Thomas & Co. (sanitary fittings); the Kleine Flooring Syndicate (Kleine flooring); the British Premier Flooring Co. (asbestic jointless composition flooring); Leo Sunderland & Co. (electric lighting); the Well Fire and Foundry Co., Ltd. (firegrates, backs, etc.); Messrs. John Daymond and Son (enriched plasterwork); Messrs. Gaskell and Chambers (bar counter, fittings, and pewtering); Samuel Haskins Bros. (lift—hand-power service); Thomas Elsley (rain-water heads); Yannedis & Co. (ironmongery).

# Houses—But No Homes

## By CROSSLEY DAVIES

NOW that the speculative builder is at work again houses are to be had, though the demand is much greater than the supply. But those who have a small capital can at least buy a roof to shelter them. The prospect is no longer so hopeless as once it was. Thanks to private enterprise, at last able to enter the field, estates are springing up on the outskirts of London which promise to meet an urgent need.

That the speculator has been obliged to go out into the country where the air is fresh and the prospect pleasing is matter for congratulation. The movement of the townspeople outwards makes for health. For this contribution to the problem of London's congestion we must all be grateful. But while the enterprise of the speculative builder has its good points there are unfortunately also reasons for grave disquiet. He is certainly giving us houses, but we are not getting homes. The houses that nobody wants are the only houses that anybody can get.

Let the builder fondly imagine that he is supplying the ideal homes of which we have heard so much and seen so little. Let him proclaim that the man with the trowel is walking in ahead of the millennium. Yet the fact remains that what he is giving us is very far from what we have a right to expect, even though that expectation is modestly based on the possibilities of to-day.

Since the ideal home became fashionable the speculative builder has rushed in with many assorted samples. Now it is possible to get a house on easy terms, like a piano or a motor car, a house, we are told, that is modern, labour-saving, artistic, spacious, and cheap. No lower standard will satisfy the altruistic builder of to-day. It is wonderful to find that the gentlemen who before the war were accused of giving us so many shoddy substitutes for the substantial homes of our forefathers, in the name of progress, have so signally seen the error of their ways.

While we gladly agree that the speculative builder has rendered valuable service in the provision of homes at an economic rent, and still plays an important part in repairing the omissions of the war, we feel that his claims in the matter of the ideal home need close examination. All the more so because he remains his own architect, a fact that an inspection of the plans of his new "villa residences" proves at once.

Alluring brochures describe the beauties and conveniences of many new estates around London, with the *rus in urbe* appeal so dear to the heart of the modern suburban couple. But a tour of some of the new estates suggests that care must be taken that we do not get all the old faults of the pre-war middle-class house repeated.

The householder too often finds that the new house is little better, if at all, than the home that before the war he could buy for half the price. Perhaps the gravest defect is the failure of the builder to employ an architect. We went into a typical new "villa" the other day. The rooms were small. The largest was not more than 12 ft. by 10 ft. The hall was described as a "lounge hall," but it opened right on to the porch. The kitchen was not big enough for a good-sized table, and there was no scullery. Nor was there a copper. Assuming that the owners would have a servant, which is almost certain, the absence of a scullery is a grave defect. The kitchen is the maid's living-room, and should be designed with that fact in view. She does not want to live with the work always on top of her. The scullery gives her a workroom outside her living-room. A copper, or a washing machine, should be in every home. Few people of the class who occupy houses of the type under discussion can afford to put all their washing out to a laundry, and they need facilities to do some of it at home.

Passing from the ground floor to the first we found the stairs deep and winding, perilous for children and tiring for adults. The main criticism of the bedroom floor is that the bathroom was ridiculously small. In one case the door could not be opened to the full extent because the lavatory basin stopped it. Electric light was laid on, but there were no power plugs.

This is a fair sample of the sort of "villa" which is to-day being built for a little over a thousand pounds, or on easy terms, with interest, about twelve hundred and fifty.

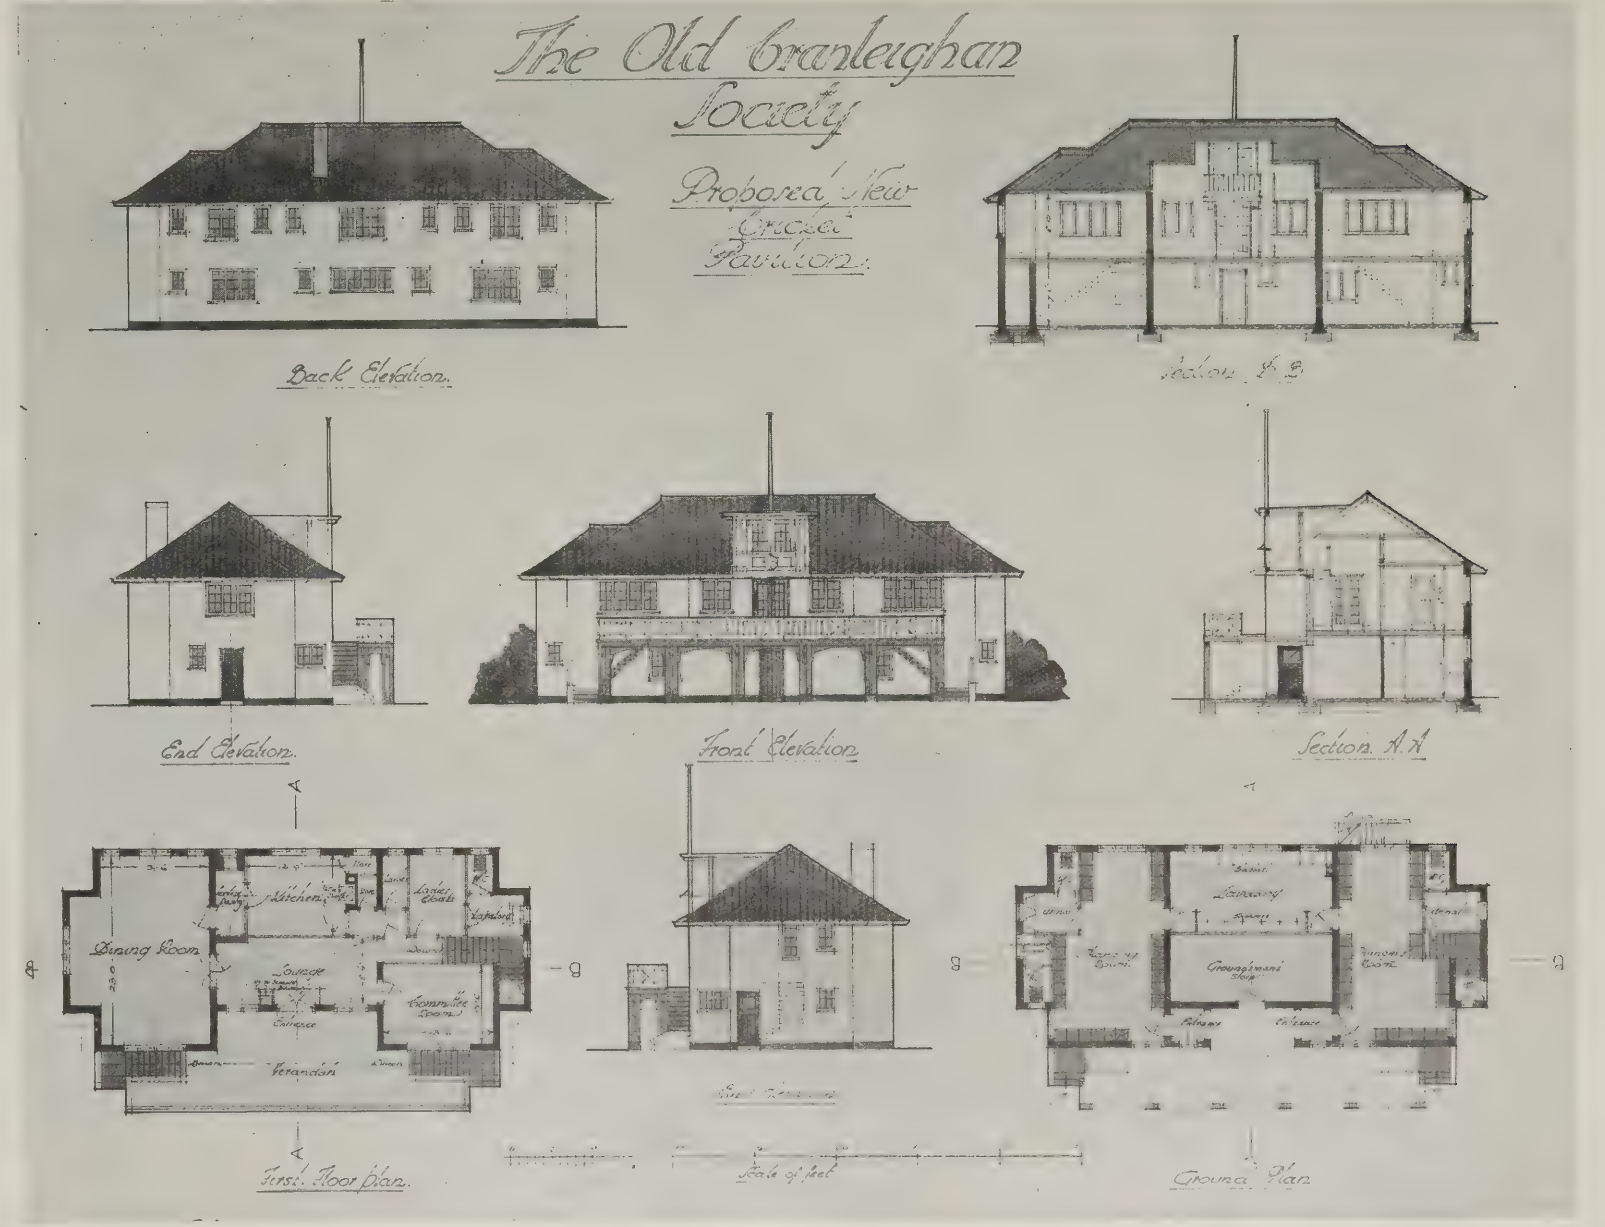
No house was equipped for central heating. None had adequate cupboard accommodation. None had enough fittings. They certainly had dressers with glass doors, but nowhere did we find a kitchen cabinet such as the housewife gets in America. In no case were there any basins with hot and cold water fitted in the bedrooms. Beyond the mantelpieces there were no permanent fitments in the two main rooms downstairs, and no built-in wardrobe in the hall, which in most cases was a waste of valuable space for the sake of vanity.

This sort of thing will not do. It is clear that the builder has not sought the advice of the women who will have to live in the "residences" he designs. Nor has he asked an architect to plan it for him.

The builder has, unhappily, a good excuse for small rooms and low ceilings. The Ministry of Health, whose officials should have known better, set him the example. They were the first to cut down the size and height of rooms, in some cases below the standards of the local by-laws. It was a retrograde move for which we may have to pay heavily before this generation has run its course. But there is hope that by some scheme of co-operation between the architectural bodies and the speculative builders we may at last have what we have never known before, small middle-class houses built to architect's plans. It may be that this has not been possible before because the architect's fees, based on the cost of the building, may have proved too heavy for the builder. Or at least that the builder cut his prices in keen competition so much that he was obliged to dispense with the architect. In any case, whatever the cause, it is surely not beyond the powers of human ingenuity to devise some way of overcoming the difficulty. It has been done in America, and it can be done here. There are obvious advantages in having an architect to plan a house. And those advantages would be heightened if the architect could be aided by the guidance of some body of women who could best get from the housewife a list of her requirements. Perhaps it is an ideal solution of the problem of getting houses worthy of the age and the people, but the collaboration of architect, builder, and housewife should not be impossible. It would certainly end in a far finer style of home than we are getting now. It might even lead us to the ideal home which to-day is, alas, but an idle dream for at least 90 per cent. of the community, who have not the means to translate into brick or stone the vision they hold of the sort of house the twentieth century should give them.

# The Old Cranleighan Society's Cricket Pavilion Competition: First Premiated Design

W. E. Masters and F. T. Dear, AA.R.I.B.A., Architects



The winners of this competition have planned an economical and symmetrical building on two floors. The disposition of the principal rooms on the upper floor and the changing rooms below, with the projecting verandah and the scoring box as a central feature, give a simple and well-proportioned effect to the design.

# Architecture in the Lay Press

## County Hall Acoustics

At the meeting of the London County Council last week a further attempt was made to find a partial remedy for the defective acoustics of the new chamber by providing the Press with an electrical apparatus to aid the reporters in their task. The experiment, it must be admitted, was not wholly satisfactory. A good telephone voice has not yet been judged a necessary qualification for a councillor, and even good voices require a good chamber. Some of the speeches, as they were received, confused the ears by their exaggerated cadences and others were blurred and dimmed. All speakers, it is true, cannot be followed with equal ease even in a satisfactory chamber, and doubtless the instruments will be improved. Clearly something must be done, if only to prevent or to postpone drastic alterations in the building. When the Council held their first sitting last year the chamber pleased the eye by its fine proportions, marble pillars, and carved galleries, but it baffled the ear by its confusing resonances. In a correspondence which followed in our columns some distinguished men of science directed attention to American researches on architectural acoustics; others urged the need of fundamental investigations in which physicists should assist the constructor. Architects were disposed to absolve Mr. Ralph Knott, the designer of the County Hall, on the alternative grounds that he had followed the known principles of acoustics and that a science of architectural acoustics did not exist. But there was general agreement as to the certain cost and uncertain result of alterations intended to fit the chamber to its primary function as a place of public debate. We see no reason to alter the opinion stated in our original comments. If there be a science of architectural acoustics, its principles have not been applied so as to lead to any but capricious results, and we doubt if any architect would pledge his reputation to acoustical success when he is explaining his plans. We believe that the Royal Institute of British Architects would do well forthwith to consult with experts in physical science, collate existing knowledge, and devise and conduct experiments which would carry architectural acoustics beyond the experimental stage.—"The Times."

## Chesterfield's Pride

The crooked spire of the Chesterfield Parish Church has not many claims on the indulgence of iconoclasts. Those who believe that a church spire should be straight and nothing but straight would have small hesitation in sweeping away this outrage of all architectural convention; this contortionist which succeeds in bending three ways at once. But though its claims are not many, there are two which are strong. In the first place, it is unique. There are not many buildings that succeed in continuing through centuries a defiance of all the laws that should govern their existence. The leaning tower of Pisa is the only one that comes readily to mind; and that achieves nothing more than a straightforward cant; the Chesterfield spire has nearly succeeded in imitating a Jacobean table-leg.

In the second place, the Chesterfield spire is the only known rebel against the poetic tradition that a spire points uncompromisingly and austerely to heaven. There is something to be said for a spire which spends its time in proclaiming the more comfortable doctrine that there is something to be said for making the best of both worlds. When this kink of compromise first made itself manifest in the spire no one can say. In its infancy and youth, presumably, it led an upright existence; but at last the stuff that was put into it began to tell and to pull it off the straight. That stuff was oak, and as the spire was put up in the fourteenth century it was probably English oak. It is not likely that timber would be imported in those days. A lot of things have been said and sung about "English oak," but those who concern themselves with old buildings will tell you that, unless it is used under water, for such purposes as sluice gates, no iron bands can hold in its tremendous power to warp and twist.—"The Manchester Guardian."

## Garden Cities and Their Pioneers

It is not easy to associate the plain, dour North-country habits of Mr. Frederick Litchfield with his pioneer work for the ideal garden suburb or garden city. But the two were in fact intimately associated with a passionate zeal that leaves the critic of either or both suspended, as it were, in mid-air. Perhaps some profound student of human personality can solve for us the riddle of a man whose soul survives the dinginess of routine work in a railway office at Derby and lives to create the Letchworths, the Hampstead Garden Suburbs, and the rest of the idealist housing schemes of which Mr. Litchfield was a pioneer. Some of us, in our cynical moments, like to amuse ourselves with stale jibes at the too self-conscious citizenship of these places; at their primness, their architectural freakishness, their long-haired men, their bobbed-haired women—in short, we suppose, their cranky houses and their even more cranky people. Well, it is still the business of a crank, we suspect, to revolt against dull convention, and if we care to look for him in the garden cities scattered up and down England, we shall certainly find him. But we shall find there, too, in the vast majority just such people as we would wish to find in any intelligent community. The garden suburb is no longer an abnormality. It is fast becoming the normal expression of man's revolt against the complete detachment of household shelter from the good brown earth. An imperfect expression it may be, subject, we should hope, to such amendment as will enable it in the next generation, if not in this, to become a self-contained community and not a mere modern dormitory. Meanwhile it spares us some of the more obvious evils of the herd instinct, which battened on the industrial revolution.—"The Westminster Gazette."

## Our Ordnance Maps

Whatever else may escape privation during an "economy stunt," a public undertaking which is only indispensable and inexpensive and does not excite any large crowd, tickle any sensational journalist, or give any politician the makings of an attractive agitation, is pretty sure to come off badly. So the Ordnance Survey, the source of nearly all our British maps, is quietly starving, as Colonel Crook reminded us in his excellent address at the Map Exhibition in the Whitworth Hall. The whole history of the Ordnance Survey's map-making forms a rather pathetic tale. At one time or another it has produced fragments of extraordinarily good work—maps so exact that even on the one-inch scale they once showed you almost vividly the whole design of a village, and so beautiful in their engraving that some of us still prefer to walk the hills round Edale with the old hill-shaded map on which there was as yet no railway to be shown. And yet the Survey has never quite given us a full and uniform set of large-scale maps of England thoroughly good all through. You could never be utterly sure that any sheet which you did not already know could be trusted as well as the best of those that you did.

If there were any hope of its success we should try to raise an agitation against the further starving of the Ordnance Survey. Whatever its past faults it has lately done much good work, and the making and using of maps of the various theatres of war in 1914-18 gave a strong new impulse to official cartography. But we fear there are not enough people, all told, who care sufficient about maps of their country's soil to mind whether these are good or bad.—"The Manchester Guardian."

## Colour in Church Buildings

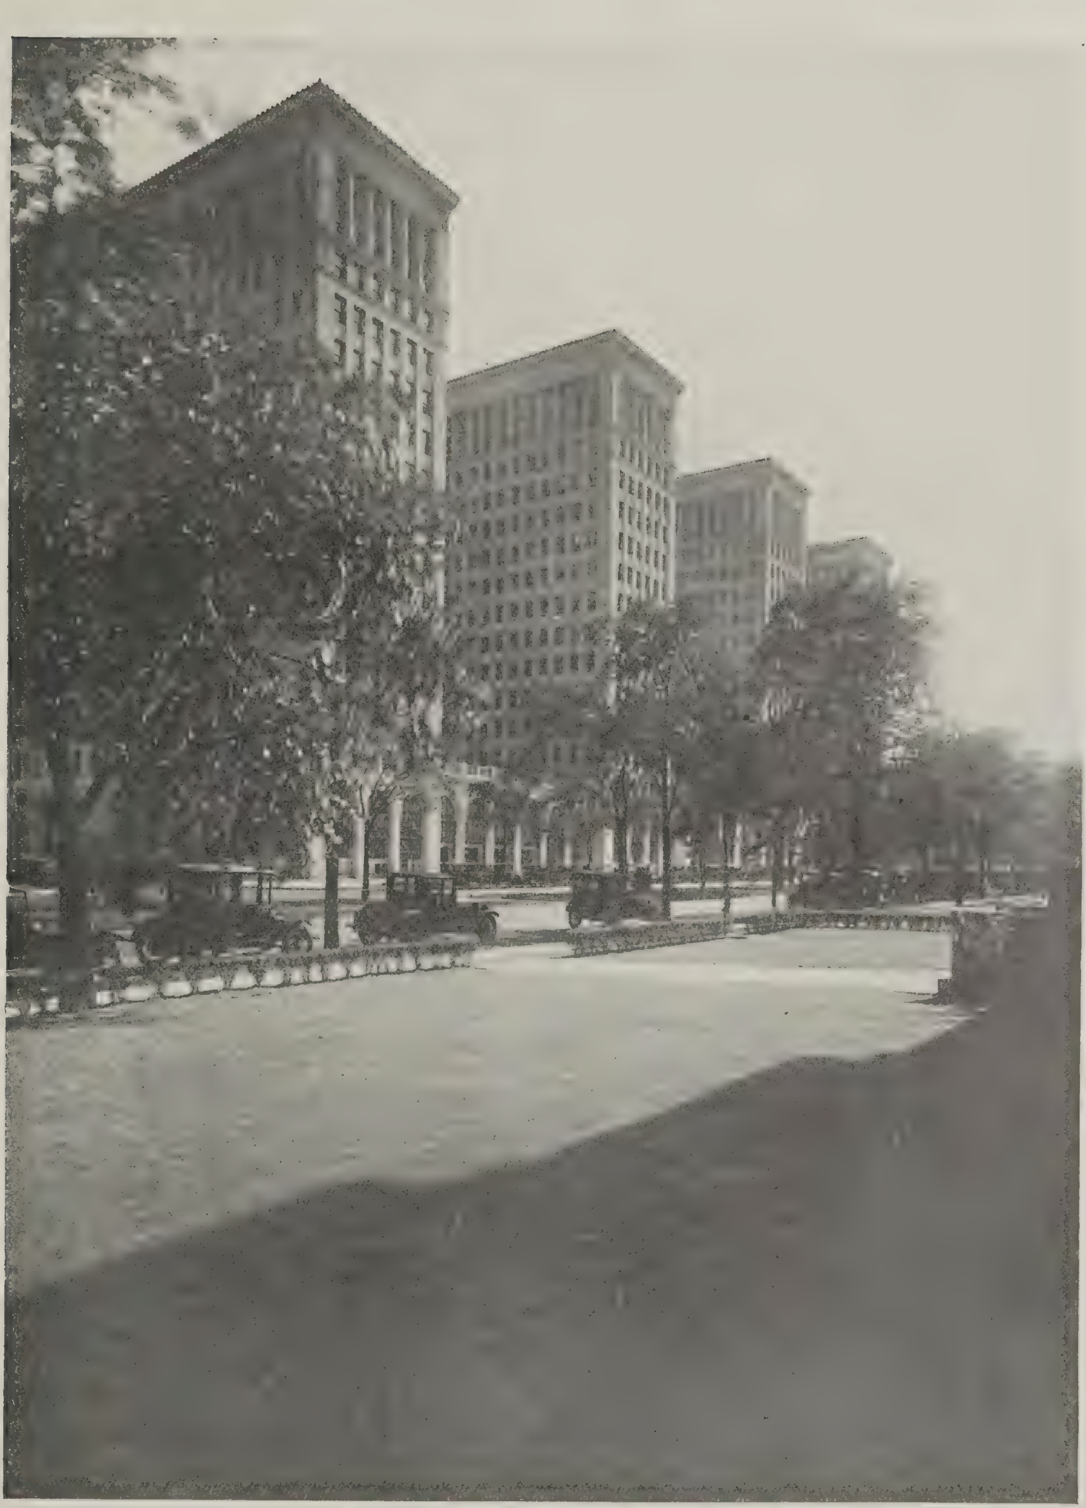
SIR,—Your reference to Mr. Grattan Doyle's plea for warmer tones in urban buildings inspires me to ask whether ecclesiastical architects cannot evolve some brighter designs in the external decoration of church buildings. That the interior of our places of worship should be suitably and artistically adorned is not disputed. But might not the association of beauty and colour with religion be carried further by the use of terra-cotta and vitreous brick and tiles in the outside walls of our churches in the great centres of population where grimy stone and dingy brick impose upon the inhabitants a dreary and depressing environment? Modern processes in the production of ceramics offer to the builder a variety of hues—greens and blues and yellows as well as buff and red; a church on whose walls these colours were æsthetically blended would be a refreshing oasis in a wilderness of bricks and mortar.

Yours, etc.,

ROBERT P. JOHNSON in "The Tablet."

# Modern American Architecture. 39.—Office Building for the General Motors Company, Detroit

Albert Kahn, Architect



The four great bays of this building are typical of the tremendous scale on which the Americans work. There is scarcely a roadway in London which would be wide enough to take such a huge block. The arcading, which is a feature of the lower floors, gives the connecting link between the bays that the eye desires. Our illustration is reproduced by the courtesy of "Kahncrete."

# The Registration Bill

As briefly announced in our last issue the Registration Bill received its first check at a special general meeting of the R.I.B.A. on Monday, January 29.

The importance of the meeting was indicated by the packed audience, about 300 being present. Mr. A. W. S. Cross (Vice-President) was in the chair.

A letter from Mr. Paul Waterhouse (President) was read, regretting his absence and giving an account of an interview he had had with Lord Crawford. Lord Crawford had, he said, expressed the opinion that it would be unwise to introduce any Registration Bill into Parliament unless it had the fairly unanimous support of all sections of the architectural profession. For his own part, he (the President) hoped that the fullest precautions would be taken to avoid any possibility of failure.

Letters from Mr. Gotch, pleading for unification as a preliminary to Registration, and from Mr. Flockton and Professor Reilly, were also read.

Mr. Cross said that all matters relative to procedure during the debate would be carried by the usual majority. For the Bill itself and all deliberations with regard to its various clauses, a two-thirds majority would be required. Mr. Perks would propose the adoption of the Bill, which would, if passed, become an Institute measure.

Mr. Sidney Perks then moved the adoption of the Bill generally, subject to its consideration clause by clause later on. The proposals of those who desired unification before Registration had been rejected at the last Council election, and the present Bill had been to some extent modelled on that of the dentists'. It aimed at giving as little offence to anybody as possible, and contained no provision for any member on the Register becoming a member of the Institute. In setting up an independent register they were following the precedent established by the legal, medical, and dental professions.

They had not heard from the Society of Architects, who had been invited to express their views on the subject, but he hoped that they would be able to come to an agreement.

It was absurd to say that the Bill, if opposed, could not go through Parliament. There had been intense opposition to other Bills, but they had all got through ultimately.

Suggestions from the allied societies had been received, and he thought these had all been embodied in the Bill. The allied societies wanted the old unification scheme, because they wanted to get into the Institute without examination. They were mainly non-members of the Institute, their total membership being 1,944, of whom only 716 belonged to the R.I.B.A.

Opposition to the Bill was only to be expected, but they wanted to find out where it was coming from and how to meet it. It might be from the general public, on the grounds that Registration for architects was simply a trade union. The promotion of a Bill was the only way to find out the true position. It had taken the veterinary surgeons twenty-one years to get their Bill through, but they had done it in the end, and he thought they ought to test the thing and go ahead.

Mr. Charles Heathcote seconded the motion.

Mr. G. A. Middleton said he considered himself nearly the father of the Registration movement. He had been working for it for forty years and would be willing to wait yet another year for the sake of getting a good Bill. It should, he thought, go back for further detailed consideration. In this Bill a board and tribunal had been set up in addition to the Institute. The tribunal was only a committee of the board, and he thought only one of them was necessary. The existence of two bodies would merely multiply labour. The board itself, to consist of forty-seven members, was, in his opinion, over-large for the administration of an Act of Parliament. It was, besides, over-dominated by the Institute, twenty-five of its members being nominated by that body.

They could be turned out at the will of the Council, and he thought this was a mistake. A five years' term of office would be none too long. The board should be a paid one, as most of the work came of practising architects.

In the proposed Act only the words "architect," "architecture," "architectural" were registered, and it would be quite easy to get round that. The same mistake had been made by the dentists and had had to be rectified.

The Bill would kill the Society of Architects—another point in its disfavour. He moved the following amendment :—"That the draft Registration Bill be referred back to the Council for both general and detailed reconsideration before being again submitted to a general meeting."

Mr. Bernard Dicksee seconded the amendment, and said that under the Bill no single member of the Institute was absolutely entitled to Registration. He himself was a district surveyor and not an architect in practice, and would therefore be ruled out.

Professor Beresford Pite supported the amendment, and said the Bill must secure the support of the allied and other architectural societies before it went forward. It did not register satisfactorily, or define the qualifications necessary for registration.

Mr. Gilbee Scott said the principal objection expressed had been with regard to the Board and tribunal. It was to disarm Government and public hostility that nominees of the Privy Council, Board of Trade and Board of Education had been included. They wanted the Institute to predominate, since it represented the majority of architects.

Mr. Herbert Welch inquired whether or no the Council had received the views of the Parliamentary Agents on the Bill.

Mr. Perks replied that the agents had drawn up the Bill.

Professor Beresford Pite wanted to know the views of the Parliamentary Agents on the prospects of the Bill.

Major H. C. Corlette said he did not think the Bill should be referred back to the Council. It was a question whether the Council had any power to bring the Bill before the meeting. They were acting contrary to the charter in reversing a resolution of the Institute—that of 1920.

Mr. Percy Thomas pressed the question as to the chances of the Bill becoming law.

Mr. Scott-Moncrieff thought that if the amendment was passed, there would be a danger of the question of unification before registration being revived.

Mr. Middleton's amendment was then put to the vote, and lost.

Mr. Guy Dawber, saying that he wished to deal with broad principles only, moved that—"This Bill be not considered until the other professional societies and interests affected have been consulted and a general consensus of professional opinion obtained in favour of the Bill."

No attempt, he said, had been made to consult the other allied societies, and no attempt had been made to unify. Why waste time and money when they were so far from agreement? The Society of Architects and the A. and S.A.P.U. were unable to support the Bill, and it was opposed by many of the allied societies. He would like to know whether the Surveyors' Institute and the Civil Engineers had been consulted. He would like to have Messrs. Sherwood's opinion as to the possibility of a Bill going through Parliament. Until they had unity in the ranks, discussion was a mere waste of time.

Mr. Josiah Gunton seconded Mr. Dawber's amendment, and said registration was useless without unification.

Mr. Buckland, speaking as Chairman of the Conference of Allied Societies' Presidents, said that they had made very strong recommendations that unification should precede any attempt to promote a Bill in Parliament. He urged the necessity of obtaining general support for the measure before putting it forward.

Mr Francis Jones and Mr. Edward Warren also spoke.

Major Harry Barnes said that a clear issue was before the meeting. They were not asked to decide between registration and unification, but as to whether they were going to make a further attempt to get a general consensus of opinion in favour of the Bill before they went on with it.

He had been much impressed by the dashing speech of Mr. Perks in introducing the Bill. Mr. Perks was prepared to go on twenty-one years to get it through; but he would like to shorten that period. Could not the profession be united on the Bill? If nothing could be said or done, they were justified in going on, but was that the case? The chances of a Bill would not be improved by differences of opinion between large bodies in the profession. The nurses and dentists had only got their Bills through after substantial unity had been established. How could they meet opposition from the public if the profession itself was divided? Opposition in the House would be engineered in formidable quarters and supporters of the Bill would be torn to rags.

Mr. Dawber's amendment was wise, temperate and judicious. Let them make one more effort to try and obtain unanimity in their own profession.

Sir Aston Webb supported Mr. Dawber's amendment, and suggested that friendly meetings for the discussion of the Bill might be arranged at the Institute.

Mr. Delissa Joseph, Mr. Alan E. Munby (President, York and East Yorks Society of Architects), and Mr. Woodward, spoke in support of the Bill.

Mr. Perks dubbed the unification scheme a " funk-hole," and said he hoped the Council would be allowed to proceed with the Bill.

A vote was then taken on Mr. Dawber's amendment, with the results announced last week.

The Chairman said that the Council would consider the position created by the vote.

On the advice of the parliamentary agents the preamble which appeared in the first draft of the Bill has been omitted, and a memorandum giving the public case for the Bill has been prepared by the Registration Committee with a view to its being printed on the face of the Bill.

The memorandum is as follows :—

It is expedient in the public interest that persons requiring professional aid in architecture should be enabled to distinguish qualified from unqualified practitioners, and that consequently the use of the title "architect" should be confined to persons enrolled under the provisions of this Bill.

The practice of architecture in modern times demands of architects many and varied gifts and attainments, and the spending, in the aggregate, of vast sums of money. Artistic sense, scientific knowledge, practical skill and business ability are some of the essential qualifications for the proper performance of the duties of an architect which involve many questions affecting the life, health, convenience and financial interests of a very large section of the public. It is, therefore, in the public interest to prevent untrained and incompetent persons, styling themselves architects, from imposing upon the community to its material loss and detriment.

The statutory registration of architects involves no new principle. It has already been adopted in British Columbia, Alberta, Quebec, the Transvaal, New South Wales, Western Australia, New Zealand, in several European countries, and in many of the United States of America.

The Bill is promoted by the Royal Institute of British Architects, which acts under the Royal Charter or letters patent of his late Majesty King William the Fourth, and of her late Majesty Queen Victoria, by which the Institute was incorporated, and the supplemental Charter of his late Majesty King Edward the Seventh of 1909. The Institute contains, with its allied societies, the greater part of the architects practising in the British Empire, and is, by its numbers and high standing, eminently fitted to be the controlling body in the examination and registration of architects.

The object of the Bill is to provide for the compulsory registration within three years of the passing of the Act of all persons who are now bona-fide following the profession of architecture, and afterwards of those persons who pass a statutory qualifying examination. The vested interests of engineers, surveyors, builders, or any other persons engaged in constructional building works, or in the preparation of plans, or in the supervision of such works, are not interfered with.

The Bill creates for the purposes of this Act a Board and Tribunal of a thoroughly representative character consisting of representatives of the Privy Council, the Board of Trade, the Board of Education, the Council of the Institute of the Society of Architects, the allied societies, the Incorporation of the Architects of Scotland, the Royal Academy, and all the universities who possess a recognized school of architecture. The Board will determine the standard of examinations, and the Tribunal will determine who, subject to the provisions of the Bill, are proper persons to be enrolled in the register.

# Correspondence

## The Best Building of the Year

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—It is to be hoped that the R.I.B.A. will adopt the suggestion in your last issue to decorate "the best building of the year" with a plaque setting forth the reasons for the award. I agree that the plaque is the most important part of the scheme.

Unfortunately, many people imagine that because a building is a new one it is good architecturally. Quite recently, on a visit to a provincial town, a native pointed with pride to the latest monstrosity—a new cinema—and coolly informed me that an eighteenth-century building (the best example of architecture in the district, the work of a famous architect) should be pulled down as it was out of date! This is, I am sure, the general notion of a very large section of the public.

It is not enough to state that a building is good. The public should be told "*why.*"

R. HUTCHINGS.

## Whitgift Hospital

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—As a resident of Croydon I should like to thank you for the stand you are taking in the matter of Whitgift Hospital. It is a disgrace to this town that a majority of its inhabitants should have so little regard for the historic past that they enthusiastically approve the deliberate destruction of a building of such rare distinction as the Whitgift Hospital, and to what end ? A moderate improvement of traffic facilities !—an improvement that Mr. Milnes Emerson has clearly shown in your columns can be secured without disturbing a single brick of the building.

One would think that every conceivable alternative would be considered before the destruction of so venerable a relic were even thought of. Yet Croydonians quite cheerfully say : "It stands in the way of our trams. Pull it down." Really, one begins to despair of the public. After all the educational efforts of Press and platform we still find the same old indifference—nay, antagonism—towards the things that really matter. May Parliament protect us!

" DISGUSTED."

## Records of London's Buildings

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—A very noticeable feature in our streets to-day is the large number of historical buildings and monuments now undergoing repair, for which work the necessary scaffolding is often of an elaborate character consisting of several stages.

The stone lantern surmounting the dome of St. Paul's Cathedral, the crowning turrets of the Victoria Tower, Kent's cupola at the Horse Guards, Henry VII's Chapel, and Decimus Burton's famous arch at Constitution Hill are conspicuous examples of the praiseworthy efforts now being made by the authorities to carry out these long overdue renovations.

In view of the circumstances to which I venture to call attention, it appears to me that this scaffolding presents exceptional opportunities to architectural students for making careful measured drawings of the buildings in question. I would even suggest that the Art Standing Committee of the Royal Institute of British Architects might well make it its business to acquaint itself with these activities, and advise students through the professional journals—as the occasion arises—that facilities of this kind are available for studying and recording a particular work of architecture.

It might even be possible, and in the interests of architectural study most desirable, for some such committee to request public authorities to inform them beforehand of the intention to undertake repairing work of this description, so that the resulting records might gradually include most of the masterpieces for which London is so justly famed.

FREDERICK CHATTERTON, F.R.I.B.A.

## The R.A. Exhibition

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—Please grant me space to point out one of the slips in the second part of my critique on the R.A. Exhibition. I refer to that paragraph in which I say that certain craftsmen "against every possible *disability* . . ." etc. The word I intended was *disadvantage*. I wish to point out this mistake in particular because the word "disability" implies a meaning derogatory to the men whose works are so much to be admired.

W. W. SCOTT-MONCRIEFF.

# Mr. Clausen on Decorative Painting

THE lecture room at the Royal Academy was again packed to the doors when Mr. George Clausen, R.A., recently delivered the second of the public lectures being given in connection with the Exhibition of Decorative Art.

Mr. Charles Sims, R.A., who was in the chair, introduced Mr. Clausen, who gave a most interesting account, illustrated by lantern slides, of decorative painting in all times. The term "decorative painting," he said, was commonly understood as referring to paintings on walls or ceilings executed as the permanent decoration of a building. That was the sense in which it had been used by Sir Reginald Blomfield the previous week, and he proposed to go more or less over the same ground, but from the painters' and not the architects' point of view.

He did not altogether agree with this limited point of view, as he thought all painting should be decorative, even that kind which was often referred to rather contemptuously as the easel picture. He did not think that that distinction existed in old times, when work was done because it was required, and painters were prepared to execute large or small works. At present the only living for the painter was from the small picture.

The only difference between the easel picture, a portable thing, and the decorative painting as commonly understood was that the latter had to be designed both in regard to its form and colour in relation to its architectural setting, while the easel picture had no relation to anything outside the boundaries of its frame. But within that the same qualities were necessary as in the large fixed panel—balance, harmony, expression, good colour and composition. It should not be forgotten that those who had given us large monumental work of the utmost grandeur and beauty were also painters of little pictures, and one had only to go to the National Gallery to see that the finest qualities of painting were shown in small works equally with those of large size.

Practically all our painters were painters of easel pictures. It was not that they had not the ability to paint large decorative works, but they had not, and had not had for generations, the opportunity of doing so. A great deal would therefore have to be learnt and we must look to our younger artists to rise to the opportunities which it was to be hoped would be afforded them. There was a growing feeling in favour of their work, for it was widely felt that painting should have its use and purpose as in old times, that there should be a need for it. At present it was only needed for poster advertisements, some of which were indeed of great beauty.

Decorative painting was worth a permanent place, and there was among younger artists a strong desire to employ their talents in that way, a desire which had been greatly encouraged by the establishment of the British School at Rome. South Kensington had had a school of decorative painting for over twenty years, and a serious beginning in that direction had been made in the R.A. schools.

It was to be hoped that the exhibition would awaken and stimulate the interest of our public bodies in this branch of art, for the necessary encouragement must come from them. With few exceptions, our public buildings were dreary and needed adorning, and the talent was available.

The object of decorating a building should be not merely to adorn it, but to express something of its use, of its associations, or of the history of the people concerned with it. In this sense our cathedrals were made living buildings, expressing not only the sacred story, but all sorts of amusing contemporary things. The old artists wanted to say something, to communicate, and in the older painters' work this communication was made in the plainest terms. It was little more than an outline touched here and there with colour—in fact, a description.

All early art was primarily descriptive, like the drawings of children, and as artists gradually learnt to represent things and painting developed it passed, in Europe, from its early descriptive stages through various degrees of realism up to the point where it was almost possible to give the complete illusion of reality.

There were the two opposing tendencies in art, both aiming at representation; the earlier giving, by recording facts, what was practically a description, the other, by recording appearances, aiming at illusion. Somewhere between these extremes was the ideal, and, perhaps, the central position which Raphael and Michelangelo held rested to some extent on the balance and restraint shown in their realism, expression not being sacrificed to it.

The early artist, if he had to represent a man in a passion, would notice the lines of the face, the movement of the body, and this would be the main thing for him to render—he would give the expression. He would not notice whether the man was standing half in light and half in shadow, or how he was relieved against the background; it would be a lesser interest, and would not occur to him. But in later times the study of appearances, such as this, overshadowed the study of expression, to the loss of the qualities which were so valuable in decorative art—simplicity and clearness of statement. Before the pre-Raphaelite movement the primitives had hardly been seriously studied, it was assumed that the later developments of painting sufficed and summed up all perfections. But since then greater attention had been given to primitive art and its basis more closely examined. The beauty of the art of primitive races, of Byzantine and Oriental work, particularly the Chinese, had been recognized, and its relation to early European work studied, and the conviction had grown that the progress of painting towards illusion had not been altogether a gain, that painting, in its search after truth to appearances, had lost something of the force of its early appeal, of its simplicity, expressiveness, and decorative value. Chinese art, in which expression had always been the aim, developed into an art of the greatest possible beauty without the slightest leaning towards illusion.

There was, however, little doubt that the aim of painting in all countries had been to give the effect of reality, but the Eastern mind's conception of this was not the same as the Western. In Europe the early frescoes were pictures frankly painted on the wall. But later came the effort to make the picture part of the room in which it was placed, enlarging the room and bringing the spectator, as it were, into the company of the persons represented, the actual architecture of the room was skilfully continued into the painting.

Such admirable work had been done and in so many different methods that it was impossible to dogmatize and say that one style of painting was decorative and another was not. It all depended on the conditions, the style of the building, and the position and lighting of the work. The full range of colour should not be attempted in this country, there was not light enough. A simple treatment of flattish, well-adjusted tones was preferable in a light and shade modified to suit the building. The situation of a work should determine the weight of its colour, but the artist should aim at enlarging rather than at contracting the boundaries of his room. A decoration that was to harmonize with architecture should have certain qualities that we associated with architecture, a formality in the planning of its groups, and a sense of stability in the figures, with an ease and clearness of design, so that the figures should seem to be naturally employed and their actions understood. The treatment of light and shadow should be simple, and as to colour, it should be clear and harmonious and related to the building. The work of Puvis de Chavannes stood at the head of modern decorative art. His pictures rested happily on the wall and were part of it. In his Pantheon decorations there was no colour darker than the natural shadow of the cornice above them, which apeared to be taken as the key for his work—the dark end of the scale of colours he employed.

---

# Public Lectures on Architecture

The public lectures on architecture given at the R.I.B.A. last year met with such great success that the Royal Institute have arranged for a further series during February and March. The lectures will be given in the large gallery in the afternoons on the following dates :—

February 22.—Sir Ryland Adkins (subject to be announced later).

March 1.—Mr. J. A. Gotch. "A Note on the Life of Sir Christopher Wren."

March 8.—Mr. Walter Bayes, A.R.W.S. "Architecture and Painting."

March 15.—Mr. H. S. Goodhart-Rendel. "Architecture—a Necessity or a Luxury?"

March 21.—Lord Sumner. "Architecture and the Public."

It is important that the public should know more of architecture, and public lectures should be arranged by all those societies who have not already done so.

# Reinforced Concrete Calculations for Beginners. VII

By Professor HENRY ADAMS, M.Inst.C.E.

*(Continued from January 17, page 163.)*

WE said in the opening remarks that reinforced concrete building consists essentially of slabs, beams, and pillars. For instance, in a building 76 ft. by 130 ft. the main beams were 12 in. by 26 in. and 25 ft. span, the secondary beams 6 in. by 14 in. at 6 ft. 3 in. centre to centre, and 16 ft. span, the bays being 25 ft. by 16 ft.; the floor slabs 4 in. thick finished with 1 in. granolithic on top, which counts for weight only in the calculations. A small piece of the plan is shown in Fig. 17, the reinforcement was not known, but we can try what would be suitable. In calculating the floor slab the span will be from centre to centre of the secondary beams, 6 ft. 3 in., the effective depth will be 4 in., less, say, ½ in. for cover on the underside. If the load to be carried is 2½ cwt. = 280 lb. per ft. sup., and the slab weighs 5 × 12 = 60 lb. ft. sup., the total load on a width of 12 in. and span of 6 ft. 3 in. will be 6¼(280+60) = 2,125 lb., and the maximum bending moment taking the L.C.C. rule of

$$\frac{WL}{10} = \frac{2125 \times 75}{10} = 15{,}937{\cdot}5 \text{ lb. in.}$$

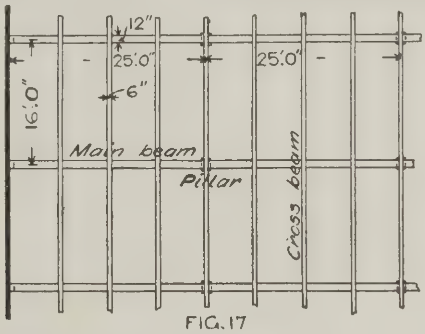


FIG. 17

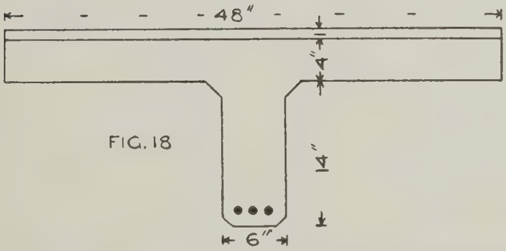

FIG. 18

Assume that the reinforcement consists of ⅜ in. rods at 4 in. centres.

$$p = \frac{\cdot 1104 \times 3}{12 \times 3{\cdot}5} = \cdot 0079,$$

$$m = 15,$$

$$\begin{aligned} k &= \sqrt{(p^2m^2 + 2.p.m)} - p.m. \\ &= \sqrt{(\cdot 0079^2 \times 15^2 + 2 \times \cdot 0079 \times 15)} - \cdot 0079 \times 15 \\ &= \sqrt{(\cdot 00006241 \times 225 + \cdot 237)} - \cdot 1185 \\ &= \sqrt{\cdot 251} - \cdot 1185 = \cdot 3825, \end{aligned}$$

$$\begin{aligned} t &= \frac{B}{p.b.d^2\,(1 - \frac{1}{3}k)} \\ &= \frac{15{,}937{\cdot}5}{\cdot 0079 \times 12 \times 3{\cdot}5^2\,(1 - \frac{1}{3} \times \cdot 3825)} \\ &= \frac{15{,}937{\cdot}5}{1{\cdot}1613 \times \cdot 8725} = 15{,}726 \text{ lb. sq. in.}, \end{aligned}$$

$$\begin{aligned} c &= \frac{2.B}{k.b.d^2\,(1 - \frac{1}{3}k)} \\ &= \frac{2 \times 15{,}937{\cdot}5}{\cdot 3825 \times 12 \times 12{\cdot}25\,(\cdot 8725)} \\ &= \frac{31{,}875}{56{\cdot}23 \times \cdot 8725} = 649 \text{ lb. sq. in.} \end{aligned}$$

An approximate rule for slabs is: effective thickness in inches = ½ span in ft.

The secondary beams, or cross beams as they are sometimes called, would be calculated next. They would, however, not be taken as ordinary beams, but as tee beams, having a section as shown in Fig. 18. The width of flange of the tee beam should be whichever is least of:

(*a*) One-fourth the effective span of the beam.

(*b*) The distance between the centres of the beams.

(*c*) Twelve times the thickness of slab.

Now, $(a) = \frac{16 \times 12}{4} = 48$ in., $(b) = 6\frac{1}{4}$ ft. = 75 in., $(c) = 12 \cdot 4 = 48$ in., the width to be taken will, therefore, be 48 in. The load on this beam will be 4 × 16 (280 + 60) = 21,760 lb. for the flange portion of slab and superimposed load, and 6 × 14 × 16 = 1,344 lb. for the secondary beam; and 21,760 + 1,344 = 23,104 lb. total load. Maximum bending moment,

$$\frac{WL}{10} = \frac{23{,}104 \times 16 \times 12}{10} = 443{,}597 \text{ lb. in.}$$

It will be useful now to give the notation for tee beams:

$m$ = modular ratio = 15,

$d$ = effective depth of tee beam,

$d_s$ = total depth of floor slab,

$p$ = ratio $\frac{A_s}{A_c}$,

$k$ = fraction of depth given by neutral axis from compressed edge

$$= \sqrt{(p^2m^2 + 2.p.m)} - p.m.,$$

$n$ = distance from compressed edge to neutral axis = $d.k.$,

$z$ = when neutral axis falls within slab

$$= \frac{n}{3},$$

$z$ = when neutral axis falls below slab

$$= \frac{d_s}{3} \times \frac{3n - 2d_s}{2n - d_s},$$

$$t = \frac{B}{A_s\,(d - z)},$$

$$c = \frac{2.B.n}{b.d_s\,(2n - d_s)\,(d - z)}.$$

Reinforcement, say, three ⅞ in. rods, 3 × ·6013 = 1·804.

Then $d$ = (say) 16·5, $d_s$ = 4,

$$p = \frac{1{\cdot}804}{48 \times 4 + 12{\cdot}5 \times 6} = \cdot 00675,$$

$$\begin{aligned} k &= \sqrt{\cdot 00675^2 \times 15^2 + 2 \times \cdot 00675 \times 15} - \cdot 00675 \times 15 \\ &= \sqrt{\cdot 0102516 + \cdot 2025} - \cdot 10125 \\ &= \sqrt{\cdot 2127516} - \cdot 10125 = \cdot 36, \end{aligned}$$

$$n = dk = 16{\cdot}5 \times \cdot 36 = 5{\cdot}94.$$

Then as $n$ falls below the slab

$$\begin{aligned} z &= \frac{4}{3} \times \frac{3 \times 5{\cdot}94 - 2 \times 4}{2 \times 5{\cdot}94 - 4} = \frac{4}{3} \times \frac{17{\cdot}82 - 8}{11{\cdot}88 - 4} \\ &= \frac{4 \times 9{\cdot}82}{3 \times 7{\cdot}88} = \frac{39{\cdot}28}{23{\cdot}64} = 1{\cdot}66, \end{aligned}$$

$$t = \frac{443597}{1{\cdot}804\,(16{\cdot}5 - 1{\cdot}66)} = \frac{443597}{26{\cdot}77} = 16548 \text{ lb. sq. in.},$$

$$c = \frac{2 \times 443597 \times 5{\cdot}94}{48 \times 4\,(2 \times 5{\cdot}94 - 4)\,(16{\cdot}5 - 1{\cdot}66)} = \frac{5269932}{22452} = 234 \text{ lb. sq. in.},$$

so that the steel shows a little above, and the concrete much below the regular stresses. To equalize this better we can increase the reinforcement a trifle and reduce the depth of concrete, making the reinforcement, say, three 1 in. rods, and reducing the depth of beam by 3 in.

$d = 13{\cdot}5$, $d_s = 4$.

$A_s = \cdot 7854 \times 3 = 2{\cdot}356$,

$A_c = 48 \times 4 + 9{\cdot}5 \times 6 = 249$,

$$p = \frac{2{\cdot}356}{249} = \cdot 00946$$

$$\begin{aligned} k &= \sqrt{(\cdot 00946^2 \times 15^2 + 2 \times \cdot 00946 \times 15)} - \cdot 00946 \times 15 \\ &= \sqrt{\cdot 30393561} - \cdot 1419 = \cdot 4094, \end{aligned}$$

$$n = 13{\cdot}5 \times \cdot 4094 = 5{\cdot}5269,$$

$$z = \frac{4}{3} \times \frac{3 \times 5{\cdot}527 - 2 \times 4}{2 \times 5{\cdot}527 - 4} = 1{\cdot}622.$$

Owing to the reduction of depth and, therefore, weight, the bending moment will now be 428,851 lb. in.

$$t = \frac{428851}{2{\cdot}356\,(13{\cdot}5 - 1{\cdot}622)} = 15{,}321 \text{ lb. sq. in.},$$

$$c = \frac{2 \times 428851 \times 5{\cdot}527}{48 \times 4\,(2 \times 5{\cdot}527 - 4)\,(13{\cdot}5 - 1{\cdot}622)} = 294{\cdot}6 \text{ lb. sq. in.}$$

This gives a reasonable stress on the steel, but still very low on the concrete, which is usually the case in tee beams, and we may leave it at that.

If the whole rectangle of a tee beam be taken, the suitable bending moment is approximately given by B = 40 $bd^2$, and the reinforcement ·33 per cent. For example, in the present case B = 443,597, the width of tee beam = 48 in., then approximate depth =

$$\sqrt{\frac{443597}{40 \times 48}} = \sqrt{231} = 15{\cdot}2.$$

The slab is 4 in., therefore, projection of rib = 15·2 − 4 = 11·2, and we have taken 11 in. The sectional area of 48 × 11 = 528 sq. in., and ·33 per cent. of this is $528 \times \frac{\cdot 33}{100} = 1{\cdot}74$ sq. in., for which we have taken three ⅞ in. rods = 1·8 sq. in.

*(To be continued.)*

# The Week's News

*A London Hospital to be Rebuilt.*

It is proposed to rebuild the Eye Hospital, Marylebone Road, N.W., at a cost of £30,000.

*The Late Sir Ernest George's Estate.*

Sir Ernest George, R.A., left £32,019. The executors may select drawings not exceeding thirty and give them to his friends.

*Ideal Home Exhibition.*

The next Ideal Home Exhibition—the seventh of the series—is to be held at Olympia, London, from March 1 to 24.

*Whitby War Memorial Hospital.*

£10,804 has been subscribed towards the proposed hospital at Whitby. A site has been secured of over 3,000 acres, at a cost of £3,000.

*Blyth Welfare Scheme.*

Blyth miners are going in for a big welfare scheme to cost over £12,000. It is proposed to build a large hall to seat 500 people, a library, and reading, billiard, and ball rooms.

*The International Air Congress.*

The president of the R.I.B.A. has nominated Major Harry Barnes, F.R.I.B.A., to represent the Royal Institute on the General Council of Honour in connection with the International Air Congress, 1923.

*The National Gallery.*

The fire proofing of the roofs of rooms IX and X of the National Gallery has now been completed, and the rooms have been re-opened. The whole of the galleries at Trafalgar Square are thus made available for the first time since the war.

*Proposed Tunnel at Amsterdam.*

It is reported that the Advisory Committee for Public Works of the Corporation of Amsterdam has decided to advise the municipality to lay a tunnel for traffic under the Y, the river communicating with the North Sea canal from Amsterdam to Ymuiden.

*Public Contracts.*

Sir Eric Geddes, President of the Federation of British Industries, has addressed a letter to the Prime Minister, urging upon the Government the importance of placing public contracts, both national and municipal, in the United Kingdom.

*The R.I.B.A. and the Wren Bicentenary.*

The Council of the R.I.B.A. have decided that the annual dinner for 1923 shall take the form of a banquet in connection with the bicentenary celebration of Sir Christopher Wren. The dinner will be held on February 26 at the Hotel Victoria, Northumberland Avenue, London. In place of the usual after-dinner speeches addresses will be delivered by the president, Sir Reginald Blomfield, R.A., and Mr. Mervyn Macartney, F.S.A., dealing with the various aspects of Wren's life and achievements.

*The Tombs of the Kings at Luxor.*

Professor Percy E. Newberry will deliver a lecture on "The Tombs of the Kings at Luxor" in the Lecture Theatre of the Victoria and Albert Museum, on February 9 at 4 o'clock. The number of applications for tickets for the lecture is considerably in excess of the number of tickets available. In consequence, no further applications for tickets can be entertained.

*House Builders' Demand.*

A national housing programme is outlined in a manifesto which has been issued by the National Federation of House Builders. The federation declares that the first step towards a resumption of building is the removal of "the exacting restrictions now imposed by the Rents Restriction Act," which, it is claimed, has intensified the housing shortage.

As some assistance is necessary at present to build houses for the working classes, the Federation advises a cash subsidy to the owner of any new house of an approved type, or, alternatively, an exemption from local rates for a period of years.

*Patents in 1922.*

Messrs. Rayner & Co., of Chancery Lane, London, patent agents, inform us that during 1922 there was an increase of more than 300 patent applications over the previous year. The figures were about 35,500, the second highest on record. For "Wireless Telegraphy" there was a considerable increase in the number of inventions, as there was for reinforced concrete building construction. Numerous patents were taken for labour-saving devices for the household. Aviation patents have gone entirely out of favour and show a considerable decrease. Recent months show a distinct inclination to increasing business in H.M. Patent Office, which should be an indication of better industrial times, as inventions nearly always precede improvements in commerce.

*Mr. W. Haywood on Guide Books.*

"The greatest mistake of our guide books is that they do not stress the things in which we excel or are unique." This statement was made by Mr. William Haywood, F.R.I.B.A., in a lecture at Birmingham. He said that the pre-Raphaelite work in the Art Gallery, the Burne-Jones glass in the Cathedral, the work of the Birmingham School in painting, book illustration, and jewellery; the Shakespeare library, the Watts' collection; illustrations of some examples from each of these, and a simple but scholarly description of the whole, would strike a really distinguished note. These were the treasures peculiar to Birmingham, and they had not made enough of them. They might add to this list—among other things—those portions of arterial and ring roads now completed. These were good evidence of a progressive spirit and of a greater Birmingham. The work of the Repertory Theatre was the work of Birmingham men, and work to be proud of. Let the stranger be told and shown these things attractively, for without them he could not properly grasp what Birmingham meant.

*The British Empire Exhibition.*

Passengers through Wembley by the Metropolitan, Great Central, and London and North Western railways, although they miss the old Watkin Tower, so conspicuous though never finished, have a new landmark in the Empire Stadium. This great steel and concrete structure stands on the crest of the hill in the parklands once owned by the monks of Kilburn Priory. It is built, in fact, on the very site of the old Watkin Tower. But it is not the Stadium alone that informs railway travellers of the site of the exhibition. Great hoardings now proclaim the fact at every one of the four local stations—one at Wembley Park on the Metropolitan line, two of 40 ft. by 15 ft. at the Wembley-Sudbury Station (L. & N.W.R.), two others of the same size on the same company's North Wembley Station (Euston to Watford), and the largest of all, 80 ft. by 12 ft., on the Great Central Coy.'s Wembley Hill Station. At the fifth local station notice boards will not be necessary; it will be actually within the exhibition grounds. An illustrated article by Mr. Percy Marks, Licentiate R.I.B.A., dealing with the progress of the exhibition was published in a recent issue.

## The Chevalier's House, Exeter

On page 246 we illustrate the Chevalier's House, which is to be sold under an order of the Chancery Division, by Messrs. Debenham, Tewson, and Chinnocks (Cheapside). James Crocker, the architect, regarded the house as "by far the best example of seventeenth-century work in Fore Street, Exeter. The architectural features are as faithfully preserved as when first fixed in place." The oak panelling has been painted, but that could be easily remedied, if desired. The original winding oak staircase leads to what must have been the "withdrawing room." The timbers of the ancient window frame, in the first floor, have the marks of the adze with which the carpenter worked. The plaster ceiling is one of the earliest of the more elaborate style, and it is not the only specimen of early ornamental plastering in Exeter. There is an old secret recess, concealed by panels.

## Clay as a Building Material

Mr. H. J. C. Johnston, president of the Institute of Clayworkers, in a lecture at the London Polytechnic on "The Story of Clay," illustrated his remarks by cinematograph films of various brick and terra-cotta works. The "Brighter London" movement, he said, had created renewed interest in ceramic constructional materials for city buildings, as terra-cotta and glazed bricks were the only materials of a permanent character by means of which colour in architecture could be introduced. Mr. Halsey Ricardo and others had shown how the quiet shades of ceramic material, used with stronger colours in special features, could produce highly artistic results.

Although glazed bricks had been very effectively used for the elevation of a number of London buildings, the principal part they had to play in brightening life was to aid sanitation and general welfare by their use in factories, areas and wells of office blocks, hospitals, schools, swimming baths, railway stations, etc. The English manufacturers of glazed bricks had reached a standard unequalled by those of any other country, and their products had been used extensively in all parts of the world. Mr. Johnston gave interesting data on the comparative durability of clay and other constructional materials, and pointed out that the materials the use of which he was advocating were absolutely fireproof.

## Mr. Albert Rutherston at the A.A.

"The Artist Craftsman in the Theatre of To-day" was the subject of discussion at last week's meeting at the Architectural Association. Apparently the subject is a painful one; speaker after speaker dwelt on the gloomy nature of the present outlook.

We really had no theatre in this country to design for, said Mr. Rutherston. Until we had something stable—a theatre independent of accident, or passion, or chance, or stockbrokers, and supported by the country, as the police, Navy, and Army, were supported—we should not reach a higher standard either in acting or design. There were very talented actors and actresses, and also designers; but those who stood for finer things in art had to compromise. If we had in this country a permanent national theatre in which people interested in stage-designing could work and experiment, they might be able to do great things; but, as matters stood, it scarcely seemed worth while, and he saw no career before the architectural student who thought of taking up designing for the theatre.

Mr. C. W. Ellis thought the suggestion that we might take a few risks with the Army and Navy in order to get a better theatre was worth consideration. The way to get a finer theatre was to work together to make the mere commercial productions a failure, and in order to do that it was necessary to catch the critics, who had considerable influence, but who, unfortunately, were for the most part unfit for their job.

Mr. Geoffrey Whitworth said it was almost tragic that the modern theatre was unable to make use of the undoubted talent which existed in many quarters, and which could raise it from the rather disreputable place it occupied to something delightful. There were productions like the "Beggar's Opera" and "Polly" which owed a great deal to the pioneer work of the band of artists who, before the war, under Mr. Granville Barker, were showing English people what could be done in the theatre; but, in general, theatrical production had not improved from the purely æsthetic point of view. He suggested that architects should take the matter in hand and build a national theatre in London, in which they could incorporate all their highest ideals.

Mr. W. J. Turner thought that Mr. Rutherston erred on the side of idealism. Ninety-nine per cent. of the potential architects present would be bad architects. (Laughter.) This was regrettable, but true. Let them leave out the question of inspiration, but help with organization; each individual must decline to support a bad theatre or a bad play.

Mr. C. W. Ellis asked how architects were to get employment in the theatre.

Mr. G. Norman thought that architects should design theatres, but that the decoration should be left to craftsmen like Mr. Rutherston.

## Town Planning

The Minister of Health thinks it desirable, in connection with the administration of the Town-Planning (General Interim Development) Order, 1922, to issue some further guidance to local authorities. If there is not an approved town-planning scheme in force local authorities have now power to prevent development which complies with the by-laws or other statutory provisions in force. The Minister considers that the presumption should always be in favour of the person who wishes to undertake development. Town planning is new, and it would not be right to attempt so close a control at the early stages as may later be warranted. It is highly desirable that cases should be settled locally.

## R.I.B.A. Council Meeting

Following are notes from the minutes of the last meeting of the Council of the R.I.B.A.:—

Unification and Registration.—The Council received a deputation representing the members of the former Unification and Registration Committee and consisting of Mr. H. T. Buckland (F.), chairman of the Conference of presidents of the Allied Societies; Mr. E. J. Sadgrove (F.), former vice-president of the Unification and Registration Committee; and Major H. C. Corlette (F.), representative of the architects in Australia on the committee. The deputation urged the Council to permit the committee to complete its work and present a report. The Council decided not to accede to this request.

British Non-Ferrous Metals Research Association.—The Council made the usual annual grant of £10 in aid of this research.

Tenders without Quantities.—The Council, on the advice of the Practice Standing Committee, decided to make a protest to the Margate Corporation against its action in inviting tenders for a building costing £20,000 without supplying quantities.

The Rent Restriction Act.—It was decided to make representations to the Rent Restriction Act Committee with regard to the hindrance to large building operations which is caused in some cases by the working of the present Act.

Brechin War Memorial Competition.—Members and Licentiates of the Royal Institute of British Architects must not take part in this competition, as the conditions are not in accordance with the published regulations of the Royal Institute for architectural competitions.

R.I.B.A. Prizes and Studentships.—The report of the Board of Architectural Education on the award of the R.I.B.A. prizes and studentships was approved.

# London Building Work

*Following is a list of the building work which has been, or is about to be, started upon, in the Commercial Road East area of London:—*

| JOB. | ARCHITECT. | BUILDERS. | WORK. |
|---|---|---|---|
| Messrs. Charrington, Ltd., Anchor Brewery, Mile End Road. | Messrs. Bradford and Sons, 12 Regent Street, W. | Messrs. F. and H. F. Higgs, Ltd., Station Works, Hinton Road, S.E.24. | Extensive additions and alterations, vat house and plant. |
| 97 Mile End Road. | Mr. F. S. Coles, 40 Craven Street, W.C.2. | Messrs. Franks and Simons, 354 Mile End Road. | New building, restaurant and flats. |
| Messrs. Wickham, Ltd., 65 &c., Mile End Road. | Messrs. Jay Evans and Son, 34 High Holborn, W.C.1. | Messrs. Parker and Sons, Ltd., 124 Sumner Road, S.E.15. | Extensive additions and alterations to drapery establishment. |
| Messrs. Mann, Crossman, and Paulin, Ltd., Brewery, Raven Row. | Mr. William Stewart, 4 Aldgate, E.C. | Messrs. Holland and Hannen, Belvedere Road, S.E.1. | New steel-framed building, bottling stores. |
| Ford Motor Co., Ltd., 39 Commercial Road. | Mr. E. H. Abbott, 6 Warwick Court, W.C.1. | Messrs. Fram, Ltd., 135 Grosvenor Road, S.W.1. | New reinforced concrete building, garage, etc. |
| Jewish Hospital, Stepney Green. | Messrs. Joseph and Sons, 2 St. Paul's Bakehouse Court, E.C.4. | Messrs. Gaze and Sons, Ltd., 23 High Street, Kingston-on-Thames. | Additions—laboratories. |
| Seamen's Hostel, Commercial Road. | Messrs. Daniel and Parnacott, 36 Victoria Street, S.W. | Messrs. G. E. Wallis and Sons, Broadmead House, Panton Street, S.W. | New steel-framed building. |
| Messrs. Hubbucks, Ltd., Broad Street. | Mr. E. J. Gosling, 1 Verulam Buildings, Gray's Inn. | Messrs. Curtis and Sons, 24 White Horse Street, E.1. | New reinforced concrete building, chemical manufacture. |
| Electric Power Station, Harrow Street. | Stepney Borough Council, Mr. Bernard J. Belsher (engineer). | Messrs. J. Jarvis and Sons, 8 Wormwood Street, E.C.2. | Additions and suction plant. |
| Messrs. Lendrums, Keepier's Wharf, Harrow Street. | Mr. Victor Jackson, 4 Finsbury Square, E.C. | Messrs. Walter Jones and Sons, 64 Victoria Street, S.W. | New reinforced concrete building, paper warehouse. |
| 86A White Horse Street. | Mr. J. C. Codrington, 191 Bishopsgate, E.C. | Messrs. Shurmur and Sons, Ltd., Riverside Works, Upper Clapton, N.E. | New building, club. |
| 438 &c., Mile End Road. | Mr. C. A. Aish, 22 Bedford Street, W.C. | Messrs. Cohen Bros., 103 Mile End Road, E. | New building, shops and flats. |

## London County Westminster and Parr's Bank

The annual ordinary general meeting of the shareholders of the above bank was held at the head office, 41 Lothbury, E.C., on Thursday of last week. Mr. Walter Leaf (the chairman) presided.

The chairman said it was with somewhat mixed feelings that they must all look back upon the year through which they had just passed. The year had been for this country one of stabilization. Fiscally we had been engaged in stabilizing the £. This had been effected by just balancing the Budget and leaving nothing over for the payment of debt. We had thus avoided adding to the suffering involved in deflation, and had escaped the far greater evils which accompanied inflation, ills of which Germany was at present giving us a terrible example. The result of this policy was that prices during 1922 had been remarkably steady, and the purchasing power of the £ had been stabilized. Having detailed factors which went to show that we were on the way to recover through reduced prices the position we held in international trade before the war, the chairman went on to speak of the dark cloud of unemployment, which he showed was essentially a world phenomenon.

Of course, we felt the burden of taxation which honesty involved, and so far as the urgent cry for relief took the form of an insistence on reduced expenditure—the one means by which taxation could be legitimately reduced—it must have all our sympathy. But when one saw suggestions that we should not attempt to pay our way, that we should accept a deficit in the Budget and borrow the money in order to relieve the burden of the moment by throwing it vaguely somewhere on the future, then it was time to raise the voice of protest.

The immediate problem of unemployment depended on the prospect of such an early improvement in trade and industry as would afford the natural, and therefore most efficient, remedy for the present troubles. The Continental outlook at least was not encouraging. Having commented on the position farther East—in Russia, China, and India—the chairman went on to say that, in spite of the adverse conditions, there were definite signs of a strong trade revival which was already doing something to diminish unemployment here, and seemed likely before long to do a great deal more.

Finally, the chairman referred to the internal affairs of the bank, and dealing with the bank's balance sheet, he said, like all other institutions, they showed a diminution in the amount lodged with them. This he did not regard as evidence of continuing deflation, though it was the result of deflation in the past. The fact that prices had remained steady, with a slight tendency to rise, was, in itself, a proof that there had been no deflation during the past year. Their total profits showed a shrinkage, but this again was an experience the bank shared with its competitors; but on the whole the shareholders would, he hoped, feel that the results were not unsatisfactory. The year had, for pure banking profits, been rather a lean one, but, on the other hand, the appreciation in the value of investments had made up behind the scenes for a good deal that they had missed in other ways.

The report was unanimously adopted, and other formal business transacted.

At a special meeting, which followed, an extraordinary resolution was submitted to change the name of the bank to "Westminster Bank Limited." The chairman said that there was no part of their name to which a certain amount of goodwill did not attach, and there was not a word in their long name which they could surrender without a certain amount of regret. It was only because they strongly felt that the advantage of shortness outweighed the value of any part which they gave up that they put the resolution before the shareholders. The resolution embodying acceptance of the change of name to "Westminster Bank Limited" was agreed to.

A cordial vote of thanks to the chairman closed the proceedings.

## Coming Events

*Wednesday, February 7.*

Northern A.A.—Visit of the R.I.B.A. president, Mr. Paul Waterhouse, Annual Dinner, County Hall, Newcastle.

Royal Academy.—"The Influence of the Arts and Crafts Movement on Architecture." By A. R. Powys.

Institution of Structural Engineers.—Annual Dinner.

*Thursday, February 8.*

R.I.B.A. Chadwick Lecture.—"London's Unhealthy Areas: the Possibility of their Elimination." By G. Topham Forrest.

Institute of Mechanical Engineers, Midland Branch. — "Escalators." By Cyril Poole.

Birmingham Town-Planning Lecture. —"The Importance of Environment." By John Robertson, C.B.E., M.D., B.Sc.

University of London Public Lecture on "The Acoustics of the Auditorium." By G. A. Sutherland, M.A. 5.30 p.m.

*Friday, February 9.*

Royal Technical College Architectural Craftsmen's Society.—Open night.

Town-Planning Institute.—"Relation between Health and Site and Use of Site." By Professor F. E. Wynne, M.B., D.P.H.

*Saturday, February 10.*

A.A. Visit to Westminster Hall Roof.

*Tuesday, February 13.*

Art Workers' Guild.—Annual Shrovetide Revels.

### *The Institution of Structural Engineers' Annual Dinner.*

The annual dinner of the Institution of Structural Engineers is to be held at the Savoy Hotel to-day. Speakers will include Lord Riddell, Mr. Justice Darling, Major-General Sir Sefton Brancker, K.C.B. (Director of Civil Aviation), Sir Charles Ruthen (Director-General of Housing), and the Rev. F. H. Gillingham (the Essex cricketer). As on former occasions, the seating accommodation (250) has already been over-subscribed for by the members, and in future years it is hoped to find some banqueting hall to seat 500.

## List of Competitions Open

| Date of Delivery. | COMPETITION. |
|---|---|
| Feb. 28 | Scheme for the distribution of drinking water for the town of Mantes-sur-Seine. Apply Mairie, Mantes, or at the offices of La Renaissance des Cités, 23 Rue Louis le Grand (11c). Premiums: 4,000, 3,000, and 2,000 francs. |
| March 31 | War Memorial for Port Said, Egypt, to the memory of the soldiers of the Australian and New Zealand Forces who fell in Egypt, Palestine, and Syria during 1916, 1917, and 1918. Premiums: 250 guineas, 100 guineas, and 50 guineas. Apply High Commissioner for Australia, Australia House, Strand, W.C. |
| March 31 | War Memorial in Crow Nest Park, Dewsbury. Assessor, Professor C. H. Reilly, O.B.E., M.A., F.R.I.B.A. A copy of the conditions together with plans of the site may be obtained on application to Mr. H. Dearden, A.R.I.B.A., Borough Surveyor, Town Hall, Dewsbury. on payment of one shilling. |
| June 30 | Bridge over Nygaardsstrommen in Bergen. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, S.W. 1. |
| No date | New Town Hall for Cork. Limited to Architects living or practising in Ireland. |
| No date | Concert Pavilion to seat approximately 2,000. Estimated cost £100,000. Assessor, Sir Edwin Cooper, F.R.I.B.A. Premiums: £300, £200, and £100. Apply Town Clerk, Municipal Offices, Bournemouth. Deposit £2 2s. (cheque). |
| No date | The Crown Agents for the Colonies, acting on behalf of the Government of the Straits Settlements, invite competitive designs for the reinforced concrete work required in connection with the construction of a new general post office at Singapore. Tentative designs, for which no fees will be paid, are required in the first instance, from which it is proposed to select a design and specify its adoption in the contract for the construction of the building. The firm whose design is so adopted will be subsequently engaged to prepare full detail plans, specification, quantities, &c., for an approved fee. Drawings can be seen and further details of the competition obtained from the Crown Agents for the Colonies, 4 Millbank, Westminster, S.W. 1, quoting Z/Straits Settlements 5664. |

## Competition News

### *Salford Union Homes.*

The plans of Mr. Charles Swain, Manchester, for the erection of homes on land adjoining the Salford Union Infirmary at Hope have been approved by the Board. The estimated cost of the buildings is £48,454.

### *Colombo Town Hall and Municipal Buildings Competition.*

The following awards have been made in the competition for the proposed new municipal offices for Colombo: First, Mr. Joseph Edwards, M.A., A.R.I.B.A.; second, Mr. W. H. Bourne, F.R.I.B.A., assistant consulting architect to the Government of the United Provinces, Allahabad.

### *Hills Estate, Douglas, Competition.*

The design of Mr. N. H. N. Darby, P.A.S.I., of Liverpool, has been awarded first place in the Hills Estate, Douglas, Isle of Man, competition. The second place was secured by Mr. Ewart Crellin, of Douglas.

## Rates of Wages in the Building Trade

During the past month the only alterations made in the rates of builders' wages in the provincial towns were at Salisbury and Stonehaven. In the other towns the rates remain the same as those published in our issue of January 10.

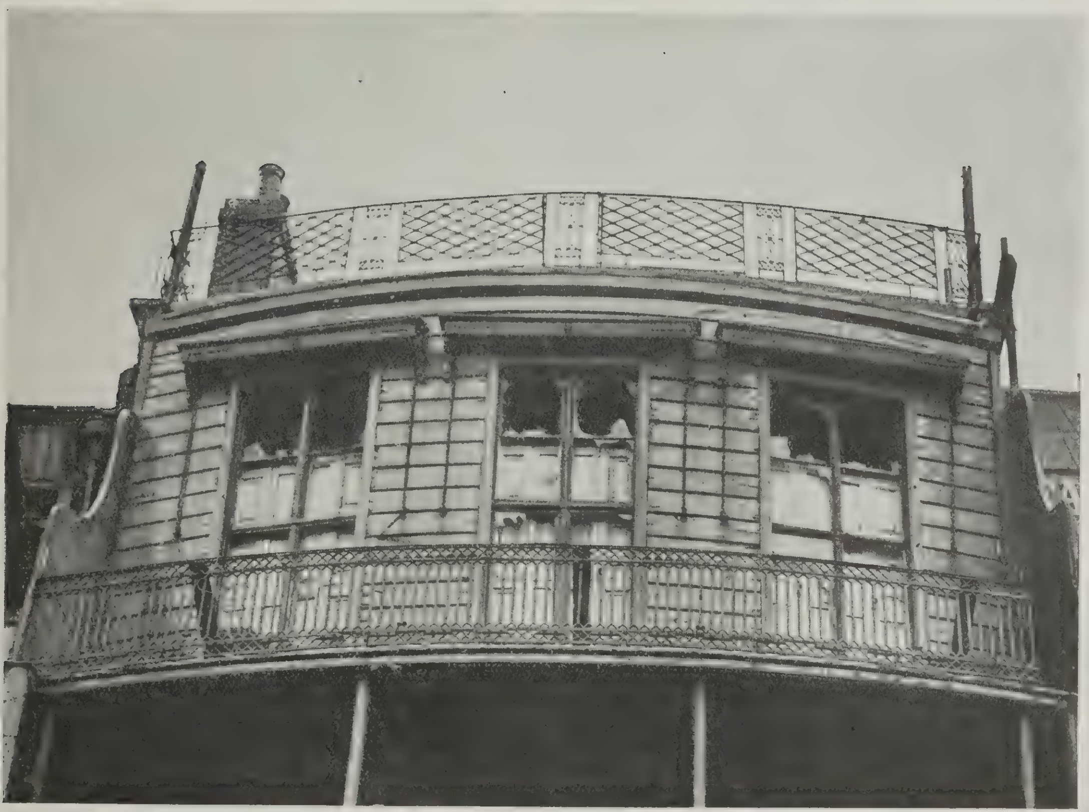
*With which is incorporated "The Builders' Journal."*

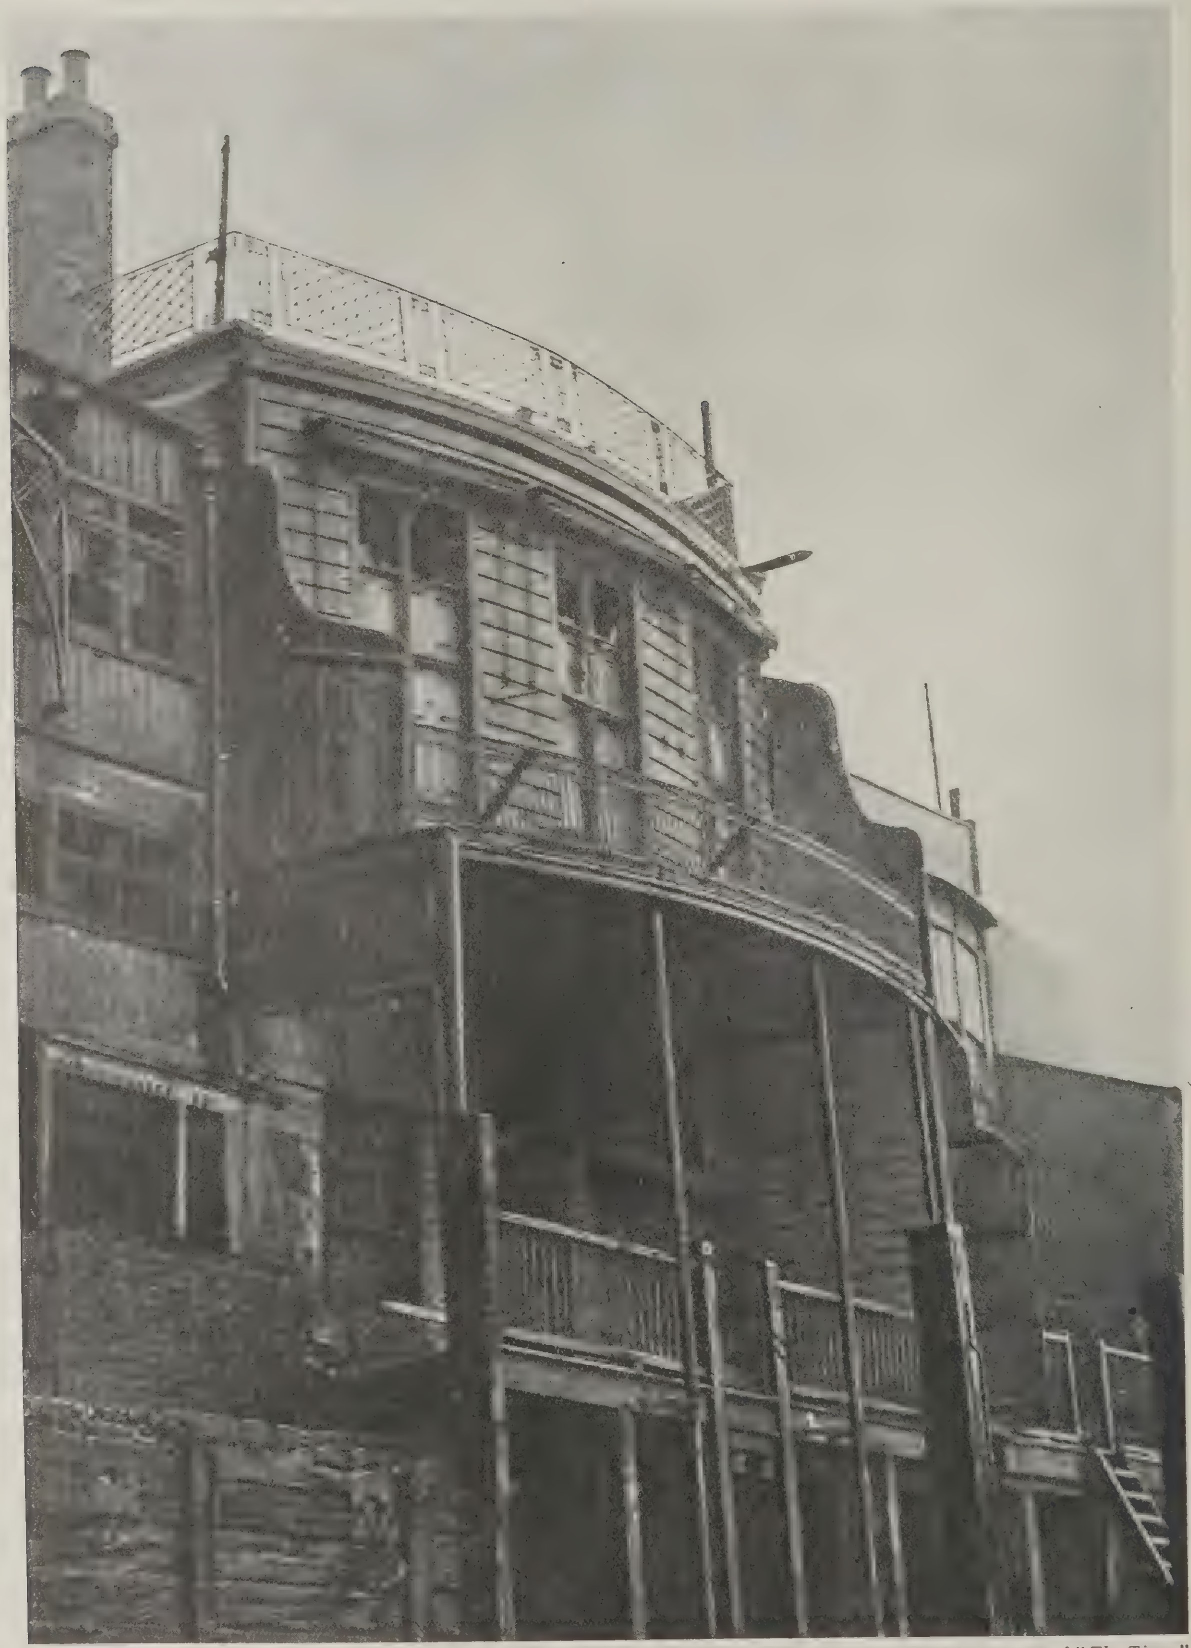


[*Reproduced by courtesy of "The Times."*

A LIMEHOUSE LANDMARK:
THE OLD HARBOURMASTER'S HOUSE, WHICH IS TO BE DEMOLISHED.

27-29 Tothill Street, Westminster, S.W.1.

# Architecture of the Eighteenth Century. 19.—The Old Harbourmaster's House, Limehouse



*[Reproduced by courtesy of "The Times."*

The old harbourmaster's house at Limehouse is marked down for demolition. It is out of use and deserted now, and urchins have flung stones through the glass of the windows. The house is of the Queen Anne period, and was once a handsome structure. The frontage to Narrow Street is probably as the eighteenth-century builders left it, but a big room, with curved French windows giving on to a balcony overlooking the river, was probably added in Georgian days. There is a flat roof with a decorative protecting grille.

# Why not a Publicity Campaign?

PUBLICITY has become an integral part of the fabric of modern organization. No one, neither monarch nor tradesman, politician nor actress, can afford to dispense with it. A well-known and popular author was once heard to exclaim, "I do not feel *safe* unless my name appears in at least one paper every day." In the turmoil of modern life the insistent hammer-beat of the publicity agent is essential to keep the public up to the mark, whether it be to buy a patent pill, to visit a farce, to read the best-seller, or to vote for a politician. The excuse for the procedure, which is one that must be objected to by many more sober-minded citizens, is that it works. People do buy the pills, visit the farce, read the best-seller and vote for the politician. The actual mental process entailed must be left to the psychologist to explain; the end is said to justify the means, and the means vary. They vary from blatancy of illuminated sky-signs to the subtly-worded news paragraphs, from the polychromatic hoarding to a photograph of the quiet "home-life," from systematic circularizing to a parade of strange sartorial sandwichmen, and from sporadic stunts to carefully organized campaigns.

If a trade or an organization wishes the public to buy its goods, or to patronize its services, it must resort to some sort of publicity. Even those organizations which would appear to have a monopoly cannot afford to dispense with advertisement. It might, for instance, be thought that Londoners must patronize, in their millions, their underground railways, whether or no they are urged to do so by pictorial or statistical posters. So, too, it might be thought that people must build without an external stimulus to urge them to it. Yet we know they are holding back: they have waited so long, that procrastination has indeed become their medium of existence, and if they scent the change of a fall in prices they will defer again. Those who know, however, realize that now is the moment for building—now, and through the coming year. Why, therefore, should not the building trade come into line with other great trade organizations and, resorting to publicity, force home to a pusillanimous public the necessity of building now?

We read of a prolonged publicity campaign which is to take place in America during the coming year on behalf of the book trade, urging, month by month, the American citizen to buy books—books to educate himself and his children, books to entertain and to amuse, books to increase his efficiency and to widen his outlook, books for the fireside and books for the holiday. The American booksellers are combining to strike this note everywhere and to turn every occasion, every season and every event into a cogent reason for book-buying. Yet the book trade is in no way so much in need of patronage as the building trade. Is this not then an example which might be followed on collective lines by the building trade organizations? A persistent note must, by dint of constant reiteration, strike a way into the brain of the British public so that it is finally convinced that now or never is the moment for building!

The exact lines along which a campaign should best be conducted we are not in a position to suggest. There are those who have made publicity their particular study and who know to a nicety what measures and artifices, what subtleties and blatancies to employ in order to influence public action. To such we would leave the actual organization of the campaign. Let it be understood that what we are urging is no mere competitive advertising between firms having similar goods to market or similar services to offer, but a combined undertaking on the part of all building trade organizations to sear into the public consciousness the necessity of building now. Incidentally there are certain misconceptions that might be removed. One is, that there is a particular building season. Modern materials have enabled the modern contractor to transcend the limitations of the seasons, and building operations can now proceed at all times of the year. Another incidental service which such a campaign might perform would be, by implication and suggestion rather than direct request, to persuade every prospective building-owner to employ proper architectural services. Every contractor prefers a job of which an architect is in charge, and although the public, until recently, seemed to be losing sight of the difference in function between the architect and the builder, the nation would soon suffer if it failed to avail itself of services which, by training and temperament, the architect is particularly qualified to supply.

We do not doubt that the result of such a campaign, if conducted on *decent* lines, calculated to stimulate and not to offend (a gentle and determined pressure, rather than a harsh aggression), would be in a very short time an immense increase in building activity. We have only to observe how other undertakings have enlarged their scope by just these means which we are advocating. The underground railways have been cited, gas producers afford another example. The public attitude towards building is just now unique. The desire to build is urgent, yet there is a distinct holding back. This is partly due to temerity and partly to uncertainty as to immediate future conditions in the building trade. The prospective builder-owner fears both a rise and a fall. If there is to be a further decline, he will await its advent before signing a contract; if there is to be an immediate rise during the period of preliminary site negotiations and plan preparations, he would resent his lost opportunity and await once more the downward curve! A well-organized publicity campaign, as distinct from mere individual advertising, would do more than anything else to dispel these fears and promote the necessary confidence.

The building industry is organized upon such thoroughly sound and comprehensive lines (it might, indeed, afford an example to other industries) that there should be no difficulty in conducting such a campaign as we have in mind. The Building Trade Exhibition is a publicity undertaking that is immensely appreciated, although its appeal is more to a special than a general public. It might, however, form the basis of a prolonged campaign directed towards the general imagination and made to include every person as a potential builder-owner: the artisan no less than the captain of industry, the village tradesman no less than the vast corporate body, the suburban dweller no less than the landed proprietor. The reverberations of such a building revival as might result from such a procedure would be immense, for the ramifications of the building trade extend through decoration to household equipment and furnishing. Thus a real and important step would be accomplished towards the establishment of a general trade revival which it is the hope of every one of us to see during the coming year.

---

## Salisbury's Spire

The spire of Salisbury Cathedral, which has reared its 404 ft. of height above the valley of the Avon for 600 years, is believed to be unsafe, and Messrs. Forsythe and Maule have been appointed to overhaul it. Many years ago it was found to be 23 in. out of the perpendicular, but this was not regarded as a dangerous inclination. It is now feared, however, that the vibration caused by heavy motor traffic has seriously endangered its stability. Salisbury spire, though exceeded in height by Amiens (422 ft.) and by Strasburg (488 ft.), is infinitely more lovely than these lofty rivals. It grows easily and naturally out of its tower and its tapering lines are as perfect as may be. The timber framework erected as a scaffold during the progress of the building still remains inside the spire and helps to strengthen it. It is arranged in nine stages and weighs about 15 tons. Much interesting information on the construction of the spire, as well as many plans and other drawings, are given in Francis Price's "Antiquities of Salisbury," 1774.

## The New Building Guild

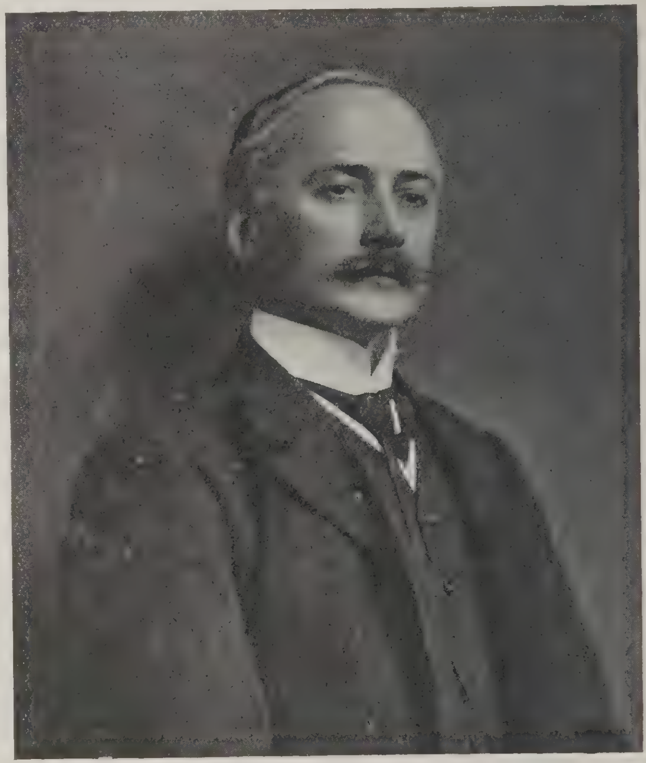
Like the phœnix the Building Guild arises from the ashes of its dead self. "Guild Housing, Limited," is the title under which a number of new Guild contractors, with offices and works at Acton, return to their arduous enterprise. A standard code for Guild contractors has been drawn up and provides, *inter alia*, for the hiring of capital at a fixed rate of interest without powers of control, but subject to withdrawal at suitable notice; for the payment of wages, as far as possible, during bad weather and for holidays; and for the allotment of all surplus earnings to the improvements of service. Administration is on a salary basis. The Guild system, as the promoters frankly admit, has yet to prove that it can not only hire capital successfully, but can also do more efficient work. The new experiment will be watched with interest.

## Protecting the Past

Why is it that those proposing to erect big buildings in London nearly always try to get hold of a site that is already occupied by something of architectural and historical value? There are many, many square miles of ground in London covered by third- and fourth-rate property that is crying out to be replaced; yet this is all passed by as though it did not exist. Covetous eyes seem to turn instinctively towards the things that all well-disposed people wish to preserve. The Masons propose to erect a great temple, and promptly decide to buy up the Adelphi; commercial people want sites in the City, and craftily they tempt the needy Church with offers of much gold for the City churches; a cinematograph company wish to build a picture house, and straightway make assault upon the secluded precinct of a venerable square. Are these people actuated by what Edgar Allan Poe would have called "The Imp of the Perverse," dealing destruction all around in mere malevolent delight of so doing; or are they merely indifferent to all interests except those of personal glorification or money-making? The latter, we fear, is the true explanation. Not till the idea of communal interest and responsible citizenship is generally apprehended may these onslaughts be expected to cease. Until then it is the duty of all who have a respect for our architectural heritage to band themselves together against the invader.

## Sir John Burnet: Royal Gold Medallist

The nomination of Sir John Burnet, A.R.A., R.S.A., F.R.I.B.A., for this year's Royal gold medal will give general satisfaction. It was a foregone certainty, indeed, that Sir John would one day receive the medal; his record of work accomplished clearly marked him out for this high distinction. Sir John Burnet is one of the most predominant and pervasive architects of his time. By example he has done probably more than any of his contemporaries to re-establish a sane tradition of British architecture. He possesses in a rare degree the power of expressing modern structure in truly significant architectural form—an ability that is probably traceable to the fact that while at the Ecole des Beaux-Arts he studied engineering as well as architecture. The natural and perhaps inevitable expression of this training was the Kodak Building in Kingsway—an essay in pure form. But Sir John's reputation is far from depending upon one building; to his credit stand many works of rare architectural distinction both in England and Scotland. In London we have the great British Museum extension, the insurance building in Aldwych, and the giant Adelaide House at London Bridge, now in course of erection—a magnificent architectural treatment of a modified skyscraper—besides many other buildings of lesser importance. In Scotland Sir John's works are legion; among them may be mentioned the Royal Institute of Fine Arts, the Athenæum, the Barony Church, the Infirmary extension, Atlantic and Waterloo Chambers, the Union Bank of Scotland Head Office, all in Glasgow, and many others. One of Sir John's most recent tasks has been the design of some forty war cemeteries in the East for the Imperial War Graves Commission. Sir John was born in Glasgow, the son of an architect, sixty-four years ago. After studying at the Beaux-Arts he travelled in Germany, Italy, and America. Besides the distinctions given above he has those of Hon. LL.D. (Glasgow), and F.S.A. (Scot.). He is also a member of the Société Generale des Architectes Français, and of the American Institute of Architects.



SIR JOHN BURNET, A.R.A., R.S.A., F.R.I.B.A.

# Registration of Architects

### By "OBSERVER"

I CANNOT go back so far as Mr. Middleton and claim to have had a share in drafting the earlier Registration Bills, but I remember the time when any mention at the Institute of Registration or of the Society of Architects was as a red rag to a bull. That was long ago, and the Society began to reap its reward for long and consistent advocacy of the cause when the Institute became converted to registration and began to look about for means by which to accomplish its end.

It was about the time when Mr. Leonard Stokes was president of the Institute and the late Mr. George Bond was president of the Society that the Society of Architects purchased the lease of its premises in Bedford Square. Whether this was taken by Mr. Stokes as an indication that the Society had also entered on a new lease of life, which it was not likely readily to relinquish, I do not know, but the fact remains that the president of the Institute was present at the opening of the Society's new premises, and that shortly afterwards the first feeler from the Institute as to the possibilities of some alliance with the Society on the registration question was put out. This was followed by a tentative agreement between the councils of the two bodies as to the terms of a Registration Bill in principle, and of the conditions under which the members of the Society were to be absorbed into the Institute.

Presently, and for the first time, the president of the Institute was a guest at the Society's annual dinner, which function was generally looked upon at that time as the Society's last of its kind, in view of Mr. Leonard Stokes's statement on that occasion that if there was any honour in the Institute the agreement between the two councils would be ratified by the R.I.B.A. Unfortunately for Mr. Leonard Stokes's reputation as a prophet, the council of the Institute discovered at the eleventh hour that it had no power to enter into an agreement with the council of the Society, which latter body was then on the eve of passing a winding-up resolution.

If these negotiations did nothing else they afforded opportunities for the architectural wits of the day to allude to "flirtations with a flapper" and the coming "bond of union," and no doubt it was this sense of humour which prevented the termination of the negotiations from being taken too seriously at the time, and opened the way to much friendly intercourse between the members of the two bodies, which resulted in clearing away a great deal of misunderstanding and in keeping ajar the door to future conferences on this subject.

It was the circumstances caused by the outbreak of war which followed fast on the breakdown of the negotiations referred to that led to the members of the two organizations working still more closely together on many of the committees which were organized to meet the emergencies of the time, and when hostilities ceased the two bodies were probably in closer relationship in regard to professional matters than at any other time.

It naturally followed that when the Institute was able again to take up the thread of its work in regard to registration, it turned once more to the Society, this time with an invitation to join the Unification and Registration Committee, charged with the duty of drawing up a plan for the unification and registration of architects. The Society came to the conference with a proposal already agreed in principle by its council for the accomplishment of registration by federation, and it was the secretary of the Society who was selected to submit the federation proposal in detail at the same time that the honorary secretary of the Institute was entrusted with the task of submitting an alternative one for getting the whole of the architects in the kingdom into the Institute as a preliminary to registration. From its earlier experience the Society saw the snag in the Institute's proposals, viz., the difficulty of absorbing the members of other bodies and unattached architects into an organization the large majority of whose members were very naturally jealous of the privileges they had obtained after much tribulation.

The committee, however, preferred the Institute scheme, and the Society's representatives, desirous for unity and prepared to subordinate their views if registration could be obtained by other methods, threw in their lot with the majority and worked in support of a proposal which obviously meant the end of the Society by the absorption of its members into the Institute. The Society's representatives proved to be better prophets in their way than was Mr. Leonard Stokes in his, because the position which they foresaw came to pass when dissensions arose between some of the Institute's representatives on the committee, who very strongly objected to "dilution" of the Institute membership by architects who, it was supposed, were to be admitted on preferential terms. The result was that a minority party of the committee, being very much more businesslike than the majority, adopted such tactics as ensured the overthrow of the existing R.I.B.A. Council and the substitution of a new council pledged to registration before unity and the immediate production of a Registration Bill.

The first tactical mistake which the new council made was to alienate many of its friends within the Institute by purporting to disband the Unification and Registration Committee and to discharge its members, the large majority of whom had been appointed by other constituent bodies. Its next tactical error was to draft and present a Registration Bill without consulting other interested parties, and in the meantime to turn down a request from representatives of the Unification and Registration Committee that the committee might be permitted to complete the work which it had been entrusted with on behalf of the whole profession. The logical outcome of all this was that when the draft R.I.B.A. Registration Bill was presented to the Institute meeting on January 29 a resolution was passed that the Bill be not considered until the other architectural bodies and interests had been consulted.

The present position, therefore, is not due so much to any inherent defects which may exist in the R.I.B.A. draft Bill, because there was little or no discussion at the Institute meeting on the Bill itself, but the position is due rather to the manner in which the whole affair has been mishandled on questions of procedure and policy by the council of the R.I.B.A. This is a matter which can very easily be adjusted, and if the final result is the presentation to Parliament of an agreed Registration Bill, no one will grudge the time which has been expended, but not necessarily wasted, in dealing with the matter so far.

The air has been cleared to the extent of demonstrating that the Institute cannot hope to achieve registration except by the good-will of all concerned, and it seems clear that we must approach the problem afresh, and it would be well to do so this time as architects, and not as bodies representing professional men enclosed in water-tight compartments indicating varying degrees of qualification. We are architects first and members of architectural bodies afterwards, and if we can get away from the idea that bargaining for terms of registration and membership between professional bodies is a necessary precedent to registration we shall have gone a long way to securing that unity of thought and action which is an essential preliminary to the achievement of statutory registration.

If some of us in the process are called upon to make what we may consider to be sacrifices, are these not in reality more apparent than real? Are we likely really and permanently to suffer by including in a Registration Bill, as we must do, all bona-fide practitioners of architecture whether they come up to our personal standard of qualification or not? Are these not much more of a menace to us and to the profession generally if they remain outside the fold than they would be if they were brought within its discipline, and is it not better that they should be brought in and controlled rather than be left as free lances who can and do compete with us on very much better terms from outside than they could from inside?

If we hope to attain registration we must protect all vested interests whether we like it or not, and the sooner we do it the better. If the Institute had taken up registration and accomplished it years ago, as it might have done, we should by this time have been wondering why in the past we made mountains out of molehills instead of making one bold bid for success.

The present situation is that of two architectural bodies both pledged to registration in principle, and therefore neither of them desirous of opposing the other on points of detail if it can be avoided. In fact, the only point at issue is one of detail, and inasmuch as the Institute and its allied societies are one body for all practical purposes, and the Architectural Association is closely associated with the Institute and has contracted itself out of architectural politics, the whole matter is narrowed down time after time to the question of an agreement between the Institute and the Society on registration. This being so, and the Unification and Registration Committee having proved to be an unwieldy body largely dominated by the Institute and torn by dissensions amongst the Institute representatives thereon, the way out of the present *impasse* would seem to be in the direction of a small joint Registration Board of the R.I.B.A. and the Society formed to settle their differences on points of detail and to produce an agreed Bill for the registration of architects as such, and not a measure complicated by or dependent on any proposal for a closer union between the two bodies than is indicated by a joint Registration Board.

The advantage of this would be that all contentious points relating to transfers of members, etc., would be ruled out, and each body, while giving due attention to the registration question in the interests of the whole profession, would be free to devote much time, now wasted in controversy on matters which are not essential to the accomplishment of registration, to the development of their respective activities in other directions, such as education and other pressing problems of particular urgency affecting their own members and the profession as it exists at present. The chances are that this joint work on registration would probably lead to joint action in other directions in matters of professional interest, and the energies of the two bodies would become more co-ordinated and conserved while each would preserve its autonomy and continue to fill that useful place in the profession which it has attained by separate endeavour, and foster that spirit of friendly rivalry in the advancement of architecture and the professional interests of architects, which must be to the good of all concerned.

# The New Building for the Swedish Chamber of Commerce

### D. B. NIVEN and H. WIGGLESWORTH, FF.R.I.B.A., Architects

THE Council of the Swedish Chamber of Commerce for the United Kingdom, when determining to build a new home to serve as a focus for Swedish trade interests, showed a happy discrimination in selecting and acquiring a corner site in Trinity Square. Out of the noisy turmoil of the City's militant life, Trinity Square is close to some of the most important commercial markets: Lloyd's Register of Shipping, the Corn Exchange, the Commercial Sale Rooms, the Baltic, are all in the immediate neighbourhood, and the presence of the new offices of the Port of London Authority, which adjoin the Swedish Chamber, is a further notable indication of the growing value and importance of this historic spot.

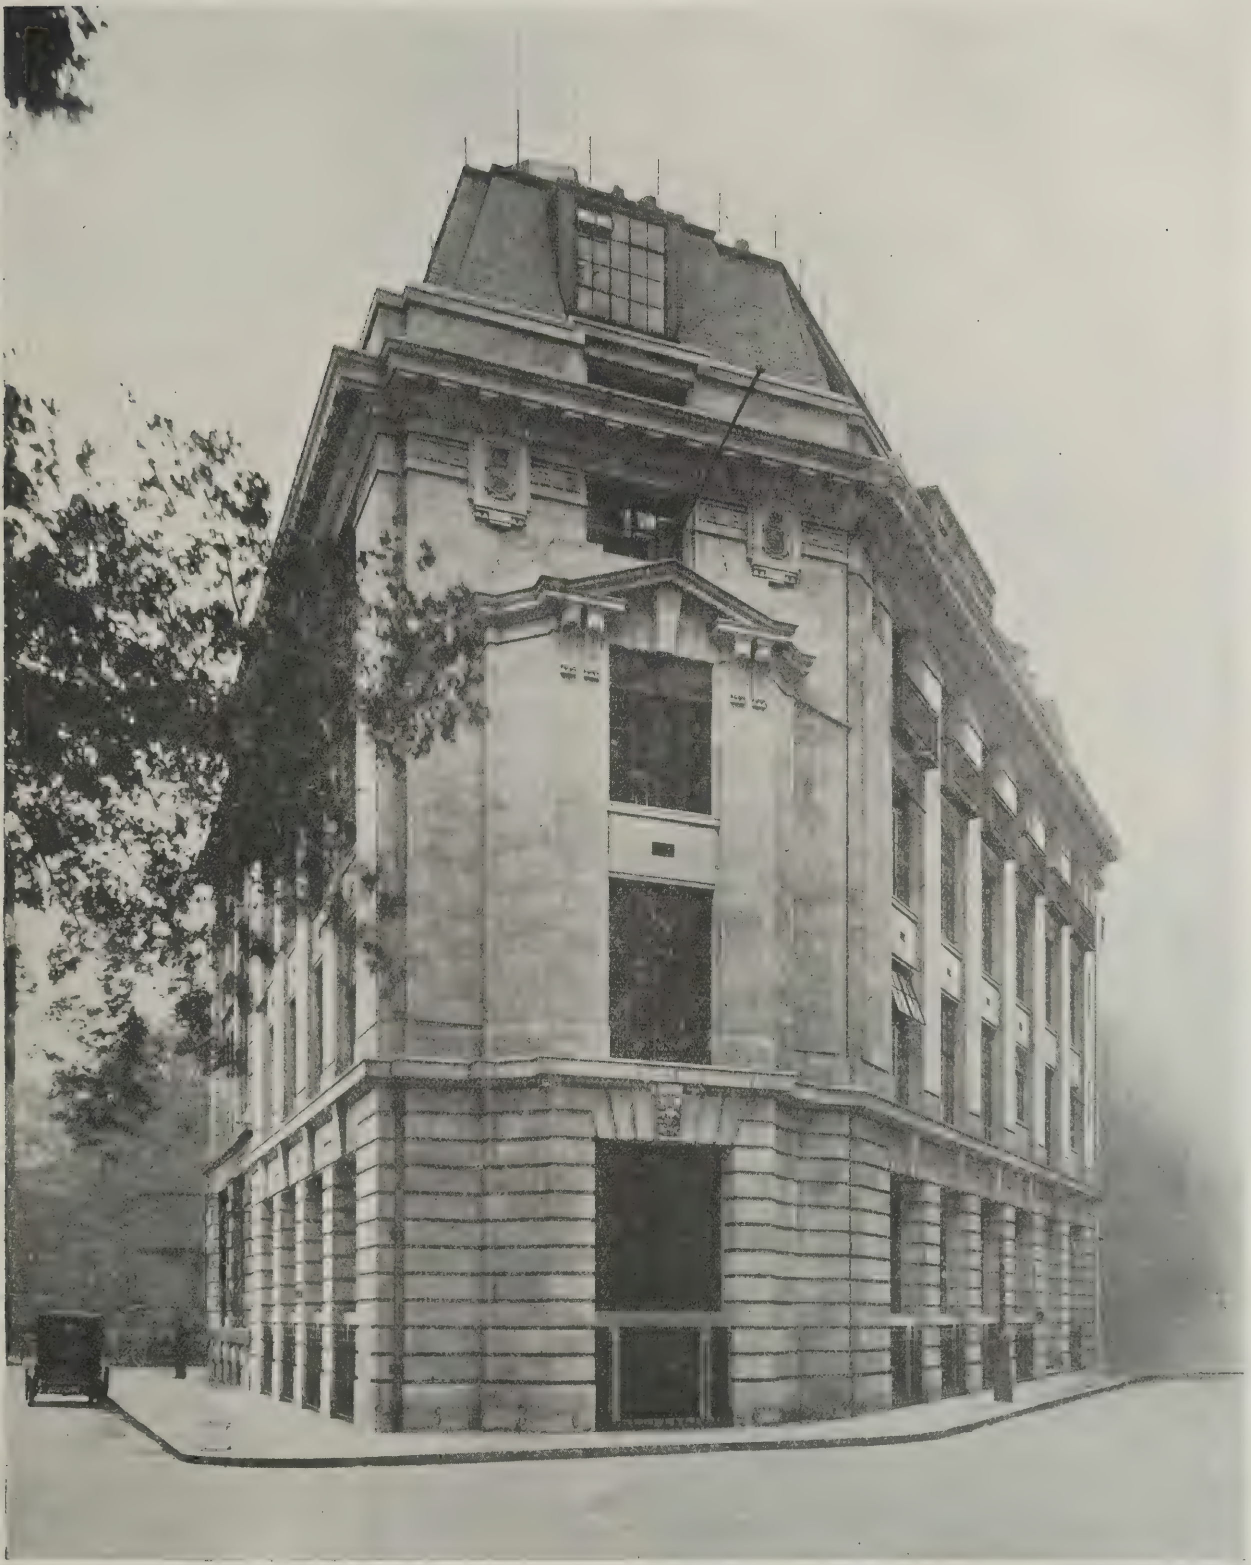
It has been said that "the City" is gradually moving westwards. Perhaps its *arms* are moving westwards, but the erection of such important buildings as this and the adjacent P.L.A., with other big buildings going up in King William Street, Moorgate, and on London Bridge, shows that the London of Wren, the Lord Mayors, and Gog and Magog still has its *feet* firmly planted near the old bridge across which goes, as went five hundred years ago, the greatest business of the day. And large ships cannot pass beyond this point. The bustle and activity on this part of the Thames are enormous. Ships from every nation discharge their cargoes; the river teems with shipping, from enormous steamers to tiny fishing boats.

London is, just here, almost Venetian. The mud-larks dipping their feet into the water from the embankment steps; the red sails of the barges glistening in the "Pool"; the dancing wavelets; the shouts; and, most Venetian-like of all, the dazzling white cupola and spire of Wren's St. Magnus surmounting the near houses at the head of the bridge.

The accompanying plans show the peculiar shape of the site. The rectangular area contiguous to Trinity Square is conjoined to an irregular truncated triangle. The architects, with a view to reserving the larger area for the accommodation of the chamber and offices, placed the entrance hall, staircase, and lavatories at the narrowest end. The three upper floors are occupied by the chamber and its offices, the lower floors being available for tenants. The entrance hall is of generous dimensions. The lift is placed axially with the entrance doorway. The ground floor level is raised some feet above the pavement, so as to ensure good light to the basement offices. The second floor has been sub-divided to meet the needs of the secretaries and staff, and has direct access to the floor above by means of a private staircase.

It will be seen from the plan that the lift faces one upon entering, whilst the staircase ascends upon one's right. In modern buildings of great height it is, perhaps, better that the passenger lift should be made the central, and the stairs a subsidiary, feature. In these days of hurry, only upon occasions of ceremony and leisure has one time to pant up the stairs!

The third floor is for the use of the members. Here is the council chamber, which occupies the whole front towards Trinity Square, and commands a delightful, possibly unique, view of Trinity Gardens, the Tower Bridge, the Tower itself, the Mint, with glimpses of the river and its shipping. Such a view, which would attract everyone, must be especially refreshing to the Swedish people, far from the lakes and fiords of their native land. The level of the main cornice, as determined by the surveyor to the ground landlord, cuts across the chamber at an awkward level, so the windows have been disposed in two storeys, as shown in our illustration. The home-like, domestic character of this room has been obtained without extravagant details. The walls are simply panelled with enriched plaster mouldings, with dado of walnut. The ceiling is coved, panelled, and decoratively moulded. A portrait of



THE SWEDISH CHAMBER OF COMMERCE, LONDON.

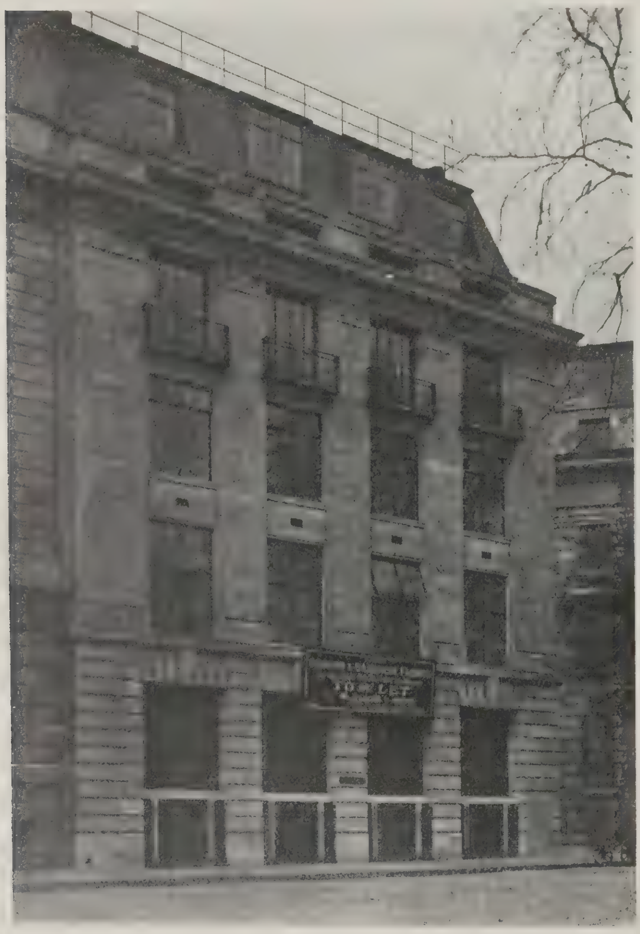
D. B. NIVEN AND H. WIGGLESWORTH, FF.R.I.B.A., ARCHITECTS.

the King of Sweden (presented to the Chamber by His Majesty) adorns the chimney-breast. The Swedish colours, blue and gold, prevail in carpet and curtains, and the rich walnut furniture is copied from the best Queen Anne models, supplemented by some beautiful contemporary specimens.

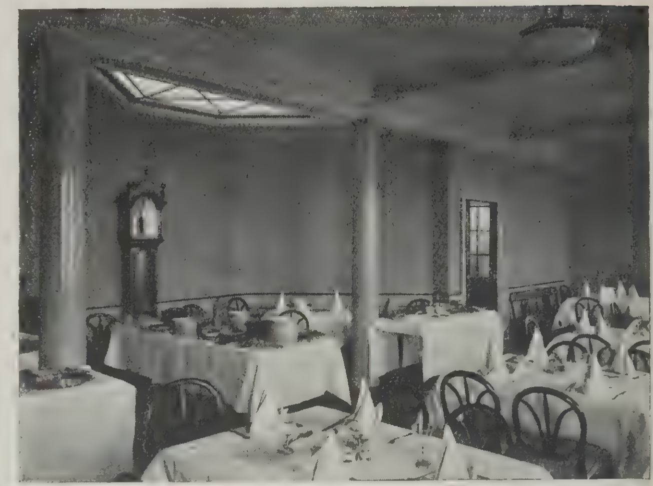
The commodious lounge-hall, which gives access to the council chamber, is equally well furnished. An " antique " portrait of Charles XII hangs in the semi-circular recess of the staircase. The pale face is that of a visionary, and explains to students of history this monarch's romantic and meteoric career. Above the council chamber, upon the fourth floor, are placed the members' dining-room, which we illustrate, and the kitchen and service rooms. The flat roof is a superb vantage point for a bird's-eye view of London. It is proposed ultimately to convert the roof into a garden. Its potentiality for this purpose is very evident.

Neither fantasy nor fashion seem to have swayed the architects' conception of the whole project : rather they have endeavoured to impress upon the building a modern character without sacrificing the vital traditions of architecture. The façades are of Portland stone throughout built in a simple rhythmical sequence of alternating piers and windows carefully proportioned, the whole crowned by a wide projecting enriched cornice. At the salient angle a stone bay has been devised to correct the irregularity of the site and to mask to some extent the awkward angle of Muscovy Street. The position of the wrought iron balconies emphasizes the domestic character and importance of the third and council chamber floor.

The members' dining-room is very well lighted, and its windows look over the river up which Swedish sailors bring their ships. An old-fashioned hob-grate has been refixed in the fireplace, the mantel of which has been kept very simple in design. The oval picture hung above (shown in the illustration on page 290) is also old, and highly valued by the Chamber. This supplies the only touch of colour in the room.



THE SWEDISH CHAMBER OF COMMERCE, LONDON: SIDE ELEVATION.



THE CLUB DINING-ROOM.

The skeleton construction of the building is steel, carried upon a raft of reinforced concrete. A raft was adopted to obviate the necessity of excavating to the ballast, which slopes from a considerably lower level down to the bed of the river. One great column was found to be sufficient as support in the central area. This has assured great elasticity in the planning and arrangements of the different floors. The floors, of fire-resisting material throughout, are finished with granolithic, except in the hall and main staircase, where slightly polished Roman stone is used, and some of the more important rooms are of wood block. Gas cooking apparatus is installed in the kitchen, a hood, with horizontal ventilating shaft, carrying off the fumes so effectually that there is an entire absence of smell. The construction and workmanship of the building as carried out by Messrs. Holliday and Greenwood, Ltd., the general contractors, maintains the high standard expected of and given by the best London builders.

Count Wrangel, the late Minister to the Court of St. James's, laid the foundation stone, with Mr. Branting, the Swedish Premier, acting as sponsor. The building was formally opened by the Crown Prince of Sweden in the presence of a distinguished company representative of State and commerce of Sweden and of the United Kingdom.

Architecture always profits by the close personal interest of clients with knowledge and taste, and this the Swedish community possess in a remarkable degree. The valuable assistance given by the representatives of the Chamber is warmly acknowledged by the architects, Messrs. Niven and Wigglesworth, who found it both helpful and inspiring and consider it contributed largely to the result achieved. The architects also wish to record their appreciation of the valuable services rendered throughout the undertaking by their assistant, Mr. G. Maxwell Aylwin. The Swedish nation, though a small one, is obviously enterprising, and is to be congratulated upon a notable contribution to British commercial architecture.

Messrs. Holliday and Greenwood, Ltd., were the general contractors, and the sub-contractors were as follows: Mr. Laurence Turner (carved stonework and chimney-pieces and fibrous plasterwork); Stuart's Granolithic Co., Ltd. (reinforced concrete construction); Moreland, Hayne & Co. (steelwork); Kleine Patent Fire-resisting Flooring Syndicate, Ltd. (fireproof floors and partitions); R. E. Pearse & Co., Ltd. (casements and casement fittings); Dent and Hellyer, Ltd. (plumbing and sanitary work, sanitary ware and fittings); Acme Flooring and Paving Co., Ltd. (flooring, wood block and parquet); Bryon & Co. (wall tiles, and mosaic, marble, and stone flooring); Electrical Installations, Ltd. (electric wiring); Yannedis & Co. (door furniture—locks, electric bell plates, &c.); Waygood-Otis (lift); J. H. Nicholson & Co., Ltd. (heating and ventilating); Briffault Range Co. (cooking fittings); C. Hall, South Hampstead Art Metal Works (wrought ironwork).

# London's Unhealthy Areas

## A Chadwick Lecture

### By G. TOPHAM FORREST, F.R.I.B.A., Architect to the L.C.C.

When I received an invitation from the Chadwick Trustees to deliver two lectures, it seemed to me that I could not choose a more fitting subject for at least one of them than "London's Unhealthy Areas." I felt that if Sir Edwin Chadwick were alive to-day he would be gravely concerned that such areas exist and would give earnest thought to the possibility of their elimination. Moreover, any attempt at a solution would assuredly have been readily welcomed by him.

The question of effectively dealing with London's congested areas was one which for many years before the war exercised the minds of those interested in housing. Various remedies were suggested, all of them worthy of consideration, since they were the outcome of knowledge and experience. But it need hardly be said that post-war conditions have intensified and complicated the problem—to such a degree indeed that the difficulties in the way of reaching a satisfactory solution appear to be almost insurmountable. That, however, would be no excuse for failing to seek one—at least it would not be in my case, since as architect to the London County Council I am bound to examine the problem and to suggest means by which it may be solved. That was what I set out to do when I took up my duties in London.

At the outset I think I should make it clear, however, that the London County Council accepts no responsibility for my opinions or conclusions. If a solution of the problem can be discovered, if within a short time we could completely reconstruct these areas, no relief would thereby be afforded to the existing shortage of houses. The question of the elimination of the areas is a special one, quite distinct from the question of the provision of additional houses to meet the general shortage. Moreover, it may be assumed that in all the congested areas there is in the houses themselves—most of them only fit for immediate demolition—a considerable amount of overcrowding. Because of this overcrowding, any reconstruction schemes which are put forward must provide for more rooms than at present exist on the areas.

My examination of the subject has been focused on wiping out the slums and providing the inhabitants with a type of building which shall at once give clean, healthful, and pleasant accommodation.

The Housing Act says that when the houses on any area are so bad in themselves and so congested as to be dangerous to the health of the inhabitants or of their neighbours, and that the most satisfactory method of dealing with the evils is by clearance and reconstruction, then such areas are unhealthy within the meaning of the Act. According to a publication issued by the London County Council in November, 1921, there were in the year 1919 about 1,900 groups of three or more houses which were either insanitary or so congested and badly arranged or badly situated that they required to be dealt with. These comprised over 24,000 houses occupied by more than 180,000 persons. There is also an enormous amount of overcrowding in London, as was revealed by the last census. Of course, it does not follow that all areas in which there is overcrowding are necessarily unhealthy as defined by the Act—that is to say, such as can only be remedied by reconstruction; but overcrowding and unhealthy conditions are closely related. The census shows that the 4½ million people in London occupy upwards of 4,000,000 rooms. The distribution of population over the county is, however, by no means equal. Taking the county as a whole, the average number of persons to the acre is 60, but in the northern portion of Saint-George-in-the-East there are nearly 260; in part of Stepney and in Bethnal Green approximately 200. Moreover, as the areas for which these figures are given include all open spaces, the actual density is much higher. Again, in the county there are just about as many occupied rooms as there are persons, but according to the census over half a million people are living more than two to a room, and nearly 130,000 more than three to a room. Or to take the figures relating to families, nearly 20,000 containing three persons in a family; approximately 7,000 of four persons per family; and over 2,000 of five persons per family are each living in one room.

The problem is something more than one of magnitude. The moment we begin to examine it closely we discover seemingly endless difficulties in the way of arriving at a satisfactory solution. A very considerable proportion of the people living in the congested areas are the families of workers who must of necessity live near to where they exercise their calling: for example, the dockers, many kinds of transport workers, the market porters, public service workers, such as gas-workers, water-service workers, police, firemen, postal servants, sewermen, scavengers, etc. Some, therefore, at least of the population of the congested areas must remain in their present locality, and this constitutes a very real difficulty when we come to deal with the question of demolishing the slum houses. Of course, a number of the inhabitants might be housed outside London, but even then the breadwinners would have to travel to their work-places, which are probably within reasonable distance of where they now live. The distance from the centre of Birmingham to the open country is only 2½ miles, comparatively easy walking distance. In Liverpool the corresponding distance is only 2 miles, but in London it is from 6 to 7 miles. The conclusion reached is that if the people are to be rehoused it must be on the areas themselves and not some six or eight miles away. A further question as regards transferring the people to the outskirts is its effect on London as it already exists. Between the central parts of London and the open country there is a barrier of miles of densely massed houses, and I am of opinion that this should not be further extended without some break in the continuity. If we are to go on building on the outskirts, then the interposition of a sylvan belt, or of a series of open spaces linked together by broad boulevards, would surely become a necessity, but here, again, the increased distance of the new houses from the centre would still further accentuate the transport difficulty. As regards London the idea of any wholesale transference of the present occupants of the

central congested areas to the outskirts, as a means whereby the problem of the slums can be solved, is at best but partially practicable.

It will be appreciated that the idea of the creation of new dormitory districts on the outskirts is an altogether different thing from the creation of new townships, complete in themselves, situated some distance from the metropolis, but connected with it by quick and cheap means of transport. This idea of the formation of new townships to meet the needs of a general expansion of the population has, in my opinion, everything to recommend it. The problem which is complicated by the fact that present-day conditions make it necessary in nearly every case to deal with each particular area as a separate and distinct unit, as if no other congested area existed. In practice it comes to this, that unless we can find upon the area itself a site or sites upon which an initial block can be built, no beginning can be made with the clearance, unless we first obtain a vacant site elsewhere and build upon it accommodation for the people to be displaced from the first section of the area. In pre-war days the conditions were different. The need for discovering a satisfactory way of dealing with the problem is one of extreme urgency.

With regard to the areas already being dealt with by the London County Council the only hope of remedy is by clearance and reconstruction. As to the most suitable type of building to be employed in the reconstruction we shall consider cottages, three-story cottage flats, and also what are usually known as block dwellings, that is, buildings of more than three stories, and I think we shall discover that the only practical solution of the problem is by means of buildings of the latter class. Let it at once be understood that by no process of reconditioning can the houses on the areas be rendered fit for human habitation.

Coming now to the question of the actual clearance of the areas, we are at once confronted with the fact that clearance can only be done in small sections at a time, each large enough for one block of

COTTAGE DEVELOPMENT

buildings. This limitation is a dominating factor in planning the lay-out of the reconstruction. In the Ware Street area to be cleared, if the tongue of land in the middle could have been included a much better result would have been obtained.

In the hypothetical reconstruction on the basis that a more generous clearance were possible, we obtain a more pleasing lay-out and the valuable land is fully utilized. Moreover, accommodation for more than the whole of the displaced persons is provided on the area itself, whereas in the approved scheme, to which we are forced by present conditions, some 490 persons have to be housed elsewhere. In the actual scheme of lay-out shown the new housing sites have been secured without constructing new roads. The question of roads is one which in present circumstances calls for most careful consideration. It is, of course, important that mean streets, courts, and alleys should be blotted out and their sites thrown into the sites for new buildings. But wherever possible existing roads sufficient to meet the needs of the area should be retained and, if necessary, improved, rather than that entirely new roads should be constructed. This is dictated by the necessity for economy. Moreover, in cases where there is a possibility of any roads on the area becoming at a future date through traffic routes, the new buildings along such roads must be set back sufficiently to allow of future widening at a minimum of cost. All the new buildings to be built on the area as approved are five-story block dwellings, which is the type of building usually employed in central areas. The question at once arises whether this is the most satisfactory type for the purpose. I realize, of course, that it does not always find favour with certain members of the public who are interested in housing, but I would emphasize that our present problem is not that of reconstructing a huge area of London, but rather that of rehousing healthily on a restricted area the large number of people who already live there. As you know, the L.C.C. on all its new estates in the suburbs has, up to the present, confined its building operations to houses of the cottage type, with generally satisfactory results. But with regard to the central congested areas which we are considering, this type of construction is out of the question.

In the plan of the reconstruction of the Brady Street area as approved, 1,600 persons, that is, 85 per cent. of those displaced, will be rehoused. It was not possible to rehouse all the people and at the same time provide a recreation ground of 1½ acres, very badly needed in this congested neighbourhood. If the area was laid out with twenty-three cottages to the acre, which is utilizing the same ground to the limit of its hygienic capacity, we should only be able to rehouse less than 800 people, and no recreation space could be provided. In the planning of the reconstruction of an unhealthy area there are two fundamental requirements: The first is that the new buildings comprised by the reconstruction shall be healthy in themselves; the second that it shall not be possible in the future for the buildings to become unhealthy owing to alterations of the property immediately adjoining. That is to say, the planning must be so arranged that there can be no possibility of the slum being perpetuated. It is this second requirement which presents the greater difficulty; because before it can be met, it is essential to forecast what the possible and probable future development of the adjoining property will be. In making this forecast it must first be realized that in all the old streets, courts, and alleys in and about unhealthy areas the owners are, under the London Building Act, at liberty, if they so desire, to build on the sites of existing houses business or industrial premises up to a height of 80 ft. above the level of the footway with, in addition, two stories in the roof. Moreover, most of the streets in question are considerably narrower than the minimum statutory width for new streets, which is 40 ft. So that you may have buildings approximately 100 ft. high abutting on a street very likely no more than 20 ft. wide.

A small area in one of the congested districts of London is now undergoing reconstruction (though not by the London County Council) by means of two- and three-story cottage flats. A factory to the north-east is actually being extended at the same time as the new houses are being erected, and it cannot be said that the houses on the two other sides will necessarily remain at their present height. As things stand the outlook towards the north for the people living in the longer row of cottages will consist of a factory wall, and if the remainder of the surrounding property is heightened, the cottages will lie, so to speak, in a well, and the effect on the circulation of air, to say nothing of the smoke, can be better imagined than described. In fact, I cannot see how cottages in a neighbourhood such as this can be prevented from approaching slum conditions in the future. On the right hand of the illustration we see what might have been done if the development had been by five-story blocks. Not only could more than the whole of the displaced people have been rehoused, but the possibility of a return to slum conditions in the future would have been obviated. We are therefore driven to the conclusion that the only practicable method of dealing with the congested areas is by a type of building

THREE-STORY COTTAGE FLATS.

having more than two stories. Let us, therefore, see how far three-story flats will go to meet the requirements.

In the plan showing how the Brady Street area might have been laid out with three-story cottage flats, only 1,250 of the displaced persons would be rehoused, that is, nearly 380 less than in five-story dwellings, and no recreation space could be provided. It is clear, therefore, that, generally speaking, central area rehousing cannot be accomplished by three-story buildings. Buildings of three stories containing cottage flats would be very suitable for sites in the inner suburbs, in order to provide rehousing accommodation for people at present living in congested areas who it would be necessary to displace so that clearances of such areas might be begun. Suitable sites for working-class dwellings in the inner suburbs are few and far between. It is, therefore, clearly desirable that fuller use should be made of them than is possible with a cottage development, and as one-and-a-half times as many people can be put on to a given area by three-story buildings as can by two-story cottages, it follows that the three-story buildings containing cottage flats have much to recommend them. I do not claim that housing by three-story cottage flats is necessarily cheaper than by cottages, but I think it will be found that their cost will be no greater. This type of building has, however, a limitation—it is not suitable for lettings smaller than three rooms.

I have an idea of three-story cottage flats such as might be employed on the estates I have in mind. The two lower stories are enclosed by brick walls, and the topmost story is entirely within the roof. The rooms are rather larger than is usual in the working-class dwellings in England. This extra size has been obtained by throwing the space usually appropriated by passageways into the rooms themselves. Because of this the bedrooms as well as the "kitchenette" communicate directly with the living-room. This arrangement has certain advantages; it reduces the amount of housework to a minimum, and enables the mother of a young family to go about her duties whilst the younger children are always under her immediate supervision. Each flat has a private covered-in balcony in which domestic washing can be dried, and where the younger children can play—again under the mother's eye. Buildings of this class would not meet the rehousing needs of London's congested central areas, and we therefore turn to the consideration of dwellings of more than three stories. It will be realized that whatever the height of buildings used in the reconstructed areas, special regard will have to be had to the fact that the buildings must be so disposed in relation to each other and to the surrounding buildings as will permit of a sufficient amount of sunlight and air both in and about the buildings to satisfy hygienic requirements. It may not perhaps be generally appreciated that, geographically, London is a northern city. It is about 700 miles more northerly than New York, which city, it may be remarked, is situated at about the same distance from the equator as Naples. London is also 167 miles more northerly than Paris. Because of this northerly situation the sun in London at noon is relatively to Paris and New York much lower in the heavens, in mid-winter reaching only about 15 degrees above the horizon, and in the spring and autumn under 39 degrees. It follows that the shadows cast by London's buildings are longer than those cast by buildings of the same height in Paris, and very much longer than in New York.

The diagram shows how in five-story buildings facing due south the direct rays of the sun are obstructed at high noon in winter, and also in spring and autumn, by similar buildings opposite them. From this it will be seen that in winter in Paris, buildings of at least a story higher, and in New York at least four stories higher, could be built without causing any greater obstruction to light than would five-story buildings in London. Or to put it another way: Buildings of nine stories in New York and of six stories in Paris would throw shadows no longer than do five-story buildings in London.

The other diagram shows what the minimum distance must be between buildings of five stories in London, in Paris, and in New York in mid-winter, and also in the spring and autumn, if even a modicum of sunlight is to be obtained in the ground-floor rooms. It will be seen how much farther apart in winter the buildings must be in London, namely, about 158 ft., as against 131 ft. in Paris, and 82 ft. in New York. The law in London permits buildings of, say, five stories to be as near each other as their own height, but this means that the ground floors can only have direct sunlight for something less than six months out of the twelve, and for the greater part of even that period they will not have more than an hour or so a day. I would suggest, therefore, that it is not desirable that buildings whose walls are, say, 45 ft. high should be much nearer together than about 60 ft., and if economic considerations would permit, I should, of course, prefer that buildings should be kept away from one another to a distance equal to about twice their height, so as to secure the kind of lighting you get in suburban districts with 40 ft. roads and houses of only two or three stories, set back in their small forecourts.

Block dwellings in Paris are much higher than in London, but because of the latitude of Paris the conditions as regards light are, of course, much better than they would be in London. The porter's lodge is on each side of the entrance. In the Paris buildings of this class there is always a porter whose duties include supervision of those who enter or leave the buildings.

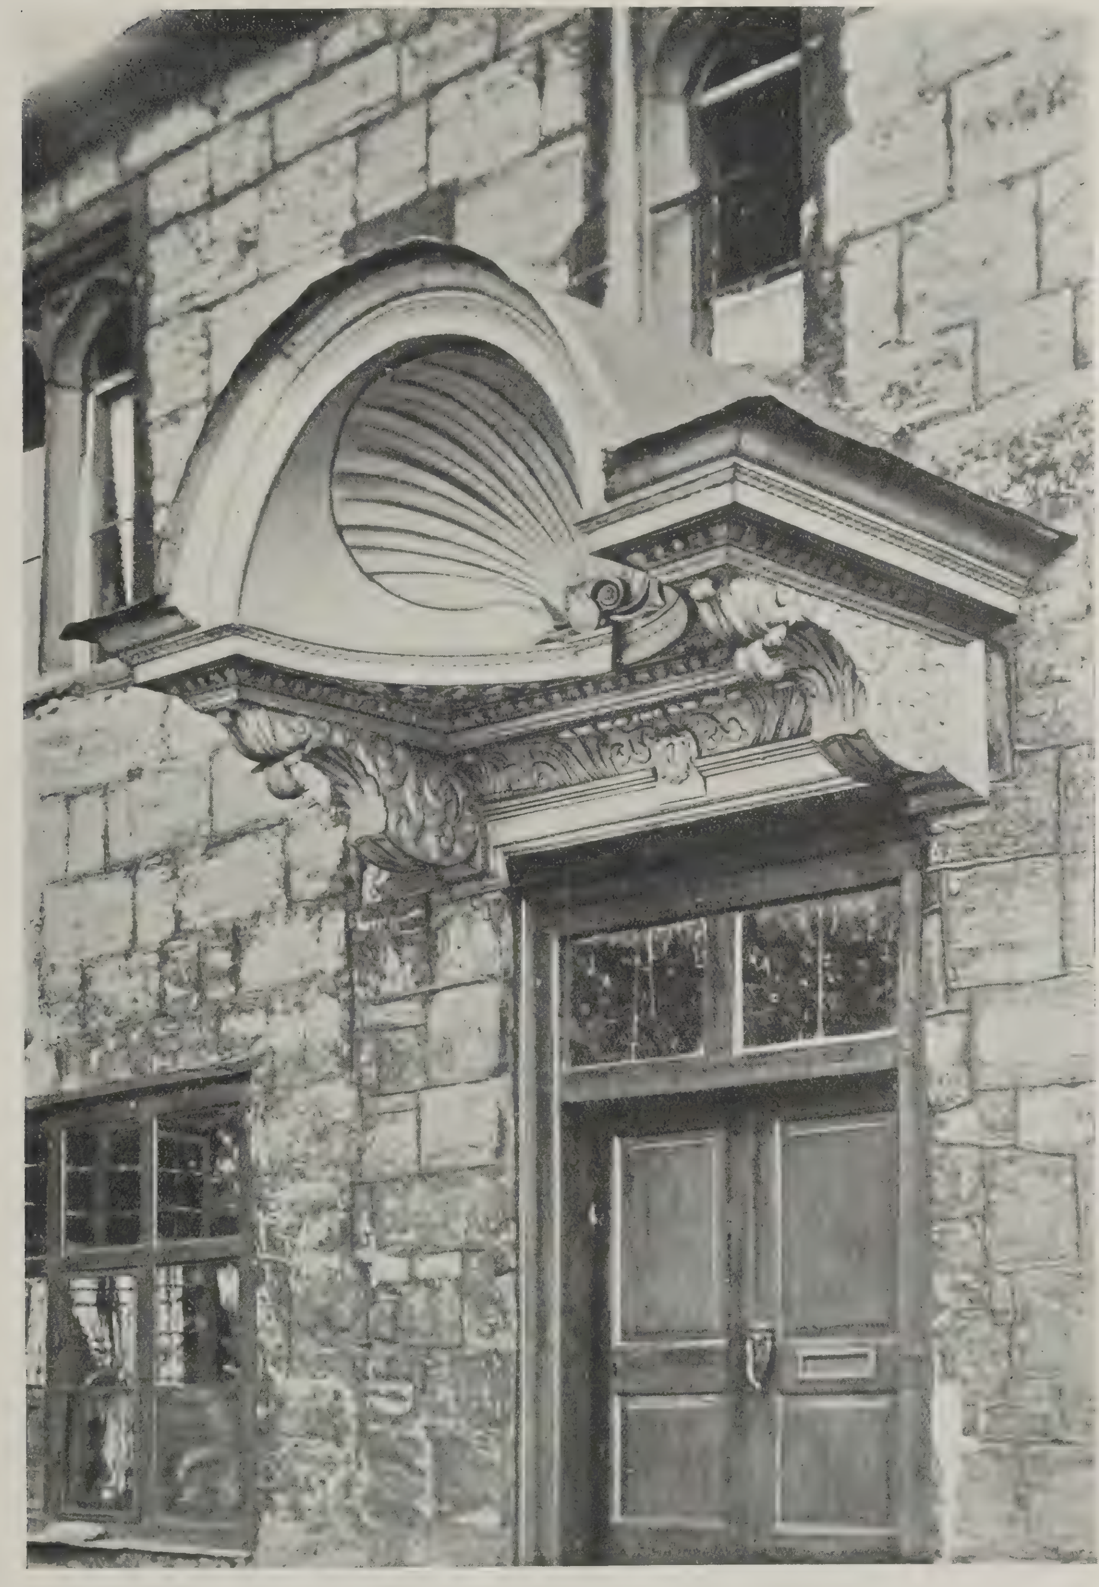
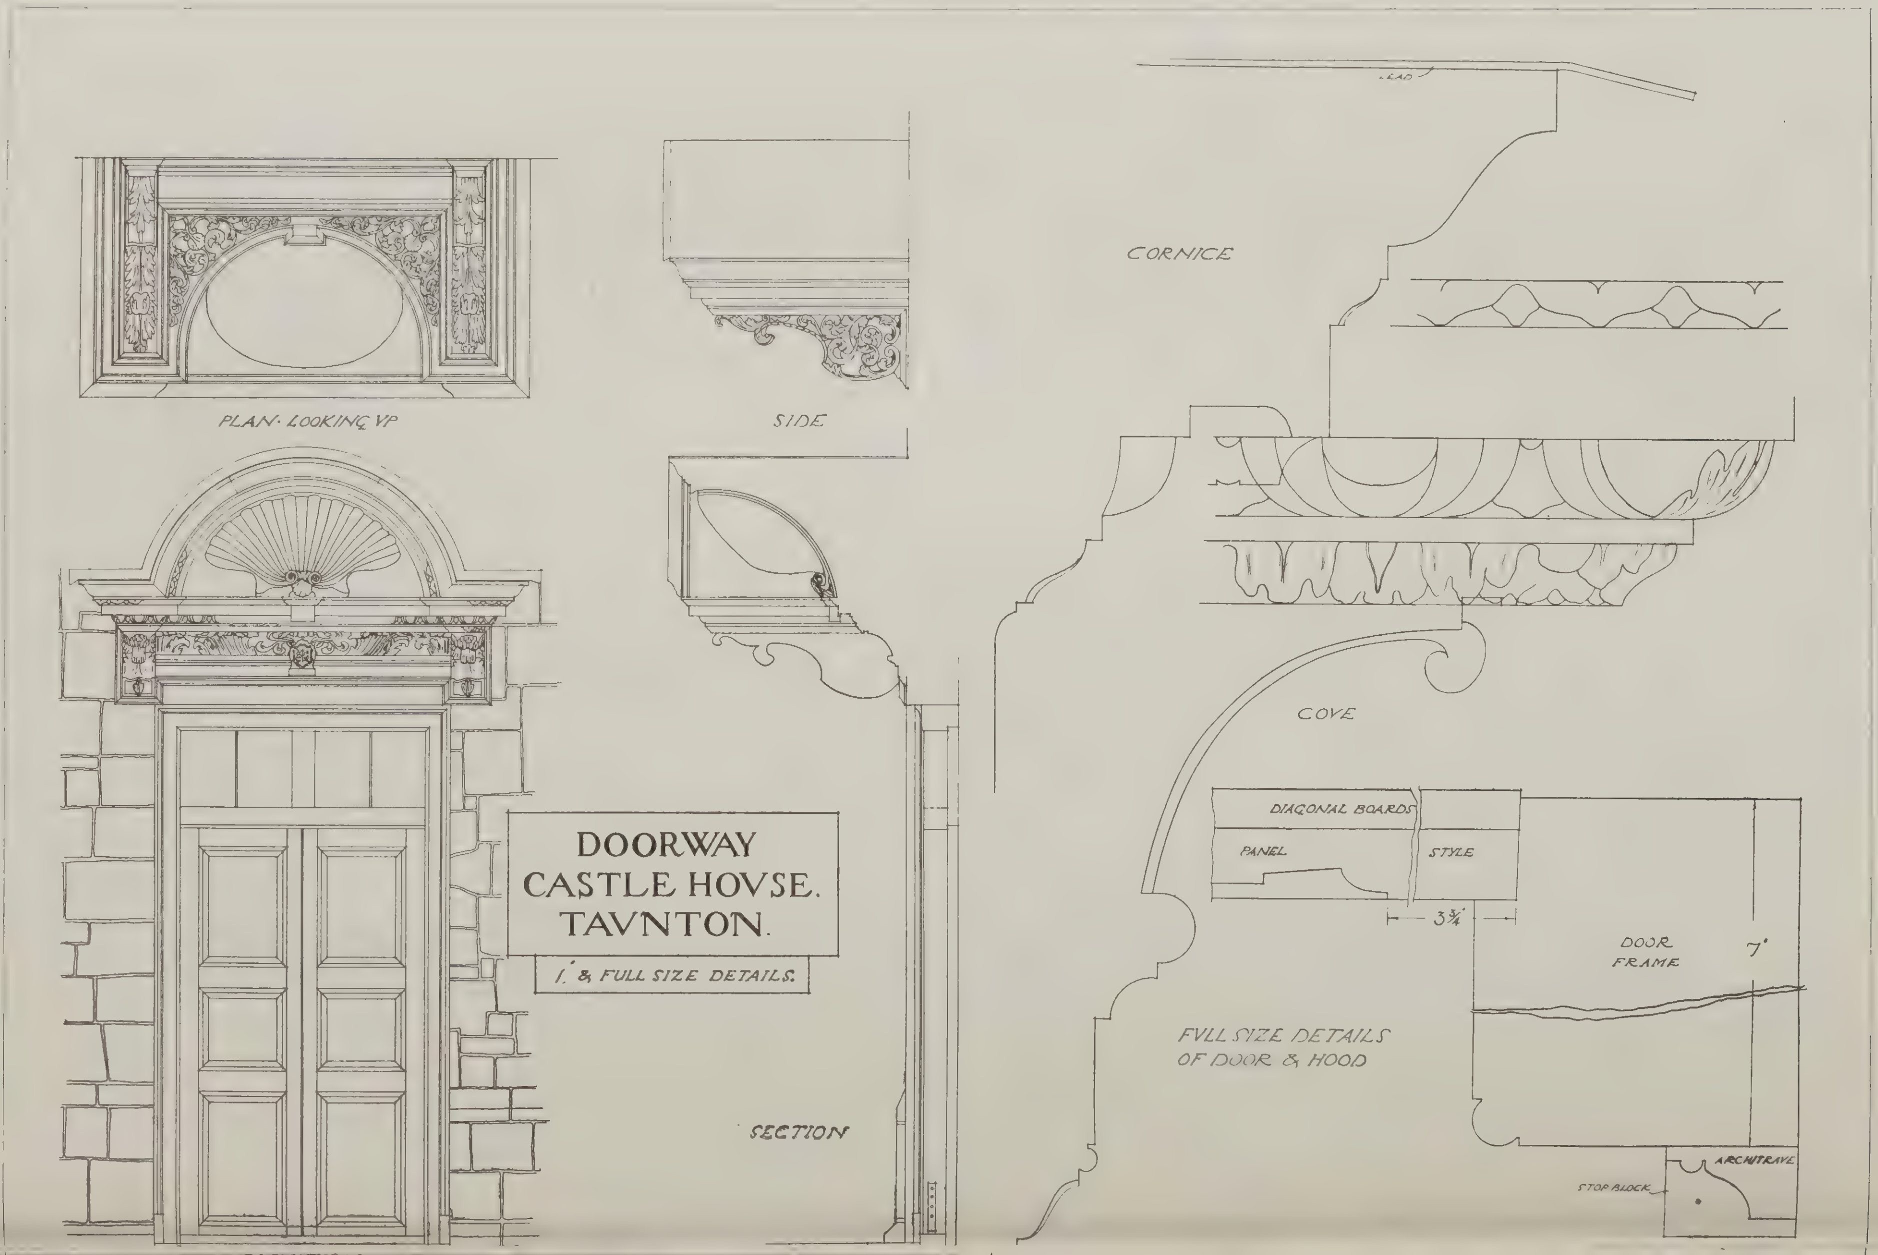
# Doorway to Castle House, Taunton, Somerset

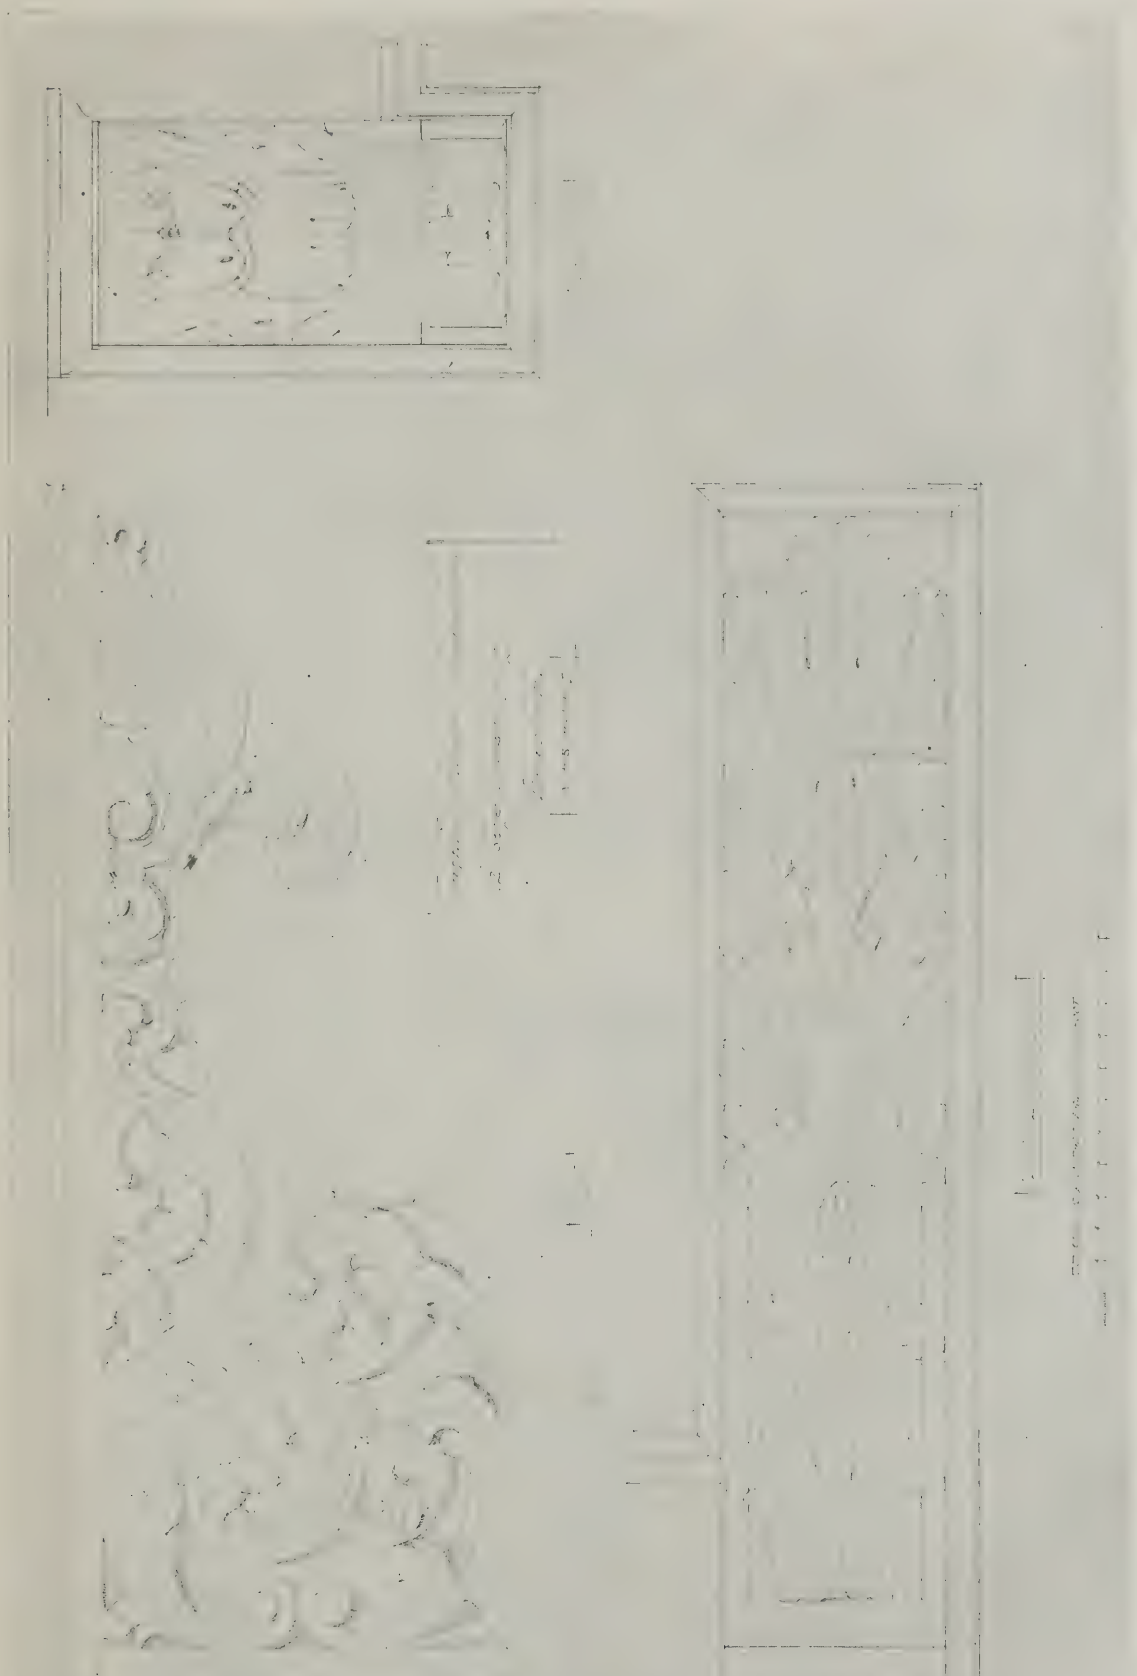


Castle House stands on the right of the gatehouse of the Great Hall of Taunton Castle. The date of its foundation is uncertain. Measured drawings of the doorway appear on the succeeding pages.

# Measured Drawings. 22.—Doorway to Castle House, Taunton, Somerset

Measured and Drawn by W. H. B. Harris





The doorway is of the late seventeenth century, and the panelling within the house belongs to about the same date, although some of the interior is Tudor.

## HOUSE AT TEMPLE FORTUNE, GOLDERS GREEN.

W. E. MASTERS AND F. T. DEAR, A.A.R.I.B.A., ARCHITECTS.

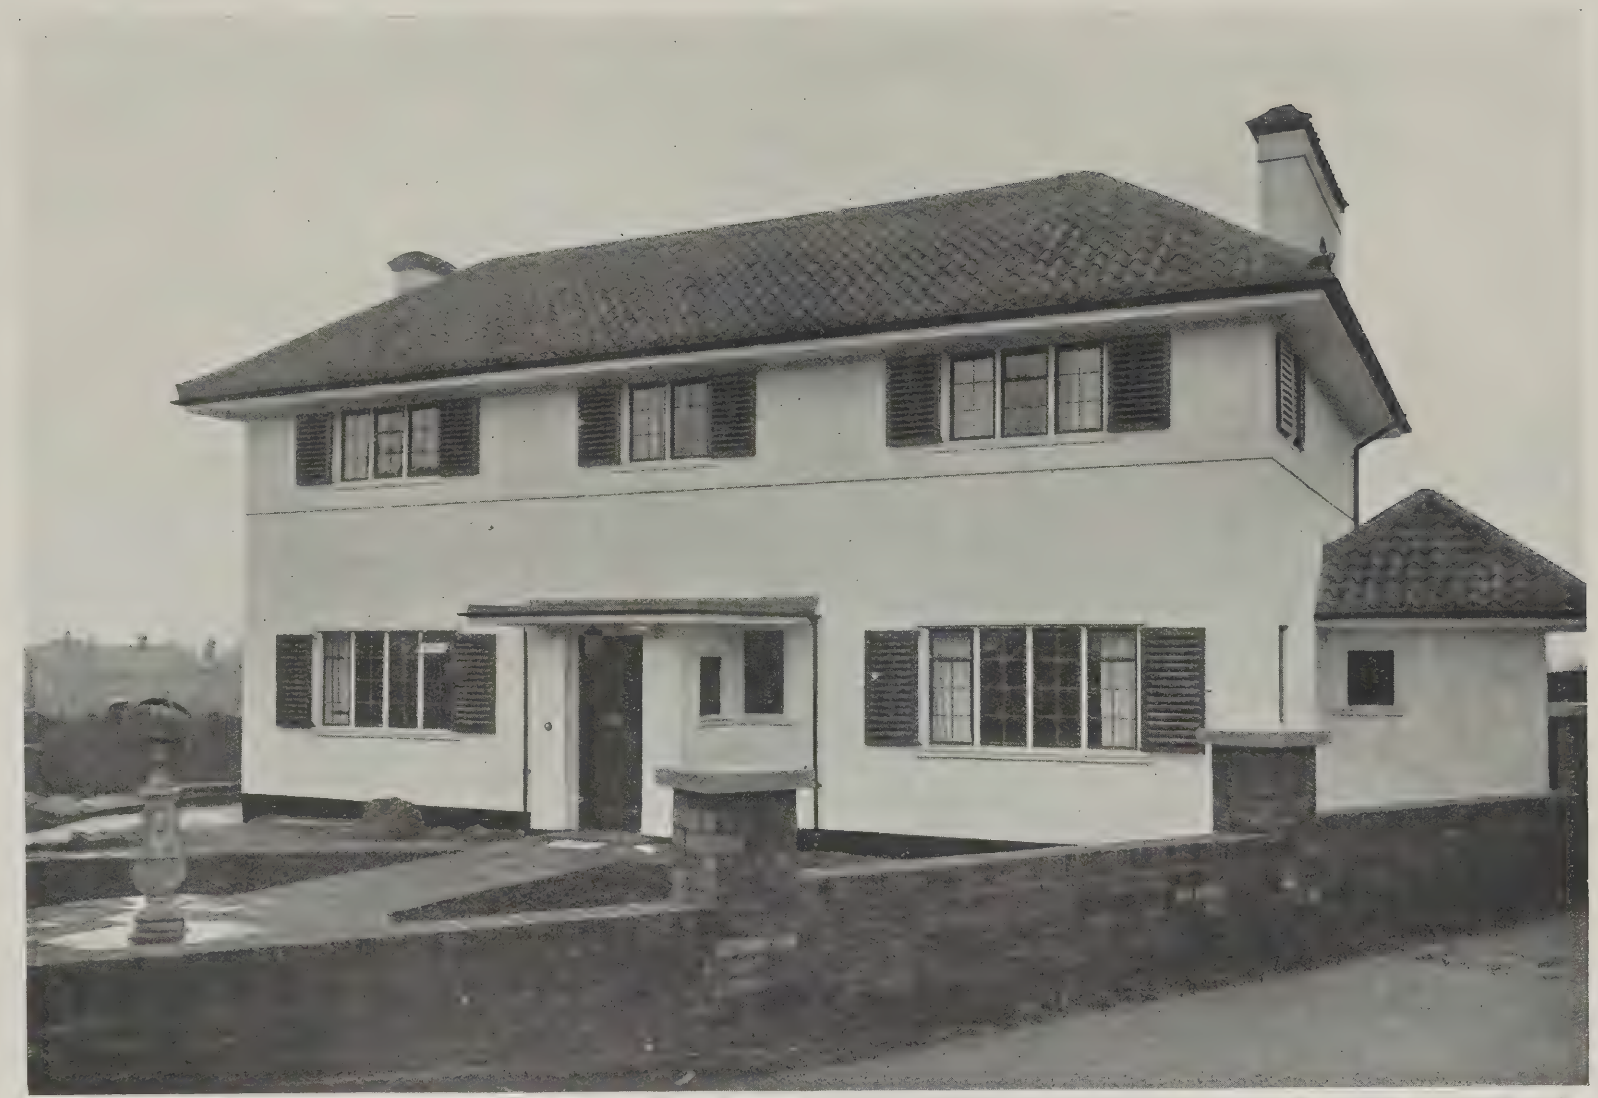

*Photo: Architects' Journal.*

The house here illustrated (plans of which appear on page 304) has been erected at Temple Fortune, Golders Green, on the axial line of a corner site. It is approached across a formal garden, of which a sundial forms the central feature, and has a lych-gate at the entrance from the road. Simplicity is the keynote both in plan and elevation, and the proportion and disposition of windows, overhanging eaves, and the red-tiled roof give it a charming and dignified appearance.

## Viscount Leverhulme's Youthful Dream

MR. PAUL WATERHOUSE, P.R.I.B.A., in his annual address to architectural students of the nstitute, delivered on Monday evening, ast week (prior to the distribution of rizes), spoke on "Clients," a subject, e said, so fraught with pitfalls that it vas almost ranked among the indelicacies f conversation. Proceeding, Mr. Waterhouse said :—

"I do not remember to have ever heard . responsible architect with clients of is own speak publicly upon the topic. The reason for this lack of utterance may ossibly lie in the fear that no man can ossibly speak from experience of clients n the past without hopelessly alienating he clients of the future. I have no such ear; for in the first place the employers f my past energies have seldom or never ailed to deserve the kindest things I an say of them, and in the second I do ot propose to utter anything to-night n the subject of clients in general that ould bring any blush, but that of satisfaction, to their honest cheeks.

"Do you all know what a client is? The word has a strange origin, and has n the course of history partly, I believe, through the action and attitude of lawyers, turned itself upside down.

"A powerful Roman, on whom waited a hungry crowd of dependents, was wont to call himself their patron or *patronus*, and the dependents, who didn't mind what name they took so long as they got his favours, were dubbed clients. Literally, I understand, the word means one who listens eagerly, and, therefore, so long as our employers are waiting like faithful hounds with ears cocked to catch our lightest word we may appropriately call them clients. But in this age of ours the *queue* system for employers of architects is, I believe, confined to one or two rather grave cases, and until it becomes a nuisance of general application I am given to think that the word is, from an antiquarian point of view, rather misapplied. The patron was the legal protector of his clients. Hence came the modern application of the word client to a solicitor's or barrister's employer. The application soothes the lawyers, but I have never heard of a lawyer who went the length of setting himself up as a *patronus*.

"Anyhow, there are the clients for you—or there may be—and I mean to talk about them, even if I venture, out of respect for the class, occasionally to call them employers.

"A great part of your business, if you are going to swim and not to sink, will consist in the successful treatment of your employers. You will please observe that I have escaped using the word 'management.'

"I escaped it on purpose, because any idea of illicit persuasion, of cajolement, or of deceptive encouragement is entirely foreign to what I have to say to-night.

"There is one very simple, very obvious and very rational condition embodied from the very beginning in every transaction between an architect and his employer. It is so radical and integral that it astonishes me to find how frequently it is entirely overlooked by both parties.

"The client's outlook on the coming job is hedged in like most fields of logical enterprise by two data, which you may call, if you are in a logical mood, the major and minor premises. But since the word premises is liable to be misunderstood in connection with architecture, and since these two data are of equal cogency, and are not necessarily pulling in the same direction, I prefer to call them the two counterpoises.

"One of these, of course, is the house (or other building) that the employer wants and the other is the sum of money he is content to spend. Observe, I do not say the house he first asks for or the sum he first names.

VISCOUNT LEVERHULME.
(*From a Caricature by H. de C.*)
"And so, you see, I *am* an architect!"

"And when I thus differentiate I am not at all implying that he is going to be screwed up to a building more costly than he wants or can afford, but simply that you and he, acting on one another, may modify these conditions at a very early stage in various directions.

"Anyhow, there are these two elements—the price offered and the building wanted. Will they fit one another? It is a hundred to one that they will not. If they do not, it is well to remember that this misfit is probably nobody's fault.

"At this stage it will be your privilege to point out to your employer that something has got to give way. The original idea of the house must be reduced or the sum of money must be increased. If you are both honest and really capable, no embarrassment attends the explanation. But you must be quite sure in your own mind that you are capable of working without extravagance.

"The expedient at this stage of deceiving your client or yourself with an approximate estimate based on an unreasonably low factor of price is, of course, unpardonable as well as very impolitic.

"You should always make approximate estimates and, I entreat you, always keep them. Start an approximate estimate book as soon as you have a brass plate, check each estimate with the contract figure, check it also with the final account, and keep it till you can hand it over to your office successor.

"When you have satisfied your employer about price and he has satisfied himself about size and degree of luxury or simplicity, there remains still, as we all know, the great question of agreement on questions of taste. Here is, or may be, the hardest trial of all. You may, it is true, come to a parting of the ways at which your ways must literally be parted. Your conscience as an artist may compel the severance. But it should not come before you have made sure that it is art, not obstinacy, that is stiffening your backbone, and until you have realized that there is more than one way of doing even a work of art. Certainly you should never do a work of which you are ashamed, but there is a difference between shame and mere disappointment, and you may be able, by substituting simplicity for your own choice in display, to achieve a triumph—not of mediocrity, but modesty. It is in cases where your patron asks for the too much rather than the too little that your profession of faith is most likely to be put to the trial.

"Shall we remember here to come back for a moment to the more elementary essence of your craft, that architecture, as I have said elsewhere, is not so much a noun as an adverb. And the adverb is not 'how much' but how.

"The client pays for his house to be built. The builder builds it. The whole business of 'how' it is built is yours.

"It is with no disrespect towards clients that I tell you that they are of different kinds. Being human beings, they can hardly fail to differ. And these differences which make them so interesting as employers are partly differences of mentality and partly differences both of taste and of wealth. It is your business to be perfectly respectful students of these differences, not merely in your own interests but in theirs. Remember, it is you who stand, not as antagonists before your employers, but as mediators between them and the fulfilment of their own desires. There are some people who find great difficulty in expressing their needs. To them you will be helpful in guiding that expression. There are some who do not fully know their needs and who look to you for initiation into likely directions. Others there are who require your services chiefly because they rightly look upon an architect as the doorkeeper of building enterprise, just as a solicitor is the doorkeeper of law. It is well at the outset to discover by observation and with tact what is the light in which you are viewed, and if possible to make sure without any derogation from your office as artists that you do to the utmost of your ability supply, along with your artistry, that guidance, that prompting, or that specially businesslike alacrity which your employer quite legitimately seeks.

"You will find some clients—both individuals and bodies corporate—who do not trust you. I do not blame them, for their attitude is caused either by unhappy experience in the past or by incorrect information as to the nature of an architect. It is best in such cases to make sure at an early stage of your own intention to be scrupulously worthy of trust, and, if possible, to convince your client in such a way as to change his mind. I say this not for your sake, nor wholly for his sake, but for the sake of the job.

"I once had such a client—he was a corporate one—on a fairly large scale. Banking on the certainty that I should lead that body corporate into an expenditure 20 per cent. in advance of the contract, the said body cut my authorized expenditure down accordingly. I, being honest, robbed the building of certain things which I should have dearly liked to have incorporated in it, and came out of the final accounts triumphant. At least, I thought it was a triumph until I met the committee, when I discovered that my parsimony was a genuine disappointment. Let us gather from this experience, not that we may always exceed our orders, but rather that, if we all unite in keeping up the general reputation for working to a fixed figure, we shall kill that reputation for expansion, the rumour of which had led my friends into a temper of insufficient confidence.

"But there are other minds who equally need our respect. There are employers to whom the achievement of a really fine building is of greater importance than the saving of money.

"It will happen to you if you become moderately busy men that you will be simultaneously the stewards of the finances of employers, some of whom are at opposite extremes in this respect; and I know nothing more difficult than the exercise of brain demanded by having to turn, perhaps in the very same morning, to the interests of those who demand rigid economy, those who look for a perfect building, and those, again, on whose behalf decisions have to be taken on doubts, in which the counterpoise of perfection and cash has to be very evenly weighed.

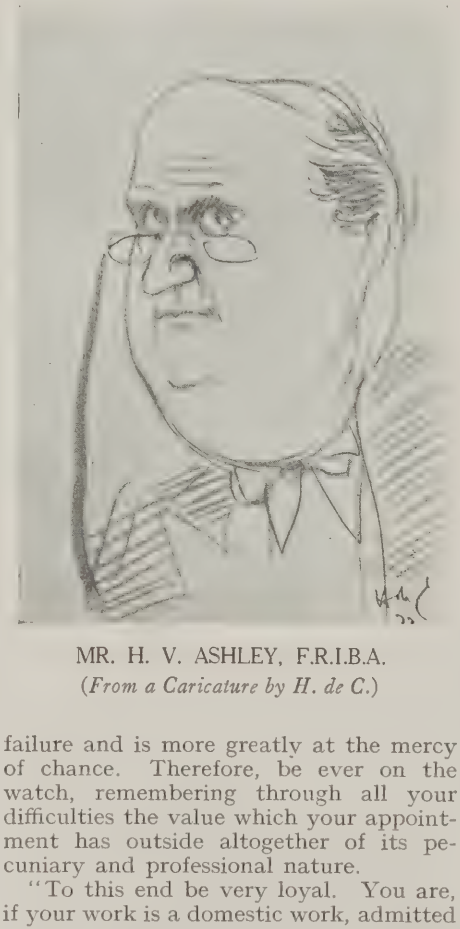
"No large building, however carefully planned and specified, gets through its whole course of creation without any variations. These variations are beset at every turn by the question of cost, and every question of cost has to be judged by one criterion only—that of the inclinations of the client. I say 'of his inclinations,' which is not the same as saying his 'wealth,' and by no manner of means the same as your personal wishes.

"You will think that I am degrading architecture to the level of rather sordid finance. Let me put the thing in another light. If an employer were to bring you an irregular mass of costly marble, and were to say to you, 'It strikes me that this queer-shaped but precious block might be so cut that we could obtain from it material for the jambs and pediment of a doorway. It is unique, no man can obtain more of it; it is so valuable that we must not leave any of it unused.'

"With what gaiety of heart would you set your ingenuity to work to get some original design achieved which would employ every ounce of that material and call for no more. My young friends, the stipulated price named for his building by a client whose means or legitimate wishes are limited is just such a block of precious marble.

"If you have *carte blanche* it is another matter, and if the *carte blanche* relates not to money only, but to a free exercise of your own fancy, you are lucky indeed. But, remember, the greater the trust the greater the responsibility; and remember also that the best architecture is wrought as a rule from the conflict with limitations.

"Remember, again, that quite apart from the question of future favours there is no friend like an old client. The relationship of architect and employer is one of a most intimate and delightful nature when nothing mars its perfection. The architect is, on the whole, the more likely of the two parties to disturb the smooth surface of that delicate relationship, for he has more opportunities of failure and is more greatly at the mercy of chance. Therefore, be ever on the watch, remembering through all your difficulties the value which your appointment has outside altogether of its pecuniary and professional nature.



MR. H. V. ASHLEY, F.R.I.B.A.
(*From a Caricature by H. de C.*)

"To this end be very loyal. You are, if your work is a domestic work, admitted to an interior knowledge of your client's family life, which is very near that of the doctor, and very like that of the solicitor.

"Never tell stories of one client to another. Consider the financial side of your transaction as a confidential secret and regard as sacred all intimacy to which you are admitted.

"If trouble comes between you, search your own mind for the cause of it, remembering that your employer, being a gentleman, may shrink from telling you what is the real cause of the break.

"Now let me talk quite boldly about the unspeakable subject of asking for work. You and I know that it 'isn't done,' but when we have said that we have said what isn't historically true. But between sending a letter of definite appeal direct to the projector of a building and lying low there are a great many fine shades of discreet or indiscreet suggestions, and persons have been known to draw the line for themselves at various points between zero and the boiling point I am not going to tell you where the right line is except that, speaking in terms of the thermometer, I believe it is somewhere between zero and freezing point and that the further it is below 32 deg the better. I do not suggest that a man should keep his candle under a bushel, but he should not push it under people's noses.

"I have, however, one appeal to make Every man who does in any degree propose his own employment, except by the legitimate means of competition and the like, not only does injustice to the more modest and loyal practitioners, not only breaks the code of our etiquette, which is after all, a sportsmanlike agreement with one another, but he paves the way for a possible breakdown of the conditions under which we all live and work.

"Consider for a moment the strain under which we should all live if the solicitation for work were general, and if we felt it our duty to ourselves, our wives and our families, to be always out on the warpath attacking every opening and besieging every likely promoter of building enterprise.

"Gentlemen, if you wish our profession to 'live happily ever after' and to be respected by those to whom we owe our opportunities, set your faces against self-recommendation.

"The best people don't do it. Be best people.

"In conclusion, I hope for you all that you may enjoy from the outset—through all the successes, disappointments and worries of honourable and happy careers those pleasures and satisfactions which have been my own cherished possessions —the friendship and trust of good clients.

"That they are long-suffering, that they often give that friendship where it is little merited, and bestow that trust in a degree which seems scarcely deserved, I for my own part know only too well.

"Long live the good clients!"

Mr. Henry V. Ashley, F.R.I.B.A., in a review of the works submitted for the prizes and studentships, said: The work as a whole he believed to be better, both in quantity and quality, than that of last year. That was all to the good, but he felt sure the competitions were by no means as keenly contested as in pre-war days; he had had the records from 1899 to 1913 looked up, and found the average number of competitors for the Pugin to be ten compared with two this year, and for the Tite eighteen compared with nine. That falling-off could not by any means be attributed entirely to the war—there were plenty of students and plenty of schools—it was due, he believed, in quite a large measure, to the schools and their students working in watertight compartments. They had their own prizes and studentships, and in many cases the intensive training left the students too tired, or with neither time nor inclination for independent study or research. It was a great pity. He sometimes thought that students did not fully realize the opportunities presented to them in the prizes and studentships of the Royal Institute. In the first place, they had the opportunity of paying homage to those architects now passed away, who in their time achieved great things, and who founded these studentships; in the second place, they had the opportunity of carrying on the traditions of those elder students, the practising architects of to-day, who had always desired to uphold the dignity and high importance of the Institute; and lastly, by their own studies and researches, they had the opportunity of proving to the world how good a thing it was to advance the profession and practice of architecture.

In general terms the studentships might be taken in two divisions, viz., those involving study of and research into existing building work, and those involving the creation of something—or design. In the former they counted the measured drawings, the Pugin and the Owen Jones; in the latter, the Tite, Saxon Snell and Grissell prizes, with the Institute silver medal for essays; also the Henry Jarvis studentships. He liked to separate them in that way because the student by his research learnt how the builders of all ages built, how they laid out, devised, constructed, and embellished their buildings. Only by that means could the student hope to succeed in originating and creating buildings of his own; and the studentships offer him excellent opportunities—there were few obstructive conditions, no difficult clients, and the awards were made by sympathetic juries. With the verdicts of the juries this year he could honestly say he agreed.

With regard to the Tite prize, nine designs had been received, the subject being an Italian Embassy in a European capital. Many difficult problems were involved, and no single competitor had mastered all of them. Mr. J. C. Shepherd, who received the prize, had well earned the distinction, his planning generally, and the lay-out of the principal floor, his arrangements of the ambassador's quarters, with its terrace garden, and his treatment of the longitudinal section, were all very ably devised and logically worked out. The elevation, however, was not so successful. Miss Helen Chambers entirely merited the honourable mention for a fine design, excellently drawn. In many respects he thought the elevation was more effectively treated than the winner's. The design submitted by "Tishy" was treated very similarly to the other two. He commended the author for his effort; for his own part he should have recommended him for an honourable mention.

There were four entries for the Grissell prize, the subject for which was a design for a warehouse with certain requirements. The scheme prepared by Mr. P. Morrey had rightly gained the first place; it was a good example of what a warehouse should be. "Bluzz" submitted a scheme on somewhat similar lines, but his constructional details were not so well worked out. The design submitted under motto of a red Fleur-de-Lys was not good, and "Syntithemi" had far too much architecture of an indifferent kind in his elevations.

Viscount Leverhulme, in proposing a vote of thanks to the President, said it had been the dream of his youth and the maturer ambition of his riper years to be an architect. Instead of being an architect he had been adding to existing buildings ever since he was nine years of age, when he built a rabbit-hutch. His only regret had been when he had to cut down his architect's plans, and he never entered the church at Port Sunlight without thinking of the original designs which, for reasons of economy at the time, were never carried into effect.

It had been estimated that the old city of Athens must have cost about five hundred million sterling to build, and he thought the city fathers of Athens must have felt satisfaction that they had not cut down the cost because there was no part of the civilized world in which one could not see the influence of their buildings.

Mr. W. R. Davies, C.B., seconded the vote.

The prizes won by the students in the Institute competitions were then distributed by the President.

Previous to the meeting the following guests were entertained to dinner by the Council :—

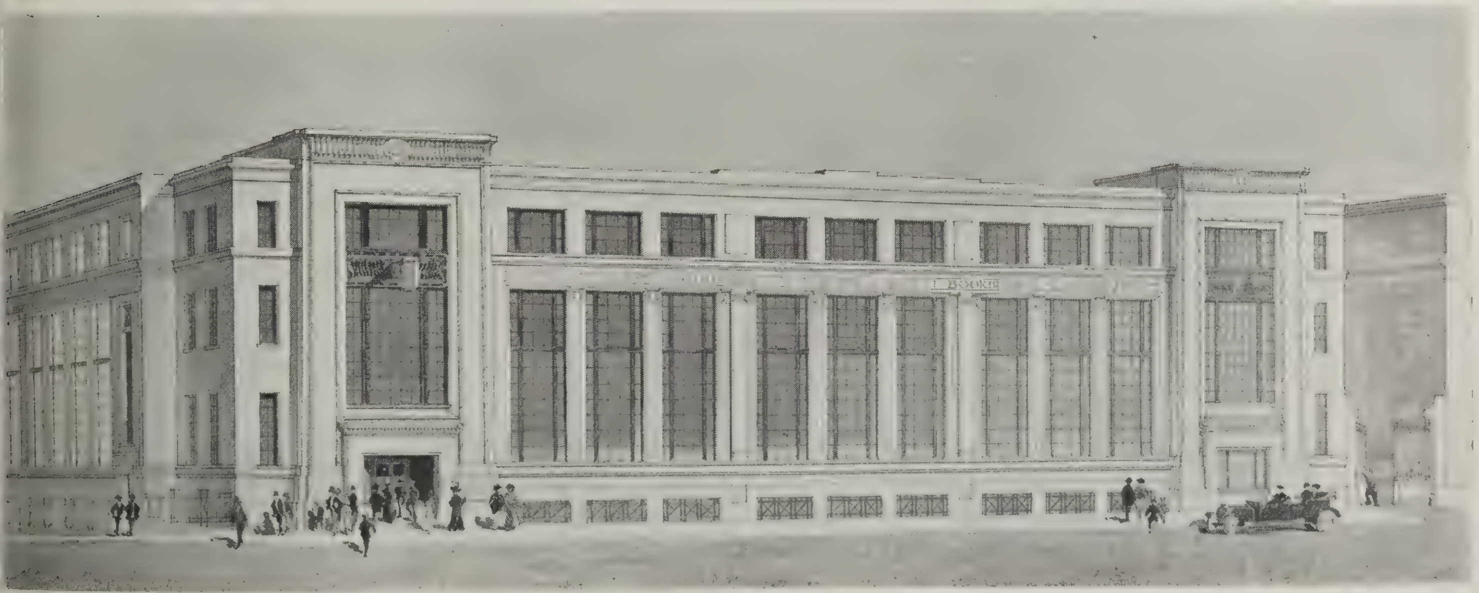
The Rt. Hon. Viscount Leverhulme; Mr. W. R. Davies, C.B.; Mr. Hugh Davies, Board of Education; Professor A. M. Hind, M.A., O.B.E.; Mr. Henry V. Ashley (F.); Mr. C. F. Filbey, winner of the Owen Jones studentship; Mr. W. T. Benslyn (A.), winner of the Godwin Bursary and Wimperis bequest; Mr. A. Newton Thorpe, winner of the Pugin studentship; Mr. Ernest G. Theakston (F.), winner of the Henry Saxon Snell prize; Mr. Percy Morrey, M.B.E. (A.), winner of the Grissell gold medal; Mr. Lionel B. Budden, M.A. (A.), winner of the Essay silver medal; Mr. Wesley Dougill, B.Arch. Liverpool (A.), winner of the Measured Drawings silver medal; Mr. J. C. Shepherd (A.), winner of the Tite prize.

### *Royal Gold Medallist,* 1923.

During the evening, the President said he had pleasure in announcing that the Council proposed to submit to the King the name of Sir John J. Burnet, A.R.A., as a fit recipient of the Royal gold medal for the current year.

## The Wren Bicentenary

The R.I.B.A. have completed their arrangements for the Christopher Wren bicentenary celebrations, which will begin on Monday, February 26, and will continue during the week. A memorial service will be held in St. Paul's Cathedral on the first day, and a visit will be paid to the crypt, where a memorial wreath will be laid on the tomb of Wren by the President. It was originally proposed that a procession should take place from the Mansion House to St. Paul's, but this proposal has been dropped, and members of the Royal Institute and others taking part will assemble in front of the Cathedral, and pass in procession up the steps.

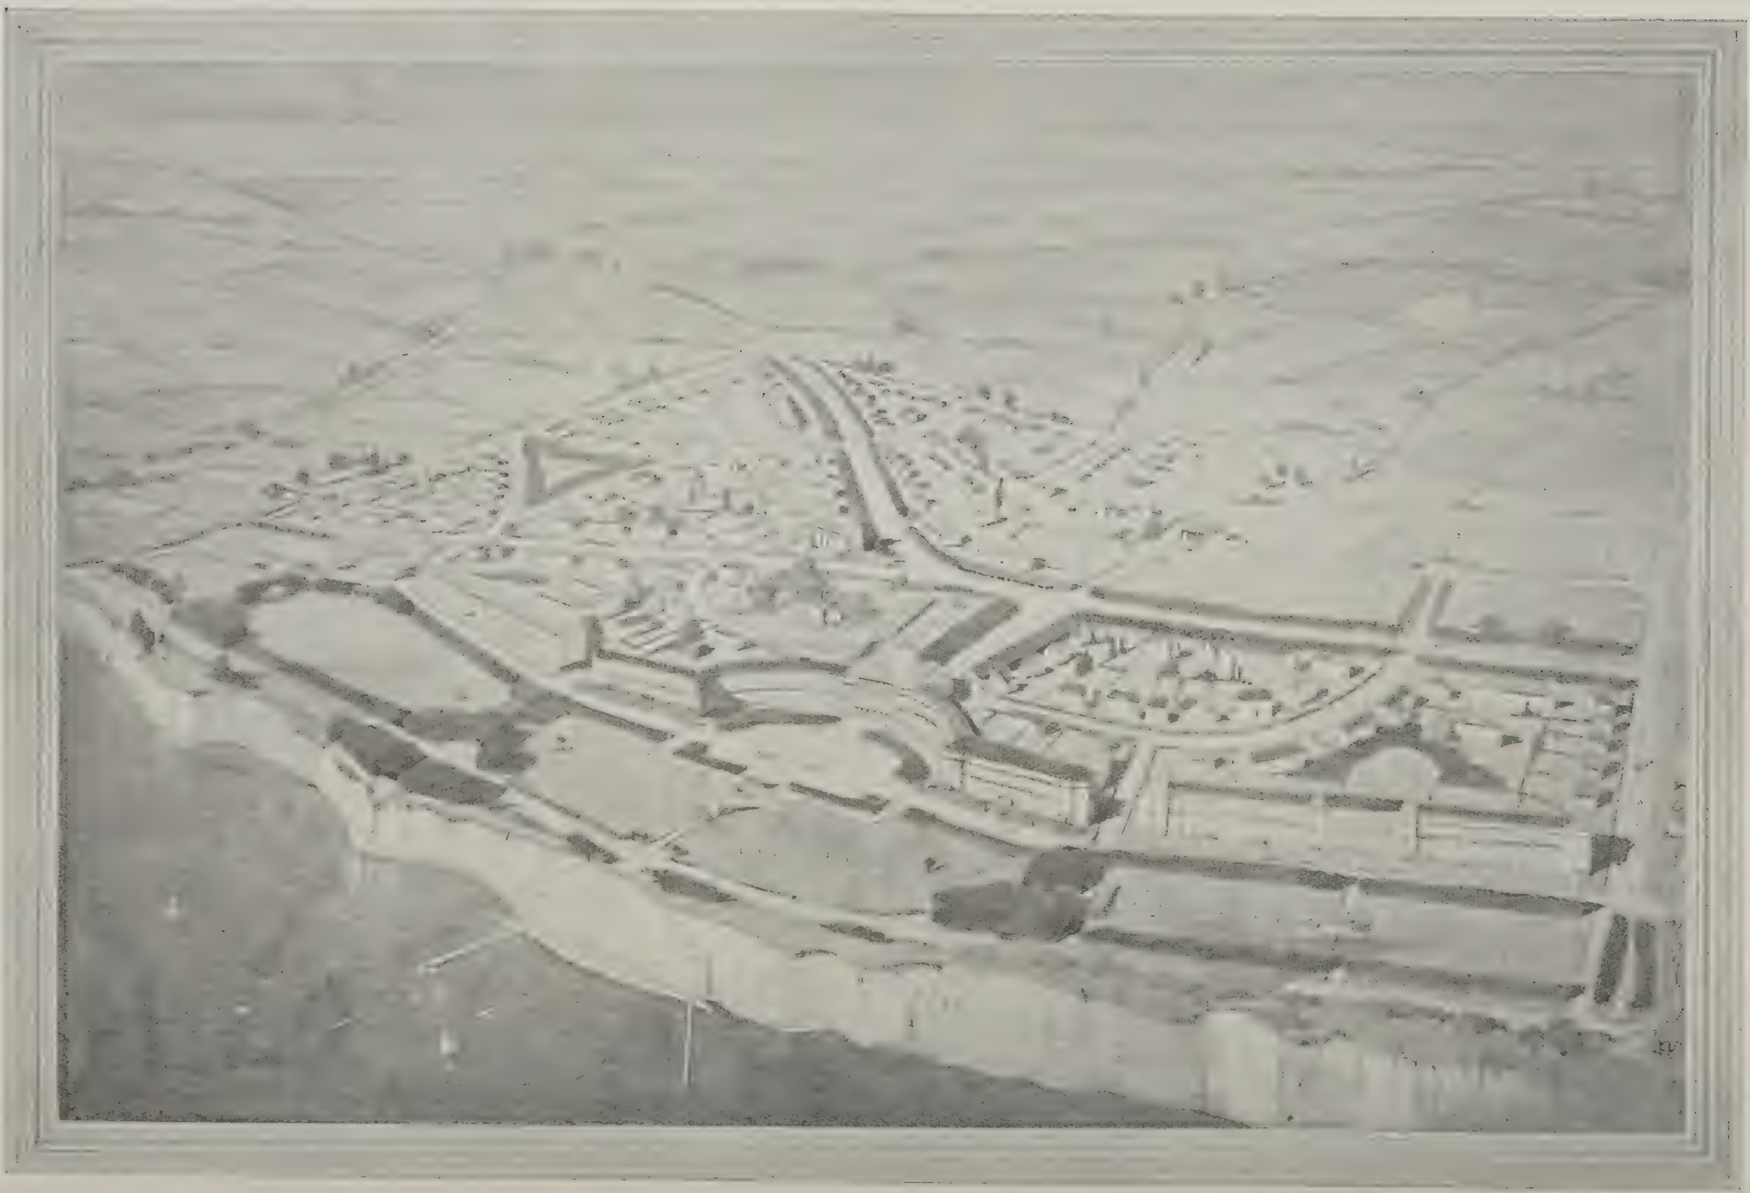


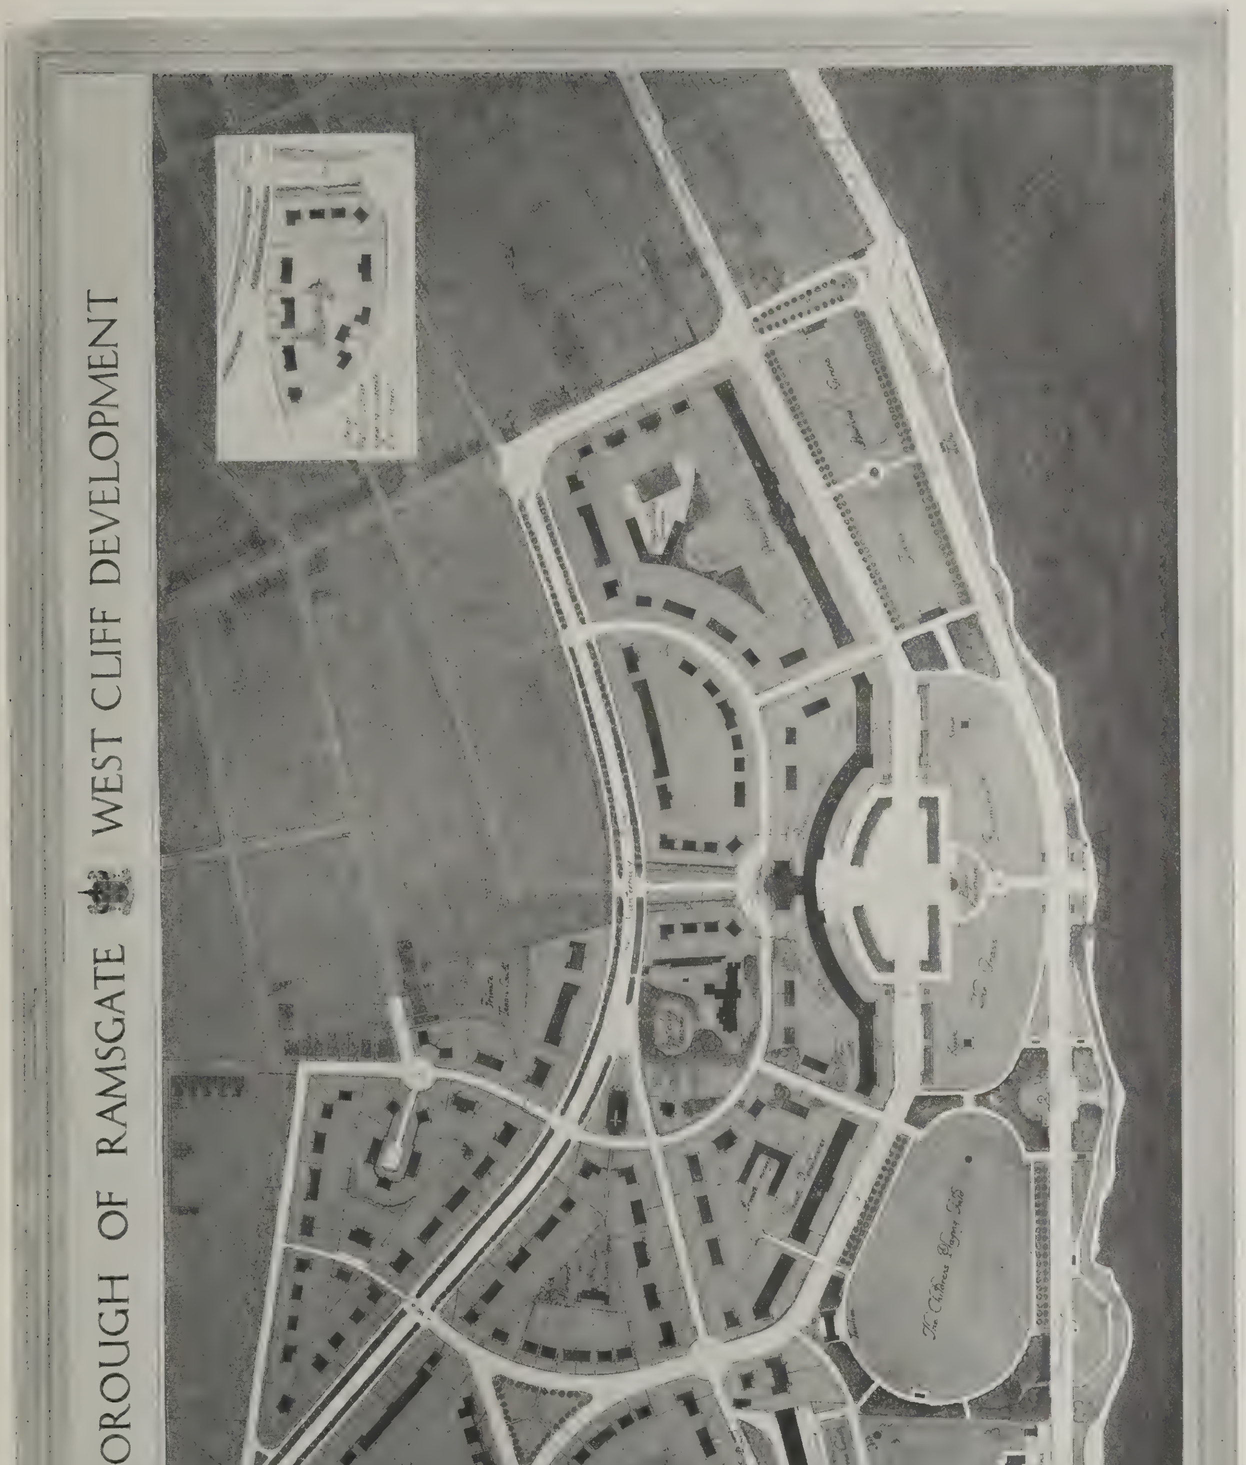
PREMISES FOR MESSRS. W. H. SMITH AND SON, STAMFORD STREET LONDON.

C. STANLEY PEACH, F.R.I.B.A., ARCHITECT.

Ramsgate West Cliff Development Competition : First Premiated Design

W. Harding Thomson and P. D. Hepworth, Architects





In the above design the chief factor which determined the lay-out was the desirability of presenting, as far as possible, an unbroken line of buildings facing the sea, with a succession of attractive gardens and recreation grounds along the cliffs.

# The New Parliament Buildings, Cairo

The new parliament buildings will stand in the centre of Cairo. It was difficult to find a suitable site, but as there existed a hall for the legislative assembly, it was thought desirable to convert that for the use of the senate and so save time and expense, and then to build out in the grounds the new chamber of deputies. This meant pulling down certain small unimportant buildings. The site, however, is still left somewhat congested, though it is hoped that before long it may be possible to open it up further when fresh accommodation can be found to replace other buildings.

The new building covers an area of approximately 3,000 square metres. The accommodation consists of the salle des séances, or chamber of deputies, with a gallery for the Press and the public, two committee rooms, ante-chamber and salon for the King, a room for the president, four other rooms for the ministers and vice-presidents, and four offices for the secretaries. In addition, a salle de pas perdus, connected to the old legislative assembly building, is provided, which can be used by both chambers.

There are two entrances and staircases for the Press and public, one for the general public, the other for the Press and reserved public, and these give access to the gallery of the chamber of deputies. There is a main entrance and vestibule under a colonnade for the deputies, and separate entrances in the colonnade of the wings for the King and the ministers. A buffet and considerable office accommodation is provided in the existing legislative assembly building. The general style of the exterior of the buildings is Renaissance based on the French Louis XVI period.

The salle des séances is circular in plan, roofed with a reinforced concrete dome. It provides accommodation for 235 deputies. The benches of mahogany, upholstered in leather, are arranged in a horseshoe formation and in tiers. About 100 fauteuils are arranged behind the back benches for the senate when special conferences of both houses are required. There is a raised daïs with a throne for the King when he opens Parliament, and accommodation for the speaker and the orator. The diameter of the hall is 21 metres, and the height to the top of the dome 21 metres from the general ground-floor level. The style of decoration of the interior of the hall is Renaissance and more classic than the exterior.

The decoration of the king's antechamber and salon is in the "Empire" style. For the rooms of the president and the ministers no definite style has been adhered to, and they are fairly simple in design.

The decoration of the interior of the salle de pas perdus does not agree with the exterior, as it was thought desirable to have it in an adapted ancient Egyptian style. The columns are circular, of a diameter of 80 cms., and terminate in the palm-leaf capital. The whole will finally be richly painted in accordance with the style and period.

The preliminary plans were approved on August 12, 1922, and it is hoped that the buildings will be completed in March, 1923.

The architect is Mr. B. R. Hebblethwaite, A.R.I.B.A., and the whole of the drawings have been prepared in the architectural office of the State Buildings Dept., P.W.M.

# Architectural Art in the United States

A large number of lantern slides, made as the result of a series of visits to the United States during a period of fifty years, were shown by Mr. J. Coulson Nicol, F.R.I.B.A., in delivering a paper on "Architectural Art in the United States," before the Birmingham Architectural Association. The speaker said that the energy and foresight of such cities as Chicago and Washington in laying down a city plan, and the general enthusiasm amongst the business men to see it carried through was without parallel in the older countries. He did not think that the great public buildings in the United States were finer than those in England and France, but they were on a much larger scale and were better placed. It was gratifying to find the very great admiration all Americans had for the English homes, both ancient and modern, and the intimate knowledge they had of the work of our best architects. The finest monumental buildings in the United States were usually the most modern. With regard to town planning, he said that in no country was the art better understood and more generally practised than in that country. An astonishing example of broad outlook was the scheme for the rebuilding of a large part of Chicago. It was brought forward and was being run by the business men of the city, and was backed by the inhabitants as a whole. It was too much to hope that something of the same kind could be done in Birmingham. The majority of the lantern slides exhibited were prepared from photos taken and sketches made by the lecturer in Spain, California, and the Middle West and East States.

## "Waste"

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—The leading article in your last issue entitled "Waste" draws attention to subjects that are badly in need of ventilation. For some reason or other they are never tackled in the professional Press—perhaps because of a disinclination to "tread on people's toes," or because it is thought that anything in the nature of adverse criticism will be attributed to professional jealousy or spite. In setting forth the position in general terms you have avoided giving offence, and have opened up a number of "banned" topics for profitable discussion. With this word of praise, may I pass to one or two criticisms of your article?

The grievances are well enough stated, but what of the remedies? It is not enough, surely, to wait for an improvement of professional conditions until the public is sufficiently educated in architecture. Cannot something *positive* be done for the private practitioner? In France every Prix de Rome man is assured of a Government commission. Why not establish a similar system in this country?

Then why should the great bulk of the State and municipal work be done by official departments? I suggest it should be put to the various authorities that every year a certain number of buildings be set apart for private architects—preferably for those who have shown themselves capable of doing good work.

The question of the uninformed building owner is a very ticklish one. Directors of companies, as you say, seem to have a positive knack of getting hold of the wrong architect. And how pleased they are with their monstrous erections! If some means could be found of putting them in touch with good architects, how great would be the improvement in our commercial architecture. Could not the R.I.B.A. do something in this matter?

LONDON ARCHITECT.

## Loading of Office Buildings

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—In the recent paper read before the Royal Institute of British Architects descriptive of the New County Hall, it was stated that the floors were all designed for a loading of 100 lbs. per ft. super.

It would be instructive to learn what relation this bears to the actual loading.

The L.C.C.'s own regulations for steel frame buildings certainly call for a calculated loading of 100 lbs. per sq. ft. for offices, which presumably covers the worst case; but administrative offices are surely the most lightly loaded of any, and even an additional 10 per cent. on the steelwork of a huge building like the County Hall must represent a very substantial sum.

For the past month I have noticed twice a day the arduous demolition of the floors of a "temporary" office building in St. James's Park, the rooms of which have never probably carried, or were ever intended to carry, more than light office furniture and a few officials. Was this designed to some such theoretical loading?

NEMO.

---

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—In reply to your request for comments on the letter of "Nemo," I would suggest that we probably have the building regulations which we deserve. Architects of experience are, of course, fully aware that theoretical loadings, like 70 lbs. per sq. ft. in bedrooms and 100 lbs. in ordinary offices, are wildly improbable, except under the most exceptional circumstances, for which generous factors of safety are always provided.

But however flagrant the absurdity may be, who can afford to protest publicly, with any hope of professional backing? The merest suspicion of heresy against that blessed term "established practice," the very mildest plea for a little common sense, generally suffices to arouse the vociferous ire of somebody who hides his practical ignorance under an unctuous reverence for "sound and safe building." After all, we know that when imprisoned within our textbooks we are safe, and we generally play for safety all the time and hug our chains.

And we shall continue to do so until we can educate professional opinion through a new generation of young architects whose training has been more practical. It is futile to abuse the officials of local authorities or of Government departments, who can scarcely be expected to adopt standards less conservative than those which are indicated by published professional opinion. Equally useless is it to deride textbooks. They are too firmly established; and their authors have generally copied older textbooks, generation by generation, back to the time when fat commissions might be expected to result from writing a pseudo-scientific book of rules and dedicating it by permission to some Right Honourable architectural amateur.

Apparently the only cure is to catch our architects young, and to give them opportunities of coming into physical contact with those forces which they are supposed to control.

We do this with our young engineers: we send them into the shops, regardless of dirt and grease, and we compel them to make innumerable practical tests before we give them a professional status. But the young architect can obtain his A.R.I.B.A. without touching a tool or even testing a small stick, to say nothing of a beam, to destruction.

If the embryo architect cannot find time to lay his own bricks, to cut his own tenons, to set out his own rods and frame his own roof, and then in due course to act as foreman or clerk of works on his own design, let him at least be taught to learn his structural mechanics in such a way that forces and loads mean to him something more than mere figures. At least let him learn the laws of leverage with a 5 ft. rod and the kitchen weights, and the nature of roof stresses by building up model trusses with laths and string. Even one Saturday afternoon stolen from sport and devoted to building a floor with real joists and testing it with real bricks, would teach that which cannot be learned from a year of lectures or extracted from a whole shelf of textbooks.

The cost of materials for this kind of training can be almost infinitesimal, but its value is incalculable. Until it is adopted we shall never get architects who are also master craftsmen, who can build safely without waste. Until we do get such architects we must expect that extravagant anomalies in by-laws, regulations and textbooks will continue to tax unduly our industrial resources.

PERCY J. WALDRAM.

## Reinforced Concrete Calculations for Beginners

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—On reading the article "Reinforced Concrete Calculations for Beginners—VI," by Professor Henry Adams, M.Inst.C.E., in your issue for January 17, I discovered an error which, although not likely to affect experienced designers, is likely to be very misleading for beginners. Professor Adams states: "We might have obtained an approximately correct section for a simple beam by making $95.b.d^2$ equal to the bending moment, in a similar manner we can find the approximate section for a continuous beam by making $120.b.d^2$ = bending moment." In the design of reinforced concrete beams and slabs the formula $BM = 95.b.d^2$ is correct for working stresses of 600 lb. per square inch on the concrete and 16,000 lb. per square inch on the steel whether the beam or slab is simply supported or continuous, and the amount of tension steel required is $\cdot 00675\, b.d$. The formula $BM = 120.b.d^2$ is approximately correct for stresses of 700 lb. per square inch on the concrete and 16,000 lb. per square inch on the steel, the required amount of steel being $\cdot 0087\, b.d$.

The above figures are on the assumption that the modular ratio is 15.

The number by which $b.d^2$ is multiplied in the above formulæ varies only with the allowable stresses on the materials and not according to the method of support or loading.

Possibly Professor Adams meant that $BM = \frac{WL}{8} = 120\, b.d^2$ gives approximately the same result as $BM = \frac{WL}{10} = 95\, b.d^2$. Or expressed in words: if the bending moment on a *continuous beam* is calculated as though the beam was *simply supported*, the factor 120, used instead of 95, will correct the error.

This is rather an unusual method of procedure, and he must have overlooked the fact that he had previously calculated the BM as $\frac{WL}{10}$

READER.

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—I thank "Reader" for his criticisms, but I do not agree with him that "the number by which $b.d^2$ is multilied varies only with the allowable tresses on the materials and not according to the methods of support or loading." 'or a given load the section required and lso the amount of reinforcement will ertainly vary according to the method f support and also of loading. If he had aid the multiplier depends only on the llowable stress and the true bending noment he would have been correct. He s right in assuming that what was in ny mind was that if the beam be taken s simply supported, 120 $b.d^2$ will give he equivalent section for a continuous eam.

HENRY ADAMS.

## The Press and the Architect

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—Your journal is to be congratulated on its efforts to secure justice for the architect from the lay Press. It is not that the architect desires personal advertisement, but that the public should be taught that the success of any building is due, at least, just as much to design as to construction. Unfortunately, the lay Press are not the only offenders. In the cinema, when important new buildings are screened, the name of the architect is never given, and the same omission occurs on many of the posters exhibited on the railways. Why should not the name of the architect of any building in course of erection be displayed in a manner similar to that of the builder? Much of the indifference of the public is due to the curious modesty of the architect. The profession should use every means within its power to impress upon the public that there are such people as architects, and that buildings have to be designed as well as built. It does not seem to be realized that the planning and designing of buildings is an art only to be laboriously acquired.

"OBSERVER."

# The Purchase and Selection of Timber

THE fifth of the series of public lectures at the Northern Polytechnic, London, was given by Mr. Montague L. Meyer upon "The Purchase and Selection of Timber."

Raw or unmanufactured timber, said Mr. Meyer, is divided into two classes—softwoods and hardwoods. It is rare to find an individual who is an expert in both. I do not propose to discuss hardwoods because they comprise only a very small proportion of the timber which is used in construction and are of such numerous varieties, with so many different types of each variety, that it would be impossible in a short lecture to tell you anything of any lasting value.

Softwoods are produced from coniferous or cone-bearing trees, and although there are many species of these, when they are sawn up and ready for use they are reduced to two types, namely, the redwood and whitewood which come from European countries, and the pine and spruce from Northern America.

The timber merchants and consumers in the United Kingdom generally favour the use of European woods.

It is much easier to make a selection of sawn timber than it is of round timber. In the latter the defects are more or less hidden. In the former they are exposed to view. There are four defects which should always be kept in mind: knots, sap, splits or shakes, and rot.

To take the first: knots are unpleasant things. We should all prefer to have wood without them, but that is almost impossible. Avoid, however, the black knot—it is dead and will probably fall out. The tight or live knot, when not too large, need be no cause for serious anxiety if the timber is being used for frame work or carcassing.

Sap need not worry you unless it be discoloured. If it is so, that is a serious defect, as the wood, unless very carefully treated, will rapidly decay. Timber with bright sap is perfectly sound and quite suitable for general purposes.

Shakes or splits are of two kinds. The first, and less serious, is a straight split which occurs during the seasoning of a piece of wood. It is generally visible from the ends. The second is the cross shake, which is a bad defect and proves that the timber is not straight grained.

Rot or doat is not so easily visible as you may think. You cannot look at a pile of wood and be able to say with certainty that there is or is not rot in the parcel.

There are two kinds of doat—hard and soft. You do not find this defect all over a piece of wood, but in patches and blotches, dark brown in colour. It is a disease and for constructional purposes should be avoided as such. When you go on your tour of inspection or selection, you must also bear in mind that there is such a thing as dead wood—timber cut from trees which have died before being felled.

For constructional purposes it should be left alone, as it breaks off short immediately it receives a strain.

We have now dealt with the ordinary defects which are found in timber.

There are, in addition, what may be termed disadvantages rather than faults.

For instance, pieces of wood with open grain at the ends show that the wood has been quickly grown, probably in a swampy district. Such pieces have not the strength or lasting power of slower grown and closer grained wood, and however attractive they are otherwise in appearance, they should be avoided except for cheap work of a temporary character. Then again, one should be careful of strong cross-grained timber. It is liable to twist, warp, and split. Its appearance is difficult to explain, but the words used by the technical expert on inspecting such a parcel would be—harsh and strong.

Wane is a technical term to describe timber which has rounded edges as opposed to square edges. This is caused by the sawmiller endeavouring to get too large a quantity of sawn timber out of a round tree. He has brought in some of the bark and, therefore, the edge where the bark is is rounded. Such timber is serviceable for cheap purposes, but for high-class construction would not be satisfactory.

I now propose to discuss a point which may be of some use to you in the future and may also tend to make the life of the timber merchant a little less harassing than it has hitherto been. I refer to specification and conditions as imposed by the architect upon the builder and by the builder upon the timber merchant.

As regards specification, always endeavour to confine yourself to those dimensions which may happen to be available in considerable quantities in the vicinity of the district where you propose building. If your job is a large one, it will often pay you to find out what is available before you start your plans and design your work according to what you can most economically obtain. For instance, if you want 2×4 or 2×5, you may find that those two sizes are very scarce and expensive, and yet $2\times4\frac{1}{2}$ is cheap and easy to obtain.

A further point as regards size is, never specify, if you can possibly avoid it, what is called "out sizes," such as $3\frac{1}{2}\times7\frac{1}{2}$. Wood is never imported in this dimension, and if you insist upon it, it would have to be cut out of much larger timber, and you would have to pay not only for the work of conversion, but also for the waste wood which would result.

Now, there are two reasons why it is not so necessary for the timber importer to inspect his purchases beforehand:—

Firstly, there are many well-known exporting firms abroad who have established shipping marks which are known and esteemed by both timber importers and users of wood.

There are hundreds of these marks, and a timber man does not know his business until he has pretty well mastered most of them. They are generally uniform year by year as regards quality and condition and, in any case, they are guaranteed to be so. If they are not, however, the timber importer has a claim upon the shipper for the damage or loss which is caused to him thereby.

Secondly, if the timber importer has a parcel which is not good, he can dispose of it for some less important use.

When you know the marks you can safely buy from the timber merchant the well-known brands without seeing them.

Timber in this country at the present time is approximately 100 per cent. above the pre-war value. In my opinion it is too high, and I do not think that we have yet reached the period of stability when the holding of large stocks can be regarded as a safe commercial operation. At some time or another I feel that there is bound to be a heavy fall in value.

The lecture was followed by a discussion in which a large number of the audience took part, including Mr. D. W. Ayre, A.R.I.B.A., Messrs. H. T. Deacon, H. W. Grainger, and A. Hewitt.

Mr. T. P. Bennett, F.R.I.B.A., in proposing a vote of thanks, referred to the efforts being made to reduce the cost of housing and other building works, and suggested that considerable assistance would be rendered by the timber trade if they published from time to time official lists of the sizes of timber most easily obtainable and those which were cheapest. This list should be published by the professional journals, and should be circulated officially by the R.I.B.A., L.M.B.A., Surveyors' Institute, Institution of Civil Engineers and other bodies.

# An Old Surbiton House Transformed

MUCH has been heard recently of the revival of craftsmanship; but practical evidence of this has hitherto been a little difficult to collect. One sees fine work being done in workshops and studios, fine specimens are periodically on view in exhibitions, occasional public lectures assure us that all is well.

Nevertheless, it is all rather remote from real life. We bestow heartfelt admiration on isolated examples of the craftsman's skill, but somehow fail to visualize them in everyday surroundings, which is, after all, what they were primarily intended to embellish. We seek new ideas in furnishing and decoration, new inspiration for our gardens, and find but cold comfort in a shop window or an exhibition stand.

The architect, before all men, must be conscious of this. It is impossible for him, with his multifarious activities, to keep abreast of every development of modern craftsmanship, to acquire an intimate acquaintance with every labour-saving device as it appears, and yet the insistence of clients can only be met by an encyclopædic knowledge of the latest in everything that pertains to house and garden equipment, from cooking ranges to curtains, from tennis courts to tulips.

Herein lies the charm, and the value, of "The Gazeway." It is as good as the Mappin Terraces at the Zoo. Nay, better, for the exhibits are not caged in, and visitors are allowed to touch.

An old house and, moreover, an extraordinarily ugly and inconvenient house, has been transformed into an abode that will appeal alike to the ultra-artistic and to the ultra-utilitarian, to the seeker after new things, and to the lover of the old. Messrs. Gaze, who are responsible for the achievement, have done a rare service to both architect and layman by affording a practical illustration of the service they can offer. The infinite variety of modern craftsmanship is here shown and, moreover, one can test the look and feel of things as they appear in an average house on an average day. There is none of the "to be looked at but not lived with" sensation about "The Gazeway." The chairs are evidently meant to sit in; one does so, and finds them good. One can discover here whether one would really like a yellow drawing-room or no, the nurseries look as though the small inhabitants would return at any minute—the bath is a sheer temptation.

Not everything will appeal to everybody, but that is the delight of it. One can wander from room to room holding exciting arguments with oneself—at any rate there is plenty to argue about. There is the stimulus of novelty, the shock of unaccustomed colour, the wonderment as to whether every device has all the advantages claimed for it. Seen, as here, under normal conditions, one has the best possible opportunity of arriving at an unprejudiced conclusion.

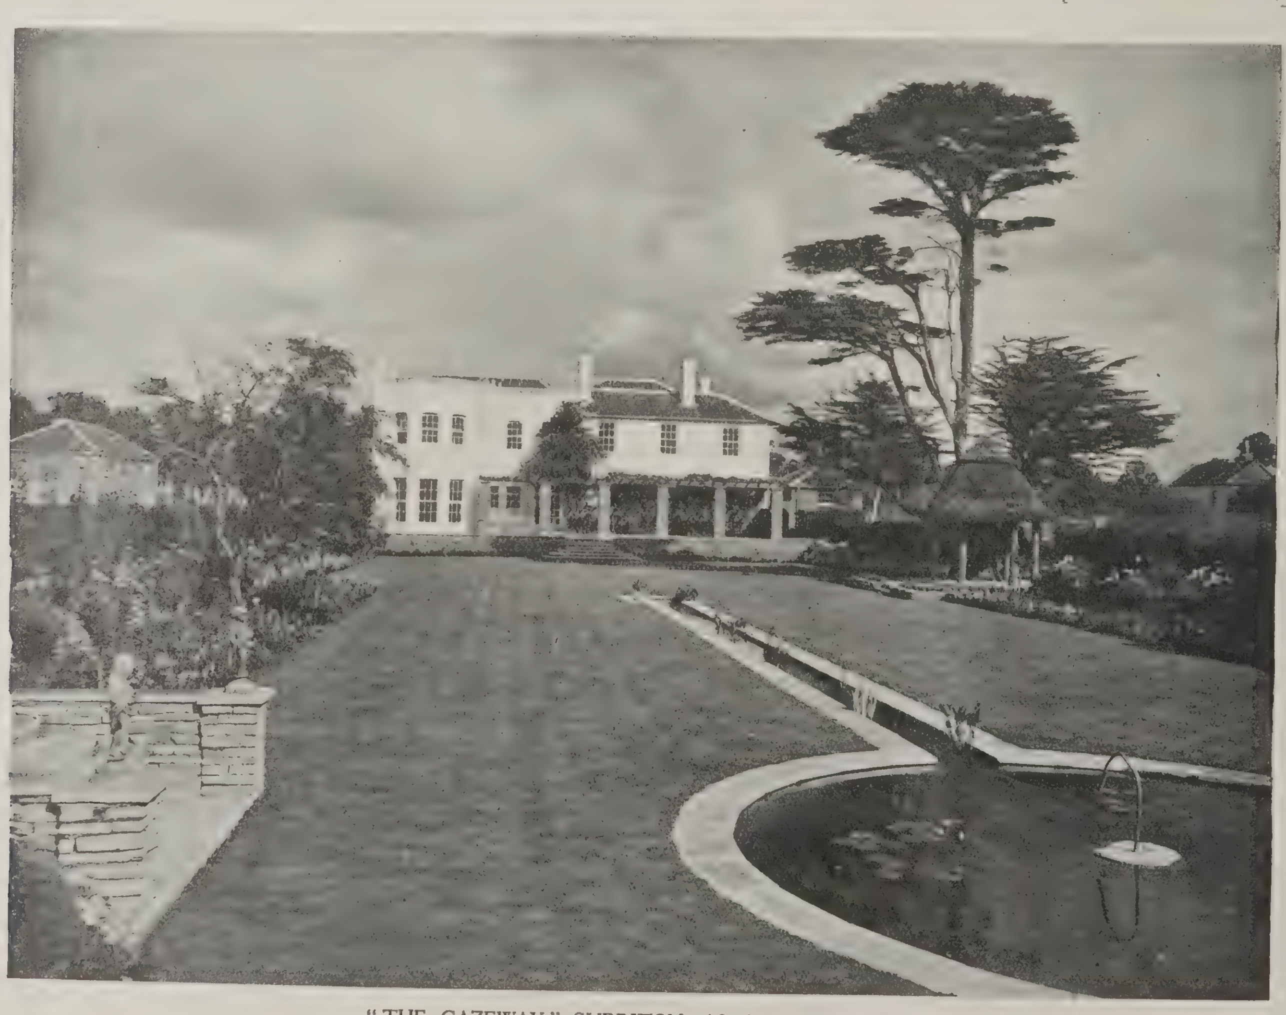
Concerning the gardens there can be no two opinions. They are the work of an artist. Transformed from the wilderness of a year ago, they are a revelation of what can be accomplished, a foreshadowing of the delights that are to come. There is quiet spaciousness about the wide lawns, old-world formality in the topiary garden beyond, while rose garden, rock garden, terrace garden, gardens too numerous to mention are all alike crammed with promise for the future.

One or two fine statuary groups are particularly worthy of mention, and the little lead figures that peer distractingly into the ponds and fountains invite one to bend down and examine the lilies and gold fish in their company.

All is not formal, however. The athletically disposed will inevitably linger by the hard tennis court with its electric lighting system for night use. Nursery folk will make straight for the corner dedicated to their use, complete with see-saw and swing, playhouse, and sand. A pond for "the young navigater" even is not forgotten. There is a wild bit, with a green bank and a little stream in which bluebells will presently be mirrored. And lastly, the presiding genius of the place has a crowded nursery of his own, packed with healthy babies of every size and shape. This is, perhaps, the nicest corner of all.

Every one, be he architect or layman, will find something to interest him in "The Gazeway." The owners extend a cordial invitation to all and sundry to "come and see," and a journey down to Surbiton will be well repaid.

E. N. B.



"THE GAZEWAY," SURBITON, AS IT IS TO-DAY.

# Tints and Towns

## By the Rt. Hon. J. R. CLYNES, M.P.

WHEN St. John saw the New Jerusalem coming down out of heaven, he saw it in colour; the jeweller as well as the architect and the mason had been concerned in its building. Each of the gems which formed the foundations of its twelve walls represented a specific tint, from the reddish-brown of the sardius and green of the chrysolite to the yellow of the topaz and the deep azure of the amethyst.

Outside the limits of the glowing Orient, cities in whose decorative scheme colour takes a definite place are rarely encountered. Two exceptions will jump to the traveller's mind—Venice, with the greens and blues and scarlets of her jalousies, and the pale pink of her palazzi; and Moscow, which has, I am told, a dazzling kaleidoscope of roofs in red and brown, blue and green, broken by sapphire and emerald and gold cupolas and gleaming white minarets—beauties, by the way, that I am not likely to be invited to view.

The English town of Tudor times must have presented a gay and vari-coloured aspect. The weathered red tiles, timbered fronts, and painted escutcheons and shop signs gave to the narrow, cobbled thoroughfares a many-tinted background. It was only with the arrival of the industrial revolution and crude utilitarianism of the nineteenth century that the love of colour was crushed out of the British people and our large centres of population became the leaden-hued and depressing huddle of sombre buildings we know too well.

Hints of reaction against the grim domination of stone and stucco and dingy brick are happily beginning to appear. Here and there an oasis of ivory white, terra-cotta, or tinted vitreous brick breaks the monotonous line of smoke-begrimed buildings. In some of the newer erections decorative designs in coloured wall-facings introduce livelier hues and suggest possibilities of varying and brightening the scenes of our daily toil.

As yet, however, little has been achieved in the direction of formulating definite colour-schemes in town-planning or improvement. With the ingrained national distrust of the bolder use of colour, British architects and builders are slow to realize the remarkable diversity in decorative possibilities which modern processes for the production of ceramics have placed in their hands.

A skilful gardener plans his herbaceous borders with the deliberate design of producing at different seasons certain pleasing combinations of colour. Why should not the architect, who is called upon to prepare plans for the erection of large blocks of buildings or to lay out a new residential area, take a leaf out of the gardener's book, and set himself to combine with stately and harmonious proportions a colour-scheme that will enhance the beauty of his work? One can imagine a combination of greys and yellows, browns and greens, blues and whites, or even gradations and shades of a single colour, in the façades of a thoroughfare, that would perceptibly mitigate the dreariness and depression which we have mistakenly come to believe to be inseparable from the grey skies of our island home.

Scientists and medical experts more and more emphasize the curative and health-giving properties of sunlight. Unfortunately, in these northern latitudes an adequate supply of sunshine cannot be turned on at our will. But its absence may be in some degree counterbalanced by utilizing every opportunity to bring into play the next best thing—those colours which delight the eye and subconsciously infuse man's being with lightness of heart and gaiety of spirit.

No inconsiderable part of the depression and listlessness which characterizes the life of the workers under the monotonous conditions of modern industrialism may be traced to the drabness and absence of light and shade in their environment.

If our streets and buildings presented to the citizen's eye the variety and beauty which spring from æsthetic employment of harmonious colouring, the whole tone of our industrial population would be beneficially affected. A light-hearted and cheery temper would be stimulated which would not merely lighten the burden of the daily task and eliminate a good deal of the friction, but insensibly educate eye and brain, and restore to our people some measure of that artistic perception of which they were robbed a hundred years ago by the crudities of the industrial revolution.

---

# Law Report

## Roof and Roof Covering—Interesting Points

*Ellis v. Lapidge.*

Jan. 15. King's Bench Division.
Before Mr. Justice Shearman.

This was an action by Mr. Henry Ellis, of The Grove, Hampton Wick, against Mr. Macdonald Henry Lapidge, of Lower Teddington Road, Hampton Wick.

For the plaintiff, Mr. G. W. H. Jones said his client took The Grove, Hampton Wick, from the defendant under a lease dated September, 1918, for fourteen years at a yearly rent of £120. The premises included a dwelling-house, stable, greenhouses, and garden. The claim was for a declaration that defendant was liable to repair a lead flat and to keep greenhouses in repair; alternatively damages for alleged breach of covenant. The lead flat was so much out of condition that it was necessary to have a new one. His submission was that that work was a structural repair which fell on the landlord. If he were wrong on that, he asked that the lease should be rectified, because the correspondence and interviews between the parties showed that that particular liability should be placed on the landlord. His contention was that the lead flat or roof covering was part of the roof, which the landlord had to keep in structural repair. Defendant said it was plaintiff's duty to repair the greenhouses, but plaintiff contended that defendant should be liable, and he asked a rectification of the covenant so as to put that liability on the landlord. Plaintiff also said defendant had failed to repair the riverside frontage in accordance with his obligation, and he claimed under that heading damages for alleged breach of covenant.

Plaintiff also claimed £52 15s. 10d., money expended on structural repairs.

Mr. Charles Gordon Smith, surveyor, Cannon Street, London, gave evidence for the plaintiff as to the condition of the lead flat and other matters.

Mr. C. Tindale Davis, for the defendant, submitted that on the proper construction of the covenants in the lease there was no liability on the landlord in connection with any of the claims made.

After considerable argument between his Lordship and counsel, his Lordship in his judgment said that he would make a declaration that the landlord was liable to repair the lead flat and slates and the riverside frontage. There was evidence that the lead, which was part of the covering of the roof, was out of repair. "Structural repairs" had a well-understood legal meaning. But when premises were out of structural repair was a question of fact. Structural repair was something that repaired a dwelling-house itself. If the lead roof were absolutely worn out that was a matter of not being in structural repair.

Defendant said he was not responsible to repair the lead flat, because slates and lead roof did not come within his covenant. He referred to the other covenant and said that "a roof" was a different thing from "a roof cover," and that slates were not roof, but roof cover. It seemed to his Lordship that the two covenants, that of the landlord and that of the tenant, fitted into each other, and it was clear to him that looking at the landlord's covenant slates and lead flat were part of the roof. Therefore, if the lead flat or slates were out of structural repair the landlord must take action to do the work or pay damages. In his judgment the slates and lead flat were part of the roof and it followed that the roof covering was included in the roof, and subject to the landlord's covenant to repair the roof structure.

As to the greenhouses, there was another contention by the tenant that the landlord should repair them, but it was clear to his Lordship that upon the construction of the covenant there was no obligation upon the landlord to do so. They were not part of the dwelling-house. There was no reason for rectification.

His Lordship further said that the question of damages would be referred to an Official Referee if the parties did not reach an agreement between themselves. Costs were reserved.

# The Institution of Structural Engineers

The annual dinner of the Institution of Structural Engineers was held at the Savoy Hotel on Wednesday of last week. The chairman was the president of the Institution, Mr. E. Fiander Etchells, who is just concluding his third year of office as president.

A toast "to the pious memory of a great structural engineer" was proposed by Mr. Ewart S. Andrews, B.Sc., who said that he hoped to inaugurate a custom for future observance. We were apt to forget the debt of gratitude we owed to the memory of past masters of the profession, and among these was John Smeaton, designer and constructor of the Eddystone Lighthouse. The toast was honoured in silence.

The toast of "His Majesty's Services" was proposed by Sir Charles T. Ruthen, O.B.E., F.R.I.B.A. (member of Council of the Institution, Director-General of Housing), and was replied to by Major-General Sir Sefton Brancker, K.C.B., A.F.C., Director of Civil Aviation, who gave an interesting forecast of the developments that might shortly be expected in civil aviation. There would be, he said, great opportunities for structural engineers in the construction of aerodromes, sheds, and hangars.

The toast of "The Institution of Structural Engineers" was proposed by the Rt. Hon. Lord Riddell.

His Lordship said that he had proposed at the last of these functions the toast of "The Concrete Institute," and he was now proposing the same toast, but the name of the Institute had been altered. The advent of concrete had led to enormous developments in building, and had been followed by reinforced concrete, special steels, and many other new accessories. This had led, really, to the establishment of a new branch of engineering which had aptly been termed "Structural Engineering." The other specialist branches of engineering—mechanical and electrical — were each governed and held together by great specialist institutions, and it was only right that the new branch—the structural branch—should be so governed.

The president (Mr. Fiander Etchells) responded to the toast in his usual humorous vein.

The toast of the "Guests" was proposed by Major James Petrie, O.B.E. (vice-president), and responded to by the Rt. Hon. Mr. Justice Darling, and the Rev. F. H. Gillingham.

Amongst those present were the president, Mr. E. Fiander Etchells, A.M.Inst. C.E., hon. A.R.I.B.A., etc., and Mrs. Etchells; the Rt. Hon. Lord Riddell and Lady Riddell; the Rt. Hon. Mr. Justice Darling and Miss Darling; Rev. F. H. Gillingham and Mrs. Gillingham; Major Boyd-Carpenter, M.P., and Mrs. Carpenter; Sir Charles T. Ruthen, O.B.E., F.R.I.B.A., and Lady Ruthen; Sir Charles Morgan, C.B.E. (representing the Institution of Civil Engineers), and Lady Morgan; Mr. H. D. Searles-Wood (past-president, representing the Royal Institute of British Architects) and Miss Searles-Wood; Brigadier-General Hon. F. C. Stanley, C.M.G., D.S.O.; Major-General Sir Sefton Brancker, K.C.B., A.F.C.; Brigadier-General Magnus Mowat, C.B.E. (secretary of the Institution of Mechanical Engineers); Dr. H. H. Jeffcott (secretary of the Institution of Civil Engineers); Mr. E. J. Partridge (president of the Society of Architects) and Mrs. Partridge; Mr. W. H. Nicholls (president of the National Federation of Building Trades Employers); Mr. H. C. Johnston (president of the Institute of Clayworkers); Mr. I. Akerman (manager of "The Times"); and Captain M. G. Kiddy (secretary of the Institution of Structural Engineers).

In all there were over 250 members and guests present.

# List of Competitions Open

| Date of Delivery. | Competition. |
|---|---|
| Feb. 28 | Scheme for the distribution of drinking water for the town of Mantes-sur-Seine. Apply Mairie, Mantes, or at the offices of La Renaissance des Cités, 23 Rue Louis le Grand (11c). Premiums: 4,000, 3,000, and 2,000 francs. |
| March 31 | War Memorial in Crow Nest Park, Dewsbury. Assessor, Professor C. H. Reilly, O.B.E., M.A., F.R.I.B.A. A copy of the conditions together with plans of the site may be obtained on application to Mr. H. Dearden, A.R.I.B.A., Borough Surveyor, Town Hall, Dewsbury, on payment of one shilling. |
| April 15 | Buildings for the Polytechnic Institute, Reval. Premiums 200,000 marks, 150,000 marks, 100,000 marks. Apply Office National du Commerce Exterieur, 22 Avenue Victor Emmanuel III, Paris. (8e) The competition is an International one. |
| June 1 | New Municipal Buildings and Town Hall, Cork. Total cost not to exceed £120,000. Assessor Mr. Lucius O'Callaghan, F.R.I.A.I., A.R.H.A. The successful competitor will be appointed to carry out the work. Second and third premiums £200 and £100 respectively. Apply Mr. William Hegarty, Town Clerk, Cork. The competition is limited to architects living and practising in Ireland. |
| June 30 | Bridge over Nygaardsstrommen in Bergen. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, S.W.1. |
| No date | Concert Pavilion, Bournemouth, to seat 2,000. Estimated cost £100,000. Assessor, Sir Edwin Cooper, F.R.I.B.A. Premiums: £300, £200, and £100. Apply Town Clerk, Municipal Offices, Bournemouth. Deposit £2 2s. (cheque). |
| No date | The Crown Agents for the Colonies, acting on behalf of the Government of the Straits Settlements, invite competitive designs for the reinforced concrete work required in connection with the construction of a new general post office at Singapore. Tentative designs, for which no fees will be paid, are required in the first instance, from which it is proposed to select a design and specify its adoption in the contract for the construction of the building. The firm whose design is so adopted will be subsequently engaged to prepare full detail plans, specification, quantities, &c., for an approved fee. Drawings can be seen and further details of the competition obtained from the Crown Agents for the Colonies, 4 Millbank, Westminster, S.W.1, quoting Z/Straits Settlements 5664. |

### *Port Said War Memorial Competition.*

The secretary of the R.I.B.A. writes us as follows: "In view of the fact that the supply of copies of the conditions of the above competition at Australia House is now exhausted, and that the time limit does not permit of further copies being obtained from Australia, the High Commissioner has asked me to state that the notices regarding the competition which you have been good enough to publish for some time past should now be withdrawn."

### *The Bergen Bridge Competition.*

The acting British Consul at Bergen has forwarded to the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1, a memorandum giving the replies of the judging committee to certain questions which have been raised regarding details of the new bridge in Bergen, in connection with which a competition has been organized by the Municipality of Bergen. The memorandum is available for inspection by interested British firms at the Department of Overseas Trade (room 50). (Reference 6751/F.R./E.P.)

### *Bridlington Sea Front Development.*

The terms of the above competition have not yet been finally settled. Full particulars will appear as soon as conditions are decided.

# International Congress on Architectural Education.

The Council of the R.I.B.A. have decided to hold an International Congress on Architectural Education in London in the autumn of 1924.

The congress will consist of special meetings for the purpose of considering the history, position, and prospects of architectural education with special reference to the following points :—

The revision of the methods and system of obtaining professional qualifications.

The sources of study; the use of travel.

Prizes and awards of honour.

Preliminary studies.

Detailed subjects: Draughtsmanship; study of history; practical handwork; professional journals; contact with works.

Examinations: Standards; relation to practice; paid examiners.

Promotion of post-graduate studies: relation to preliminary and general education.

These meetings will be held for formal and informal discussion. Arrangements will also be made for social intercourse; visits to schools, museums, places of interest; a reception; an exhibition.

The subject of the congress, important at all times to architects, is more than ever important at the present day in view of the vital changes which are being introduced into British architectural education by the schools. It is hoped that a national and international exchange of ideas will lead to valuable future developments.

The organizing committee of the Board of Architectural Education will be glad to receive and consider suggestions for the greater success of the congress, which should be sent to the secretary of the Board of Architectural Education, 9 Conduit Street, W.1.

# The Future of Industry

I HAVE been reading a letter by Lord Weir in "The Times" of January 13. It is headed "The Future of Industry," and in it Lord Weir states that his object is to draw attention to a factor governing our costs which he does not think is fully recognized as in a degree at least forming an entirely new element in the consideration of the wages question. Lord Weir, like the rest of us, is very much concerned with our industrial position, and has been following with some attention the recent debates in the House of Commons on unemployment, while also giving consideration to the Mining Association's note on conditions in the mining industry, and to the various schemes of the Government for the encouragement of enterprise and the quickening of industrial activity. He thinks the Labour Party is usefully employed in insisting on the recognition of the gravity of unemployment, but finds their marked dissatisfaction with the limited scope of the Government's schemes associated with a lack of suggestive, practical, and effective help, the only suggestions put forward by them being regarded by him as dangerous experiments.

We must have an improvement in trade, and he thinks we cannot afford to wait upon time to bring that about. He agrees with the Prime Minister, whom he quotes as having said, "Although I am not a pessimist and I do not believe we are going to disaster, I say without the smallest hesitation that unless in a reasonable time there is an improvement in the whole trade of the country, our population cannot be maintained in anything like decency and comfort on the present conditions."

Lord Weir is not a pessimist: he would describe himself as a sane optimist, and in justification points to the wonderful position in which Great Britain is to-day. In spite of the currency difficulties she is providing work for 85 per cent. of the trade union membership, her credit stands almost at par, and, above all, there is a unique undeveloped British Empire available for development.

What a list of solid assets! what a field for sane optimism! We must have the trade, we can have the trade, says Lord Weir, then why don't we have it? To that question he has his reply. It is because the cost of production is too high, the cost of living is too high, and there is a lack of confidence and enterprise.

If we continue to inquire why these things are, the whole purpose of his letter is to tell us. Listen to him. It is because of the "relativity in remuneration" which exists to-day in the wage-earning class. If that seems a little obscure, he makes it clearer by explaining that the relation of wages and hours between one block of industries and another differs to-day from 1914.

His explanation is further clarified by statistics. Lord Weir divides the great industries of this country into two blocks, one of which is exposed to foreign competition and feels the powerful influence which foreign consumers exercise on contracts and prices. The other is not so subject.

In the first block he places mining, agriculture, iron and steel, engineering and shipbuilding. In the second, railways, building trades, dock labourers, and municipal employees. He finds that in the first block the industries comprised are in receipt of wage rates ranging from 30 per cent. to 50 per cent. over the corresponding rates of 1914, while in the second block the percentage increase on the railways is 80 per cent. to 160 per cent., the building trades about 115 per cent., and for dock labourers well over 100 per cent.

It is this changed relativity which forms the new element in the consideration of the wages question. In fairness to Lord Weir it should be pointed out that when he contrasts the relativity of 1923 with the relativity of 1914 he is not to be taken as regarding the 1914 basis as fair, or as not looking forward to fairer relativity in future. He simply finds the present relativity impossible.

He is not only fair but frank, and illustrates from his own action the results which follow.

His firm want to build new houses near their engineering works. They are not able to do this because it would present to their engineering tradesmen who are working for forty-seven hours a week for 57s., the spectacle of bricklayers receiving 72s. 6d. for forty-four hours' work, and what would be almost more exasperating, the bricklayer's labourer carrying mortar and receiving 55s. 6d. for a forty-four hour week, or a rate very little less than that paid to the skilled engineer. The houses therefore remain unbuilt, and presumably will do so until the bricklayer is induced to work longer and to accept less. There is the situation as Lord Weir sees it. Some sections of industry worse off than they were in 1914, others considerably better off, a situation which in his opinion has the effect of unduly penalizing the low-paid, of checking confidence and enterprise, and directly aggravating unemployment.

Well, what is to be done about it? How are we to get what Lord Weir describes as "a redressed line of relativity in remuneration"? Is it to be by peaceful or coercive measures? Lord Weir himself put these alternatives. He asks, "Must the trader and manufacturer assail the new railway combination and demand that they make *their proportionate contribution* towards the reduction of the cost of coal, iron, steel, ships, and engines? Is it not rather the part of these authorities to recognize, and that speedily, *their responsibility in regard to the nation's productions and no longer to maintain a relatively high wage rate and costly working conditions in regard to hours?* Surely for other authorities and industries where *the adequate contribution* has not been made it is for each to face this issue without loss of time. The cost of production, cost of living, and re-employment itself demands a more uniform national effort in regard to this painful but essential process of readjustment."

What does all this exactly mean? It is a little cryptic. Is it just a euphemistic way of saying to the railway directors, the building trade employers, the local authorities, "We mine-owners and shipbuilders and engineering employers have had it out with our men and brought them to a recognition of what our industries can afford, and you must take your courage in your hands and have it out with your men too. We have got cost down in our industries by getting wages down, you must help us to get other cost in our industry down by getting the wages down in yours."

If that is what it means, and it may well be, there is little more to be said. If such a call is responded to, and there are many indications that it will be, we shall, I suppose, see the other half of the industrial struggle with probably the same results, finding at the end of it railway employees, the building trades operatives, employees of local authorities retired to a line where they will not be too much in advance of, if at all, their fellows in the mining, engineering, shipbuilding, iron and steel, and agricultural industries. That means a working class which has, indeed, lost the war, sullen, discontented, waiting for its chance.

If it means more than that, if it is an appeal not to the employers, but to the employed in these more fortunate industries, if it is asking them to sacrifice some of the advantages their protected position has given them, in order that there may be a trade revival with consequent increment in remuneration to their less fortunate fellows, then some interesting questions are raised.

I do not think that Lord Weir is wrong in his diagnosis of the situation. I do not think that he would be wrong in making such an appeal, but I also do not think he should be surprised, if that be his appeal, at being asked what proposals, if any, he has to make in the direction of giving security and stability to the workers.

Lord Weir, in his concluding paragraph, speaks of looking forward to some stabilization of wages. He has already said that an industrial country such as ours cannot permanently guarantee to any section of its population its specific standard of living. How does he reconcile the dogmatism of the latter statement with the speculation of the former? After all, his proposal means to the railway men, the building operative, the municipal employee, that they will be less able to make for themselves the necessary provision for the future. Has he any proposals by which collective provision can and will be made for them? Might they not say to Lord Weir, "after all, the conditions in our industry at the present time enable us to exact high wages, at other times the conditions in your industry enable you to exact high prices. Would you under such conditions abandon your advantages? If not, with what assurance do you ask us to abandon ours?"

It may be quite true that labour associations should recognize to-day that they are not entitled to maintain any longer relatively high wage rates and costly working conditions in regard to hours, but I cannot help thinking that such appeals, as I suppose Lord Weir to be making, would be weighted with more authority if they also reminded trade associations that they, too, ought no longer to maintain relatively high prices.

The day has passed for one-sided admonition. If there is to be what Lord Weir calls "proportionate contribution towards reduction in the cost of coal, iron, steel, ships, and engines," there must be some evidence that they are coming equally from both of the factors engaged in industry. If I saw Lord Weir coming forward with an appeal to trade combinations not to maintain high prices, I should feel a little more hopeful of the result of his appeal to the great labour combinations which must be affected by the reduction he desires not to maintain high wages.

Reductions in wages and increases in hours it may be needs must come, but a Government that would press forward a really adequate scheme of unemployment insurance, together with a vigorous attack upon trusts and rings, would do more to induce the working classes of this country to accept wage reductions with reasonable content than can be done in any other way.

If Lord Weir is really to help us, he must tell us a little more fully what is in his mind, to whom he is appealing for these "proportionate contributions," what he means by "stabilization of wages" in the future. If there is to be a peaceable contribution by labour, and not a "levy" on it, it will require more than a phrase to work the disarming miracle.

HARRY BARNES.

## Houses First!

In a very able article in "The Daily News" last week, Mr. Henry R. Aldridge (Secretary of the National Housing and Town Planning Council) gave the only answer that can be given to the rent de-control proposals, namely, "Houses first!" Very graphically he likened the present shortage of houses to a famine, observing "if we had a food famine . . . no Government would be permitted to take the view that the right line to adopt . . . would be that of allowing those who had food to sell it to whom they pleased and charge what prices they liked"—a deadly parallel! The policy of reaction must be abandoned and in its place there must be a sound, constructive housing programme. Prices have fallen to what may be regarded as a normal post-war level, so nothing is to be gained by delay. Now is the time to build.

## The City Churches: A Suggestion

What is to be done with the City churches? That they must be preserved all right-minded people are agreed; but it seems to be necessary to justify their preservation apart from the claims of art and antiquity. With any scheme that involves their being put to secular uses we have no sympathy; the mind instinctively revolts at the thought of turning them into libraries, museums, or halls of city companies, as variously suggested. There are many other ways of justifying their continued existence—ways that would do no violence to their sacred associations. Here is our suggestion: Let the livings of the City churches, with of course, their attendant expenses, be transferred to new churches in the suburbs, the relationship between the two sets of buildings being that of mother and daughter. The City churches (in the charge of caretakers) should remain open, as at present, for prayer and meditation, and other appropriate purposes, such as midday organ recitals (which are always well attended), the rendering of choral music, and for any special services that it might be desired to hold from time to time. By these means it should be possible to derive an income quite sufficient for the maintenance and upkeep of the fabrics. The churches would thus remain as a symbol of spiritual things amid strictly temporal surroundings, affording solace to the "weary and heavy laden," as well as inspiration to the devotees of architecture.

## Model Clauses for Town Planning

As we go to press we are in receipt of a book of model clauses for use in the preparation of town-planning schemes, issued by the Ministry of Health (H.M. Stationery Office, price 1s. net). These clauses have been prepared in six parts, as follows: I, General; II, Streets; III, Buildings and Building Lines; IV, Reservation of Lands; V, General Convenience and Amenity; VI, Miscellaneous. We have no space this week in which to give them the careful consideration that they demand, and propose to publish a special article upon them in a later issue.

## The Not Negligible Nail

American business men are frequently attacked for their over-keenness in commercial matters, but in one respect they set an example that might well be emulated by British manufacturers. That is, their desire to make their product, whatever it may be, the most efficient of its kind. The news that there is a cottage more than 400 years old in the village of Cheam, in Surrey, reached America, and immediately American business men began to seek information about it. A St. Louis firm wrote asking what kind of material the cottage was built of, while a firm of nail makers in Illinois asked for samples of the nails used for the roof. There is a charming naïveté about the idea that the cottage had defied the elements for 400 years without undergoing any physical deterioration and consequent renewal of parts; but this does not matter. What does matter is that American manufacturers are keen to make their own productions as durable as possible, and they care not what trouble or expense they go to in the effort.

# The Architectural Setting of "Robin Hood"

THE architectural settings of films, especially those of an historical character, are commonly so badly done that to anybody with a knowledge of architecture they are positively depressing.

It is one of the inexplicable anomalies of the film industry that while producers are willing to expend thousands of pounds on the salaries of "star" performers, they are unwilling to spend a few hundreds to get correctly designed architectural settings for their plays.

The immediate purpose of this article, however, is not to castigate producers for their known sins, but to compliment one of them upon a present success. "Robin Hood," which is now being shown at the London Pavilion, has one of the most remarkable architectural settings that, so far as we are aware, has ever been created in a producer's studio.

Let it be said at once that archæologically the whole production is full of anachronisms. Never was there such a castle as this. The great hall of the British castle at its highest development never had such a scale as this one in which Douglas Fairbanks performs his amazing feats of agility. Never was there a staircase winding around a great pier as we have it in that wonderful Gordon Craig-like interior. And what is a Tudor arch doing in a castle of the twelfth century? A page of this Journal could be easily occupied in unworthy criticisms of this sort.

The answer to all such criticisms as these is that when history becomes intractable for film purposes some amount of liberty has to be taken with it.

The producer of "Robin Hood" is to be complimented on having handled his history reasonably. His main object, we take it, was to get into the film something of the romantic atmosphere of the Plantagenet period, with special regard for the big massed effects of pomp and pageantry. Obviously too strict an adherence to literal fact would have handicapped him unduly. Hopeless the attempt to get anything of an effect within the restricted confines of a Norman keep. And what pleasure would there be in seeing Fairbanks disappear round the bend of a narrow internal turret stair? But to see him spring ever so lightly up that external stairway around the giant pier is a real thrill. This stairway is a stroke of genius. The designer (or research director, as he is called), Mr. Robert Fairbanks has out-Normanded the Normans. If William the Conqueror could come to life again he would probably have some hard things to say of Gundulf, or some other architectural assistant, for not thinking of it!

The scale of this interior is astonishingly fine. With its enormous piers soaring away into upper darkness, its strong vertical masses, its wide spaces peopled with spectral figures, its smouldering flambeaux, deep shadows and dim lights, the whole scene is one of extraordinary impressiveness. In its general effect, indeed, it resembles a great Norman cathedral more than a castle. One's only regret is that the scenes are switched off so quickly. One would like to linger upon them for the pleasure of their sheer beauty, apart from the action of the play.

One or two touches are especially pleasing to those who like archæological verisimilitude. For example, when, in the second part of the film, Fairbanks storms the castle alone and goes up to the battlements on the chains of the drawbridge, a picture is shown of the sturdy henchmen within hauling it up by means of a windlass. The thing is an amusing sham, of course, for the drawbridge is operated by a 25 h.p. electric drum hoist!

For those who like facts and figures the following particulars are of interest. The castle covers an area of 2½ acres, and 400 workmen were employed for twelve weeks in building the sets. The materials used were 252 tons of plaster, 15,000 sacks of cement, 178,000 ft. of wallboard, and 25,000 ft. of fibre. The castle is semi-permanent, and is intended for use in other films.

This remarkable film is an object-lesson to British producers. It shows at least two things: (1) That competent architectural guidance in the design of settings is essential, and (2) that it pays to erect semi-permanent sets. In other words, if British producers are to compete with the Americans, they must enlist the aid of the architect and the builder.

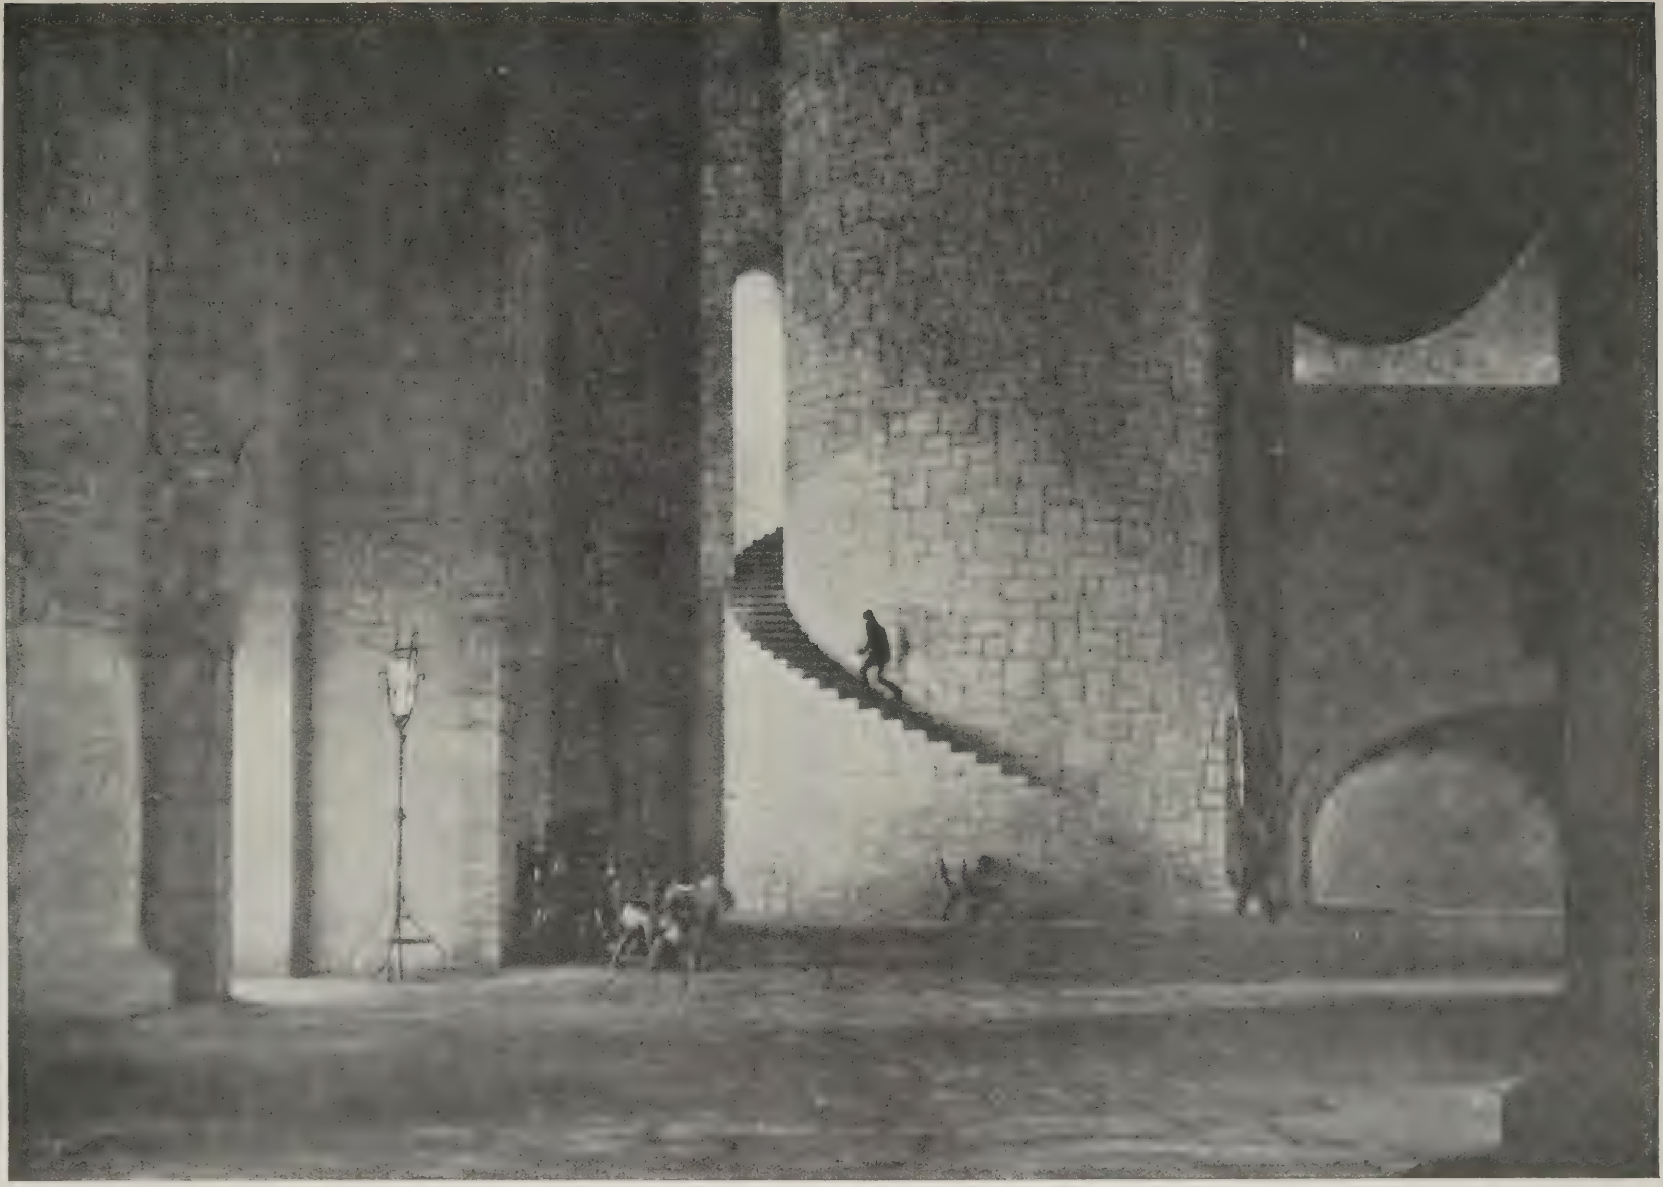
# Architectural Designs. 19.—The Architectural Setting of "Robin Hood": A View in the Castle



The total cost of the production of the "Robin Hood" film was about a quarter of a million pounds—which will be well understood from the tremendous scale upon which everything is designed. Against these massive walls men look like flies; and a single stone is bigger than the figure ascending the steps.

# London's Unhealthy Areas

## By G. TOPHAM FORREST, F.R.I.B.A., Architect to the L.C.C.

*(Concluded from last week.)*

THE London County Council has been fully alive to the need of fresh air and sunlight, and in every case the buildings are kept as far apart as practicable. Unfortunately, their example has not always been followed by others.

High buildings have been objected to because of the number of stairs which have to be negotiated by the inhabitants before they can reach their rooms or get from them to the street. This objection has been particularly emphasized as restricting the healthy development of the younger children owing to the fact that they cannot obtain sufficient open-air exercise because of the difficulty of seeing them up and down the stairs. This we cannot but agree is a valid objection.

In the Council's dwellings an attempt has been made to overcome this objection.

Outside the entrances of the flats on the upper floors there is an external balcony communicating with the ground level by one or more common staircases. These balconies enable the smaller children on the upper floors to be put out in the open air whilst remaining under the supervision of the mother.

There is, I believe, a considerable amount of prejudice to the use of external balconies mainly on the grounds that: they obscure the light of the rooms below; they destroy the privacy of the rooms whose windows abut on them.

These are, of course, in certain types of plan, quite reasonable objections.

An economic advantage of the external balcony means of approach is that it will serve for an unlimited number of separate lettings, whether of two rooms or more. Were it not for the balconies the lettings would have to be approached by a series of common staircases which could not generally, without wasteful planning, be made to serve for more than two lettings on a floor. Common staircases are one of the most expensive parts of a building and, moreover, are costly as regards management, because they must of necessity be lighted at night. Again, the ground space they occupy is sufficient for an additional bedroom on each floor. An equivalent amount of balcony is considerably cheaper, is less costly as regards management charges, and leaves all the valuable frontage available for rooms.

The objection to dwellings of more

BULLEN HOUSE, BRADY STREET AREA.

than three stories on account of the great number of stairs to be climbed has also been mitigated in a second way, viz., by combining the two uppermost floors into a series of two-floor lettings each having its entrance at the third floor level, the topmost floor being devoted to bedrooms reached by internal cottage staircases.

Although the building has a housing capacity of five stories, it is, so far as the difficulty of high staircases is concerned, virtually one of four stories only.

There is also an economic advantage to be noted here. Whereas in the old type of block dwelling it was found by experience that the rents obtainable for flats on the fourth floor—that is the top floor—were less than those on the third floor; in the new type of building the rentals obtained for the top lettings are all third-floor rentals, while the cost of construction entailed by the light cottage staircases is no greater than the external balcony on the fourth floor which now becomes unnecessary.

An outstanding feature of this type of plan is the manner in which the various kinds of apartments are disposed. As a general rule, the habitable rooms—that is, the living-rooms and bedrooms—are in series on one side of the building, while on the other side are the domestic offices and entries, and also the balconies.

This arrangement readily lends itself to the selection of the most agreeable outlook for the habitable rooms.

For example, if the best outlook should happen to be on to the street, then the building would be turned so that its habitable room side faced the street. If, on the other hand, the more agreeable outlook were over a garden or other open space to the rear of the site, the building would be reversed so that its habitable room side faced towards it, the offices, balconies, and courtyard being towards the street.

In Geoffrey House (Tabard Street area), completed last year, the habitable rooms face north-west, that is, with their outlook over the recreation space of 5 acres which is to be provided. The bay windows were designed in order to catch the afternoon sunlight.

Every case must, of course, be decided on its merits, but, generally speaking, it is, I think, better to go for the good outlook. Even if the living-rooms face north the balcony will be on the sunny side of the building, and the tenants can still get a fair amount of sunshine.

The balcony type of building can be used advantageously in London, which on the whole enjoys a mild climate, but I would question its suitability for districts liable to prolonged periods of snow and frost.

The objections to the types of plans in which the flats are directly entered from the landings of common staircases (such as stuffiness and noisiness) do not, of course, obtain—or at all events do not obtain to anything like the same degree—in buildings containing suites of roomy flats, with considerable entrance halls and with subsidiary entrances to the kitchen quarters, as they do in the case of very small flats for the working classes in five-story buildings.

In this respect, and in many others, the conditions regulating the planning are manifestly widely diverse, an arrangement in one case which is quite suitable and gives satisfactory results may in another be entirely unsuitable and unsatisfactory.

I incline to the opinion that a fundamental source of certain unsatisfactory features common to the earlier types of dwellings for the working classes, to be seen in London and elsewhere, lies in their being adaptations of pre-existent types of plan, designed for buildings of an altogether different character. That is to say, the unsatisfactory types are the result of an attempt to solve the architectural problem by "boiling down" a pre-existing type of building, rather than by producing an entirely new type for the specific purpose. But as I conceive it, it is only by this latter process that any entirely satisfactory solution of the exceedingly difficult problem presented by the small working-class dwelling is ever likely to be arrived at.

The minimum sizes of the habitable rooms in the Council's dwellings are as follows :—

| | | |
|---|---|---|
| Living-room | 160 | superficial feet |
| First bedroom | 120 | „ „ |
| Other bedrooms | 100 | „ „ |

As a result the width of the living-rooms is about 12 ft., the first bedroom 9 ft. I should like to see these sizes, especially for the first bedroom, increased. For rehousing calculations each of these rooms is regarded as affording accommodation for two persons, the basis for each being a minimum air space of 400 cu. ft. Generally, bedrooms smaller than 100 super ft. are not provided in the Council's dwellings for central districts. In Geoffrey House an experimental lift was provided, and for that reason the balcony extends without interruption from end to end of the building. The high brick wall between the courtyard and the street is not required for the sake of privacy only, but because in certain districts it was found that something more than an open railing was necessary to prevent the mysterious disappearance of the domestic washing.

In Harbledown House the balcony extends right across the building to accommodate a lift which, however, will not for the present be provided. In this building the living-rooms face south-west, and there is, therefore, no need for bay windows. The same type of building is being employed with modifications on what is known as the Brady Street area (to be known when reconstructed as the Collingwood Estate). In order to provide for a recreation space on this area, provision had to be made for housing a number of people elsewhere, and a building has been provided on a small site about three-quarters of a mile to the north of the area, in what is known as Goldsmith's Row, Shoreditch. The building is known as Whiston House.

Owing to the peculiar shape of the site and the need for accommodating as many people on it as possible a special type of plan had to be devised. One staircase is made to serve both wings. Buildings of

This building has been erected on a small site about three-quarters of a mile to the north of the Brady Street area. Owing to the peculiar shape of the site and the need for accommodating as many people on it as possible, a special type of plan (illustrated on the opposite page) had to be devised.

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

a greater height than five stories are not recommended for London. In addition to the physical disadvantages the cost of building the upper stories is much greater, whilst the rents receivable are actually less than for the lower stories. The employment of a five-story type of building generally enables us to rehouse all the displaced inhabitants, and in my opinion this is the type which should be employed at the moment. I say "at the moment" because when the present housing shortage diminishes it will then, I hope, be possible to employ a type of dwelling which, while meeting utilitarian needs, secures more pleasant conditions for the inhabitants as well as for the community.

This type of building, as far as I know, has never before been produced. The two lower stories, the ground and first floors, are combined in a series of two-floor lettings; the lower floor being utilized for living-rooms and domestic offices, the upper floor for bedrooms. The two upper floors, that is, the second and third, are similarly combined. In effect the arrangement consists of two ordinary cottages set one above the other. The greater part of the top story, which is occupied by bedrooms alone, is contained within the roof. All of this story could, however, be included in the roof with the result that we should have a building of three stories with attics above—a very usual height for domestic buildings in London. As regards the internal arrangements. Placing the bedrooms over the living-rooms instead of alongside them as in flats, has the effect of doubling the number of lettings with their entrances at the ground-floor level. Another advantage is the fact that most of the bedrooms are now on the upper floor, thus securing them from being overlooked by people in the street, and removing them to some extent from the noise and dirt of the traffic. As regards the upper lettings, access is at the second-floor level by an external balcony connected to the ground level by a common stair. The same economic and physical advantages here accrue as in the case of the upper lettings of the five-story blocks already described.

It has often been strongly advocated that cottages should be provided in the central areas as being the popular form of accommodation. But, as we have already seen, this is an impossibility. Here, however, is a practical method of providing the inhabitants with a near approach to cottage conditions, and is the type of building which I would recommend. I am also hopeful that the employment of this type of building will allow of a cheaper form of construction than would be the case in buildings of a greater height.

The effect on rehousing in the Brady Street area by the employment of buildings of this type would be that the open space could be retained and over 1,200 people could be rehoused as against 1,600 in five-story buildings. This reduction in the number it would be possible to rehouse at present prohibits the use of the four-story type of building, except possibly in special cases.

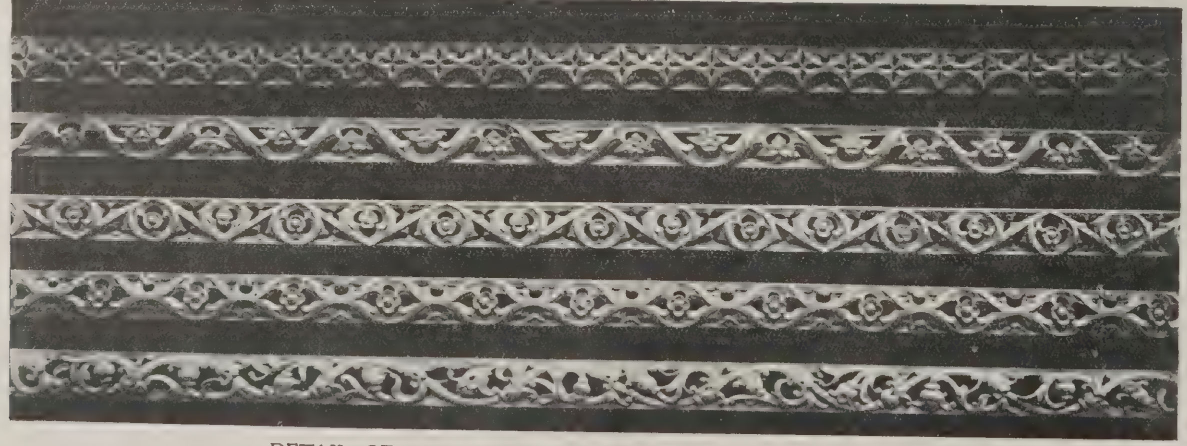
LAVENHAM CHURCH.

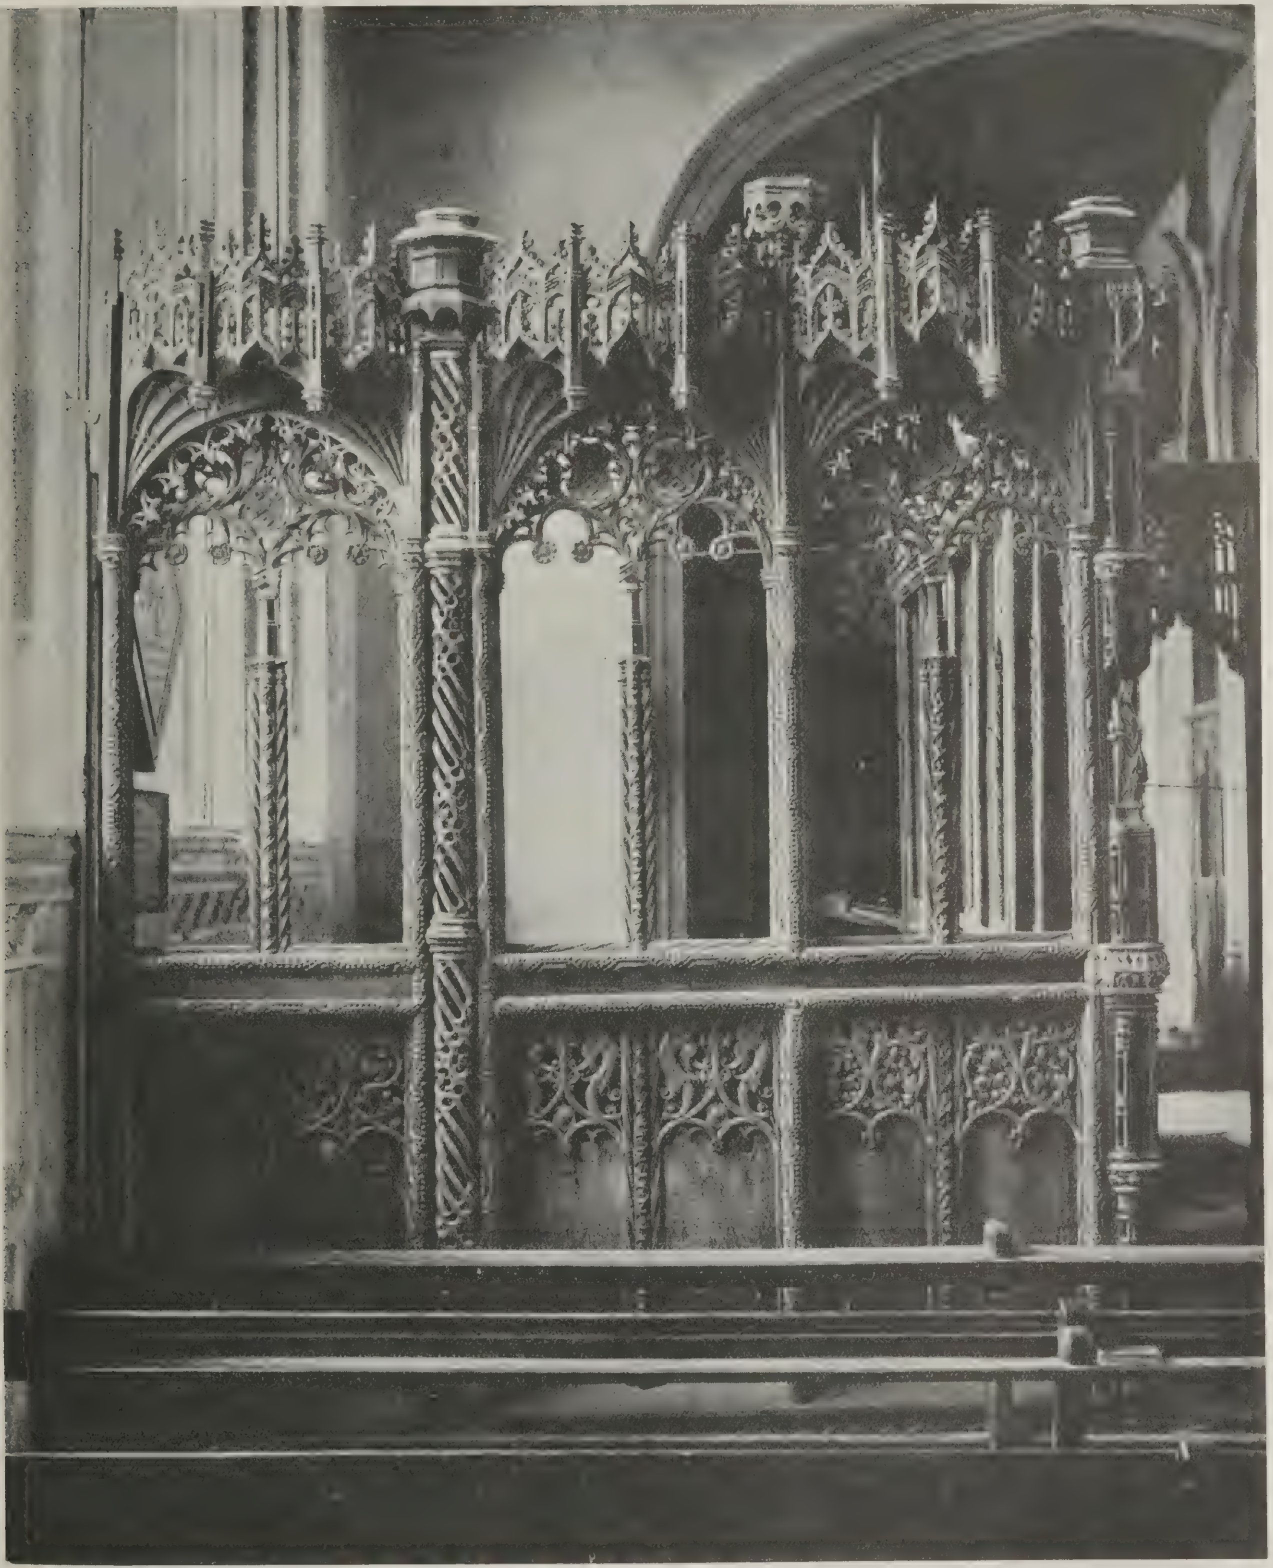
# Lavenham Church, Suffolk : The Parclose

THE following particulars of the Church of St. Peter and St. Paul, Lavenham, Suffolk, are taken from Mr. T. Hugh Bryant's "County Churches: Suffolk." Lavenham Church is one of the finest Perpendicular churches in England, erected between 1480 and 1530 by John de Vere, Earl of Oxford, and a family of clothiers of Lavenham named Spring, whose arms appear both inside and outside the fabric, also the de Vere mullet. It is, including the tower, nearly 200 ft. long and 68 ft. wide, and consists of chancel, with N. and S. chapels, nave of six bays, lofty clerestory, south porch, and a magnificent west tower, 141 ft. high (the finest in Suffolk), though still unfinished, containing a splendid peal of eight bells (the tenor weighs 23 cwt., and is considered one of the best in the country, and certainly the finest ever cast by "Colchester Graye"). There are some remains of decorated work in the chancel, the sedilia being of that period, also the five-light east window. The chapels were erected about 1530—the north by Simon Branch and Elizabeth his wife, and the south by Thomas Spring the younger. The latter has a fine roof, the cornice composed of foliage and shields of arms, and the principals spring from stone shafts, on which are small figures. Each chapel is separated from the church by good traceried oak screens. The nave, 96 ft. long, of perfect proportions, is of six bays; the pier capitals are adorned with Tudor flowers, and the spandrels of the arches filled with good panelling; a good cornice and band of panelling runs above. The clerestory has two three-lights in each bay, divided by delicate stone shafts, from which, and from the main shafts, the principals of the roof spring. The tower arch is of elegant proportions; the interior of the tower is panelled, and the staircase has a hand-rail cut out of the masonry. There is a fine modern reredos, with figures of apostles. There are remains of old painted glass in the east window of the south chapel, and under a window is a richly ornamented string. The decorated rood screen has four bays on each side of the entrance, but is not so elaborate as the parclose. There is a rood staircase at the north-west corner of the Spring chapel. Over the porch is a series of six shields representing the alliances of the de Vere family; it has an elaborate stone-groined ceiling; in the spandrels of the arch are boars—the supporters of the de Vere shield—the door ornamented with the linen pattern. The rich carving in the Oxford, or de Vere, Chapel resembles the canopy work in Henry VIII's chapel. The chapel seems to have been the private pew of the Oxford family. The church was restored in 1867.



DETAIL OF MOULDING AT BOTTOM OF THE PARCLOSE.

# Architectural Details. 42.—The Parclose, Lavenham Church.



The Decorated work of this screen must rank as one of the best examples of craftsmanship of the period. There is here nothing hurried, yet is there nothing that has been overworked at.

# Hightown War Memorial

## TRENWITH WILLS, A.R.I.B.A., Architect

THIS memorial has been designed to suit its present and future surroundings. Hightown is a growing village of small residential property some ten miles from Liverpool. The site of the memorial is at the centre of cross-roads, about four hundred yards from the sea, and is the future main centre of the village. At present the only important buildings at this point are a church hall and a bank, both of brick and stone.

No matter what development takes place the monument will always be seen in silhouette against the western sky over the sea. The sculpture and main outline of the memorial therefore have been kept as compact and restful as possible, and the colour considered in relation to the surrounding yellow sand-dunes.

The memorial stands on a raised mound about 30 ft. in diameter, and is 20 ft. high to the top of the figure. It is constructed with small orange-red hand-made bricks ($6 \times 1\frac{3}{4} \times 3$ in.), with wide unpointed lime mortar joints (five courses to the foot), and the sculpture and dressings are in Bath stone. Immediately surrounding the memorial is a brick-paved platform enclosed by bands of stone, and approached from four sides by wide flights of steps (of brick and stone) through a grass bank.

The symbolic idea of the composition is that the fallen, represented by the military trophy, pass through their Cross to the welcome and sheltering spirit of a Life Eternal, who stoops to receive and crown them. There are four panels. One bears the inscription, "Their Name Liveth for Evermore," and the remaining three will be inscribed with the names of the fallen.

The sculpture was executed and the memorial erected by Mr. H. Tyson Smith, of Liverpool.

It is probably due to this co-operation of sculptor and craftsman that the monument gives an appearance of complete unity.

Mr. Smith has also executed memorials in other parts of the country.

# The Wren Bicentenary

## The Celebrations in England

PREPARATIONS are complete for the celebration in this country and in America of the bicentenary of the death of Sir Christopher Wren. In this country the chief celebrations, arranged by a Grand Committee formed by the R.I.B.A., with the assistance of other bodies, include a commemoration service at St. Paul's Cathedral, a banquet, an exhibition of drawings and photos of Wren's work, together with books, letters, and other relics, a fancy-dress ball and carnival, visits to Wren's principal buildings, and the publication of a memorial volume. Here is the complete programme :—

### Commemoration Service

Monday, February 26, Commemoration Service in St. Paul's Cathedral.—The members of the Grand Committee, led by Mr. Paul Waterhouse, President of the R.I.B.A., and accompanied by the Lord Mayor and Sheriffs of the City of London, will assemble in St. Paul's Churchyard at 2.20 p.m., and proceed into the Cathedral. In the course of the service an address will be delivered by the Very Rev. W. R. Inge, D.D., Dean of St. Paul's. The Anthem to be sung will be "O Clap your Hands," by Greene, who was Organist of St. Paul's, 1718–1755. The members of the Grand Committee, accompanied by the Lord Mayor and Sheriffs, will then proceed to the Crypt, where the President of the Royal Institute will lay a wreath upon the tomb of Sir Christopher Wren. The service will be open to the general public.

4 p.m.—The Lord Mayor will entertain the members of the Grand Committee at tea at the Mansion House.

### Banquet

7 for 7.30 p.m.—The Royal Institute will give a "Christopher Wren Commemoration Banquet" at the Hotel Victoria, Northumberland Avenue. The members of the Grand Committee and a large number of other distinguished guests have been invited to be present. In place of the usual after-dinner speeches, commemorative addresses, dealing with the life and work of Wren, will be delivered by the President (Mr. Paul Waterhouse), Sir Reginald Blomfield, R.A., and Mr. Mervyn Macartney, F.S.A., Surveyor of St. Paul's Cathedral.

### Exhibitions

February 26 to March 3.—An exhibition of drawings and photographs, illustrating Wren's work, and of books, letters, and other relics, will be held in the Galleries of the Royal Institute. It will be open from 10 a.m. to 6 p.m., Saturday 10 a.m. to 1 p.m.

A small exhibition, arranged by the Public Record Office, will be open to the public between 2 p.m. and 4 p.m. (except Saturdays and Sundays) in the Museum of the Public Record Office, Chancery Lane, W.C.2. Autograph letters of Wren, original drawings and other contemporary documents will be on view.

### Visits to Buildings

February 19 to March 3.—A programme of visits to Wren's principal buildings, under the general direction of Mr. Percy Lovell, B.A., A.R.I.B.A., hon. secretary of the London Society, has been arranged by the Selborne Society. These will include specially guided visits to St. Paul's Cathedral, the City Churches, Chelsea Hospital, Hampton Court Palace, Kensington Palace, Greenwich Hospital, and the Universities of Oxford and Cambridge. Full particulars of these visits, which are open to the general public, and the necessary tickets can be obtained on application to Mr. Percival J. Ashton, 72 High Street, Bromley, Kent. (Early application should be made.) At Cambridge the main Wren buildings to be seen are the Library of Trinity College, the Chapel of Pembroke, and Emmanuel College. At 4.15 p.m. the Master and Fellows of Pembroke College will entertain the party to tea. There will be an organ recital of contemporary music in Pembroke College Chapel at 5.15 p.m., for which a limited number of tickets are available for Members and Licentiates of the R.I.B.A.

The Art Standing Committee have arranged a visit to the City Churches on Saturday, February 24, beginning at 2.30 p.m. Mr. Arthur Keen, Hon. Secretary, R.I.B.A., has kindly consented to conduct the visit. The following churches will be visited: 2.30. St. Stephen's, Walbrook; 2.55. St. Mary Abchurch; 3.20. St. Mary's, Aldermanbury; 3.45. St. Margaret Lothbury; 4.10. St. Lawrence Jewry; 4.35. St. Mary-le-Bow. Members and Licentiates desiring to take part should apply to the Secretary, R.I.B.A., as soon as possible.

### Memorial Volume

By arrangement with the Grand Committee, Messrs. Hodder and Stoughton will publish a memorial volume, dealing with various aspects of Sir Christopher Wren's life and work, under the general editorship of Mr. Rudolf Dircks, Librarian of the R.I.B.A. The volume will contain facsimile reproductions of original letters and drawings of Sir Christopher Wren, numerous reproductions of engravings, and original drawings by various artists, as well as a number of coloured plates by well-known artists (including Sir G. Kneller's portrait), and contributions by S. D. Adshead, F.R.I.B.A., Professor of Town Planning, London University; Rev. S. A. Alexander, Canon and Treasurer, St. Paul's Cathedral; Sir William Bayliss, F.R.S., D.Sc., LL.D.; Somers Clarke, late Surveyor to the Fabric of St. Paul's Cathedral; J. Alfred Gotch, F.R.I.B.A., F.S.A.; A. R. Hinks, F.R.S., Gresham Lecturer in Astronomy; Arthur Keen, F.R.I.B.A.; Mervyn E. Macartney, B.A., F.R.I.B.A., F.S.A., Surveyor to the Fabric of St. Paul's Cathedral; Ellis H. Minns, Litt.D.; A. Beresford Pite, M.A. (Hon. Cantab.), F.R.I.B.A., Professor of Architecture, Royal College of Art, South Kensington; A. E. Richardson, F.R.I.B.A Professor of Architecture, London University; Sir William Schooling, K.B.E.; Arthur Stratton, F.R.I.B.A., F.S.A., Reader in Architecture, London University; Laurence Turner, Past Master, Art Workers' Guild; W. Henry Ward, M.A., F.R.I.B.A., F.S.A.; Edward Warren, F.R.I.B.A., F.S.A.; Maurice Webb, D.S.O.; with introduction by Sir Aston Webb, K.C.V.O., C.B., P.R.A., F.R.I.B.A. It will be published on February 26 at the price of £5 5s. and upwards, and all the profits from its sale will be handed over to the St. Paul's Cathedral Preservation Fund.

### Fancy-Dress Ball

March 9.—The Architectural Students of London will hold a fancy-dress ball and carnival in the Galleries of the R.I.B.A. from 9.30 p.m. to 5.30 a.m. The profits will be devoted to the St. Paul's Cathedral Preservation Fund. Tickets, including refreshments, 15s. each, to be obtained from: Mr. F. R. Yerbury (Organizing Secretary), The Architectural Association, 34–35 Bedford Square, W.C.; Mr. J. O. B. Hitch, Architectural School, Royal Academy; Mr. K. Cheesman, Royal College of Art, South Kensington; Miss A. M. Hargroves, School of Architecture, University College, Gower Street, W.C.

### Wren Lecture

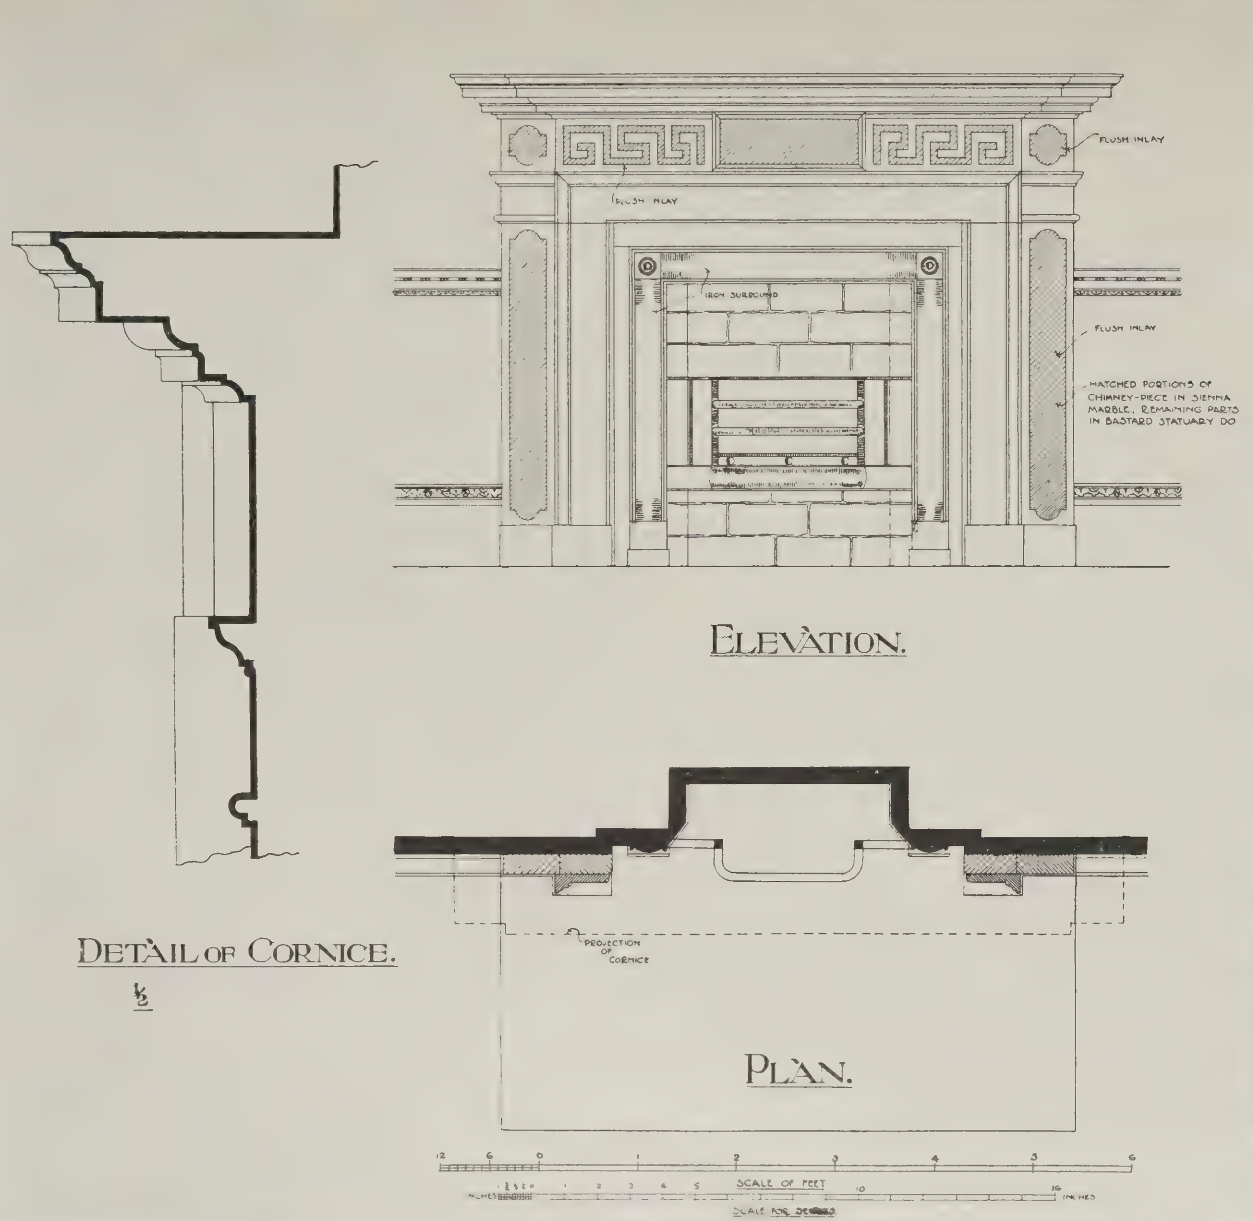
On March 1 at 5.30 p.m. Mr. A. E. Richardson, Professor of Architecture, will deliver a public lecture, with lantern illustrations, on "The Public Buildings of Sir Christopher Wren" at University College. Tickets may be obtained on application, enclosing stamped addressed envelope, to the Secretary, University College, London (Gower Street, W.C.1).

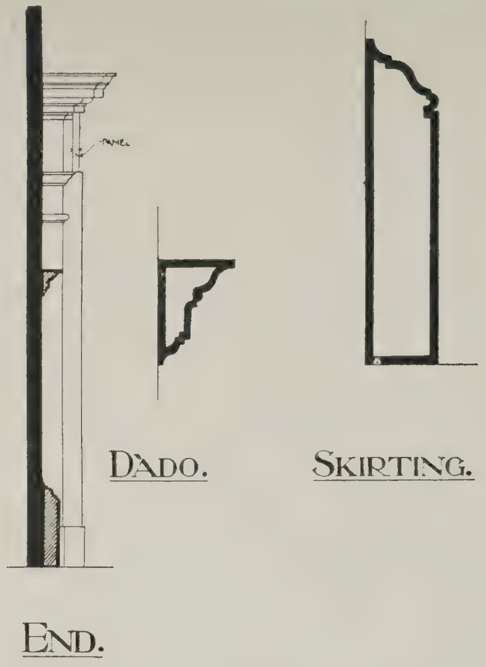
---

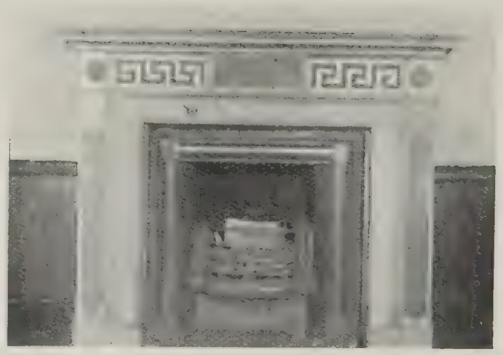
Next week a special issue of the JOURNAL will be published containing, in addition to a complete survey of the bicentenary celebrations, a number of special articles on the life and work of Wren, as follows: "Sir Christopher Wren, 1632–1723," by Frederick R. Hiorns, F.R.I.B.A.; "The City Churches," by E. Beresford Chancellor; "The Public Buildings," by Walter H. Godfrey, F.S.A.; "Wren as a Town Planner," by Professor Patrick Abercrombie, M.A., A.R.I.B.A.; "Wren's Influence on Modern Architecture," by Stanley C. Ramsey, F.R.I.B.A. The issue, which will be profusely illustrated with views of Wren's principal buildings, will form an authoritative summary and estimate of his life and work. The distinguished writers who are co-operating in the production of this issue do full justice to Wren's extraordinary genius—inventive, astronomical, mathematical, scholastic, architectural; to the last in particular, for it is as an architect that Wren is known to fame and will continue to be known throughout the ages.

# Measured Drawings. 23.—Fireplace from St. George's Hall, York

Measured and Drawn by R. W. Phillips.







St. George's Hall, York, was designed in 1740 by John Carr, of that city. Originally it was a large town house. The interior is very rich in detail; the ceilings, overdoors, fireplaces and staircase, being the most outstanding features. Only two of the largest fireplaces now remain, one of which is illustrated above. Prior to recent alterations, two others of similar dimensions were situated on the first floor, but these have now disappeared. In the fireplace illustrated, the Greek fret ornament and the jamb inlays are in yellow Sienna marble, set flush with the surrounding work.

# Magazines of the Month[*]

## A Literary and Pictorial Digest

THE ARCHITECTURAL REVIEW for Febuary opens with Decorations by Art tudents for the London County Hall.

"The project for decorating a corner f the new County Hall was first discussed between Mr. Ralph Knott and Ir. Charles Sims. Mr. Sims suggested hat students from the four chief London ainting schools—the Royal Academy, he Slade, the Westminster School, and he Royal College of Art—should prepare esigns with a view to carrying them out n situ. The project met with the ready ympathy of Professor Tonks and Mr. Valter Bayes. The site to be decorated, he subjects for the designs, and the naterial in which these should be carried ut were fully discussed; agreement was uickly reached. A modest corridor was hosen, the cartoons were to represent cenes from the public parks and gardens nder the jurisdiction of the London County Council. Each school was to nake itself responsible for four lunettes, wo of which were to be painted in risaille. Cartoons were prepared by Ir. H. J. Lee and Mr. J. C. Clark, of the Royal Academy School; by Mr. R. C. Guthrie and Mr. Burn, of the Slade School; by Mr. Norman Howard and Ir. H. W. Hawkins, of the Westminster School; by Mr. W. Liley, Miss Braden, nd Mr. R. V. Pitchforth, of the Royal College of Art."

The plan for the execution of the esigns on the actual walls has been nodified, and the paintings will be xecuted on canvas, to be fitted into the unettes.

Professor Rothenstein, of the Royal College of Art, South Kensington, who ontributes the article, adds: "As the County Hall contains countless corridors, further experiments may, it is hoped, be encouraged; while it should be possible to obtain the means, in the council chambers, for the commissioning of more important decorations by painters of established reputation."

Several illustrations of the paintings are reproduced.

THE LONDON MERCURY notes the nearing completion of the Bush Building in Aldwych, "the first important building in London to exhibit the characteristics of the latest and best American commercial architecture." "Certain details," says THE MERCURY, "may be adversely criticized. It is difficult to understand, for instance, how so good an architect can have allowed himself, for whatever object, to break the surface of his last wall by a shadowy pediment several floors down which sticks out of the wall like a fossil out of a cliff. But the great merits of the building are already obvious. The Kingsway front, with its great archway, promises to be very fine; true, it may kill its surroundings, but some of those would be better dead. The masses of the building are finely proportioned, and its upper stories are an excellent example of that gradual recession by stages which is now a standard feature in New York sky-scrapers." Mr. A. R. Powys, in his monthly section on "Architecture," writes upon "The Making of an Architect," his mind being turned to the subject by "the perusal of Mr. F. R. Yerbury's interesting little book *The Architectural Students' Handbook.*"

THE ARCHITECTURAL RECORD (New York) for January contains an article by Professor A. D. F. Hamlin upon "The State Architect and His Works." "The office of State architect for the State of New York," writes Professor A. D. F. Hamlin, "was first created by the legislature in 1909 as a part of the 'Act Relating to Public Buildings' of that year. This Act fixed no duration for the tenure of the office, and the official designated was commissioned 'to hold office during the pleasure of the Governor.' The first appointee was Mr. Franklin B. Ware, of New York City. He held the office for three years, discharging its duties with integrity amid increasing difficulties, due to the pressure and interference of the politicians and the loose way in which the Act was drawn. Upon his retirement, in 1912, Mr. H. W. Hoefer was appointed by Governor Sulzer to succeed him, but the scandals attending his administration resulted in his resignation in February, 1913, after which the office was left vacant for three months. In May of that year Governor Sulzer appointed Mr. Lewis F. Pilcher, of the firm of Pilcher and Tachau, of New York City, to the vacant office, which he has continued to hold ever since."

Without going into tedious details, the functions of the Department of Architecture (as the office of the State architect is technically designated) may be stated briefly to be the preparation of plans, specifications, and contracts for all buildings erected, altered, or enlarged at State expense, and the superintendence of their erection. An exception is made for buildings assigned by special laws to other architects, and for alterations or additions to State institutions when made by the institutions themselves or executed by inmate labour; but the department exercises general supervision over such work. The State architect is given the largest powers and widest discretion in the conduct of the office and the appointment of his assistants and subordinates, and is by the law fully protected against interference by officials of other departments or by municipal or other corporate bodies. In short, the depart-

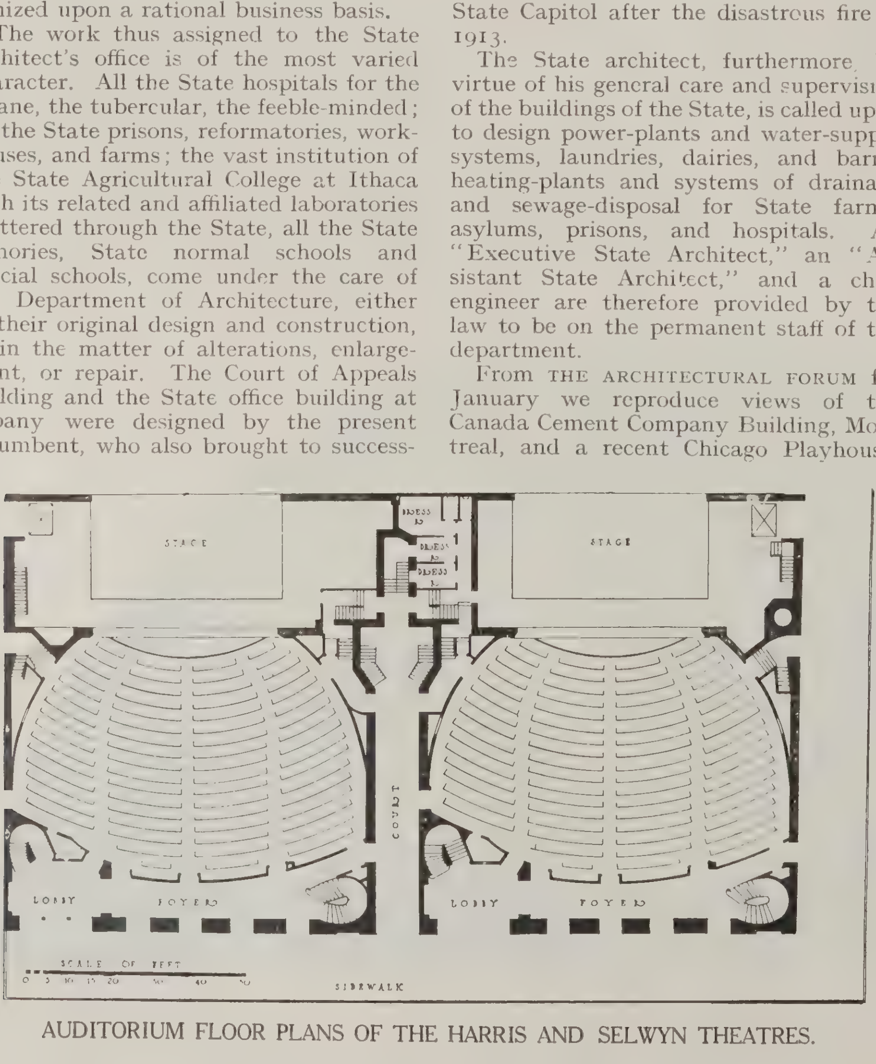
SELWYN THEATRE, CHICAGO. C. HOWARD CRANE AND KENNETH FRANZHEIM, ARCHITECTS.

ment is taken out of politics and organized upon a rational business basis.

The work thus assigned to the State architect's office is of the most varied character. All the State hospitals for the insane, the tubercular, the feeble-minded; all the State prisons, reformatories, workhouses, and farms; the vast institution of the State Agricultural College at Ithaca with its related and affiliated laboratories scattered through the State, all the State armories, State normal schools and special schools, come under the care of the Department of Architecture, either in their original design and construction, or in the matter of alterations, enlargement, or repair. The Court of Appeals building and the State office building at Albany were designed by the present incumbent, who also brought to successful completion the restoration of the State Capitol after the disastrous fire of 1913.

The State architect, furthermore, by virtue of his general care and supervision of the buildings of the State, is called upon to design power-plants and water-supply systems, laundries, dairies, and barns, heating-plants and systems of drainage and sewage-disposal for State farms, asylums, prisons, and hospitals. An "Executive State Architect," an "Assistant State Architect," and a chief engineer are therefore provided by the law to be on the permanent staff of the department.

From THE ARCHITECTURAL FORUM for January we reproduce views of the Canada Cement Company Building, Montreal, and a recent Chicago Playhouse, the Selwyn Theatre, a sister building to another, the Harris Theatre.



AUDITORIUM FLOOR PLANS OF THE HARRIS AND SELWYN THEATRES.

(*From "The Architectural Forum.*")

Only occasionally does an opportunity come to a modern architect of designing adjoining buildings in a manner which makes for harmony and symmetry, each structure possessing its own individuality and character while contributing its share to the well-ordered dignity of the group, large or small, of which it is a part. An opportunity of this kind, productive of excellent results, and full of suggestions as to what might be achieved upon a somewhat more ample scale, was recently presented in Chicago in the building of the Selwyn and Harris Theatres by the same architects.

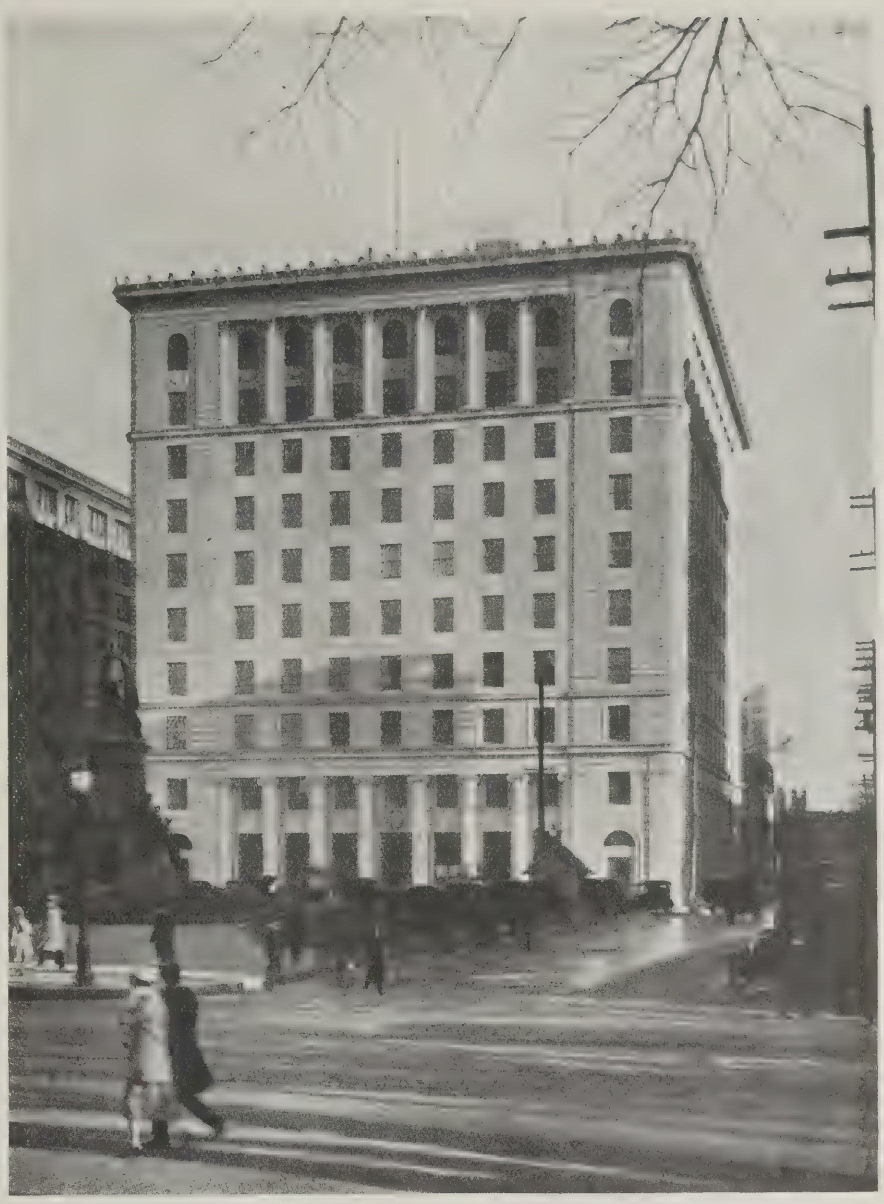
The fact that the two structures were to be occupied exclusively as theatres and not as office or loft buildings, in which theatres were to be masked or concealed, added considerably to the interest of the problem and aided in securing the beauty of the completed result. The twin structures are by no means identical in appearance or even in exterior arrangement, but their heights and chief characteristics are in complete accord, and the eye of the observer notes with satisfaction the long horizontal lines of their lower or basement storeys and the parapets before the windows, the round Roman arches, and the pilasters of their upper façades, and finally the strong, vigorous lines of the parapets which are placed above the cornices. The material of the exteriors is light toned terra-cotta with colour suggested in the trim of the windows, the canopies over the main entrances, and the bulletin boards used at various places.

The fact that each building is exclusively devoted to an individual theatre has had its due effect upon the plan, for since no provision must be made for shops, with the approaches to the theatre made f secondary importance, the entire front f each building has been given up to roviding adequate entrances which lead irectly into the theatre auditorium roper. The lobby, containing the ticket ffices, may be open the greater part of he time, the other doors, leading from he auditorium to the sidewalk, being pened only when an audience is leaving he theatre.

The interior of the Selwyn Theatre ight be described as being a sumptuous hough refined development of the styles f the English Renaissance, exhibiting ertain characteristics of what would be egarded as Georgian architecture and ecoration, while in certain other details uggesting uses which are more closely ssociated with the reign of Queen Anne. he walls from the carpeted floor to the offered ceiling are panelled with the nest English walnut, especially selected ecause of its rich grain and texture, and or the mellow softness which this wood ossesses. The walls are divided into rge panels entirely devoid of carving xcepting above the proscenium arch, round the boxes and in certain other laces where carving in high relief after he manner made popular by Grinling ibbons emphasizes the rich severity of he panelled walls. In contrast with the oft brown of the walls the ceiling of the heatre is elaborately coffered and polyhromed in antique green, cream, and old, the colouring being toned to produce he effect generally conferred by age. ighting fitments, whether hung from he ceiling or used as wall lights in the oxes and at other points in the auditorium, are of cut crystal and gilt, proucing a sumptuous appearance.

The dignified ten-story structure built y the Canada Cement Company is a triking instance of what may be done ith a comparatively tall building, for it mbodies designing and planning of a high rder. It is also of special interest ecause cement in a wide variety of uses as been employed in every practical ay in a building, the owners of which ere naturally interested in displaying he advantages of their product. The ffort is entirely reasonable. No attempt as been made to use cement products here other materials would be more uitable or less costly. The structure is einforced concrete, and the exterior acing is of cast cement.

The building occupies what is perhaps ne of the most desirable locations in ontreal, an entire block front facing hillips Square, in the centre of which tands the statue of King Edward VII. treets upon each side of the building fford permanent natural light upon hree sides.



CANADA CEMENT COMPANY BUILDING, MONTREAL.
BAROTT AND BLACKADER, ARCHITECTS.
(*From " The Architectural Forum.*")

THE PHOTOGRAPHIC JOURNAL for Febru-ry reports a speech delivered by Mr. C. ewis Hind, the art critic, before the oyal Photographic Society, in which r. Hind said : " I went last week to an xhibition at the R.I.B.A.—a very intersting show, containing representations f the chief buildings put up during the ast five years. Yet when I went away said to myself that there was no articular building standing out in my ind. What did stand out in my mind as the photography of certain buildings. gain, in each case, the photographs of he buildings that attracted me so much nd which I thought so remarkable, and eturned to again and again, were by the ame man. I knew whom they were by, because he signed his name. I believe in signing. I should like to see the County Council pass a by-law making it necessary for all buildings to be signed, and all sculpture and everything else. This man signed his name, and the two things which took my fancy—and which, oddly enough, I thought more beautiful than the buildings themselves—were the W. G. Grace Memorial at Lord's (eight or ten views) and certain aspects of Knott's County Hall, and the photographer in each case was F. R. Yerbury. These were beautiful photographs, mysterious photographs, and an aspect of the County Hall was presented which I had never felt before."

Mr. G. Bernard Shaw contributes the following letter to the January issue of ARCHITECTURE :—

Sir,—Why don't you send a competent young man round London to suggest improvements in existing ugly public buildings, and to mark the hopeless ones for demolition ? For example, the Houses of Parliament could be made almost presentable by removing the top story ; and a list of the tombs which should be cleared out of Westminster Abbey would be very useful to a Bolshevik leader in the event of a dictatorship of the proletariat being established. That would give a practical turn to much pointless grumbling and sniffing.—Yours, etc., G. BERNARD SHAW.

Mr. Shaw might have roused some architect editors to fury, but the editor of ARCHITECTURE is a tolerant man, and he comments :—

" Mr. George Bernard Shaw, in the course of a letter printed elsewhere in this issue, gives another instance of that abnormal normality which some years ago he discovered to be his most distinguishing trait. What architect, bringing up examples to illustrate his advocacy of a drastic expurgation of our architecture, would begin by pointing to the Houses of Parliament or to the Poets' Corner in the Abbey ? There are æsthetic outrages to which the mind secretes its own antidote of forgetfulness ; and it would come as a shock to many of us to be reminded that of the buildings instanced by Mr. Shaw one is the seat of our national Government and the other the inmost ganglion of our national consciousness. What insidious doom has fallen upon the works of man, that those that by their nature attract should æsthetically repel ? Could anything be more contradictory than that the spot whither all England's eyes are turned in moments of collective sorrow or rejoicing should be the laughing-stock of all persons of sensitive tastes ? The architect who is unfortunate enough to belong to this category has usually succeeded in exorcising such misgivings, and the monuments of which we spoke have become mere names to him. That the ordinary citizen still invests them with a significance commensurate to their function Mr. Shaw's examples are proof enough.

"The architect's mind is much more occupied, and rightly occupied, with the work of his own day; and it may be that questions such as those raised by Mr. Shaw do not properly concern him at all, although the profession to which he belongs requires of him a critical as well as a creative activity. At the present moment, for instance, we are all deeply curious about the result of an architectural experiment on the grandest scale which is now nearing its completion. There seems to be a general feeling abroad, however, that Kingsway is not the achievement that it might have been; there is a sense of wasted opportunity noticeable wherever that thoroughfare is spoken of. And if we are really powerless to make the best of the present, how can we set about and correct the past ? It would seem, after all, that there are things of more immediate concern to the architect than the monuments that have caused the Abbey to be likened to a stonemason's yard."

The February issue of ARCHITECTURE is given over to Wren, among the artists and authors being Frank Brangwyn, J. St. Loe Strachey, John Freeman, Professor Reilly, Sir Lawrence Weaver, and Professor Adshead. An etching of St. Paul's, by Mr. Brangwyn, forms the frontispiece, and Mr. Strachey contributes a notable poem containing the following memorable lines :—

> "Wren struck the ground, and
> straight a spirit rose,
> To write in stone and brick
> his ordered prose."

THE AMERICAN ARCHITECT AND ARCHITECTURAL REVIEW opens with an article on "The Influence of Zoning on New York's Skyline," by Harvey Wiley Corbett. Mr. Corbett says :—

"In an article by David Knickerbocker Boyd, architect, which appeared in THE AMERICAN ARCHITECT, issue of November 18, 1908, Mr. Boyd showed the development of a prophetic vision. He expressed strong protest against the rapidly increasing tendency toward 'canyon streets' in our larger cities, and constructively offered a solution, which has since been accepted an to-day is the essence of the 'set-back building as applied to zoning in thi country. Mr. Boyd proposed to 'ste back' every few stories on the stree front of buildings. He assumed that i the further building of American citie a spirit of rampant commercialism woul prevail, and that no flat, fixed and fina limit of height for all buildings would b generally accepted. Specifically as t certain cities a regulation might b adopted, but a country-wide acceptanc of a fixed height as relating to the cities conditions could not be hoped for Prophetically Mr. Boyd proclaimed hi theory of what might be accomplished He advocated the 'set-back' of uppe stories, setting the initial height at on and one-quarter times the width of th street, or a 62½-foot high building on 50-foot street. Just eight years after th publication, or in 1916, Mr. Boyd' prophetic vision became fact. It was the that the building zone resolution in New York City became effective.

"Naturally the passage of a law tha so radically affected building in Nev York was at the outset retarded b special and selfish interests. As woul be also quite natural, many peculia workings of the zoning resolutions resulted, and much controversy occurred

(*From " The Architectural Record.*")

he larger part of these disputed condi-ions was as to the correct interpretation f the conversion of existing buildings to ther purposes. Sufficient time has now lapsed to provide a zoning law, amended nd changed to fit conditions, that will ecure to New York the best development n its building operations that a prohetic vision could foresee, and it is ossible to make note of just what has een accomplished.

" It was hoped to obtain certain ighly desirable things, viz., to stabilize nd conserve property values, to relieve he increasing congestion in streets and ransit lines, and to stop the further uilding of canyon-like streets where unlight would never enter or at best be een for only a very small portion of the lay.

" Admittedly, the law could not be etroactive. We could not, therefore, ope to change existing conditions in the ongested regions of the city. But the aw affects every new project, as well as very proposed future building developnent. Any law affecting buildings is ecessarily slow in demonstrating its value. It takes a long time (even in New York, where the skyline changes with a rapidity that astounds even the residents of the city itself) so to change and modify the general aspect of a city that the casual observer will begin to notice the change. The modifications in appearance come so gradually that they make little or no impression in themselves. When the law was first proposed, we thought of it as a theory and not a fact, as something that might begin to count in architectural effect in the dim and distant future, but certainly not in the immediate present, and so we dismissed it from our minds and went on about our affairs as usual. In saying this, I am speaking from the viewpoint of the man in the street, not from the point of view of the architect whose plans are directly affected by the law, or the operator who finds the quantity of building he can place in a certain city lot definitely limited, or the resident who happens to want a garage for his car in a zone where such structures are barred. These people all know the law; sometimes they chafe under it, and lose sight of its broader purpose and benefit in the annoyance that they find in its application to their particular case.

" But in a great city like New York, the sum total of those personally affected by the law forms an inconsiderable group as compared with the great mass of people, most of whom do not even know of its existence. And the great mass of people, the man in the street, the casual passer-by, the visitor from out of town—are these people beginning to note the changes, and if so, what is their reaction? They would certainly be able to tell you nothing as to the stabilizing of property values, and I doubt if the law has yet been in operation long enough for even the most expert real estate operator to give a definite opinion on this point. Nor could the people as a whole tell you of any apparent limit being reached in the congestion of the streets or on the transit line. Rather the opposite condition seems to be the case with increasing congestion both on transit lines and in the streets.

" Finally, as to light and air in the streets, there is certainly no more freedom of air or abundance of sunlight than there has been although a careful painstaking observer may possibly be able to demonstrate that in certain newly built sections of the city there is now a little more light than there might otherwise have been, had not the 'set-back' phase of law been in operation.

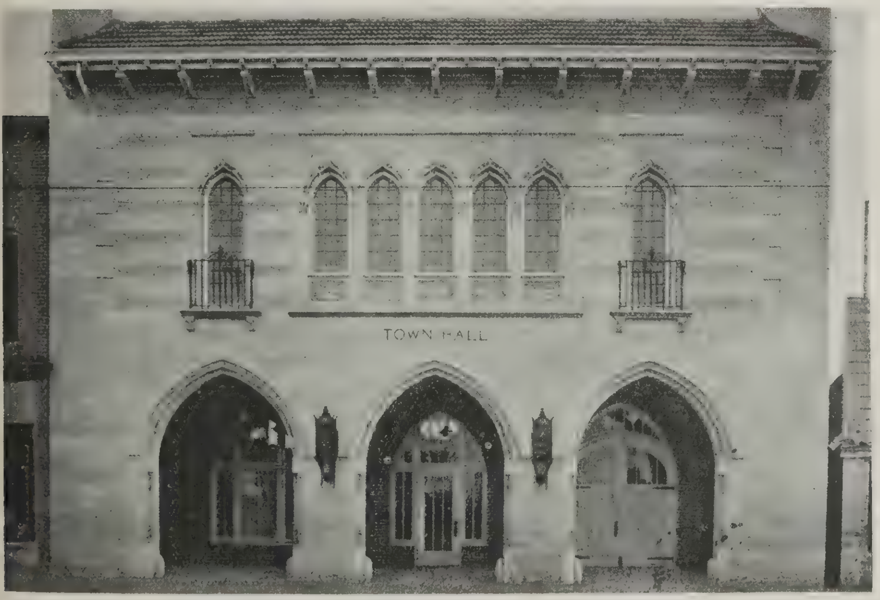
" What, then, are the results of this law, that we can take note of to-day? Has there been anything worth while accomplished, and does the man in the street begin to sense the change that is slowly but surely coming over our city?

" We do not seem as yet to have accomplished the three things for which the law was framed; yet the law is most certainly a success if in fifty years these things are accomplished. But the American of the present is not excited by something that will happen in fifty years. It is difficult enough to get enthusiastic approval of something which is to happen in fifty weeks. He is very much a man of the immediate present.

" Is the zoning law doing anything for him in the *immediate present?* It is, but not all it intended to do. It will undoubtedly achieve in time all these desired things. It has achieved up to this time, or at least is beginning to achieve, something more far reaching in its effect on world architecture and on the world's view of architecture, than anything that was ever accomplished in any single period of history.

" While this world is admittedly a three dimension world (some rare souls seem to penetrate in theory at least to the fourth dimension) most of us live in only two dimensions. We look around about us, we look from side to side, we look down the length of the street, we often have to look out, but we don't look *up!* The new 'set-back' skyline (limited as it is to the building recently erected) still makes us look up. We look up because there is something above and beyond the plain street front to intrigue the eye and fascinate the imagination.

" There can be no question that within a decade practically every city of importance within the United States will have regulated the future development of its buildings along the safest and sanest lines by carefully drawn zoning resolutions."



TOWN HALL, LITTLETON, COLORADO. J. B. BENEDICT, ARCHITECT.

## Registration

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—I am afraid I must again correct the writer of your leading article. He states with reference to the Committee that drafted the Bill: "Its next tactical error was to draft and present a Registration Bill without consulting other interested parties." The report in the R.I.B.A. Journal of the 10th inst. gives the following extract from my speech :—

"One of the first things we did was to ask Mr. Sadgrove, representing the Society of Architects, to see us. We had a very friendly afternoon, and we told him what we proposed. That was, I think, in July or August. We discussed the whole thing," etc. "At a later stage we sent round a draft of the Bill to all the Allied Societies. We received replies and suggestions from the Allied Societies; and I think we may say that those suggestions have been embodied in the Bill."

You reported these facts in your JOURNAL of the 7th inst.

The Surveyors' Institution and the Institution of Civil Engineers were exempt from the operations of the Bill.

By the way, it is most amusing to look back into the history of the so-called Unification movement: nearly forty years ago men were as anxious as they are to-day to enter the Institution without passing the compulsory examinations; for in 1886 an "Architectural Federation Committee" opposed a petition for a Royal Charter by the R.I.B.A. concerning the admittance of "only such persons as shall have passed certain examinations," and stated "that in the interests of the architectural profession and of the public alike, it is desirable that all architects in the Kingdom should be united in one body." Needless to say the Unificationists failed in 1886, as they did in 1921.

SIDNEY PERKS.

## "Why not a Publicity Campaign?"

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—I have read with interest your leading article in your last issue entitled "Why not a Publicity Campaign?"

I would like to inform you that such a scheme is at present being undertaken by manufacturers of paint, colour, varnish, and distempers. A large sum of money has been subscribed mainly by members of the National Federation of Associated Paint, Colour, and Varnish Manufacturers of the United Kingdom, and quarter-page spaces have been taken in most of the leading London and provincial daily papers, and in some periodicals. The campaign starts on February 24, and will run for sixteen weeks.

I do not think that a building publicity campaign would be feasible, as there are so many conflicting interests, but separate campaigns run by the various trades allied to the building trade would of necessity improve the trade as a whole.

Such campaigns are already running, or have been tried: as an instance, for bricks, concrete, tiles, etc.

Your article may induce others to embark on a scheme.

R. F. CLARK.

## Architects' Fees for Abandoned Housing Schemes

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—In the vexed question of arch tects' fees for abandoned housing scheme we find that very few architects appea to be aware of a published statement the Ministry in their official journa "Housing," bearing on this.

In the issue of September 13, 191 page 66, there is a query on the point abandoned schemes. The Ministry reply is as follows: "The fees should b adjusted in accordance with the custom of the profession."

This considerably weakens their contention that when conditions of employment of architects were laid down b memos. 4 and 31 they had not considere or contemplated any abandonment schemes.

We gather that the R.I.B.A. committee were not themselves aware of thi in their negotiation with the Ministry.

The matter may be of assistance t architects still wrestling with this problem.

ORPHOOT AND WHITING.

## Tutankhamen's Tomb

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—The Bishop of Chelmsford is probably expressing an opinion which is pretty widely held in protesting against the rifling of the tomb of Tutankhamen He asks with what feelings we should regard the possibility that the body o Queen Victoria should be taken from the tomb in the year 5923,

R. K. W.

# Mr. Powys on the Arts and Crafts

THE fourth of the public lectures at the Royal Academy was given by Mr. A. R. Powys, who spoke on the influence of the Arts and Crafts on Architecture.

He wanted, he said, to emphasize the fact that the Arts and Crafts movement provided no short cut to good architecture by which hard work and much thought might be avoided. It meant neither a search for originality nor a conscious casting aside of old forms. It opened to view new possibilities, suitable and sensible, which the artist and the craftsman could render beautiful and fine.

His first thought on the subject was not what was the influence of the Arts and Crafts Society on architecture, but what had been the influence of architecture on the arts and crafts. There had been for many years a group of architects whose work had been ruled by the very principles for which the society stood, and the training of an architect had helped to make many of our first craftsmen and artists. However much an architect might be trained to study the styles and manners of buildings, his mind must inevitably be directed to an examination of the nature of his materials and the way they were put together. It was through the consideration of these two things that the Arts and Crafts movement grew.

In its origin the movement was the expression of a powerful, though inarticulate force, which was not clearly recognized by art workers until William Morris and his contemporaries first consciously realized what unlimited possibilities of fine work lay in the thoughtful use and joining of materials as opposed to designing in style and manners. Men interested in the various arts immediately began to form themselves into groups for the study of these revived principles, but notwithstanding, no society of architects was formed to study and further in that profession the principles that underlay the Arts and Crafts Society. Architects who approached their art from those principles had turned to that society for inspiration and help.

He hoped that the public would help the movement forward by noting the names of the men who were building up an architecture that belonged to it. It was agreed all over the world that in England the finest new work was done, and that to this nation belonged the first craftsmen and the first designers. In number their works were few, but they were seen and appreciated abroad.

The work being done by the Arts and Crafts was important because it was forming a tradition and a school of thought to which two or three hundred years hence men would trace the architecture of their day.

It might be that in the confusion of the present time it was only possible to reach excellence on a small scale. A building might be good and have fine qualities but could hardly be as perfect as a cabinet or a chair. There were too many disturbing elements in its production. At best it was seldom more than the thought of one man, but to be perfect a building should represent a school of thought rather than an individual idea.

How was architecture to become a really great art when the majority of those who ordered buildings demanded that they should be in this style or that manner rather than in the manner which was natural to our own age?

That was where Mr. Ernest Gimson had influenced architecture so profoundly. He had shown what the present-day manner was in furniture, and it required little imagination to understand that the same spirit might be translated into architecture. One of their duties was to counter the idea that only old work was good work, and only old forms beautiful.

# Chelsea Nurses' Home Competition

## Messrs. Greenaway and Newberry's Winning Design

THE awards of the assessor (Mr. H. V. Ashley, F.R.I.B.A.) in the limited competition for the new urses' Home in connection with the elsea Hospital for Women are as llows: First place and £150, Messrs. eenaway and Newberry; second place d £100, Messrs. Field and Dighton arson; third place and £50, Mr. Morley Horder.

Twelve architects were invited to sub- it designs, but only eleven schemes were ceived, one firm, owing to unforeseen cumstances, being unable to send in awings.

The conditions of the competition ere most lucidly drawn up. It was ggested that the building should occupy at part of the site adjacent to and at e south end of the present hospital, us leaving space for a garden and nnis court, and possibly for a nursing me for paying patients.

The building was to be designed as a mplete unit in itself, except that no ovision was to be made for dining- oms or kitchen, these being provided the existing hospital. The main trance was to be in Arthur Street, and permanent covered way from the spital to the nurses' home was asked r, a suggestion being made that it might llow the line of the eastern boundary all for the greater part of its length.

The building was not to be more than three floors above the ground, and single bedrooms were to be provided for seven sisters, 38 nurses, two sick nurses and 20 maids, and bed-sitting rooms for the night sister and cook. Ten of the 38 bedrooms were for night nurses, and these, with the night sister's bed-sitting room, were to be planned so as to be cut off from traffic and noise, both within and without. Sitting rooms of specified sizes were required for sisters, nurses, probationers and maids, and a waiting room, home sister's office, linen rooms, tea kitchen and pantry, silence room, etc., were to be provided, as well as the necessary bathrooms, w.c.'s, lavatories for hair washing, room for nurses' washing and ironing, clothes drying room, etc. Each sister's and nurse's bedroom was to have a lavatory basin for hot and cold water and a wardrobe.

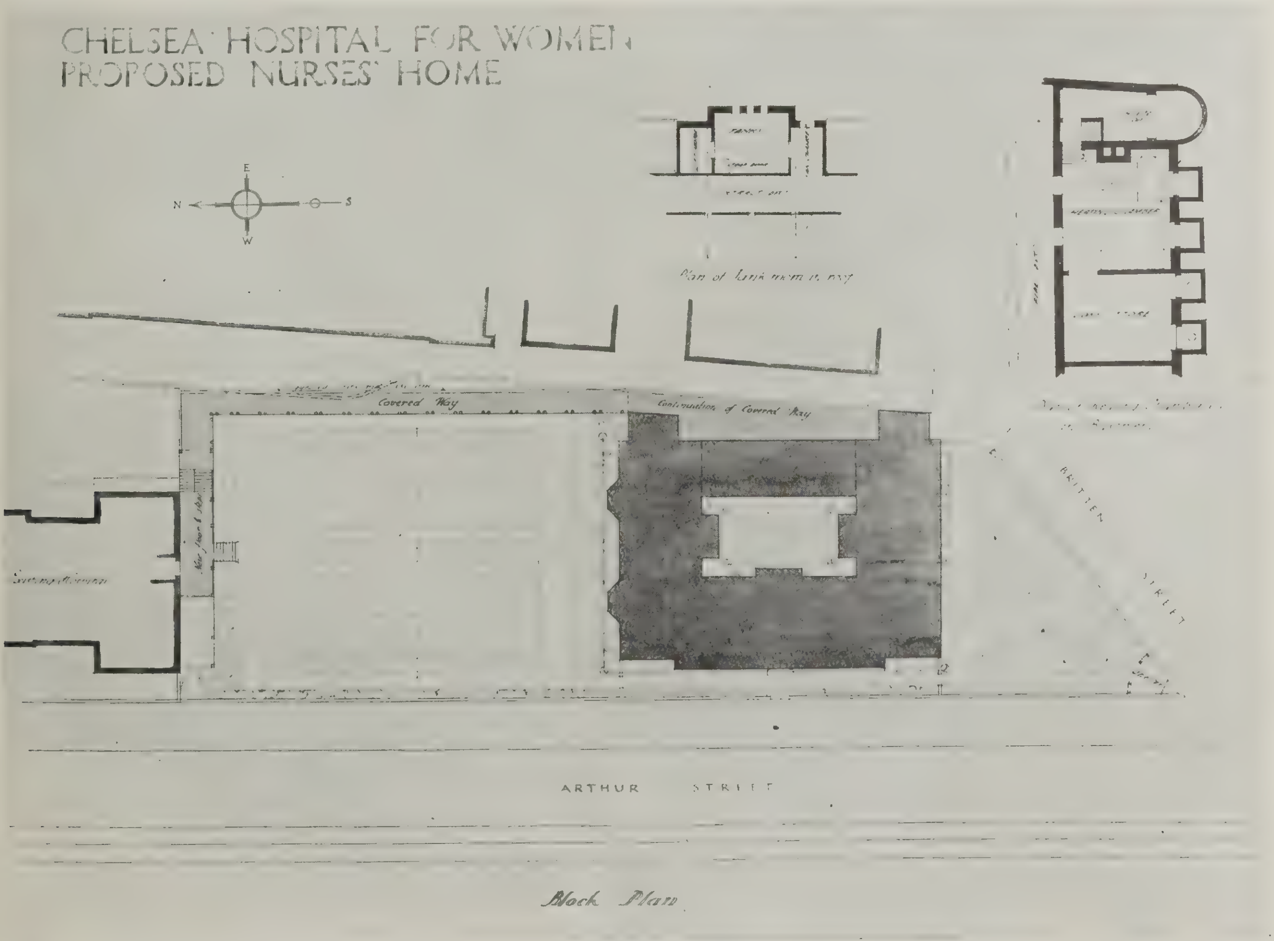
In the extension provision was to be made for 15 additional nurses and for six maids. The general design for the exterior was left to each competitor, but it was suggested that it should not be out of character with the elevations of the existing hospital buildings, though a rather more homely aspect would be desirable.

The accompanying illustrations show that the design of Messrs. Greenaway and Newberry is planned as a hollow square placed at the south end of the site. A covered way along the eastern boundary connects it with the hospital. The main entrance is in the centre of the west (Arthur Street) front, and the nurses' and maids' entrances from the hospital are at the southern end of the covered way. Staircases near each of the three entrances lead to the upper floors.

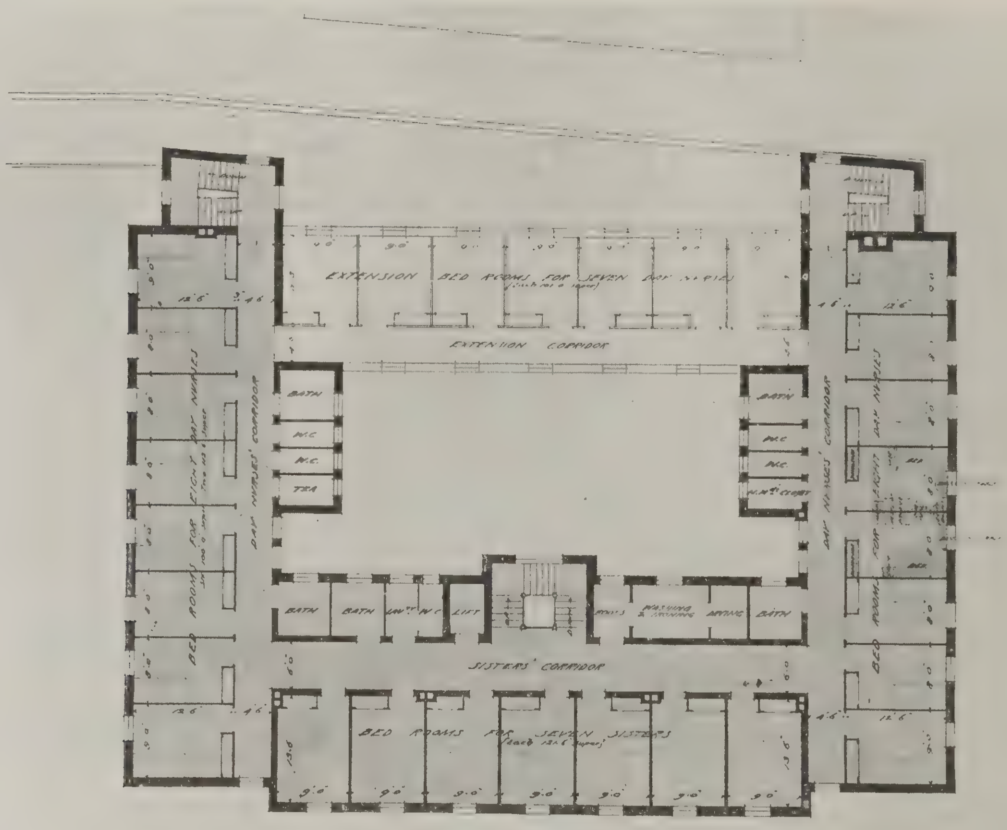
The accommodation is provided on the ground and three upper floors. The nurses' and probationers' sitting-rooms on the ground floor face towards the hospital garden. The sisters' sitting-room, silence room, waiting room and home sister's office are towards Arthur Street, and the sick rooms, tea kitchen, maids' sitting-room and linen rooms face south. A lift near the main staircase communicates with all floors.

On the first floor are seven sisters' bedrooms towards Arthur Street and sixteen bedrooms for nurses (eight on the hospital side and eight on the south). The extension, which will ultimately connect the eastern ends of the side wings, will provide accommodation for seven more nurses on this floor, the space under these rooms on the ground floor being utilized as a lecture or entertainments room.

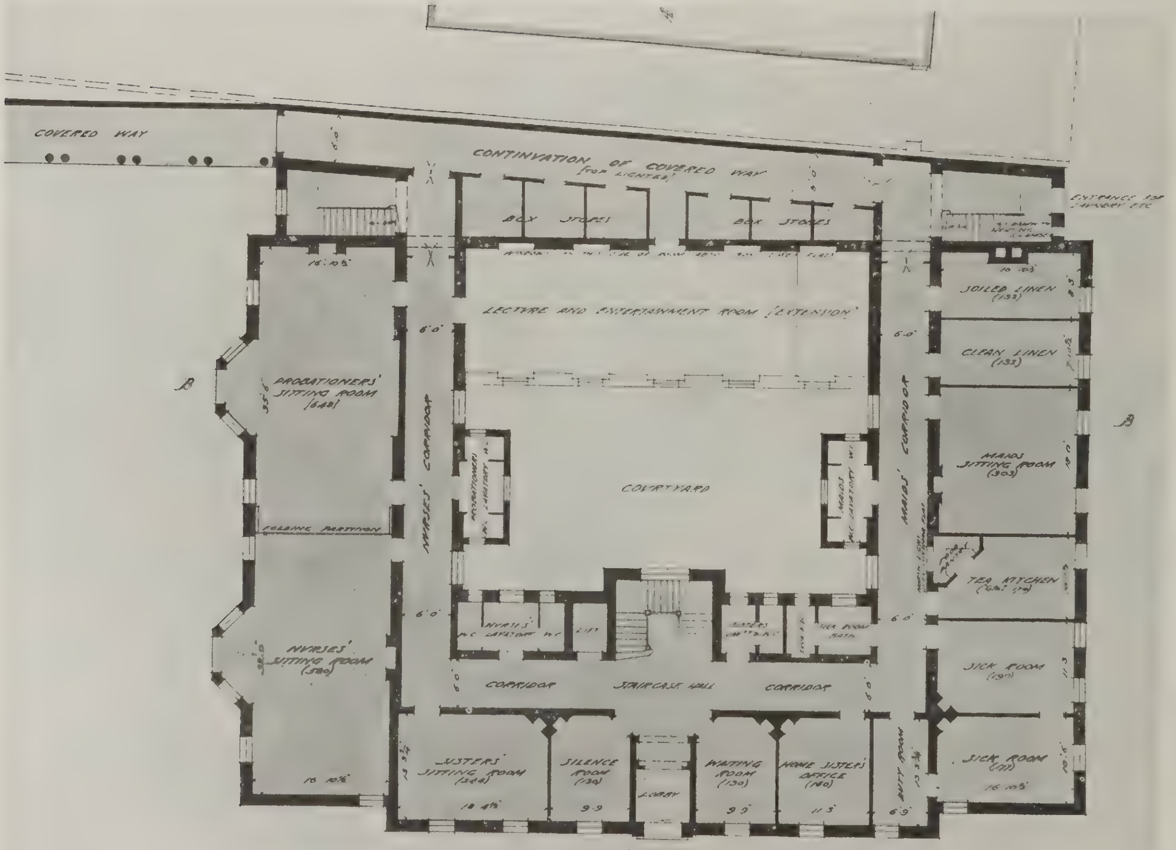
The second and third floors are similar in design to the first-floor plan.



THE GENERAL LAY-OUT.



*First Floor Plan*



*Ground Plan*

CHELSEA HOSPITAL FOR WOMEN, NURSES' HOME COMPETITION: THE WINNING DESIGN.

CHELSEA HOSPITAL FOR WOMEN
PROPOSED NURSES' HOME
Elevation
Section
North Elevation
Railing & Gates towards Arthur Street

CHELSEA HOSPITAL FOR WOMEN, NURSES' HOME COMPETITION: THE WINNING DESIGN.
GREENAWAY AND NEWBERRY, AA.R.I.B.A., ARCHITECTS.

The external treatment is intended to carry on the eighteenth century traditions of Chelsea, and effect is aimed at in the symmetry and proportions of the building. Elaboration of detail is confined to the central doorway on the Arthur Street front and the balcony, with its deep shadow and cast iron railing over.

The building is intended to be faced with red hand-made, sand-faced bricks, the ground story being treated in a rusticated manner. The use of stone is confined to string courses at the ground- and first-floor levels, keystones over the first-floor windows, a cornice at the third-floor level, and the principal entrance. A steeply pitched roof, covered with Roman tiles, rises some 18 inches above the main cornice, and contains the third floor accommodation. The roof towards the central court has a much flatter pitch and, as it will never be visible from the exterior, will be covered with slates.

Mr. Ashley, the assessor, said in his report to the Chairman of the Council, that he was impressed with the number of difficult points which had to be met to comply with the requirements laid down in the conditions. If the plan was right, the elevation might be bad or the cost impossible, and, again, a good external treatment might accompany indifferent internal arrangements.

With regard to the design placed first, the authors had devised a very successful building, both in plan and elevation. The departments were placed in satisfactory positions and the external treatment was of a quiet and restrained character and very suitable for the purpose it had to serve. The authors had suitably developed the site, and their method of extension was quite the best of any of the designs received.

The report continues: In detail, the planning is simple, direct and homely, not wasteful, and the rooms and corridors are well lighted and ventilated. On the third floor the night nurses' rooms, with their bath and lavatory accommodation, are conveniently isolated, and in a quiet position on the northern side of the building, together with the extension for night nurses very suitably arranged. On the same floor and suitably cut off are situated the cook's room and ten maids' rooms, the latter repeated in the same position on the second floor, making the required twenty bedrooms. Here, again, the extension for these maids' rooms is excellently managed. The authors suggest lavatory basins in these bedrooms also, in view of the proximity of the plumbing on the lower floors. The remaining part of the second floor is taken up by twelve nurses' bedrooms and one spare room, with the necessary bath and lavatory accommodation. On the first floor and on the west front provision is made for the seven sisters' bedrooms, and in the north and south wings for 16 nurses' bedrooms, which with the 12 bedrooms over, make up the necessary 28 nurses' bedrooms. In addition, the extension for 11 day nurses is skilfully contrived.

The bathing and lavatory accommodation throughout is well disposed, and has windows lighting into the large courtyard. The detail planning of this accommodation is capable of considerable improvement.

On the ground floor the nurses' and sisters' sitting-rooms are planned in suitable positions, but I would suggest that a large west window would be advantageous in the former room. The silence room is not too well placed, and the position of the door into it should be altered. The remaining portion of the ground floor is taken up with the sick rooms, etc., and tea kitchen and maids sitting-room. Here it is that, I think the authors have gone astray.

I do not question the suitability of placing the sick rooms on this floor I think it is good; but I am of the opinion that the planning of this accommodation can be much improved. I should add that on this floor suitable lavatory accommodation has been provided over and above that which was asked for.

As regards cost, I am satisfied that the buildings could be carried out for the sums indicated in the conditions.

# Enquiries Answered

*The Prevention of Rust.*

R. V. writes: "Can you give me any information as to the Bowers-Barff process for the prevention of rust on cast-iron drainpipes? Is the same process suitable for boilers?"

—This process is of modern introduction, and consists of the coating of the carefully cleaned iron with a hard covering of black magnetic oxide—which is immune from atmospheric attack. As the iron to be protected must be treated in a closed chamber at a high temperature, there is naturally a limit to the size of the articles which can be dealt with; but as the writer has no practical and personal experience with the process he trusts that this will elicit a more detailed reply from someone who is an expert in the process. F. S. I.

*The Death Watch Beetle.*

F. R. writes: "I was much interested in the account of the activities of the death watch beetle given in the course of the paper on 'The Restoration of Westminster Hall Roof,' read before the Institution of Civil Engineers by Sir Frank Baines. Could you give me the following information: (1) What colour are the eggs of the death watch beetle? (2) What time elapses between the laying of the eggs and the development of the larvæ? (3) How often does the beetle's sex call occur? (4) What is the best time to hear the sex call?"

—(1) The colour of the eggs is white; (2) About four weeks; (3) The sex call is rhythmical tapping by the beetle on the wood, and presumably will occur as often as there is a reply; (4) May is the month in which pairing generally takes place, and it is then that the tapping is to be heard. It goes on both day and night, and can be heard in quiet rooms where the beetles are present and are left undisturbed. Your correspondent should refer to a pamphlet on "Furniture Beetles: Their Life History," by Dr. Charles J. Gahan, of the Natural History Museum, South Kensington, obtainable from the trustees of the museum at the price of 6d. This pamphlet gives illustrations of the beetles in the various stages of their growth, together with a magnified view of some of the eggs. H.

*Bearing Value of Soils.*

E. C. P. A. writes: "Can you give me a table showing the bearing value of the different soils? Generally speaking, existing tables on this subject vary very greatly, and I should like a table resembling, in the detailing of the various soils, that given in Mitchell's 'Brickwork and Masonry' (second edition, page 6) based principally upon results proved in actual practice, and giving a reasonably definite safe unit of strength, and not, as is sometimes given, approximately."

—The safe load upon soils depends upon various considerations, and it is difficult to lay down a hard-and-fast rule. As I have before stated, the practical difficulty in all foundations is to identify the material exposed by digging with one of those given in the tables; the soils are not labelled, and personal judgment must be used to classify what is found. The depth of the underside of the foundation below the surface will materially affect the safe load in the majority of cases, and hence Rankine's formula of

$$W = wd\left(\frac{1 + \sin\theta}{1 - \sin\theta}\right)^2$$

where W = maximum load in lb. per sq. ft., $w$=weight of cub. ft. of soil in lb., $d$=depth of foundation in ft., $\theta$=angle of repose of soil. The depth should not be less than 2 ft. 6 in. on gravel and 5 ft. on clay, but it is customary to consider certain soils as capable of sustaining certain loads irrespective of the depth from the surface, as in the following table which I have adopted in practice:—

*Safe Loads on Various Soils.**

| | Tons per sq. ft. |
|---|---|
| Compact bed rock, granite .. | 30 |
| Compact bed rock, limestone .. | 25 |
| Compact bed rock, sandstone .. | 18 |
| Solid chalk .. .. .. .. | 3–4 |
| Good solid gravel .. .. .. | 5 |
| Good solid gravel overlying chalk | 7 |
| Good solid gravel overlying clay .. | 3 |
| Compact dry sand in natural beds | 2–4 |
| Gravel and sand with possible water percolation .. .. | 1½ |
| Clay in thick beds, moderately dry | 2 |
| but London clay in deep foundations may be loaded to .. | 5 |
| Moist clay and sand prevented from spreading .. .. .. | 1½ |
| Loam and soft clay .. .. | ¾–1 |
| Compact earth, vegetable soil removed .. .. .. .. | 1½–2 |
| Made ground .. .. .. | ½–1 |
| Light alluvial soil .. .. .. | ½ |
| Bog, marsh, silt, peat, etc. .. | ¼ |

HENRY ADAMS.

# Reinforced Concrete Calculations for Beginners. VIII

## By Professor HENRY ADAMS, M.Inst.C.E.

*(Continued from February 7, page 277.)*

NOW we have to consider the main beams. These are given as 12 in. by 26 in. and 25 ft. span, and they e loaded from the cross beams. They nnot be taken as tee beams because e floor slab is already taken into calculation in both directions. The last bendg moment we found on the cross beam be 428,851 lb. ins., and therefore as $\frac{Wl}{10} = 428{,}851$, W will equal $\frac{428{,}851 \times 10}{16 \times 12}$ 22,336 lb. at points 6·25 ft. apart, as own in Fig. 19. These will give actual ending moments on the main beams, as own by the dotted lines on the left in ig. 20, and adding the parts together at overlap, the final bending moment iagram will be as shown by the full line.

here will also be an addition to the ending moment due to the weight of the eam itself, $W = 12 \times 26 \times 25 - 7{,}800$ lb., $= 25 \times 12 = 300$, then

$$\frac{Wl}{8} = \frac{7{,}800 \times 300}{8} = 292{,}500 \text{ lb. in.}$$

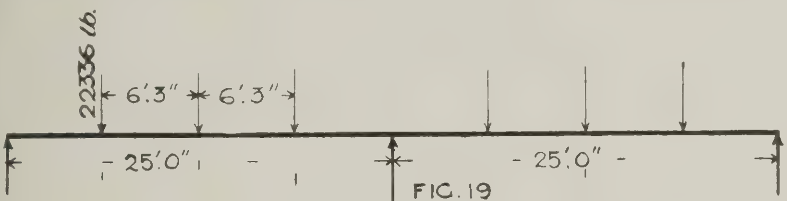

FIG. 19

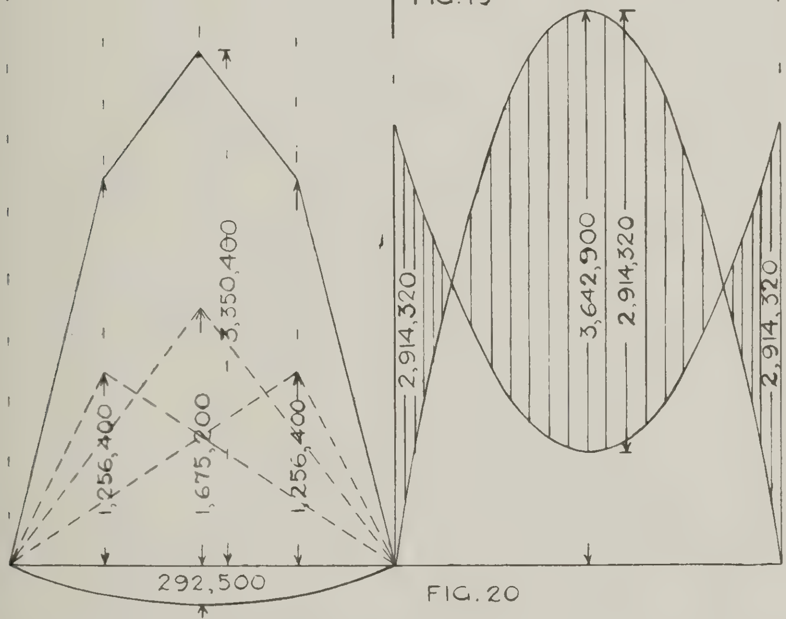

FIG. 20

his is shown by the parabola below, the aximum total depth being equal to 350,400 + 292,500 = 3,642,900 lb. in. his is, however, only what may be called e fundamental diagram which has to reduced by the negative bending moent to give the final value. By L.C.C. les the $\frac{Wl}{8}$ of supported beams becomes $l$ for continuous beams: therefore the aximum bending moment as found will reduced by

$$\frac{10-8}{10} = \frac{1}{5}, \text{ or } 3{,}642{,}900 \times \frac{4}{5} = 2{,}914{,}320,$$

d the same amount will be taken from the negative bending moment, giving the final diagram as on the right-hand side of Fig. 20. Taking the approximate rule of $B = 120\,bd^2$ for continuous beams with ·675 per cent. reinforcement we shall have roughly

$$bd^2 = \frac{B}{120} = \frac{2{,}914{,}320}{120} = 24{,}286,$$

say width 12 in., then

$$\text{depth} = \sqrt{\frac{24{,}286}{12}} = \sqrt{2{,}024} = 45.$$

Clearly there is something wrong here. Possibly the beam has double reinforcement; we must therefore consider this latter condition. The compressive reinforcement would be near the surface of the slab, so that the depth of the slab should be added to the depth of the beam in the calculations of depth. For double reinforcement, which is not so economical as single reinforcement, but enables a shallower beam to be used, the approximate size can be obtained from $230\,bd^2 = B$. In this case $B = 2{,}914{,}320$, and if we take

$$b = 12,\ d = \sqrt{\frac{2{,}914{,}320}{230 \times 12}} = 32 \text{ in.}$$

effective depth required. The slab is 4 in., therefore 32 — 4 = 28 in. projection of beam below slab instead of 26, which will produce the bending moment thus: $W = 12 \times 28 \times 25 = 8{,}400$ lb., $l = 25 \times 12 = 300$ in.

$$\frac{Wl}{8} = \frac{8{,}400 \times 300}{8} = 315{,}000 \text{ lb. in.}$$

Maximum B.M. = 3,350,400 + 315,000 = 3,665,400 lb. in.

Reduced $\frac{1}{5}$, then

$$B = \frac{4 \times 3{,}665{,}400}{5} = 2{,}932{,}320 \text{ lb. in.}$$

The tensile reinforcement may be taken as $2\frac{1}{2}$ per cent. of the total projecting section, thus $\frac{12 \times 28 \times 2\frac{1}{2}}{100} = 8{\cdot}4$, say $8 - 1\frac{1}{8}$ in. rods and the compressive reinforcement the same as the tensile.

In addition to the symbols already given, let

$x$ = distance from the top of the beam to the centre of gravity of the top reinforcement.

A = area of compressive reinforcement in square inches.

$c_s$ = compressive working stress on steel in compressive reinforcement.

Then

$$n = \frac{m}{b}(A + A_t)\left[\sqrt{1 + \frac{2b\,(x.A + d.A_t)}{m\,(A + A_t)^2}} - 1\right] \ldots\ldots (1)$$

$$c = \frac{n.B}{\frac{1}{3}n^3 b + m\left\{A\,(n-x)^2 + A_t\,(d-n)^2\right\}} \ldots\ldots (2)$$

$$t = c.m.\frac{d-n}{n} \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (3)$$

$$c_s = c.m.\frac{n-x}{n} \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (4)$$

Then

$x = 2\frac{1}{4}$ in.

$d = 29\frac{3}{4}$ in.

$$n = \frac{15}{12} \times 16 \times \left[\sqrt{1 + \frac{24\,(2{\cdot}25 \times 8 + 29{\cdot}75 \times 8)}{15 \times 16 \times 16}} - 1\right]$$

$$= 20\left[\sqrt{1 + \frac{24 \times 32 \times 8}{15 \times 16 \times 16}} - 1\right]$$

$$= 20\,(\sqrt{1 + 1{\cdot}6} - 1) = 20 \times {\cdot}6125 = 12{\cdot}25;$$

$$c = \frac{12{\cdot}25 \times 2{,}932{,}320}{\frac{1}{3} \times 12{\cdot}25^3 \times 12 + 15 \ldots\ldots \{8\,(12{\cdot}25 - 2{\cdot}25)^2 + 8\,(29{\cdot}75 - 12{\cdot}25)^2\}}$$

$$= \frac{12{\cdot}25 \times 2{,}932{,}320}{7{,}360 + 15 \times 8\,(100 + 306{\cdot}25)}$$

$$= \frac{12{\cdot}25 \times 2{,}932{,}320}{7{,}360 + 48{,}750}$$

$$= \frac{12{\cdot}25 \times 2{,}932{,}320}{56{,}110} = 640 \text{ lb. sq. in.;}$$

$$t = 640 \times 15 \times \frac{29{\cdot}75 - 12{\cdot}25}{12{\cdot}25} = 13{,}714 \text{ lb. sq. in.;}$$

$$c_s = 640 \times 15 \times \frac{12{\cdot}25 - 2{\cdot}25}{12{\cdot}25} = 7{,}837 \text{ lb. sq. in}$$

We gave some useful notes as to the effect of modifying the various proportions of singly-reinforced beams; similar notes follow for doubly-reinforced beams. Given a doubly-reinforced beam of certain dimensions and amount of reinforcement, then

(*a*) Increasing depth lowers N.A. and reduces all stresses.

(*b*) Reducing breadth lowers N.A., reduces tensile stress, but increases compressive stress.

(*c*) Increasing compressive reinforcement raises N.A., reduces compression on concrete and on steel, slightly increases tensile stress.

(*d*) Increasing whole reinforcement lowers neutral axis, and reduces all stresses.

*(To be continued.)*

# The Personnel of the Building Industry

MR. J. LEASK MANSON, B.Sc., in delivering an address on "The Question of Personnel in the Building Industry" to the Manchester Branch of the Institute of Builders, said that in the building world one of the most satisfying features of recent times had been the improvements brought about in the ability, qualifications, and status of the architectural profession. These improvements had been due mainly to a steady and consistent devotion to the importance of education and training, and to the insistence upon the necessity for qualifications of a satisfactory order. In spite of this great improvement, however, the general condition of the industry was such as to produce a feeling of dissatisfaction and a lack of confidence, and it seemed wise to try and discover what was wrong. It must surely be recognized that the progress mentioned above did not go far enough, and that—taking the architectural profession and the building industry together—the development had been one-sided. The training of the builder and of the building craftsman had been very much neglected. Obviously it was not sufficient to organize for improvements in the work of effective planning and artistic design; something more was vitally necessary.

Following mainly upon improvements in the manufacture of mild steel and Portland cement, very considerable changes had taken place both in the work executed and in the organization of the trades constituting the industry. In recent years there had been an enormous increase in the use of patented and protected materials. The manufacture and use of these materials was still largely in the hands of people who were more or less outside the organization of the industry. These people had advanced strong claims to be classed as specialists, and were, in fact, largely so treated by architects and others. The relationship which generally existed between the architect and the specialist was something of comparatively recent growth in the industry, and one might well ask why was not the builder similarly treated and classed as a specialist? His work was in no sense less responsible and arduous than that of many other specialists. The answer to that question might well contain the key to the whole situation.

The developments outlined had in fact seriously weakened the position of the builder; increasingly he was becoming the employer of but a few of the building trades, though still frequently occupying the responsible position of main contractor. In spite of the increasing dimensions and importance of the work of the sub-contractor, the main contractor might still be legally responsible for the satisfactory execution of work by sub-contractors. Various tendencies had combined to lessen the builder's capacity and power to deal with these new responsibilities, and cases were mentioned which went to show that, owing to a variety of reasons over which the builder had insufficient control, he might be compelled to replace unsatisfactory work at very great financial loss to his firm. Such a state of affairs had been brought about partly through causes which could hardly have been foreseen, but the neglect of training and of other methods for improving personnel had undoubtedly contributed seriously to this state of affairs.

Further, it would seem to be clear that the present position tended to encourage the multiplication of specialists and to increase the difficulties of the architect. He might conceivably have to deal with an increasing number of independent firms and specialists, and would only be able to depend to a decreasing extent upon the builder as a co-ordinating force. It was not unreasonable to think that the growth of genuine architecture under these conditions would be a very difficult matter, since that close contact with the results of actual construction, so necessary in this connection, would become increasingly difficult. Similarly, a united attack on those problems common to all sections of the industry would also be impossible.

They would all be aware of the fact that, in common with other industries, the building industry had recently shown that it had become conscious of its own organic unity. As with all new ideas, this one had seen the clash of opinion and had experienced sudden forward urges and equally disturbing retrogressions. The general trend, however, had been a forward one, and whatever opinions might be held about the present state of affairs, recent events had undoubtedly left an indelible impression of an essential unity which would probably influence to a very considerable extent all future efforts towards progress.

An interesting detail was the increasing use of the term, "The Building Industry," which in itself was much more suggestive of unity than the old term "Building Trades"; in addition, it was more accurate, since the building industry now embraced more sections than could be included under the older groups of building trades. Because of this fact it was conceivable that for statistical purposes new classifications would be necessary in the future. In this connection it would no doubt be an advantage if they could preserve to the industry the best features included in the term "Builder," a term which was in some danger of being misused. The term "Builder" should surely stand for that unifying influence which, on the constructional side, coordinates the work of all the trades and also stands for the sum total of that skill and knowledge which can build up an organization to which the architect can look with confidence for the satisfactory execution of his conceptions. If they could thus emphasize the technical importance of the builder he would be assured an essential place in the organization of the industry which would be unaffected by any changes introduced into the relations between employer and employed. There is an undoubted case for the builder as a specialist in the actual erection of buildings, as distinct from design; the magnitude of his responsibilities and the complexity of some of the problems with which he had to deal would warrant as much attention being given to his selection, education, and training as had been given in the past to the architect.

There could be little doubt that for th successful development of architectur the building industry must become more compact and properly co-ordinate body than at present. As a basis fo design, secondhand knowledge of construction was quite inadequate; ther should be as close and as continuous a contact as possible with the practical an experimental aspects of building problems. The more or less rigid separatio of design and practice in the past ha tended to reduce the emphasis on th necessity for continuous training in trad knowledge and expert craftsmanship. I this connection it might be urged tha some initiative should be allowed t contractors and to the trades, particularly in the matter of working detail so that the full advantage of improve workshop methods might be immediatel available to the industry as a whole The psychological effect of such a measur of freedom would be very consider able, and would go far to restore tha pride in craft development the declin of which they had all deplored in recen years.

A further effect of the lack of contac between the various sections of the industry was seen in the apparent desire t avoid the responsibility for dealing wit problems in the preparation and use materials in the industry. It was striking comment on the position affairs in this connection that such wor in research into building problems a had been carried out had been almos entirely done by people outside of th organization of the industry. A mor compact organization of the industry i the sense indicated above would lead to steadier and surer progress, and woul ensure eventually a much greater efficiency in its services to the communit than was possible at present.

The change mentioned above depende very largely upon improvements bein carried out in the personnel of the industry, improvements not merely in ski and technical knowledge, but also i general outlook. To the present stron professional and trade sense must b added something in the nature of prid in the work of the industry as a whole a feeling which would make for tha co-operation so much to be desired. T gain this end all possible means shoul be utilized. As centres for the collectio sorting, and dissemination of knowledge and also for training in the applicatio of that knowledge, they would probabl turn to the universities and technica colleges of the country. As yet n degree courses had been set up in building, though other and smaller industrie had already taken this useful step. I this connection it might be noted that i it were possible to define the work of th builder and the higher grades of his sta on the lines already suggested, then th initiation and ultimate success of degre courses in building would be assured In addition, such courses would then tak their legitimate place alongside of allie courses in architecture, sanitation, tow planning, etc., so that they might eventually look to the grouping of all thes courses under the title of architectur interpreted in its widest sense.

Messrs. The Adamite Co. Ltd.,
Regent House,
Regent Street, W.1.

Dear Sirs,

In reply to your favour of the 20th ultimo we are very pleased with the high quality of the "Colemanite" concrete floor recently installed in our new garage. We will, if opportunity presents, readily recommend your concrete-hardening and waterproofing liquid to any one who is interested in the opinion of an actual user.

This is the third garage we have completed with your "Colemanite", and in addition to the garages, the concrete yard at our Benbow Wharf which was laid early in 1920, (where we also used "Colemanite") has given satisfaction in every respect, and we were able to use the floor for heavy traffic purposes within seventy-two hours of the concrete being laid.

We shall be pleased to show our floors to any one interested.

Wishing you continued success,

We remain,
Yours faithfully,
Beck & Pollitzer

# The A.A. Visit to Westminster Hall

N the study of any work the guidance of its author is valuable. Failing Hugh Hirland, who, five hundred years ago, ade this roof, the man best acquainted ith it must be the architect who has r eight years been engaged on its storation. In having, then, the escort Sir Frank Baines, the A.A. party was rtainly fortunate. The roof is, in itself, peculiar interest, being unparalleled size and type. It is the only true ammer beam roof, differing from ex- nples at Staple Inn, Hampton Court, ıd Eltham, in that its principals are ot in single lengths, but are built up, the p length being carried entirely by the iangulated cantilever frame of the ammer beam.

This type was evolved in an attempt to an the whole 69 ft. of the hall, and so spense with the two original rows of ipports. The truss may be regarded as arch built up of three structures; (1) arch in three blocks, two lower prin- pal rafters and the collar beam; (2) ıe great arch rib, and (3) a bracket rangement of wall-post, hammer beam, ammer post, and lower and upper struts. is the arch rib, now showing signs of ippling, but not of failure, which has ved the structure till now. Incident- ly, it would seem that the infilling of assive tracery has contributed materi- ly to the resistance of the whole. In ıe original design there were, according our guide, only two slight errors. The top purlins were too light and have, without exception, failed under wind pressure; further, the upper principals bore not entirely on their purlins, but, in part, directly on the ribs of the hammer posts, which have sheared off under the load.

The whole roof has been undermined by the action of the *Xestobium tessellatum*, the authentic "death watch beetle," from which all mediæval roofs are found to suffer in some degree. As a safeguard for the future, all existing woodwork has been impregnated with an insecticide, composed mainly of ortho-para-dichlorbenzene, with small percentages of white castile soap base and cedar wood oil. If this process could conceivably be repeated every fifty years, the roof would probably be quite immune. As it is, it seems unlikely that it will suffer severe damage for several centuries.

The restoration of the roof is as interesting as the original structure. In any work of restoration there must be an element of insincerity. One cannot recapture that first state in which the actual and apparent means of stability are one, because one cannot re-endow the material with its lost strength. Stability may, then, be achieved only by the addition of other material, which addition, while vitally affecting the construction, must interfere as little as may be with the design, to add to which is not to restore but to reproduce.

In the case of the roof of Westminster Hall, there were two possible methods to be followed: to renew all the timbers which were decayed, or to strengthen as many as possible of the old timbers, in such a manner that they could be retained, strictly in their exact relative positions, for an indefinite period of time. The former alternative was ruled out, as involving the sacrifice of a large proportion of the original timber. The latter was adopted, and it was decided to support the trusses by means of a specially designed steel reinforcement, of approximately 25 tons per truss. Steel having a vastly greater resistance than wood, the additional material could be so relatively small in volume as to be a negligible quantity in the design. As a matter of fact, it is virtually invisible from the floor of the hall. This steelwork takes the whole tension, the timber acting as bracing or stiffener, a function arduous enough to require its whole bulk. A certain amount of new woodwork has, therefore, necessarily been added, but this has been in no way faked to resemble the old. Actually, the original timber trusses have now been repaired in a manner that provides for all the main members to function in the same manner as they did when first designed, though, of course, under reduced stresses. There may be, after all, a certain sincerity in restoration.

# The Acoustics of the Auditorium

## By G. A. SUTHERLAND

IN view of its importance to the community this subject has received singularly little attention from phy- cists in this country." This statement as made by Mr. G. A. Sutherland in a cture at University College, London. e said: From time to time a more than dinarily bad case serves to focus public tention on the problem, and at such mes it is customary to state that the uestion is one of pure chance, to which ience has nothing to say. A scientific lution has been found, so nearly com- ete that anything in the nature of acoustic horror such as the London ounty Hall is quite inexcusable. Exten- ve practical use has been made of this lution in America both in predicting coustical quality in advance and in medying existing defects.

To understand and apply the method is necessary to be acquainted with the ature of sound and the main phenomena f sound propagation. Sound is a form energy; it cannot be got rid of by being roken up and scattered, it remains ıdible until it is converted into some ther form of energy. It is produced ther by a single sharp impact or by a ıccession of sharp impacts of a vibrating ody on the air or some other medium, ıd is propagated by a form of wave otion, each wave consisting of a con- ensation of the medium followed by a ırefaction. The ear is affected by such aves when the number of vibrations er second is between 16 and 38,000, but ıe range of sounds used in music is between 40 and 4,000 vibrations per second.

Sounds are musical when the vibrations are periodic or regular, and sounds of different pitches all travel with the same speed, viz., about 1,120 ft. per second in air at 60°F. A sound wave proceeds from a point source in ever-widening spheres until it reaches the boundary of a medium in which its speed is different. Then part of it is reflected back through the first medium and part of it refracted through the second. The laws of reflection and refraction are definite and well known, and both phenomena play their part in the distribution of sound in an auditorium.

With certain shapes of hall it sometimes happens that a reflected set of waves is superposed on a direct set in such a way that condensation falls on condensation and rarefaction on rarefaction. This produces increased intensity. If, however, it happen that the rarefaction of one set fall upon the condensations of another, then the result is silence. This is known as interference, and may easily be demonstrated by experiment. The usual result in practice is some points of silence and some of excessive loudness.

Sound waves will also bend round obstacles, the lower the pitch of the sound the larger the obstacle round which it will bend. The sound of an explosion readily bends round buildings and blows in the windows of houses on the side farther from the place of the explosion. This bending is known as diffraction, and a consequence of it is that if a wall is to scatter the lowest musical sounds instead of reflecting them regularly, it will have to be coffered to a depth of about 3 ft. For speech a depth of 3 in. to 5 in. will be required. A sounding body may force another near it to vibrate in unison with it; if the second have the same natural period it will do so readily and strongly. These forced and sympathetic vibrations play their part in the distribution of sound in an auditorium.

Musical tones derive their quality from the fact that they are composite in character, any one tone being made up of a fundamental note which determines its pitch, and a number of other simple notes known as overtones. The presence of these different notes can easily be shown by experiment, and it can be shown that different overtones, or the same overtones with different relative intensities, produce different qualities.

Vitruvius ("De Architectura," Liber V. Cap. VIII) speaks of *dissonance*, *circumsonance*, *resonance*, and *consonance* in the theatre. The substitution of the words *interference*, *reverberation*, *echo*, and the retention of the word *consonance*, make his analysis applicable to the problem of the modern auditorium.

With a speaker on an open plain the sound wave spreads out roughly as a hemisphere. If a large audience is on the plain the lower part of the wave is soon absorbed and those at the back cannot hear. To raise the speaker and place a wall behind him in order to reflect forward the back part of the wave, and to raise the rear seats produce a great improvement, and the result is, in effect, the Greek theatre. But much of the wave still escapes into the open. Adding walls and a roof prevents this escape, and the further addition of galleries to bring part of the audience nearer the front effects a further improvement, and produces the general form of the modern auditorium.

The necessary and adequate conditions for satisfactory acoustics are sufficient loudness, freedom from distortion, and freedom from the indistinctness that is caused by the overlapping of successive sounds. A solution of the problem will show how to express such considerations numerically, will state definite desirable values for them, and will also enable us to determine in advance the values they will have in any auditorium whose plans are available.

The sound waves proceeding from a speaker addressing an audience reach the boundaries of the room unless they are absorbed on the way. At the walls they are reflected or transmitted or absorbed in proportions which depend on the nature of the walls. Reflections occur at least twenty-seven times a second in a room 40 ft. square, these reflections reinforce the original sound and ensure sufficient loudness, which is the characteristic virtue of the modern auditorium. But if the walls are hard there is little absorption at each impact, and the sound will die out very slowly, producing *reverberation*, which is the commonest defect in modern audience halls.

The Greek theatre, without walls and a roof, did not suffer from reverberation; that was its merit. Its acoustics were good, but not, as is commonly assumed, perfect. With absence of reverberation there was also absence of sufficient loudness, as the use of megaphone mouthpieces and Vitruvius's instructions for the use of resonant vases bear witness.

It is characteristic of the attitude that has been adopted to this whole question that because vases were supposed to have contributed to the good acoustics of the Greek theatre, they are sometimes employed in buildings to-day though the defects in the two cases are due to directly opposite conditions. Small wonder if with so little attempt to appreciate causes results seem to be governed by the merest chance.

## Parliamentary Notes

BY OUR SPECIAL REPRESENTATIVE.

Parliament re-opened on Tuesday, February 13. The King, in his speech from the throne, said that among the measures which would be presented for the consideration of both Houses would be Bills dealing with unemployment insurance benefit, housing, trade boards, and industrial assurance. The departmental committee appointed to consider the operation of the Increase of Rent and Mortgage Interest (Restrictions) Act had now made its final reports, and proposals would be made to carry into effect certain of the committee's recommendations. The financial burdens of the country were heavy, and reductions in public expenditure remained essential to the well-being of the State. The serious state of unemployment caused His Majesty the deepest concern, and must continuously engage the attention of his Ministers.

## Health and Housing

Professor F. E. Wynne, M.B., D.P.H., in reading a paper before the Town Planning Institute, said that the causes of the present condition of overcrowding are not always fully understood. They are naturally sought, and largely found, in war and post-war conditions, but it should not be forgotten that the normal rate of building by private enterprise had declined considerably for some years prior to the war. This decline is generally attributed to the operation of the Finance Act of 1910. That is a question involving political and sociological controversy which I am not competent to discuss, but whatever its causes, this decline in the rate of building in pre-war years is a factor of which we should not lose sight in trying to arrive at what I may call the etiology of our present social disorder.

Then, it is often asked, how is it that the war which swept away so many lives has left us overcrowded as we never were before? The war was followed by influenza, yet these two terrific visitations seemed to bleed the country without even relieving congestion. They left us weakened indeed, but unhealed.

It is difficult for people unused to consider population figures to realize how small a percentage of the total is represented even by our enormous casualties during the period from 1914 to 1919. Many of you will have found the same difficulty that I have in explaining how much more rapid is the process by which the population overtakes housing requirements than is any relief that could be afforded by abnormal depletion of the population. People forget that in considering the question of housing we must think of the population not in terms of individuals but of families.

When one member of a family dies that does not, as a rule, make room for another individual in the house. But when a house goes out of commission, or a house remains unbuilt, there is at once a shortage of accommodation affecting on an average some 4·5 individuals. For years no new houses were built, while existing houses simply died.

Again, after demobilization, and long before the natural increase of population was restored, there was an immediate multiplication of the number of families owing to the inevitable increase in the marriage rate.

Also, if our casualties and deaths from influenza and its sequels are eliminated, there was a marked decline in what we may call the normal death-rate during this period.

Another factor which is generally lost sight of is the total cessation of emigration during and immediately after the war. This is a factor in maintaining the level of population which, I believe, has not even yet been restored.

We are faced accordingly with a population so tightly packed that in urban districts at all events the present rate of building is not sufficient to enable us to evacuate a single insanitary house, even for the period necessary to put it in repair, where repair is possible, and, of course, thousands of houses are occupied in every great city which are hopelessly beyond repair.

Before the war the ideal aimed at i housing and town planning schemes wa the provision of not more than twelv houses per acre. I hope that unde existing economic conditions we shall nc permit that figure to become a fetisl I agree that it is an ideal for which w may ultimately strive, but at present to strict a limitation imposes a financia handicap on any scheme, which ma strangle it at birth. When we have t deal with areas in which people ar huddled together at the rate of ove 200 per acre, it appears to me that scheme that will even halve that degre of congestion will do more good b providing a possible environment for greater number than an attempt t provide the ideal for a smaller numbe Besides, we have to remember the evil that inevitably arise at present fror sub-letting. As we erect houses now people take them who could not possibl pay the rent demanded out of thei earnings. They do this with the certaint of making the rent, and often more tha the rent, by sub-letting one or mor rooms. The slum conditions are immediately reproduced, and twelve houses pe acre may often represent a population o over 100 per acre. It seems to me manifest that more good and less evil woul have been done by the erection of mor houses per acre to house these 100 people provided some method were found whicl would absolutely prevent the practice o sub-letting. In any amendment to th Rent Restriction Act there should b either the power to evict or som really deterrent penalty on sub-lettin without the consent of the local authority.

## The Cost of Building

Statements that the high cost of building in Great Britain is directly traceabl to the State housing policy are refute in the current "Fortnightly Record' issued by the Housing and Town-Plannin Council.

"Those who confidently advance thi theory provide," says the council, "ye another example of the truth containe in the advice 'Beware of finding wha you look for!' The experience of othe countries shows that the theory is no tenable.

"The truth is that the cost of building has been high all over the civilized world, whether the countries have adopted State housing schemes or not.

"In the United States of America, for example, where they have had no State housing scheme, and where complaints as to 'ca' canny' tendencies on the part of workmen are less common than they are in Great Britain, the cost of building has been, proportionately, as high as it has been with us.

"The statistical curve of building cost for the years 1918-1919-1920 was not greater than the curve of cost in the great key industries of the country. As the numbers of the men engaged on building cottages increased prices actually fell, the reason being that the industrial building boom, which was the major factor in putting up building cost, gradually petered out, and men were set free to do cottage work."

## Housing Achievements

"Housing Achievements, 1919-22" was e subject of a paper read by Mr. T. wyn Lloyd, F.R.I.B.A., M.T.P.I., be- re the Liverpool Architectural Society. e contended that while the cost of the o,000 working-class houses built in that riod had been colossal, it had saved us infinitely greater price in industrial rest, human hopelessness, and misery. ne cottages built under the Government heme were much superior to the older pe of workmen's dwellings. An aerial ew of an industrial town or suburb built the thirty years before the war would ve given one an impression of drab llness and indefinable chaos in develop- ent. Of gardens, in the real sense, there ere hardly any. At its best the town ttage was dull and uninteresting; at s worst it quickly degenerated into slum nditions. The rural cottage, although aced in much superior surroundings, as probably worse, lacking, as it frequent- did, the elements of sanitation and mfort.

Admirable sites were secured for the overnment schemes, the average price uid for them over the whole country being 90 per acre. The reasonable spirit own by landowners in this matter did em honour. With few exceptions, the y-out of the schemes had been on broad, odern lines, but the ultimate effect ould have been even better if all the tes had been scheduled as town-planning hemes. An outstanding achievement in ter-war housing policy was that there d been imparted to the design and erec- on of cottages for humble folk some such ement of care and forethought as was ually given to the design of more portant buildings. The chief improve- ent in internal planning was the wider ontage. Under the old conditions each ttage was built as narrow as 12 ft. to ft., but frontages of the smallest type ere now not less than 18 ft., while ontages of 25 ft. and more were usual. he provision of light and air to every om and passage was considered essen- al, and each house was provided with bath. "Cheeseparing" in regard to the ish and fitting-up of the houses had too ten been overdone, but the structural rts were usually of sound construction. ith regard to materials, his opinion was at bricks and mortar still held the ld.

The schemes had revealed very con- derable advances in the matter of design d simple architectural character. The erage council house, while not perhaps ming within the category of good design, as never offensive, with its plain brick alling, unbroken eaves, and plain pped roof. In the case of the duller signs the very stringency of the public rse had prevented the worst abuses ornamentation and bad taste which ight otherwise have presented them- lves. Recent schemes carried out by chitects were of a high character and a table advance on the nineteenth cen- ry brick boxes and slate lids. There as a pleasing note of Georgian or early ictorian distinction in the best of the ban schemes. Referring to the decline prices since the Government cried a lt, Mr. Lloyd said we were now almost ithin sight of the cottage which could built to yield a normal return on pital. The £1,000 cottage of August, 1921, was now being built for about £400, and the smaller type for £350. Pure and unadulterated private enterprise, however, was not yet in a position to function, so far as the building of working-class houses for letting was concerned.

---

## Byzantine Architecture

Mr. Harold F. Trew, M.S.A., read an interesting paper on "Byzantine Architecture and the Monasteries of Mount Athos" before a meeting of the Gloucestershire Architectural Association. He described the Palace of Diocletian at Spalato in Dalmatia, where appeared, for the first time in the West, that combination of Oriental with Western motifs and tradition which was to result in Byzantine architecture, and referred to the founding of Constantinople in A.D. 330 by Constantine the Great and the influence which the official recognition of Christianity was to have upon future architecture.

The beginnings of Byzantine architecture in the early Christian churches of Syria, Asia Minor, and Egypt were described, and the construction of the dome was traced from these early buildings to the great church of Santa Sophia at Constantinople, that masterpiece of Christian architecture which was begun at the bidding of the Emperor Justinian in A.D. 532. He said that the division of the Roman Empire into two parts, with their capitals at Rome and Byzantium, was still further to affect the development of Byzantine architecture, which henceforth was to be developed almost exclusively in the Eastern Empire, though many beautiful buildings in this style were yet to appear in Italy, and particularly at the seat of the Exarchate at Ravenna, and at St. Mark's, Venice.

The dispute of the iconoclasts was touched upon, leading up to the schism between the Greek Orthodox and Roman Catholic churches.

The Imperial palaces at Constantinople were described, and the coming of the ungainly crusaders into the advanced civilization of the Byzantine Empire, from which the European adventurers carved out for themselves new kingdoms and duchies. He said that the monasteries at Mount Athos, Constantinople, and elsewhere were often founded by the emperors, empresses, and nobility in expiation of their crimes, and these foundations were overwhelmed with gifts of sacred relics, illuminated manuscripts, and jewelled ceremonial plate.

Mount Athos had been a sacred spot from earliest times; the early hermitages became monasteries later on, and these increased in number until the whole peninsula, some twelve miles long by three or four wide, was covered with picturesque and beautiful buildings, which became the repositories of innumerable treasure of Byzantine art. The emperors made Mount Athos an independent republic, and this independence was maintained even under the Turks.

Some of the churches at Salonika and at Mistra in the Peloponnesus were described, and the development of the plan of the Byzantine church traced from the basilican type to the Greek cross. He pointed out that with the fall of Constantinople to the Turks in 1453 Byzantine art and architecture came to an end.

## Birmingham A.A. at Dinner

Sixty members and their friends attended the annual dinner of the Birmingham Architectural Association held under the chairmanship of Mr. Rupert Savage, F.R.I.B.A. Mr. Paul Waterhouse, P.R.I.B.A., was the guest of the evening, and among other guests were the Lord Mayor of Birmingham, the Principal of the University, the chairman of the Public Works Committee, the City Engineer, and the presidents of six of the allied societies.

Mr. Waterhouse expressed his pleasure in again going to Birmingham and at meeting so many of the presidents of other allied societies. He referred to registration, and said that they all thought unification was a good thing in itself and one worth having even if nothing further was achieved, because it was only a reasonable condition precedent to registration, which they were all after. If there was a party in the Institute that thought that the mere production of a draft Bill was in itself an achievement, he thought that party was mistaken. The Institute, he added, was marching forward. It was a big concern—too big, in fact, to be destroyed by a family quarrel. It had accomplished excellent work on behalf of the profession, and it was a pleasure to see men who lived outside London taking such a prominent part in its activities.

The toast to the City of Birmingham was proposed by Mr. H. T. Buckland, F.R.I.B.A. The Lord Mayor, in reply, remarked with regard to housing that they were all in agreement as to the terrible condition which prevailed in Birmingham at the present time. A scheme had been put to him by a builder who had suggested that as the working-classes were unable to pay what would be an economic rent as well as the rates, it would be possible to erect houses at a rental within their means provided they were not required to pay rates. He believed—he might be wrong—that the suggestion would to a large extent provide a solution of the problem. If no houses were built the Corporation could receive no rates, but if the houses were built and no rates were paid the Corporation would not be any the worse off. Might it not be possible for them to forgo the rates for a period of five years, to accept half rates for a further five, and then to levy full rates? Under these conditions houses could be let at an economic rent, and he thought it was a suggestion which deserved the closest consideration.

Councillor S. T. Talbot, proposing the toast of the "Association," alluded to the movement in the City, headed by the Civic Society, which sought to popularize art, and lectures were delivered upon civic responsibilities. All these things showed an awakening of the public consciousness which, if wisely directed, would produce valuable results. Mr. J. A. Crouch, replied to the toast. Mr. Holland W. Hobbiss, A.R.I.B.A., vice-president of the B.A.A., proposed the toast of the Visitors, to which Mr. C. Grant Robertson, M.A., C.V.O., Principal of the Birmingham University, Mr. Swift, president of the Birmingham Building Trade Employers' Association, and Mr. Keay, president of the Leicester Society of Architects responded.

## The Rome Scholarships

The Faculties of Art of the British School at Rome have selected the following candidates to compete in the final competitions for the Rome scholarships of 1923.

*Architecture.*

| NAME. | SCHOOLS. |
|---|---|
| Isabel M. Chambers | Architectural Association. |
| R. A. Cordingley | University of Manchester. |
| E. Maxwell Fry | University of Liverpool. |
| P. J. B. Harland | Architectural Association. |
| F. H. H. Higham | University of Liverpool |
| C. G. C. Hyslop | Architectural Association. |
| G. A. Jellicoe | Architectural Association. |
| Cyril R. Knight | University of Liverpool. |
| Geoffrey L. Owen | University of Liverpool. |
| Edwin Williams | University of Liverpool. |

*Decorative Painting.*

| | |
|---|---|
| Constance E. E. Grant | Royal Academy Schools. |
| Alfred K. Lawrence | Royal College of Art. |
| Doris M. Stacey | Royal Academy Schools. |
| Hugh G. Stutfield | Slade School. |

*Sculpture.*

| | |
|---|---|
| Frank P. Chambers | School of Architecture, University of Cambridge. |
| Ernest Webb | School of Art, Nottingham. |
| David Evans | Royal Academy Schools. |
| A. Seaton White | Slade School. |

*Engraving.*

| | |
|---|---|
| Frank C. Medworth | Westminster School of Art, and Royal College of Art. |
| W. Heber Thompson | Slade School and Royal College of Art. |
| Elizabeth Fyfe | Slade School and Central School of Arts and Crafts. |
| Charles Murray | Glasgow School of Art. |

## Competition News

### *The Bournemouth Pavilion.*

About 140 architects have already applied for the conditions of the Bournemouth Pavilion competition.

### *Proposed Cenotaph : Paragon Square, Hull.*

The president of the Royal Institute of British Architects has nominated Mr. Stanley Hamp, F.R.I.B.A., as assessor in this competition.

### *Lay-out of Park for the Town of Anvers.*

In the above competition all the successful competitors were of French or Swiss nationality. The winning design was submitted by MM. Lorone and Roy, of Paris.

### *Ryde Pavilion Competition.*

The design of Messrs. Thomas Spencer, A.R.I.B.A., and M. R. Martin, A.R.I.B.A., of Putney, has secured first place in the Ryde Pavilion competition. The second premium has been awarded to Messrs. P. J. Newby Vincent and D. West, of Southampton; and the third premium to Mr. Geo. T. Morris, M.C.I., of London.

### *International Competition in Esthonia.*

The governors of the State Technical School in Tallinn (which we know as Reval) have published details of the competition arranged by them for plans for a new school. Owing to the rate of exchange the premiums offered will not attract British architects, though they are stated to be 200,000 Esthonian marks, 150,000, and 100,000 for the first, second, and third, respectively. According to "Esperanto Triumfonta," the international newspaper, which gives details of the requirements, there are to be twenty-one lecture rooms, seating from 150 to twenty-four persons. Particulars of the competition, which closes on April 15, may be obtained from the secretary, "Tallinna Teknikum, Pikk. t 20 Tallinn, Esthonia." Among the assessors (a committee of three architects and three engineers) is Prof. Onni Tarjanne, one of the leaders of contemporary Finnish architecture. This is a tribute from a sister State to the advance which has been made by the Finns in national art and culture.

### *Prestwich Co-operative Society's Premises Competition.*

Members of the Society of Architects are notified that the conditions of this competition are not in accordance with the regulations and are requested not to take part in the competition without first ascertaining from the secretary that the conditions have been approved by the Council.

## List of Competitions Open

| Date of Delivery. | Competition. |
|---|---|
| Feb. 28 | Scheme for the distribution of drinking water for the town of Mantes-sur-Seine. Apply Mairie, Mantes, or at the offices of La Renaissance des Cités, 23 Rue Louis le Grand (11e). Premiums: 4,000, 3,000, and 2,000 francs. |
| March 31 | War Memorial in Crow Nest Park, Dewsbury. Assessor, Professor C. H. Reilly, O.B.E., M.A., F.R.I.B.A. A copy of the conditions together with plans of the site may be obtained on application to Mr. H. Dearden, A.R.I.B.A., Borough Surveyor, Town Hall, Dewsbury, on payment of one shilling. |
| April 15 | Buildings for the Polytechnic Institute, Reval. Premiums 200,000 marks, 150,000 marks, 100,000 marks. Apply Office National du Commerce Exterieur, 22 Avenue Victor Emmanuel III, Paris. (8e) The competition is an International one. |
| June 1 | New Municipal Buildings and Town Hall, Cork. Total cost not to exceed £120,000. Assessor Mr. Lucius O'Callaghan, F.R.I.A.I., A.R.H.A. The successful competitor will be appointed to carry out the work. Second and third premiums £200 and £100 respectively. Apply Mr. William Hegarty, Town Clerk, Cork. The competition is limited to architects living and practising in Ireland. |
| June 30 | Bridge over Nygaardsstrommen in Bergen. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, S.W. 1. |
| No date | Concert Pavilion, Bournemouth, to seat 2,000. Estimated cost £100,000. Assessor, Sir Edwin Cooper, F.R.I.B.A. Premiums: £300, £200, and £100. Apply Town Clerk, Municipal Offices, Bournemouth. Deposit £2 2s. (cheque). |
| No date | The Crown Agents for the Colonies, acting on behalf of the Government of the Straits Settlements, invite competitive designs for the reinforced concrete work required in connection with the construction of a new general post office at Singapore Tentative designs, for which no fees will be paid, are required in the first instance, from which it is proposed to select a design and specify its adoption in the contract for the construction of the building. The firm whose design is so adopted will be subsequently engaged to prepare full detail plans, specification, quantities, &c., for an approved fee. Drawings can be seen and further details of the competition obtained from the Crown Agents for the Colonies, 4 Millbank, Westminster, S.W. 1, quoting Z/Straits Settlements 5664. |

## R.I.B.A.

### *American Honour for Mr. Waterhouse.*

On the occasion of the opening of its thirty-eighth annual exhibition the Architectural League of New York elected Mr. Paul Waterhouse, president of the Royal Institute of British Architects, as an honorary member of the league in recognition of his distinguished services to the art and profession of architecture.

### *R.I.B.A. Council Meeting.*

As announced last week, the Coun
of the R.I.B.A. have nominated "
John James Burnet, A.R.A., R.S.
Hon. LL.D., F.R.I.B.A., as the pers
whom they propose to submit to
Majesty as a fit recipient of the Roy
Gold Medal for the year 1923."

Following are other notes from t
proceedings of the last Council meeting :

Masonic Memorial Building.—A co
munication has been sent to Grand Lod
urging that there should be an op
architectural competition for the n
memorial building, and that a deput
tion should be received.

Registration Bill.—The Registrati
Committee was instructed to consi
the action to be taken to meet the vie
expressed at the general meeting
January 29, 1923.

### *The Special War Examination.*

The following candidates have pass
the Special War Examination held
Toronto in December last : Brown, Jo
Grey, 292 Second Avenue, Longue
P.Q. ; Illsley, Hugh Percival, 134 Clan
boye Avenue, Westmount, P.Q. ; Jeffr
James Rowe, 247 Elm Avenue, We
mount, P.Q. ; Kingston, John Lyndhur
336 Jackson Buildings, Ottawa ; Merrot
Edgar Samuel, 10d Souvenir Aven
Montreal ; Nesbitt, John Kenneth,
Tuque, P.Q. ; Prideaux, Arthur,
Messrs. Nobbs and Hyde, 14 Philli
Square, Montreal ; Wiggs, Henry Ro
Hessel Grove, St. Foy Road, Queb
P.Q.

### *The Bicentenary of Sir Christopher Wre*

The Christopher Wren commemor
tion banquet, which is being given by t
Royal Institute of British Architects
February 26, is being enthusiastical
supported by architects, and a remar
able number of distinguished guests w
be present to do honour to Londo
greatest architect, including : The Ar
bishop of Canterbury, the Earl of Balfo
the Earl of Crawford and Balcarres, Lo
Askwith, H.H. the Maharaj-Rana
Jhalawar, the Lord Mayor and Sher
of the City of London, the Chairman
the L.C.C., Dean Inge, Canon Alexand
the President of the Royal Academy, t
Minister of Health, Sir Arthur Schust
the Warden of All Souls' College, t
President of Magdalen, Sir Cecil Harco
Smith, Sir A. Selby-Bigge, Sir Erne
Hodder Williams, and many members
the grand committee representing learn
societies and other bodies interested wh
have assisted the R.I.B.A. in organiz
the celebrations.

In place of the usual after-dinn
speeches, three memorial addresses w
be delivered. The president of the Roy
Institute, Mr. Paul Waterhouse, will spe
of the man, Sir Reginald Blomfield, R.
of the architect, Mr. Mervyn Macartn
of the designer of St. Paul's Cathedral.

### *"So Many Men, So Many Minds."*

A week ago "The Observer" remark
that the R.I.B.A. were commemorati
the bicentenary of Sir Christopher Wr
by the giving of a banquet, and that t
Bishop of London was commemorati
the same occasion by the proposal
demolish many of Wren's City church

# Wren's Influence on Modern Design

## By STANLEY C. RAMSEY, F.R.I.B.A.

TO attempt an estimate of Wren's influence on modern design is as difficult a task as it would be to write adequately of Shakespeare's influence on modern literature—that is to say, it is well-igh impossible. The most that can be hoped for is to arrive t an approximation, to catch some hint of how that great ervasive personality still affects and influences us to-day.

After two centuries the man looms larger than ever, olossally, almost threateningly; here in London we can o more escape his influence than we can ignore that mighty ome of his, which still dominates the capital city from the entre to the remotest of the suburbs.

It is peculiar to Wren that great as we think his work, hat splendid unfolding of his genius at Greenwich, Hampton ourt, and St. Paul's, we still hold the man greater than his reations. He dominates them as he does us, even to such n extent as at times to make us grow rebellious. Not nly we, but generations of architects that preceded us ave also been fretfully objective against the persistent ominance of that quiet-faced amiable man in the absurd ig wig, who knew so much better than the other "big-igs" of his day how to do things.

We carp at his detail, we call his work coarse and unsuitble, we accuse him of unworthy shifts and unreal devices, e point triumphantly to some lapse of taste, to some heatrical piece of design, and we think we have done with im!—and then one morning, as we hurry across Westinster Bridge in a flurry of excitement to get on with our wn little "masterpiece," we glimpse the view of Wren's ome—Paul's Dome—bathed in a glory of morning sunhine, like some benign and beautiful spirit watching over nd protecting London—then the critic within us is silenced, nd we mutter "that after all even Shakespeare at times rote some pretty poor stuff." In the end, if we are wise nd would have any peace, we accept him as we have to ccept all great men, and in the calm of the acceptance we ay be able to appreciate some of the influences he radiates.

He is, to use a somewhat hackneyed phrase, "Our great ational Architect." There were great English builders efore him, and there have been others since. The earlier uilders, those for instance, who built our Gothic catherals, are for the most part merged in the fame of their uildings, and if we remember their names it is with an ffort. There are others, like Inigo Jones, whose fragment t Whitehall, in my humble estimation, far exceeds in rchitectural distinction any work of Wren's, and yet someow misses just Wren's towering greatness. We feel that ith these others, though they include such giants as Inigo ones, there is something professional in their efforts, hat they miss Wren's broad generalizations and the sweepng majesty of his purview.

Like so many of our great English architects, such as anbrugh, Wren, the greatest, had something of the mateur in his composition.

I am not referring to the accident of his early training, r lack of training, as we understand the word, but rather o something in his mental outlook.

We live in an age of specialists, but Wren belonged to a broader and more generous time. To call a man of his attainments an amateur is, of course, ridiculous. Perhaps a better word to express my meaning would be to describe him as a "Universalist," and surely so distinguished a son of so distinguished a university should be a "Universalist."

He always seems to have been so much more concerned with "imagining the whole" than "fancying the parts," and this is, perhaps, what makes him so peculiarly English. He is always so broadly spacious in his designs—so robustly sane, ever ready to compromise on small details for the sake of main principles, that he is, as it were, the architectural embodiment of the national character. We, amongst the nations of the world, are the masters of compromise—a sailor-people, ever ready to adjust our sails and rigging to the storms and incidents of our voyages. And it is probably the spirit of compromise, this ability to adapt ourselves to circumstances, born of our island conditions, that has earned for us the title of "Perfidious" from the more logical and routine-governed land nations of the Continent. So in the same way Wren has been charged as an artist with "insincerity"—and the screen walls of St. Paul's form the main item of this tremendous indictment.

I will leave the defence of Wren and his screen walls to his many able defenders, and do but refer to the matter here in an attempt to show how Wren, in his character of typical Englishman, expresses the national indifference to the rules of pure logic. His was a logic of life, fluid and adaptable as life itself, and far above the little logic of schools and books.

Much of Wren's detail is careless, if not slovenly, and some of it is downright bad; I recall to my mind certain fireplaces at Hampton Court, which are to me the embodiment of ugliness; whilst some of his carved stonework, both here and at St. Paul's, is just as expressive (or as inexpressive) of wood or plaster, as of stone.

He typifies our national weakness as well as our national greatness, and despite all our addings and subtractings the sum total is a satisfying and respectable figure.

With, perhaps, the exception of the Dean's House in St. Paul's Churchyard and the Master's House in the Temple, as well as a few houses scattered up and down the country, there are few small houses that can be authenticated as Wren's, and yet he was essentially a "domestic" architect.

Running through all his palaces—at Hampton Court, Greenwich, Chelsea, and Kensington, as well as in his work at Oxford and Cambridge—is this note of domesticity. Even St. Paul's, in spite of its grandeur, has an intimate and homely air—it is still the parish church of London, as Westminster Abbey is the church of the Empire.

His work has none of the remoteness of a Greek or Roman temple, or the aloofness of a Gothic cathedral. So we see his influence working through the ages, through that wonderful eighteenth century, the first quarter of which he so illuminated, through the thwarted and muddled efforts of that industrial nineteenth, down to our own day, the twentieth century, the first quarter of which has nearly run its course. An influence, conscious and unconscious, exerted over the mind of layman and architect alike, a part of our national inheritance, to use and abuse, understand, or misunderstand, as we will.

As a nation we have always been slightly contemptuous of the artist, as a mere artist, as a specialist in the applied emotions, as a member of a select caste outside and beyond the comprehension of ordinary humanity—but we have always had the greatest respect for the man who could do things, and we prefer that he should do them well.

We are not indifferent to the claims of beauty and art. There never was a nation yet that loved its homes and gardens—the basis of all building-art—as we love ours, but we always insist that art shall be the servant of life, and not the master, and prefer that our architects shall serve rather than instruct us, in the same way that we insist that our soldiers shall be servants and not dictators, or our divines, ministers and not spiritual autocrats.

Wren, like all great men, artists or statesmen, was essentially the servant of his people; through his own medium he interpreted the spirit of his age, and he left it to his accomplished works to educate that public it was his privilege to serve.

So we have his influence always with us, an influence which we cannot escape, but which we must accept consciously or unconsciously; and as I shall attempt to show, it is as we accept the spirit rather than the formulæ of his teaching that we shall in our turn best express our own age in our own way.

He is the great national architect, and in addition he is the great Londoner. It is impossible to conceive London, as we know it to-day, without his cathedral, his palaces, and his City churches, or that mass of early and late eighteenth-century building through which Wren's influence runs like a fine strong thread on which are strung many and varied beads of great beauty.

We may sell our City churches to the money changers (I wonder what the value of St. Paul's would be expressed in pounds, shillings, and pence !), but we shall always carry their gracious influence in our hearts—and possibly more truly realize their peculiar significance when we have lost them.

I have said that Wren's influence persisted throughout the architecture of the eighteenth century, and this is true both of the work in this country and in the United States of America. Wren owed much to Inigo Jones—but Jones, though possibly the more brilliant architect of the two, has had nothing like the same personal influence on English architecture as Wren. His was a different mission, he revolutionized our style and produced some of the most beautiful, if not the most beautiful, of our classic buildings.

But his influence is rather more remote and impersonal, possibly because he more truly caught the Italian spirit than any of those distinguished architects who came after him.

I venture to suggest there is a greater difference in essentials between the work of Jones and of Wren than there is between that of Wren and of an architect of the late eighteenth century, such as Robert Adam. In no sense could one describe Inigo Jones as a "homely" or "comfortable" person, and although he built far more houses than Sir Christopher, he was not so domestic an architect. As an instance of what I mean, compare Lees Court, Faversham, with Groombridge Place, which, if not actually designed by Wren, is, for the purposes of my argument, sufficiently in the Wren manner.

Wren's influence is particularly discernible in the smaller houses and less important public buildings of the eighteenth century, which formed the greater part of the building work of that period.

As I have endeavoured to point out, Wren suffered, as do all great men, from the defects of his genius, and these defects must be taken into account in attempting to estimate the influence he exerted throughout the ensuing ages.

As a race we are somewhat indifferent to "fal-lals"; and English architects have for the most part been somewhat negligent of detail, and not very consistently logical in the expression of plan and section in their buildings.

But what a great architect may do with impunity often forms a fatal trap for smaller and less able men.

He who would write in the manner of Shakespeare without Shakespeare's gifts frequently but succeeds in writing mere high-sounding nonsense. Those who can with safety ignore the rules, must be above the rules—and even they sometimes come to grief !

During the nineteenth century the crime of façading (to coin a word) was particularly rampant. Both Gothicists and Classicists were guilty of divorcing plan and elevation to an alarming extent, and ornament was applied, or misapplied, according to the whims or dictates of the designers. We cannot lay the sin of all this to Wren, but he must bear his part.

Just now the whole profession is going through a tremendous schooling—"Education" is the watchword of the moment—and possibly the danger now lies in the other extreme. There is just a chance that our creative impulses may be stifled by too severe an application of rules and logic, and some of our students' work is beginning to have a suspiciously thin and papery look !

The cure would seem to be in some return to the methods of Wren, who was a master of robust actuality, and who directed the progress of his buildings on the site rather than from his office. If I could only use one word to describe Wren, I think I should select "vital;" all his works seem to radiate a living joyousness, as if each one had been his favourite creation, and this is the more surprising when one recalls the long list of his still extant buildings. Never does he appear to repeat himself; there are no threadbare devices for easy effects.

If we consider his City churches alone, we are amazed at his fertility of invention—not that all are equally beautiful, but the average is extraordinarily high.

In one respect Wren anticipated one of the worst features of the nineteenth century builders, though only in a minor degree, and that was in the confusion of locality in the use of his materials. He mixed the products of brick and stone districts with an easy disregard, using slate roofs on brick buildings, and even going to the lengths of employing brick and tile for the roofs of the same building !

The King and the capital city laid tribute on all districts, and Wren, as the King's architect and a Londoner, selected with a royal disregard of geographical distinctions.

Nevertheless, Wren as a great artist was always conscious of what he was doing, and when he uses slate for the roof of the Orangery at Kensington Palace and for the base of the cupola over the entrance, he would probably have preferred lead if it had not been for considerations of cost.

One feels with Wren that he realized the claims of locality even if he sometimes ignored them, but that our builders of the industrial period were simply ignorant—living in an age of cheap transport and with no real traditions of building; they muddled about with anything they could get hold of, mixing up timber and stone, brick and slate, marble and plaster, in one great inconsequential confusion.

It might be said that Norman Shaw was the first of the moderns to rediscover Wren, and the Queen Anne revival followed—one of the first steps in the direction of a return to simpler and better methods of building. Like most revivalists these earlier Queen Anne enthusiasts were more concerned with the letter than with the spirit of the style—it was a time of great sketch-book activity—delectable titbits of doors, cornices and swags were bagged in all directions, like a sportsman potting partridges !

These studies were quickly reflected in our buildings: a wondrous series of rich fruity swags dangled elegantly across our façades like the heavy gold watch-chain across the well-filled waistcoat of our uncle of youthful memory; cupids of an abnormal adiposity leered at us from all sorts of unexpected places; whilst doorways and cornices shouted "Wren" at us down the whole length of a street, and yet these buildings were singularly unlike the work of that great architect !

Perhaps this is the implicit antagonism that we feel to ery revival as opposed to a renaissance—the one is a *chauffé* of the details, the other a re-birth of the spirit.

Revivals (religious and otherwise) for the most part ppear to have an intoxicating effect on the revivalists. or a time we revel in our newly discovered "methods of fect"—we are graciously Georgian or grimly Néo-Grec as e mood affects us, but it is all of no avail.

To capture the spirit rather than the letter of the dead asters, we must approach the study of their works humbly d inquiringly, filling our sketch-books with analytical ans and sections as well as with mouldings and carving -striving to attain some glimpse of the purposes that spired them.

One of the worst tributes that we could offer to the emory of Wren would be to celebrate his bi-centenary with e inauguration of another Wren revival.

If he is still to influence our modern work, let it be his breadth of design, his dignity of purpose, his wide and spacious views, his joyful creativeness, that shall inspire us —let us be influenced by what was real and inherent in the man and his work, and not by that which was petty and incidental.

Many of Wren's problems are our problems. If we are no longer called upon to build great palaces for kings and queens, we have to provide great hotels and places of entertainment for the "sovereign" people. If we have no devastating fires giving us unparalleled opportunities—we also have our town-planning problems—and if we live in an age when economy of effort and of material is of primary importance, we cannot do better than study the works of that great little man who died two hundred years ago, and who created such miracles of architectural beauty out of the simplest of materials.

WREN'S TOMB IN ST. PAUL'S, WITH ITS FAMOUS INSCRIPTION.

# Sir Christopher Wren

## Born October 20, 1632; Died February 25, 1723

### By FREDERICK R. HIORNS, F.R.I.B.A.

> "Architecture has its political use, public buildings being the ornament of a country; it establishes a nation; draws people and commerce; makes the people love their native country, which passion is the origin of all great actions in a commonwealth."
>
> —CHRISTOPHER WREN.

THE most famous of British architects was born at the Rectory of East Knoyle, in the County of Wiltshire, on October 20, 1632. His father was Incumbent of the church of that place, and succeeded his better-known brother (Matthew Wren) in the Deanery of Windsor when the latter resigned office in 1636 to become Bishop of Ely. At that time Christopher was four years old, and, following a period with a domestic tutor at home, on account of his delicate health, he entered Westminster School (1641) at the age of nine. During his period there under the headship of Dr. Busby (a man of pronounced Royalist views), Archbishop Laud was, through Protestant persecution, imprisoned in the Tower, and both Bishop Wren and the Dean of Windsor suffered for the Royalist sympathies of their family.

Christopher Wren went up to Oxford in 1649, being entered as a Gentleman-Commoner at Wadham College, but not before he had already displayed brilliant talents at Westminster, attracting the notice and friendship of several distinguished men by, among other things, the composition of Latin verse, skill in mathematics, and the invention of an astronomical instrument, as mentioned in "Parentalia." A weeding out of Royalist influences had taken place at Oxford just before his arrival there, and young Wren found himself somewhat unsuitably placed in an atmosphere favourable to the authority of Parliament rather than of the King. His studies appear to have followed a course dictated by his generally scientific bent, with a continued leaning towards experiments with astronomical and mathematical instruments, such as fascinated and absorbed his inventive mind.

In 1651 came the defeat of Charles II at Worcester. John Evelyn records in his Diary a visit paid to Oxford at the end of term, in 1654, when, following entertainments at Wadham and All Souls, he "visited that miracle of a youth, Mr. Christopher Wren, nephew of the Bishop of Ely," and adds that Dr. Wilkins, the Head of Wadham, showed him a "variety of shadows of all perspectives and many other artificial, mathematical and magical curiosities, a way-wiser, a thermometer, a monstrous magnet, conic and other sections, a balance on a demi-circle, most of them of his owne and that prodigious young scholar, Mr. Chr. Wren, who presented me with a piece of white marble which he had stain'd with a lively red very deepe, as beautiful as if it had ben natural." But relatively little seems to be known of Wren's Oxford days, though such particulars as we have lead us, with no surprise, to his appointment to the Gresham Professorship of Astronomy upon its becoming vacant in 1657. His inaugural address is said to have been a notable example of Latin composition with the literary graces and finely turned phrases that, through life, were characteristic of him. The "juvenile blushes," to which his speech made reference, might well become a man holding so honourable a post at the age of twenty-five.

He was now started upon a London career, and—little though perhaps he guessed it—destined in the near future and through a period of over fifty years to hold the premier place in guiding the development of that city, and determine for centuries to come the general form and character not only of the buildings of London, but of the whole of his country. His father, the Dean, had in the meantime succumbed (1656) to the malicious oppressions of his persecutors—in which, perhaps, he was more fortunate than his brother, the Bishop, who dragged out a miserable existence in the Tower, in the King's cause, with fine patience and heroism.

The Professorship at Gresham was disturbed by the prevailing civil troubles, until, in 1660, came the Restoration of King Charles, and Wren was able to resume his interrupted lectures. He resigned his Gresham College appointment in the following year in order to succeed Seth Ward in the Savillian Chair of Astronomy at Oxford. His model of the moon, which he there prepared, attracted attention from the King, and Wren was received in private audience so that he might explain it. An event of some importance this appears to have been, for it confirmed the repute Wren had already gained at Court and established him in the Royal favour. The opinion expressed by Robert Hook about this time was probably general among the friends of Wren, that "there scarce ever met in one man, in so great a perfection, such a mechanical hand and so philosophical a mind." In the same year, as he returned to Oxford (1661), he became a Doctor of Laws of both that University and of Cambridge, though but twenty-nine years of age.

In 1662 we come to the year when Wren's attention was definitely turned towards architecture. The important post of Surveyor-General was held by Sir John Denham, in succession to Inigo Jones, and though many important works were demanding attention at the time, including the badly-needed repair of Old St. Paul's, Denham had no qualifications at all to carry them through.* He had, however, been a faithful servant to King Charles, and, to avoid dismissing him, the King ingeniously created a new post of Assistant to the Surveyor-General with the object, apparently, of inducing Wren to accept it. Yet, as Miss Milman says,† "it is impossible to account except by Evelyn's influence for the King's selection of a man unknown as an architect, who in the very Charter of the Royal Society itself (only just created) is entered as 'Christopher Wren, Doctor in Medicine, Saville Professor of Astronomy, in our University of Oxford.'" As she appropriately adds, the men of the seventeenth century so rarely specialized that no surprise would be likely to be expressed that Wren should have cared to become as skilled with the scapel (we may, perhaps, add the compass and T-square) as with the telescope.

The appointment certainly shows the extraordinary way in which Wren's abilities and personality had impressed themselves upon the men of his time. He was already recognized as the most remarkable of the many able men of his country and generation, and we now find him, within four years of the Great Fire, turning his great talents in quite a new direction and preparing himself, unconsciously, for the opportunity of his life. He was doubtless already familiar with architectural literature. His friend, John Evelyn, was a keen student of architecture and, at the time of which we are now speaking, had in hand the preparation of an English translation of Fréart's "Parallel of Architecture," which Sir Reginald Blomfield has described as "one of the most valuable treatises on the details of Renaissance Architecture ever written." It was actually first published in 1664, and gives very complete tails of the Orders from ancient examples and as treated the ten principal modern authors, including Alberti, gnola and Palladio.*

---

* In John Evelyn's Diary (19 October, 1661) he says that he discussed the placing of the Palace at Greenwich with Denham, but "came away knowing Sir John to be a better poet than Architect, tho' he had Mr. Webb (Inigo Jones's man) to assist him."

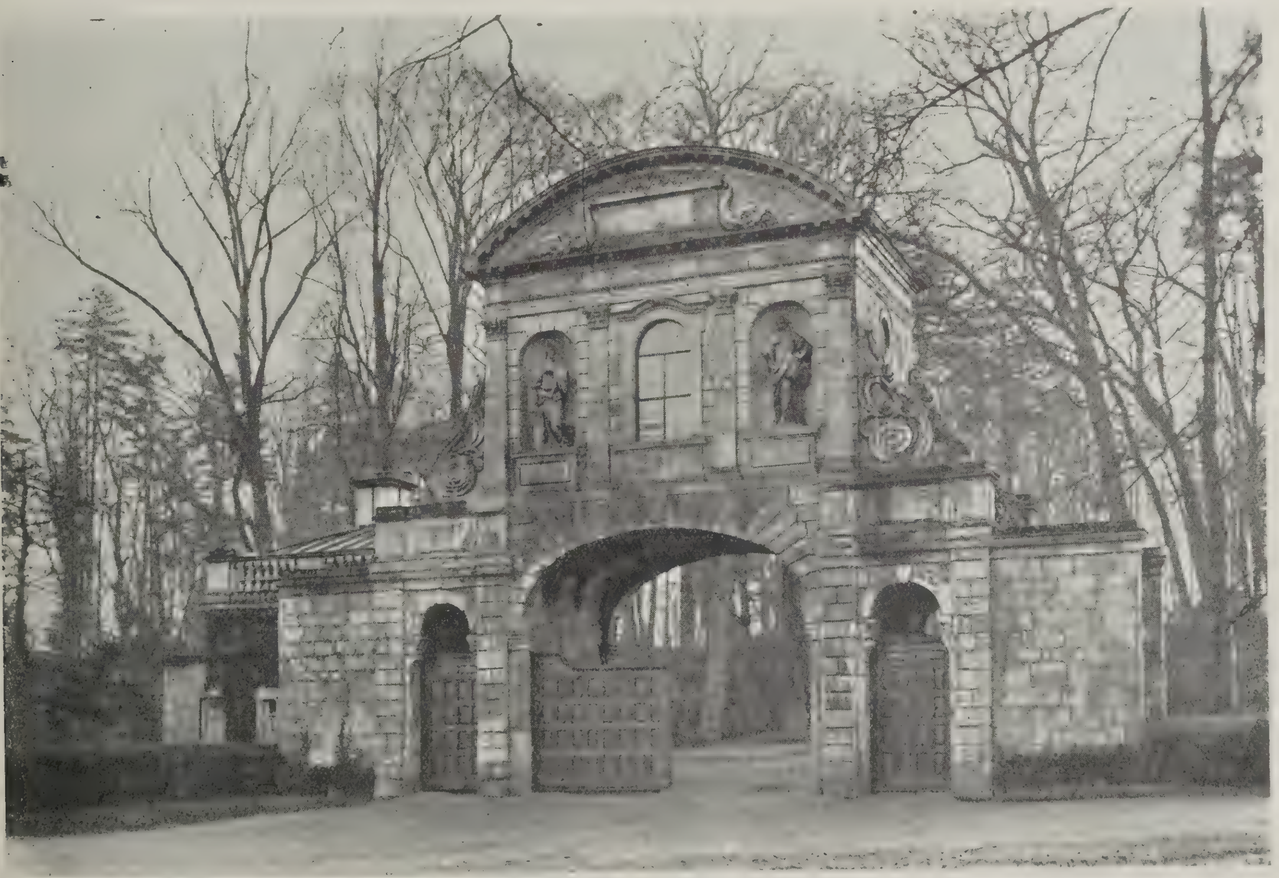
† "Sir Christopher Wren," by Lena Milman. 1908.

In the previous year, that immediately following Wren's pointment as Assistant to the Surveyor-General, Godfrey chard's edition of the first book of Palladio appeared, d though of little value as compared with the great alian editions of that master, its ready sale showed that met a need of the time. It is easy to imagine that ren would be acquainted with geometric diagrams and eories embodied in the various sixteenth and seventeenth ntury editions of Vitruvius, with the finely illustrated orks of the great Italian and French architect-authors,† d certainly with so readily obtainable and valuable a lume as Robert Peake's five books of Serlio "translated t of Italian into Dutch and now out of Dutch into nglish for the benefit of our English Nation, and sold his shop neere Holborne Conduit, next to the Sunne averne—Anno Dom. 1611." This copiously illustrated ork, published in London twenty-one years before Wren's rth, contains Raffael's and Peruzzi's plans for St. Peter's Rome and a design by Bramante for the dome of that urch, showing it in plan and section. Serlio's book ntains other illustrations of domes of lesser importance. ren would be acquainted with many of the great libraries d private collections of books that existed in London, xford and elsewhere, and there is no reason to suppose keen a student was not already quite familiar with neral and detailed representations of Classic and Renaissance architecture; while his interest in mechanics would evitably lead him towards the science of construction and sure him a considerable competence in that aspect of e art of building.

It would seem that, when the time came for Wren to take up, in 1662, the office of Assistant to the Surveyor-General, the work of Inigo Jones had become of great interest to him, and as one of the buildings for which he became, in effect, responsible was Old St. Paul's Cathedral —now suffering badly from long neglect—he probably looked with wonder upon the classic portico that Jones had but a few years before added to that dilapidated Gothic structure. With a lack of actual contact with revived classic work abroad, the very beautiful Italian work that Inigo Jones had left behind him would be keenly and carefully studied by one to whom, from the character of his own subsequent work, it must have made a great appeal. For it needs to be borne in mind that the revived classic architecture of this country was then practically limited to the few buildings erected by Jones, and his assistant and relation, John Webb; and that, apart from such works as they had executed, the City of London was almost exclusively mediæval in the character of the structures crowded together in its narrow, crooked and densely populated streets. The evil results of this condition, with its direct encouragement of ill-health and disease, was shortly to be revealed.

It is well to remember, too, that in the year 1662, when Wren was launched upon the architectural sea, that from the first he navigated so skilfully, Michael Angelo had been dead for nearly one hundred years, and his dome of S. Peter's at Rome was the wonder of Europe in the intervening period. Bernini, sculptor and architect, now held the Roman stage, and was receiving honours usually reserved for princes. He had, in fact, just completed his colonnaded approach to S. Peter's after Maderno's extension of the front of the church had changed Michael Angelo's Greek cross plan into a Latin one. In France preparations were in hand for an extension of the Louvre, and Louis XIV was about to seek a design from Bernini for completion of the building.

Having in view the nature of the career Wren had followed to the time of his appointment as Assistant to the Surveyor-General—and the fact that it had no apparent relation to architecture—it is of interest to recall the



TEMPLE BAR, AS RE-ERECTED AT THEOBALD'S PARK.

---

* In Evelyn's Diary, under date of 27th October, 1664, he says: "Being casually the privy gallery at Whitehall, his Majesty gave me thanks before divers lords d noblemen for my book of Architecture, and again for my 'Sylva,' saying they re the best design'd and useful for the matter and subject, the best printed and sign'd (meaning the *taille douces* of the Parallel of Architecture) that he had seene.'"

† Bodley's Librarian at Oxford is able to confirm my own conjecture that when ren was admitted as a reader, in 1651, the Bodleian Library contained a number Architectural works, including Vitruvius, Serlio, Palladio, Vignola and Philibert l'Orme. It may be reasonably assumed he would not fail to make use of these, of which are well illustrated.—F. R. H.

point made by Quatremère de Quincy,* that the authors of what were regarded as among the finest works of architecture in France, Pierre Lescot, Claude Perrault and François Blondel, were not originally trained as architects. But, as we have already seen, in that age of real learning, men did not confine themselves so strictly as they do now to one special branch of art or science, and culture spread its capacity and knowledge over a far wider field. It was not, therefore, the surprising thing that it would be to-day to find a scientist or doctor of medicine erecting a building of the first rank, or even to find an architect or sculptor diverting himself with the writing of Latin odes, the planning of military campaigns, or composing treatises on Platonic philosophy. It has, indeed, been well pointed out that the architecture of Wren arose out of his exceptionally varied knowledge and the peculiar aspect of genius that induced the acquirement of every accomplishment necessary to an operative builder before he was called upon to cultivate the artist. Or, as Allan Cunningham observed,† "his mathematical acquirements gave him extensive command over the very principles out of which true architecture arises."

In the troublous time of the Commonwealth fine building would naturally be discouraged, but under a restored monarchy it was about to come into its own again. Almost simultaneously with taking up his new appointment Wren was commissioned to provide the building now known as the Sheldonian Theatre at Oxford, and which he completed in 1669. The early work of adding a doorway to the north transept at Ely—which he carried out for his uncle the Bishop—showed at once the characteristic Wren manner, and recalls the much later entrance to S. Mary-le-Bow Church at Cheapside, London, with its deep curved reveal and projecting rusticated voussoirs. The door at Ely is his earliest executed work, but a Memorial Chapel for Pembroke College, Cambridge, followed it very closely. While austerely treated, for reasons of economy, it has great distinction of proportion. As an almost first work of a man possessing no previous architectural experience, so far as is known, it is remarkably good, and the activities of modern restorers have fortunately left its beautiful western façade untouched. Its foundation was laid in May of 1663, and the completed building consecrated two years later upon the feast of S. Matthew. In the year 1664 he built the Storehouse of the Tower of London, a little-known building of considerable interest.

Meanwhile, a survey of Old S. Paul's was in hand, for its generally unstable condition made repairs imperative. Inigo Jones had spent more than ten years upon restorations, but appears to have effected little that was valuable in support of a Gothic structure with which his Italian proclivities put him out of sympathy. His mighty Corinthian portico, though unquestionably fine in itself, was incongruous, and probably regarded by its designer as a first step towards reconstruction of the whole cathedral in the classic manner. Even the portico was suffering at the hands of the vandals of the period when Wren, in 1663, began his inspection of the building. From all accounts, he found its condition precarious in the extreme; but to add to the difficulty of the problem it presented being fairly faced, the plague appeared in 1664, and the normal life of London was interrupted.

Though continuing his astronomical professorship, his regular attendance at the Royal Society, and engaged on repairs to Trinity College, Oxford, for his friend Dr. Bathurst, Wren broke away from these ties at midsummer of 1665, and, leaving the dangerously-infected air and generally unpleasant condition of London, went to Paris. There he spent six months, and, according to his interesting account, preserved in "Parentalia," ‡ appears to have used every opportunity that came his way to acquain himself with the course of architectural affairs in Franc at a most interesting period; meeting there, in addition t Bernini, the most notable native artists, including Mansart Le Pautre, Le Vau, Le Brun, Mignard and Poussin. H wrote "I have busied myself in surveying the most esteem' Fabricks of Paris and the Country around; the Louvr for a while was my daily object, where no less than thousand Hands are constantly employ'd in the Works some in laying mighty foundations, some in raising th Stories, Columns, Entablements, etc., with vast Stones, b great and useful Engines; others in Carving, Inlaying o Marbles, Plaistering, Painting, Gilding, etc. Which al together make a School of Architecture, the best probably at this day in Europe. . . . Mons. Colbert, Superintendant comes to the Works every Wednesday and, if Busines hinders not, Thursday."

After recounting the many fine buildings and "Rarities ' he had seen, he adds, "and that I might not lose th Impressions of them I shall bring you almost all Franc in paper, which I found by some or other ready designe to my Hand, in which I have spent both Labour an money. Bernini's Design of the Louvre I would hav given my skin for, but the old reserv'd Italian gave m but a few minutes view; it was five little Designs i Paper, for which he hath received as many thousan Pistoles." Perhaps a closer acquaintance with Bernini' work might have modified Wren's opinion of it, for ther seems little doubt of its inferiority to Claude Perrault' design. The author of the great Louvre colonnad he does not appear to have met, for he could hardl have seen his drawings without making reference t them.

In appraising the influences that made for Wren' greatness in architecture we should do well to attach muc importance to the effects of his six months' stay in France and the vast range of experience in the art of buildin which he crowded into that short period. He saw example of dome architecture actually constructed or in contem plation, including Lemercier's Chapel of the Sorbonn (1635) and the elegant Val-de-Grace Church of Françoi Mansart and Pierre Le Muet, commenced in 1645; an though he spoke somewhat disparagingly of "The Colleg of Four Nations"—the very beautiful building we nov know as the "Institut"—Miss Milman points it out a probably the most nearly allied to Wren's own interpreta tion of architecture.

Wren concludes his letter to Dr. Bateman by remarking like the fine philosopher he was, that "Works of Filgrand and little Knacks are in great Vogue, but building certainl ought to have the Attribute of eternal; and be therefor the only thing uncapable of new Fashions." His "Obser vations on the present State of Architecture, Art an Manufacture in France," which he promised upon hi return to England, appear never to have been written, an this we cannot but look upon as a great loss.

Wren returned to London early in the year 1666, where in a space of six months, over a hundred thousand inhabi tants are computed to have died of the Plague. Th condition of the City was, in fact, pitiable. Large portion of S. Paul's having actually fallen in, Wren hastened hi examination of it and concluded his report. This wa presented to the King in May, and in it Wren roundl abused the methods of the Gothic builders and, in effect advocated what was practically a re-building scheme with as its chief feature, the "cutting off of the inner corner of the Cross, to reduce this middle part into a spaciou Dome or Rotunda, with a cupola, or hemispherical roof and upon the Cupola (for the outward ornament) a Lanter with a spiring top, to rise proportionately." We see i this, probably, one of the effects of the Paris visit, an evidence of his essentially practical mind in the suggestio that, having conferred with and observed the "Engine and Methods" of the best Italian and French artists, i dealing with large structures, he had "promoted thi geometrical part of Architecture yet farther, and thinks th

# An Air View of St. Paul's

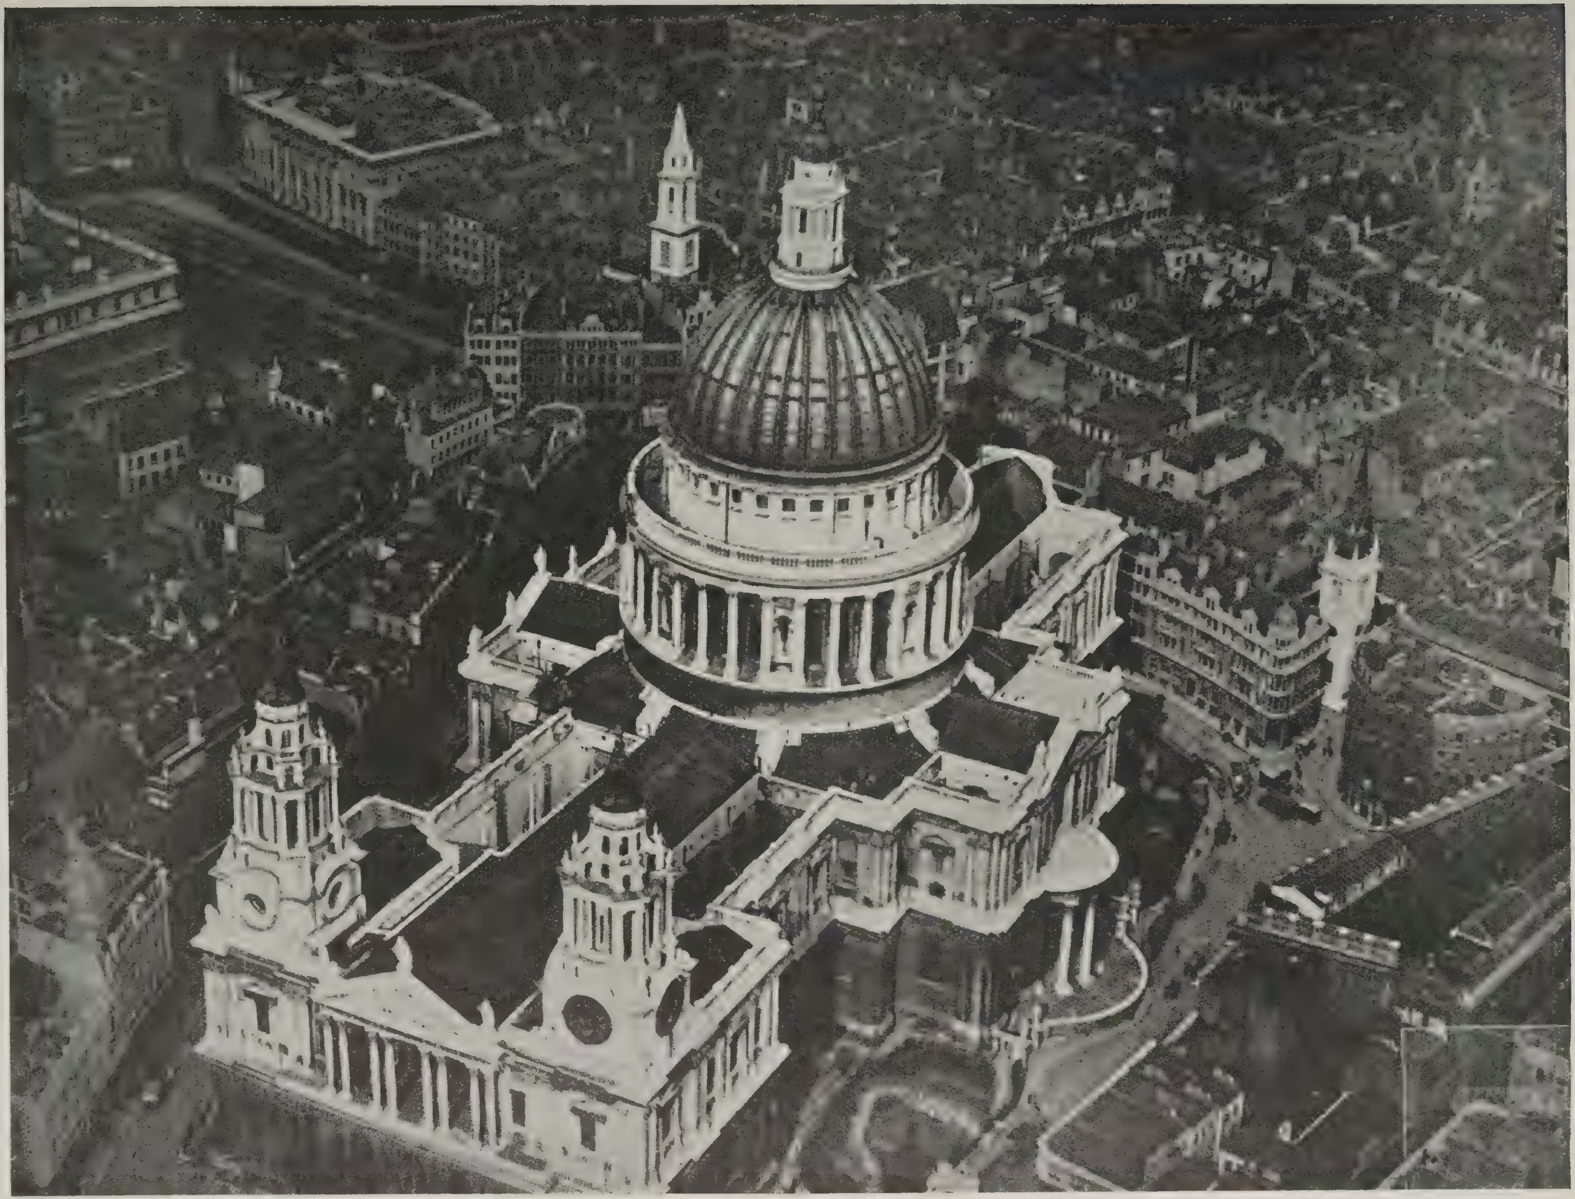

*Photo: Aerofilms, Ltd.*

This unusual view shows how dominant St. Paul's is. It appears as the Koh-i-Noor in a setting of old silver. The view also reveals certain points of construction not guessed at by the spectator on the ground—the flying buttresses behind the screen walls, and the way the drum of the dome sits upon the eight huge piers.

raising of Materials may yet be more facilitated, so as to save in lofty Fabricks a very considerable part of the Time and Labourers hire."

He advocated, too, a large and exact model being made of his suggested remodelling of the building so that "if the Work should be interrupted, or retarded, Posterity may proceed where the work was left off, pursuing still the same Design." And, naturally, he reveals his preference for carrying out new work "after the good Roman manner" rather than with the Gothic rudeness of the old design. This interesting report, which should be read in full,[*] is an extraordinary document as coming from a man who, so far as is known, had only been concerned with architecture for four years, yet who spoke already with the knowledge and authority of an experienced architect. It was referred to Wren's fellow Commissioners, including Evelyn, for consideration, and they met at S. Paul's for that purpose on August 27. Five days later, on September 2, 1666, occurred the Great Fire of London, determining the fate not only of the Cathedral, but of ninety churches and thirteen hundred houses, and incidentally obviating the execution of Wren's design, which, in view of its character, as shown in the All Soul's collection of drawings, can only be regarded, as Sir Reginald Blomfield says, as providential.

Evelyn's Diary gives a vivid picture of scenes resulting from the fire actually witnessed by him, showing the appalling effects of that calamity. From the standpoint of the subject of this Memoir the event cannot, however, be regretted, and Wren seems to have grasped at once the necessities of an entirely changed situation. In a letter to his friend Sir Samuel Tuke, Evelyn wrote that "the King and Parliament are infinitely zealous for the rebuilding of our ruins; and I believe it will universally be the employment of the next Spring; They are now busied with adjusting the claims of each proprietor, that so they may dispose things for the building after the noblest model: Every body brings in his idea, among the rest I presented his Majestie my owne conceptions, with a Discourse annex'd. It was the second that was seene, within 2 dayes after the Conflagration: But Dr. Wren had got the start of me." Wren's new plan of London, to which reference is made, was—apart from the short time in which it was sketched out—a remarkable performance, and represented quite an advanced piece of town-planning. Sir Reginald Blomfield[†] says of it that, had the scheme been carried out, London would have been one of the most beautiful cities in the world, and adds:—

> "Wren's fine intelligence grasped the full architectural possibilities of vistas of broad straight streets, linked together by groups of public buildings, the importance of a commanding site for these buildings, and the absolute necessity of a complete and consecutive scheme to the dignity of a great city as opposed to a mere farrago of houses. . . . . Wren saw at once that mere tinkering was worse than futile, and that it was a question of a large idea or nothing; unfortunately his scheme was never even attempted."

To meet the great emergency that had arisen, and having in view the obvious incapacity of Sir John Denham to deal with it, the King appointed Wren to act as "Surveyor-General and Principal Architect" for the repair of the whole City, S. Paul's, all the parochial Churches and other public structures. Wren set himself to clear away the debris resulting from the fire, in itself no mean undertaking, and to repair S. Paul's sufficiently to allow of use being made of its western portion.

From now onwards his works become so multitudinous that strict adherence to chronological order in dealing with them becomes almost impossible. The work at Oxford was being continued. The Sheldonian Theatre occupied from 1664 to 1669, and represents a skilful and practical solution of a difficult problem.[*] In the ingenious carpentry work which he there employed Wren was assisted by one "Richard Frogley, an able Carpenter." His repairs, and other works, proceeding at Trinity College, Oxford, have already been referred to. The complicated problem of rebuilding London, with its demands upon labour and material, would necessarily develop somewhat slowly, and in its earliest stages Wren was occupied with repair and other work on buildings of a public character—such as the Guildhall and the Halls of the Pewterers, Brewers, Mercers and other Companies.[†] He was being pressed, moreover, for designs for the new S. Paul's and fifty parish churches, the charge of rebuilding which had been now definitely placed upon him. A dense population was resettling in the City, providing houses and shops as best it could, with but a sprinkling of churches, relatively distant, that had survived the fire, to meet their needs. The post-Reformation attitude in respect of churches was to regard them as preaching houses, and not as buildings for viewing the Catholic ritual of the Mass. The same change of principle was to affect the design of the new Cathedral Church. The position is put quite clearly in Wren's own letter "to a friend," written in 1708 (after the fifty churches were built) concerning the Act of Parliament passed their provision. This interesting document should be read.[‡]

There is probably no group of buildings in the world, conceived and carried out by one man, equalling the Renaissance Cathedral of London and its attendant or satellite churches. They group happily with one another in the most pleasing variety and present from the lantern of the Mother-church a distinctive, imaginative charm that has no parallel. Yet, immensely valuable as this series of buildings is, and was, no fewer than eighteen of the churches have been destroyed, with the consent and even the active assistance of those who might reasonably be regarded as their natural protectors. And, what is even worse, there is at the present time serious risk of further depredations of the same sort being attempted, to the great and lasting discredit, in that event, of those responsible. Space will not admit of a detailed description of these churches, but the main types, as indicated by their plans, with a few outstanding examples, may be referred to. These are:—

(*a*) The simple rectangular room, or meeting-house type, with flat ceiling, as shown by the churches of All Hallows (1694) and S. Edmund, Lombard Street (1689);

(*b*) A variation on the last, with one aisle divided off by columns, as in the cases of S. Lawrence Jewry (1676), S. Vedast (1695) and S. Margaret, Lothbury (1690);

(*c*) The more purely basilican plan, with two aisles, of which examples are S. Magnus, London Bridge (1676), S. Bride's, Fleet Street (1680), and S. James's, Piccadilly (1683); the two latter having galleries;

(*d*) Churches with domes, the most interesting and beautiful class, including S. Stephen, Walbrook (1672–79), S. Anne and S. Agnes (1680), S. Mary Abchurch (1686) and S. Mary at Hill (1672).[§]

In the meantime Wren had taken in hand quite early the preparation of designs for S. Paul's—a task much complicated by the conflict between the general body of opinion desiring a preaching-house and the Romanist party (represented by the Duke of York, brother of the King), who more or less controlled the purse-strings. Many drawings were made, and the design that pleased Wren

---

[*] The report is largely quoted in Miss Milman's book.

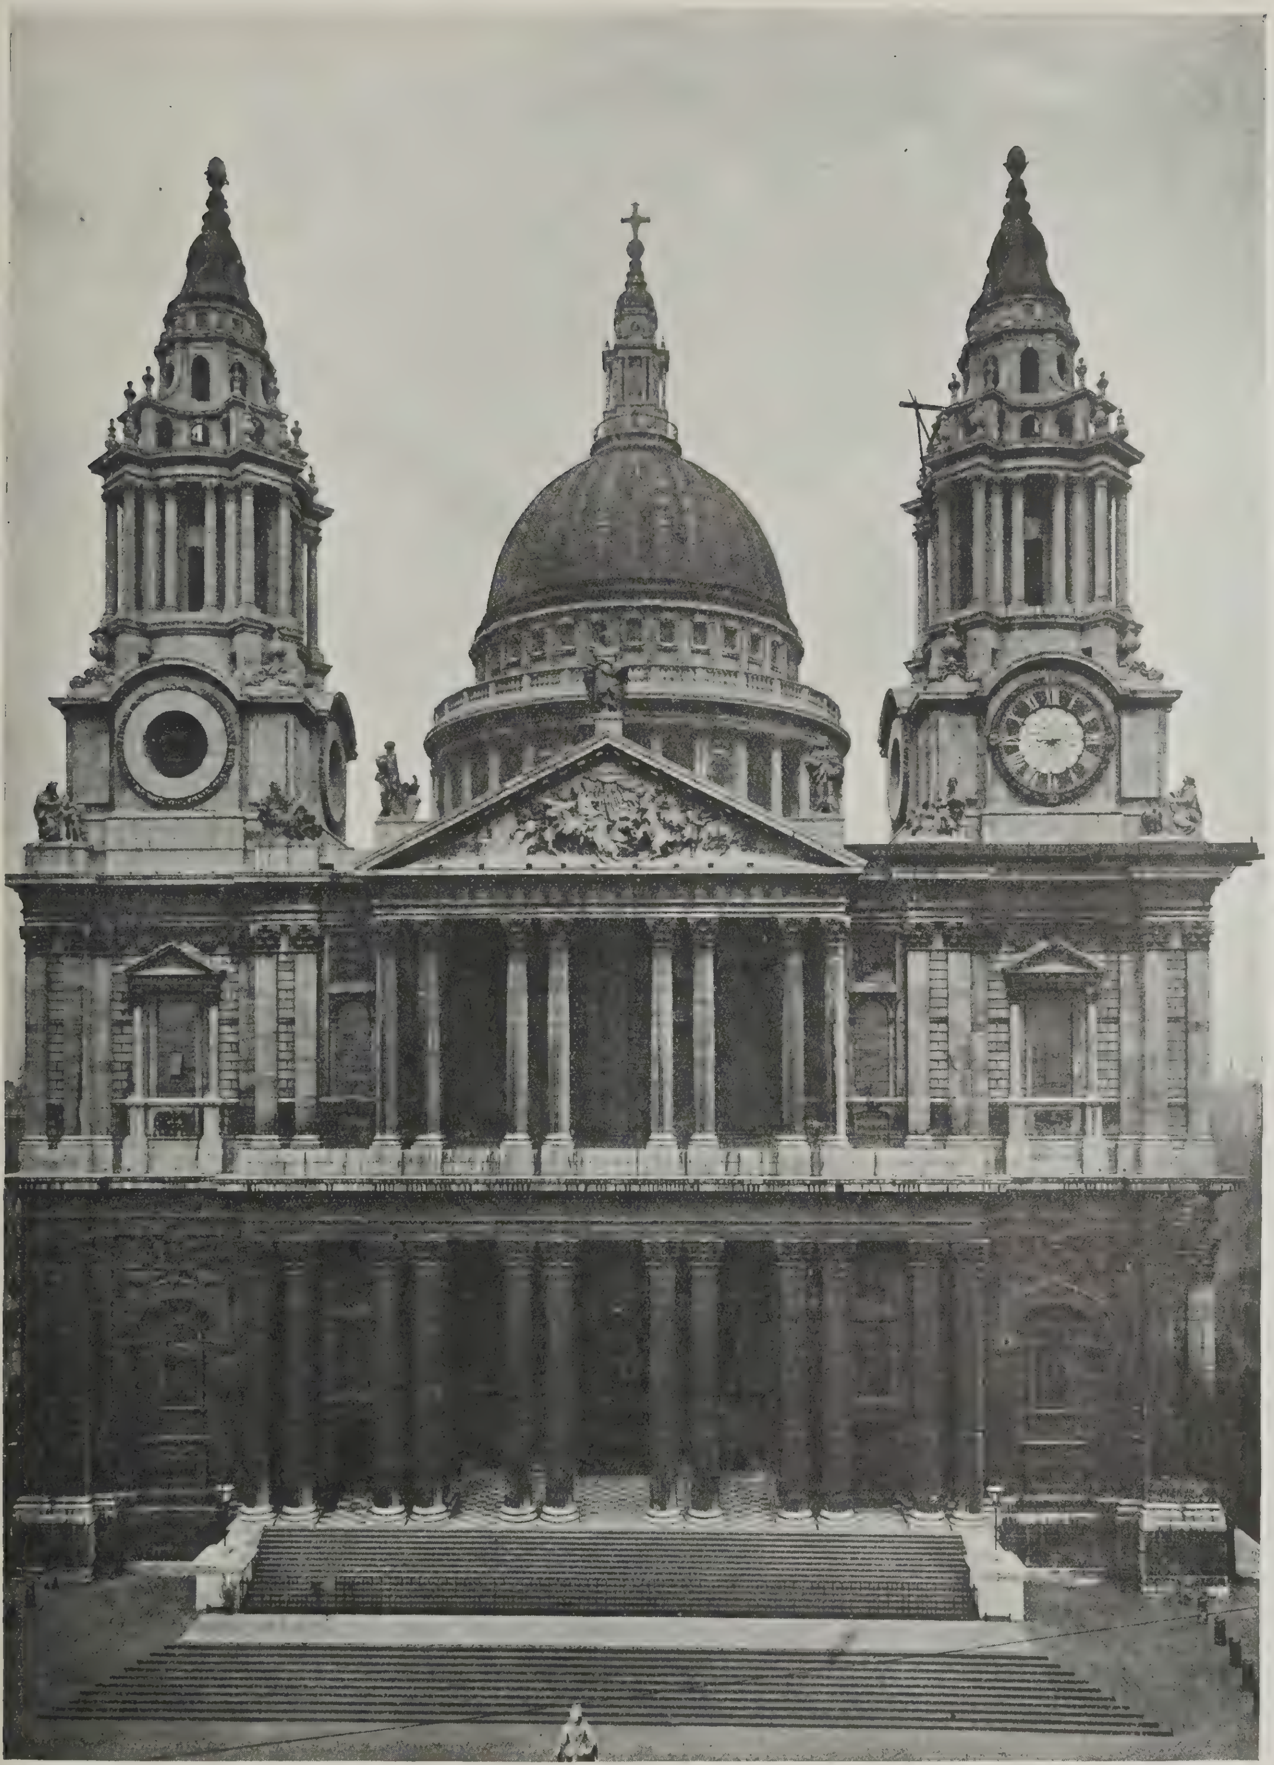
[†] "A History of Renaissance Architecture in England," 1500 to 1800, by Sir Reginald Blomfield, R.A., an invaluable work on the architectural art of the period.

[*] On 24th October, 1664, Evelyn looked over the works in Wren's company. He says, "The foundations had been newly laid and the whole designed by that incomparable genius, my worthy friend Dr. Christopher Wren, who shewed me the model, not disdaining my advice in some particulars."

[†] In conjunction with Jarman, then the City Architect, he is sometimes credited with having repaired and partly rebuilt over seventy of the Halls of City Companies—a quite incredible statement.

[‡] It is given as an Appendix in Miss Milman's book, and also quoted by Miss Phillimore.

[§] For an excellent critical description of Wren's Churches, splendidly illustrated by the author, *see* "Sir Christopher Wren and the City Churches," by Arthur Stratton. *See also* "Inigo Jones and Christopher Wren," by W. J. Loftie. 1893.



THE WEST FRONT OF ST. PAUL'S.

most was not favoured by the Court, causing the architect, it is said, tears of disappointment. He at length produced a design which the King was able to endorse (May 14, 1675) as being " very artificial, proper and useful," but which Wren, in disgust at the lack of taste and judgment shown in the King's dealings with him, possibly had not, as Mr. Loftie suggests, the slightest intention of carrying out. He certainly does not appear to have attempted to do so. No drawings were left, in fact, representing S. Paul's as we know it now, and it would seem that, as executed, it was the result of personal direction on the part of Wren, supplemented by sketches and working drawings supplied by him, assisted by his principal craftsmen, as the work proceeded. The greatest latitude was, in other words, taken with King Charles's permission to make modifications " ornamental rather than essential " in the Warrant design.

The first stone of the new cathedral was laid only a few weeks following the approval of design, and its construction then proceeded gradually but continuously to completion, in the form we now know so well, in 1710, the work of one controlling brain and probably the finest building in the modern world of which that could be said. The choir was brought into use for services in 1697.

The church undoubtedly embodies the finest example of classical dome construction—practically and æsthetically—yet carried out, and the adoption of the expedient of inner and outer domes, not concentric, with a brick cone in the interval between them, to carry the masonry lantern, was a great stroke of genius that places Wren in the front rank of inventive constructors. Only by this double dome arrangement can the effect of such a feature be equally satisfactory inside and outside a building. His upper screen walls to the aisles have been much denounced by the more extreme advocates of truth in art; but they can be effectively justified, both constructively and æsthetically. As to the suggestion that Wren adopted coupled columns through Perrault's use of them in the Louvre colonnade, such a supposition is quite unnecessary, when Serlio, and other authors with whom Wren was familiar, show their use in many examples. In fact, reasons for this, as well as other special features at S. Paul's, are given in " Parentalia."[*]

The sense of scale in the building is preserved with great judgment, and in this respect it is more effective than S. Peter's, at Rome. In Milizia's opinion, " few buildings can produce more grandeur of perspective than S. Paul's," while Horace Walpole asserted that as variety of knowledge proclaimed the universatility of Wren's mind, and a multiplicity of works its abundance, S. Paul's certainly proved its greatness.

The question of the application of colour decoration to S. Paul's is a very thorny one; but it is clear that Wren intended a fairly general use of colour, and that, apart from the contemporary paintings of Sir John Thornhill, he meant " to have beautified the interior of the cupola with the more durable ornament of mosaic work, as is so nobly executed in S. Peter's, at Rome."[†] Whether the colour decoration should have taken the form it since has is far too questionable a subject to embark upon now.[‡]

It should be added that S. Paul's, the City churches, and various other works of Wren gain considerably in their effect by the decorative carving work, chiefly in soft wood, of Grinling Gibbon—an artist craftsman of extraordinary talent, discovered by John Evelyn (January 1671) in an obscure cottage near his country seat, Sayes Court. Evelyn introduced Gibbon (commonly called Gibbons) to the notice of the King and to Wren, and the latter employed him to advantage in his numerous works; so much so, indeed, that all wood and stone carving of merit, concerned even remotely with the period, is popularly attributed to that artist.[*]

Between 1670 and 1672 Wren built the archway known as Temple Bar across Fleet Street at the western boundary of the City. This was removed in 1878 to and re-erected in Theobald's Park, Hertfordshire. The commemorative column near London Bridge, known as the Monument, was built by him at about the same time. The Royal Exchange was an earlier reconstruction, though not on the noble scale conceived in his plan of London, where it was to form what he obviously intended to be a new civic centre for the City in the Roman manner. Pepys records that King Charles went to the Exchange " with his kettle-drums and trumpets " to lay the first stone of the new building in October 1667; but in the fire of 1838 it was completely destroyed. A like fate befell the Customs House, which, rebuilt in 1668–9, was burnt down in 1719.

On December 7, 1669, Wren was married to Faith Coghill, daughter of Sir Thomas Coghill, of Bletchingdon, Oxfordshire. A letter from him to her is preserved in " Parentalia," and expresses well the charm of its author's disposition. Two sons were born to them—Gilbert, who died in infancy, and Christopher, born in February, 1675, in which year the mother died.[†] The following year Wren was married again—to Jane FitzWilliams, daughter of Lord Lifford, by whom he had two children—Jane, born in 1677, and William in 1679, in which year, by a somewhat curious parallel, the second Lady Wren also died. Wren's daughter, Jane, for so long as she lived, was her father's constant companion; but she pre-deceased him by twenty years, and was buried in the crypt of S. Paul's.

A knighthood appears to have been given to Wren in 1674, the year before S. Paul's was commenced and when a great number of his churches were in process of building. As Surveyor-General he was then being worried by numberless questions arising from the general reconstruction of London, and from his desire to prevent haphazard, irregular or unsound building. He found so many structures being carelessly or badly done that he petitioned the King on the subject, and asked for powers " to restrain the same or other ways to consider of the premises as in your Majesty's wisdom shall seem most expedient "—which petition was readily granted, and a Royal Proclamation issued, giving Wren the effective control he desired. His various works were now succeeding one another at such a rate that it is difficult to follow them. In the thirty-five years, 1675–1710, in which S. Paul's was under construction the great mass of his City churches was built, together with Trinity College Library (1673–1679) and the Chapel of Emmanuel College (finished 1677) at Cambridge; the Honywood Library at Lincoln (1675), the Kilmainham Hospital at Dublin (1680–1686), a portion of the Palace at Winchester (1683–1685) for King Charles, little of which remains, and the schoolroom of the College of that place at about the same time; the Guildhall at Rochester (1687), the Town Hall at Windsor (1688), the College of Physicians, London (1689); the Chapel of Trinity College, Oxford (1691–4), Morden College, Blackheath (1695); and, in or near London, work at Drury Lane Theatre, Chelsea Hospital (1682–1692), large additions at Hampton Court (1689–1694), the Orangery at Kensington (1705), and the magnificent Greenwich Hospital (1696–1705). These do not by any means exhaust Sir Christopher Wren's works at this period, to describe which, or touch upon their merits, would occupy many volumes.

Of the splendid Library for Trinity College, Cambridge, a more distinctively Palladian treatment than is usual with Wren may be remarked; and, as showing his care for details,

---

[*] Some main dimensions of the Cathedral may be useful as given by A. Pugin in " Public Buildings of London," viz. :—

From the vaults or crypt to the top of the cross, 381 feet, the crypt representing 21 feet to nave pavement; from the western steps to the east end, 550 feet; from the top of steps to pine apple of western turrets, 210 feet; diameter of walls supporting the outer dome, 107 feet; length of the short arm of cross (plan of building), from north to south doors, 240 feet; and from base of transept steps, 313 feet; height from pavement to ridge of roof, 112 feet; from the springing of the outer dome to the top of the cone supporting the lantern, 53 feet; inner measurement of nave and side aisles, 93 feet 8 inches.

[†] " Parentalia."

[‡] A great number of useful papers on the subject of the colour decoration of S. Paul's were produced about the middle of last century, when the question was being keenly discussed. They may be found in *Transactions*, R.I.B.A., and other Architectural Journals of the time, and their authors include Professor Cockerell, Barry, Donaldson, Penrose and others. Needless to say, there has also been a mass of discussion since.

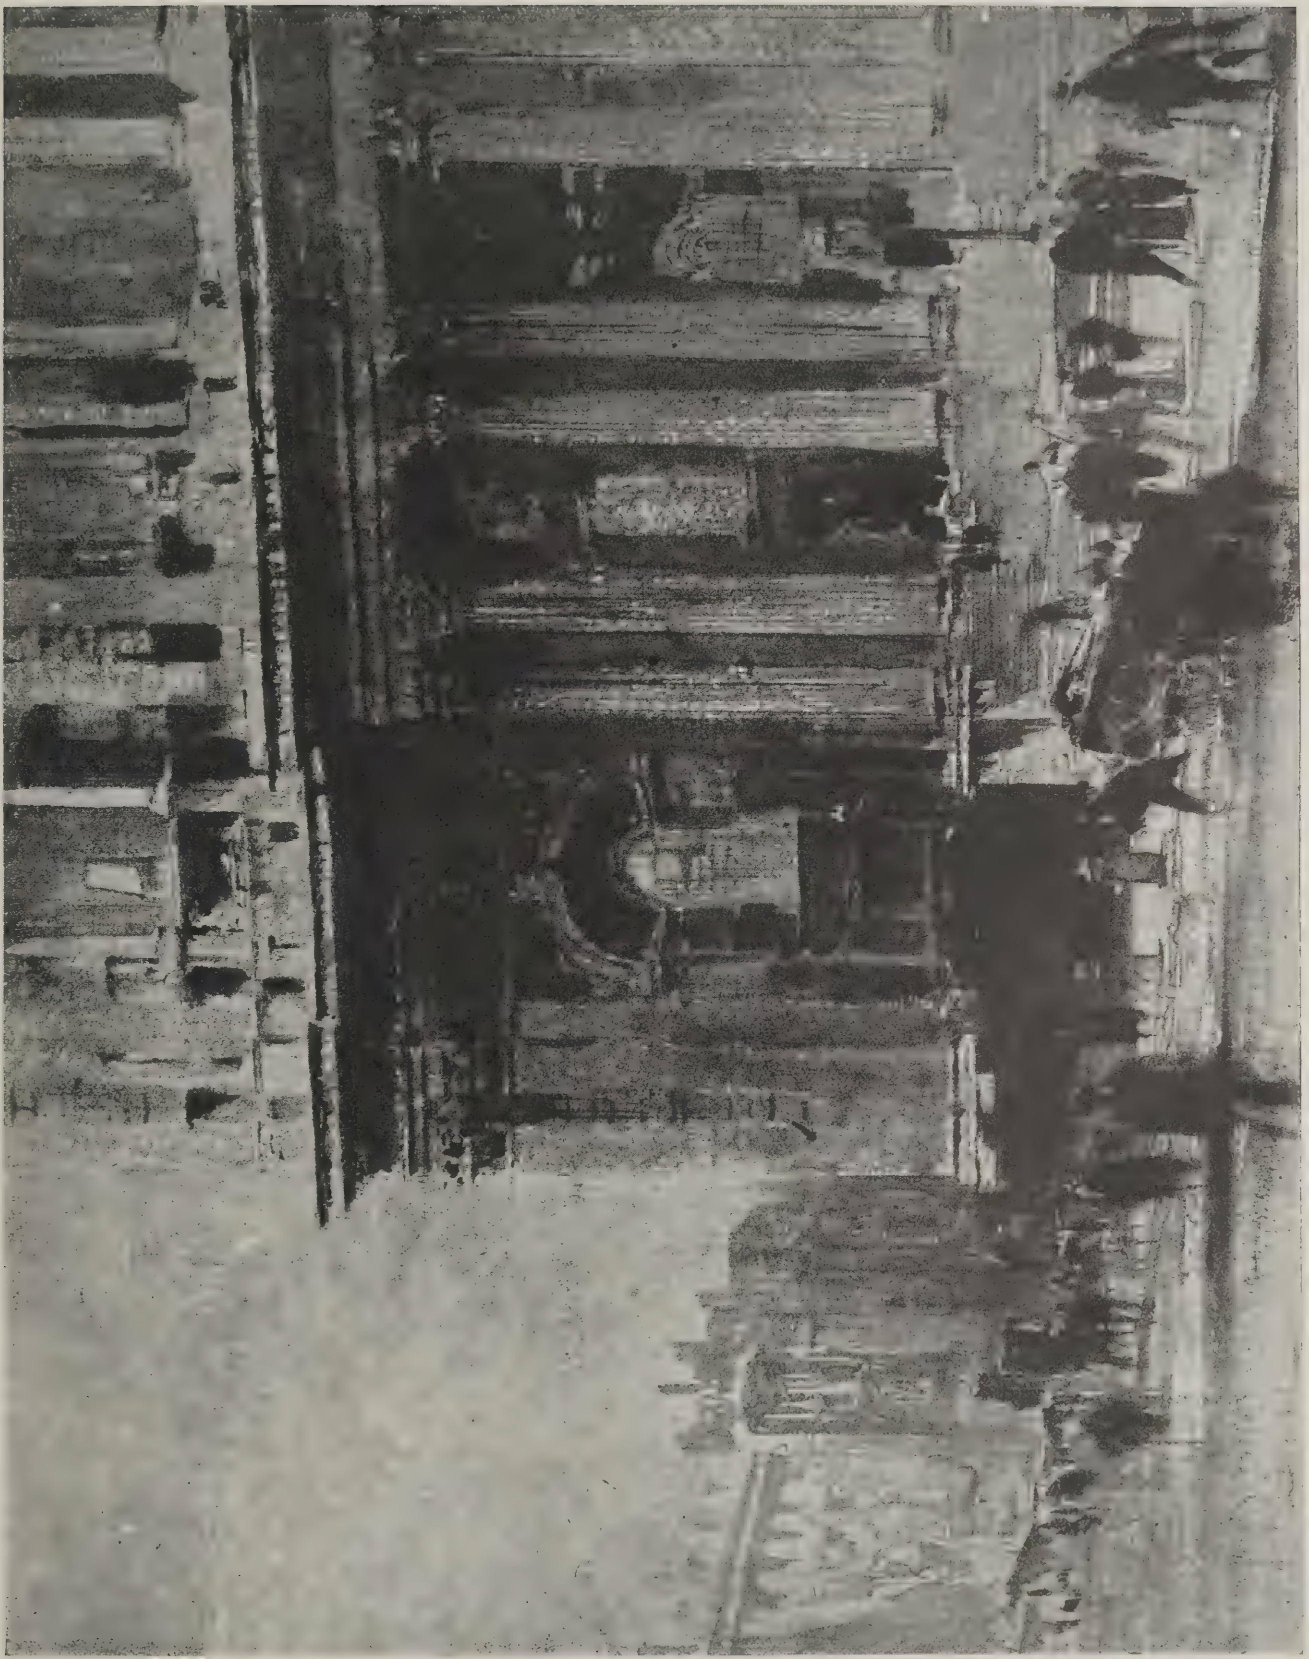
[†] The first Lady Wren and her infant son Gilbert were buried in the chancel of the then Church of S. Martin-in-the-Fields.

From a Water-colour Drawing by William Walcot



In this drawing Mr. Walcot gives us a glimpse of St. Paul's under typical London atmospheric conditions. The feeling of rain and mist is deftly suggested, with the weathered mass of the cathedral looming through.

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

an extract from a letter to the Master of Trinity may be quoted, in which he said " I would willingly take pains to give all the mouldings in great; we are scrupulous in small matters and you must pardon us, the architects are as great pedants as critics and heralds."

The masterly simplicity of Chelsea Hospital causes it to be less remarked upon than most of Wren's buildings; but a study of it emphasizes the elegance of his taste and his skill and judgment in the appropriate use of materials. Few, ndeed, could have combined such effect with so rigid an economy. The buildings at Hampton Court and Greenwich were more ambitious and ornate. The former of these constituted a considerable addition to the earlier Tudor palace, to meet the desires of William and Mary for a country residence offering greater quietude than the associations of London admitted. Wren met the requirements in the stately manner that all may now see, and if some parts are not so esthetically satisfying as others, the interference of the King is probably responsible. But Greenwich Hospital is without much doubt Wren's finest scheme of buildings of a civil or domestic kind, and its situation on the edge of the river, near the former palace in which Queen Elizabeth was born, adds to the magnificence of its effect. Only the block known as the Queen's House had been built by Inigo Jones, of the residence contemplated by King Charles I, and a portion of another by John Webb for Charles II. In the extensive additions which Wren made, and in which he was assisted by Hawksmoor, he formed the whole into one great dignified scheme, and out of the hospital for disabled seamen created an architectural masterpiece. The angle domes are notable features, happily placed, that much assist the general effect of this remarkable group of buildings. Alone, and apart from his other work, Greenwich would suffice to place Wren in the front rank of Renaissance architects, among the greatest masters of Italy and France.

Mention should, perhaps, be made of Marlborough House, now one of the minor Royal residences, and of the fact that Wren acted as Surveyor for Westminster Abbey from 1698 to 1722, the year before his death. While in that capacity he made recommendations in respect of a ofty central spire and the western towers, though the atter were not built by him, as is so often supposed. Even through the most strenuous period of his life, interest in the affairs of the Royal Society, of which he became President in 1681, was sustained, and his multitudinous public duties were added to by his representation of Plympton, Weymouth, and Windsor in Parliament beween the years 1685 and 1700.

The closing phase of Sir Christopher Wren's life was reached as the construction of S. Paul's approached completion. King William had died, and been succeeded by Queen Anne, in 1702. John Evelyn, who from the first had been one of the S. Paul's Commissioners and a valued friend of Wren's, died in 1706, at the age of eighty-five. In 1710 the crowning act in the structural completion of the cathedral was performed, when Wren's son, Christopher—born in the year when its building commenced—placed the final stone of the lantern in position in the presence of his ather, the workmen (including Strong, the master-mason) and of a vast concourse of citizens. From this same lantern might be viewed all round scores of buildings, with towers and spires of extraordinary beauty and variety, owing their origin to the same inspired spirit. Yet for fourteen years Wren had been persecuted on the false and petty charge that he was prolonging the construction of S. Paul's in order to enjoy his inadequate salary for a longer time. A moiety of his salary had, indeed, been stopped from the year 1697, " the better to encourage him to finish the same work with the utmost diligence and expedition."

Such treatment seems incredible. Worse was to follow, and culminated in a scurrilous pamphlet on " Frauds and Abuses at S. Paul's," published anonymously, but probably encouraged if not inspired by the Commissioners, who, as the building approached completion, showed themselves actively in opposition to the architect. Sir Christopher's answer to the pamphlet and his petition to the Archbishop of Canterbury and Bishop of London availed nothing; but an appeal to the House of Commons obtained support for his own view of an extraordinary situation and an instruction for payment of the arrears of his salary. Much of the beautiful decorative finishing of the building which he had in mind to do—metal work, the application of coloured marbles, mosaic work and gilding among other things—was frustrated by these annoyances, and every difficulty seems to have been placed in the way of his achieving the result that he intended. Among other things Wren desired to employ Tijou on a low, graceful railing of wrought iron round the exterior of the cathedral, but he was overruled in favour of a high and clumsy fence. Such humiliating and senseless irritations continued until, following the death of Queen Anne, the new King (George I) dismissed Sir Christopher Wren from his office and bestowed it upon one Benson, " whose cringing incompetence," as Miss Milman puts it, " marked him out for Court favours."*

Wren now returned permanently to the house at Hampton Green, that had been granted to him by Queen Anne some years before, saying " Nunc me jubet Fortuna expeditius philosophari,"† and there, free from worldly affairs, he passed the remaining years of his life, " in contemplation and studies and principally in the Consolation of the Holy Scriptures; cheerful in Solitude and as well pleased to die in the Shade as in the Light."‡ It appears afterwards to have been his custom to drive, once a year, to S. Paul's, and, sitting beneath the dome, spend some time in viewing his master-work. On one such occasion, being in wintertime, he caught a chill, and, after dining on February 25, 1723, died in his chair, with an appearance of perfect calm upon his features. They laid him near his much-loved daughter in the south-eastern portion of the crypt of his Cathedral Church. The famous inscription, composed by his son, formerly placed in the crypt but now prominently inscribed above the door of the north transept, could hardly have been bettered. From its position and the fine simplicity of its wording it constitutes the most appropriate memorial that could be given him, " Subtus conditur hujus Ecclesiæ et Urbis Conditor Christophorus Wren, qui vixit annos ultra nonaginta, non sibi, sed bono publico. Lector, si Monumentum requiris circumspice." And we may now look around us in a still wider sense, for he has impressed his influence upon the architecture of two further centuries, wherever the English language is spoken.

To a greatness of mind and character and a variety of abilities that have been rarely equalled, Wren added a modesty and disinterestedness in respect of material advancement or worldly gain that exposed him to persecution and the ingratitude of mean persons holding power in the times in which he lived. The debt his country owes him has never yet been acknowledged. His contemporary, Steele, truly said of him§ that " he was not only in his profession the greatest man of that age, but had given more proofs of it than any other man ever did "; that though some said " Surely Nestor will now be famous, for the habitations of gods, as well as men, are built by his contrivance," it was not so, and his labour and skill were all forgotten. Can it be said that it is not so now? In the interval of two hundred years since his death the greatness of Wren and the influence of his work have been increasingly felt by those whose interests, in however humble a degree, run in the same direction as his. These will surely seek now to secure such general regard for his memory as will enable it to be truly recorded of him, as did Tacitus of Agricola, that " delineated with truth and fairly consigned to posterity, he will survive himself and triumph over the injuries of time."

---

* An entry in " Parentalia " bearing on this incident appropriately quotes, " And there arose a King who knew not Joseph " (Acts vii. 18).

† " Now Fortune commands me to apply myself more closely to Philosophy."

# The Public Buildings of Sir Christopher Wren

## By WALTER H. GODFREY, F.S.A.

THE *dictum* of Jean Mignot, when he consulted with the architects of Milan Cathedral in 1398, *"ars sine scientiâ nihil est,"* attains a deeper significance when illustrated by the signal success of Sir Christopher Wren. And yet, are we not sometimes surprised when we consider that so transcendent an accomplishment in the world of art as Wren's work exhibits should apparently be the outcome of the scientific mind? The explanation, if we seek it, will probably be found in the fact that the really great man moves freely in all the departments of mental and emotional activity; he does not recognize the limitations which nowadays too often tie the feet of the expert; *nihil humani a me alienum* is literally his vital principle.

Wren has been called an amateur, and if the title is justly bestowed on all who have not served a youthful apprenticeship to the art of building, he is without doubt one of a noble company who have given the world architectural gifts without price, which are cherished in every land. The great builders of the middle ages, and even of the Renaissance, turned to the supreme problems of architecture energies which had been trained in quite other pursuits. The architect—the super-artificer—must possess an unusual type of mind, an insight into the potentialities of a hundred crafts, and he needs, more than any technical skill, the power of absorbing what is essential from each of these. Sir Reginald Blomfield has laid stress upon the extraordinary resourcefulness of Wren, and on his ability to turn the knowledge of other people to account. He was, however, no compiler of contemporary designs; he was not the slave, but the master of his means and his material. He stamped his whole output with the hall-mark of his own greatness.

To Wren came the almost unique opportunity of designing a veritable host of public buildings, and he seized on the occasion with eagerness and used it with remarkable consistency. He trained himself to be one of the world's supreme builders, which, translated into modern parlance, is to be an artist of the front rank. To-day we divide the world into three classes—the artists, the connoisseurs, and the more or less indifferent or bewildered public—and we talk of teaching the last-named the mysteries of art, and quarrel as to whether this is best done by encouraging the receptive or executive faculties. It is an unnatural division, and does not occur in the realms of literature or music, where the author and composer are sure of a reasonably general and intelligent reception of their compositions. In the plastic and pictorial arts there is no such freemasonry or common understanding. To the man-in-the-street the genius of Sir Christopher Wren is unperceived; the chief exponent of what was, at one time, the most popular form of art receives homage from the student and the connoisseur alone.

It is perhaps due to this fact that Wren's attainments are discussed in a somewhat critical and artificial atmosphere. Here is a man who without the slightest hesitation assumed the architectural command of his age and maintained the position to the end of an abnormally long life. The list of buildings to his credit is so long and so important that it seems not unreasonable to attribute everything that is outstanding in his period to this over-reaching genius. The demands of modern criticism require documentary evidence in support of the ascription of any building to a given architect, but this insistence on complete proof may be carried too far in the case of a man whose advice and counsel were sought by everyone and the characteristics of whose design are manifest in a number of buildings for which he may not have been the titular architect. In the case of the College of Physicians, Warwick Lane, for instance, Mr. Arthur Stratton has pointed out the extreme probability of Wren's authorship, although Robert Hooke is generally credited with the design. The latter, a scientist like Wren, assisted the great architect as surveyor, and if he were, in fact, the designer of Montagu House and Old Bethlehem Hospital, he certainly has a claim to the rank of artist. Unless, however, we regard Wren as merely the chief practitioner in a style that arose independently of him, instead of the virtual creator of the phase of the later Renaissance that obtained from Charles II to Queen Anne, we are bound to see the hand of the master in such designs as these.

It is common to hear some disparagement of Wren's early work on account of his inexperience, and his eccentricities, as displayed most notably in the warrant design for St. Paul's Cathedral, are cited as due evidence of the limitations of his genius. And yet, if one dares to possess a catholic taste in architectural matters, one can find a relish in even these so-called failures, and experience a joy in the tireless experimentation of Wren's self-tuition. The purist may recoil from the vision of St. Bride's tower poised on the top of St. Paul's dome, but we may be sure that it would have been infinitely more delightful than scores of more recent buildings that have disfigured the City, and it might have set the fashion in an inconsequent gaiety which our sombre architecture often lacks. Tom tower at Oxford is a case in point, an ever-present joy that laughs at criticism. Here was a live force, handling every problem with vigour and imagination, marshalling all the conflicting elements which combine only in an attempt to defeat the distracted architect. How often are materials

hard and stubborn, sites unyielding, clients antagonistic or suspicious, means scarce, and inspiration far to seek! It is enough that Wren triumphed over a legion of difficulties, maintained his powers until his ninety-first year, and left posterity a more important legacy of fine building than any other Englishman.

Wren's first public work was the Chapel of Pembroke College, Cambridge, which he designed for his uncle, Matthew Wren, Bishop of Ely, in 1663-4; quite a simple and charming building with fully developed Renaissance detail. While this was in course of erection he began the Sheldonian Theatre at Oxford, which now adjoins the Ashmolean building—the latter an exquisite little design formerly attributed to Wren, but recently assigned to an architect named Wood on the evidence of an early engraving. The inner court of Trinity College, Oxford (1665), has also always been held to be the work of Sir Christopher Wren, but in recent years some doubt has been cast on its authorship. The interior of the chapel is richly decorated with carved wainscot and is a most effectively arranged apartment with coved and enriched ceiling and an elaborate reredos. Another work at Cambridge at this time was the chapel and cloister at Emmanuel College, on which Dr. William Sancroft consulted Wren. The roof of the chapel projects forward so that its façade forms the centre of the cloister and picture gallery above, a most pleasing composition with its lower range of thirteen pierced arches.

All this work preceded that historic event which was fated to turn Wren's life into one of monumental activity. The Great Fire of London of 1666 was both an emergency and an opportunity that called for real genius to cope with all the problems which it involved. If Wren was an amateur before, he was soon to become, by means of the number of works in hand, the most experienced of builders. The raising of St. Paul's and the City churches alone would prove more than the work of an ordinary lifetime.

In the process of his City work Wren built, in 1671, the commemorative column known as the Monument, over 200 ft. high, to mark the locality where the Great Fire originated. In the same year he put up the beautiful gateway at Temple Bar, now removed to Theobald's Park, a design which in its gentle dignity and graceful outlines, seems to be a veritable mirror of Wren's character. In this vicinity also are the spacious and delightfully arranged squares of the Temple, built from 1674 to 1684, issuing on to Fleet Street by a gatehouse which is always regarded as one of Wren's happiest efforts. The square opening of the carriageway, flanked by two side arches, is contained in a pedestal of boldly-jointed masonry, forming the base for a tetra-style façade, of which the four Ionic pilasters traverse three stories and support a fine pediment, pierced by a single lunette. It is a beautiful piece of architecture, unnoticed, it is to be feared, by the crowds that pass in Fleet

# The Garden Front, Hampton Court

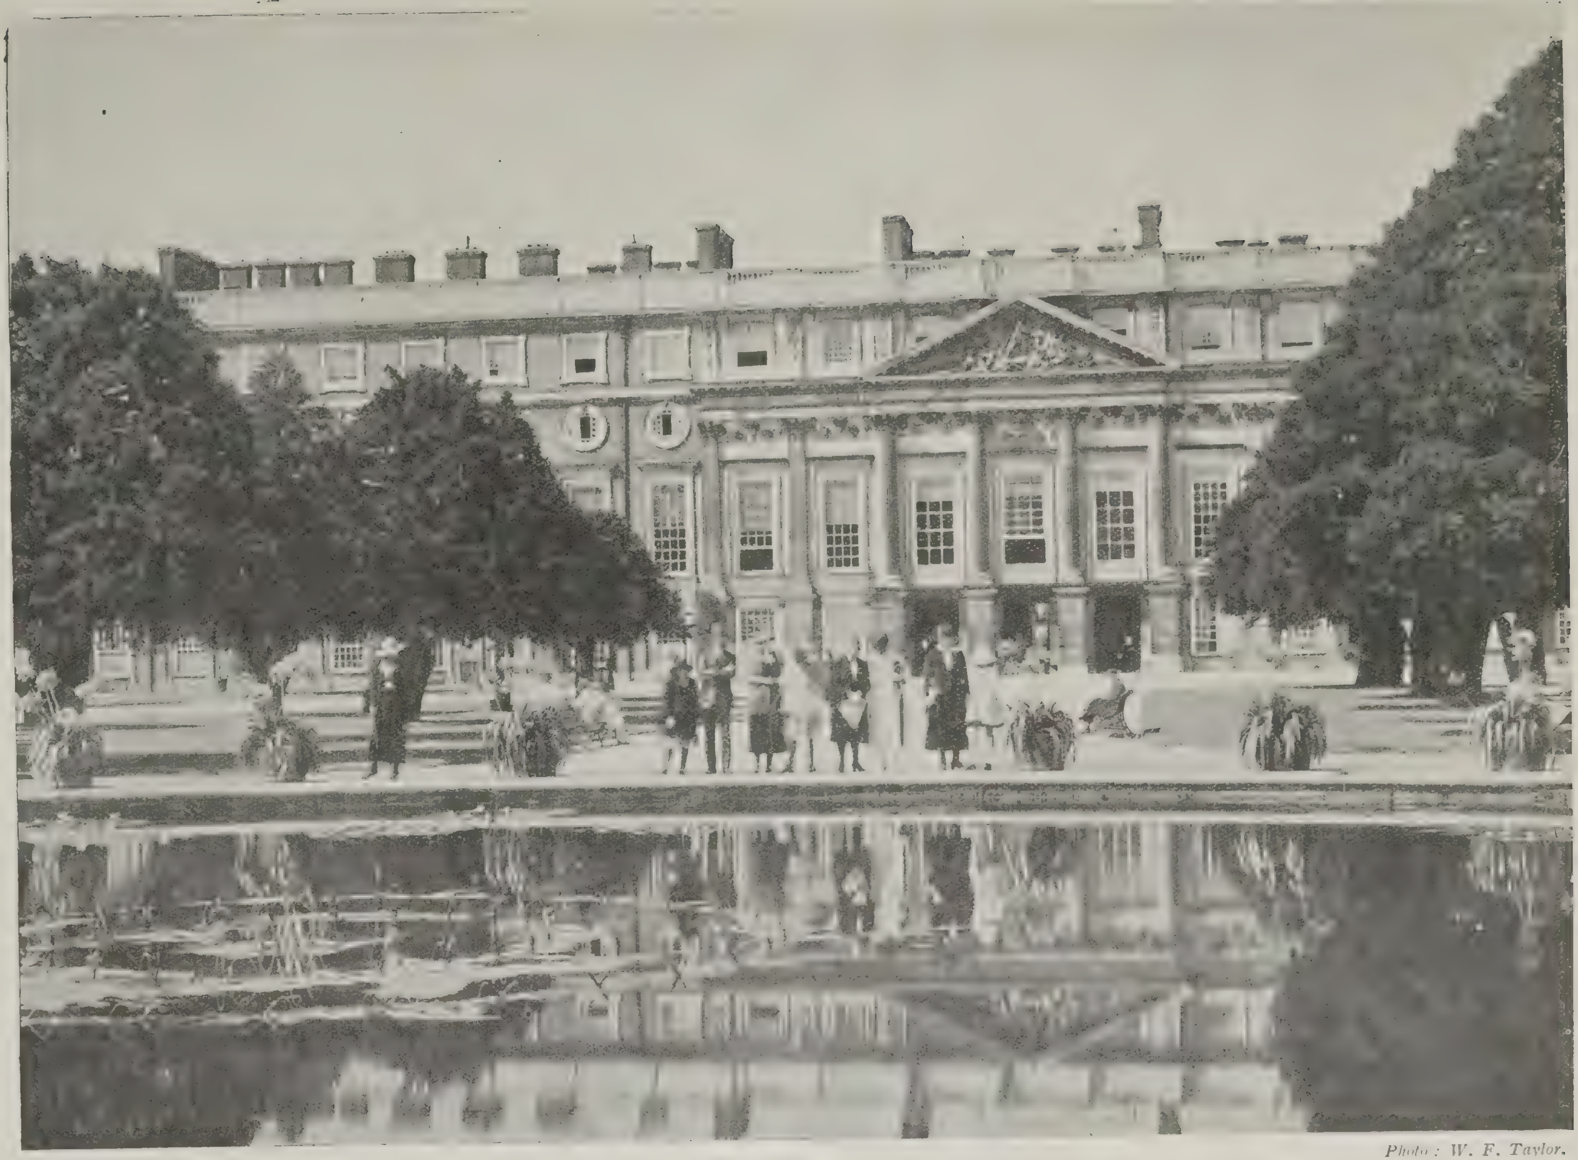

Photo: W. F. Taylor.

Hampton Court Palace is mainly of warm red brick with stone dressings, and was one of Wren's later and most finished works. The work here has that air of quiet dignity which is to be found in nearly all Wren's buildings, and which can be conveyed only by a master. Obviously the creation of one who was an artist and a genius to the finger-tips.

HAMPTON COURT PALACE: A DETAIL OF THE GARDEN FRONT.

Street, but loved and remembered by all admirers of Wren. Another interesting public building of this date—the south front of Christ's Hospital—was ruthlessly destroyed not many years ago.

From 1675 to 1690 Wren was building his fine library at Trinity College, Cambridge. Too much praise cannot be bestowed on this beautiful building, or on the thoroughness and skill with which it was worked out. The device by which the lowering of the library floor (required by the fittings) was screened by partly filling the tympanum of each arch below is well-known, as is its repetition in the Fountain Court at Hampton Court. Wren's own words are worth recalling: "I haue given the appearance of arches as the Order required, fair and lofty; but I haue layd the floor of the Library upon the impostes, which answar to the pillars in the cloister and the levells of the old floores, and haue filled the arches with relieues of stone, of which I haue seen the effect abroad in good building, and I assure you where porches are lowe with flat ceelings is infinitely more gracefull than lowe arches would be, and is much more open and pleasant nor need the mason freare the performance because the Arch discharges the weight, and I shall direct him in a firme manner of executing the designe. By this contrivance the windowes of the Library rise high and giue place for the deskes against the walls." In the same document occur the oft-quoted words regarding the importance of the details: "Wee are scrupulous in small matters and you must pardon us; the architects are as great pedants as Criticks or Heralds." Such stray glimpses as these into the mentality of the artist show us that Wren's success was no more fortuitous than that of lesser men who have to strive hard to gain distinction in their work.

The years 1683 to 1687 saw Wren on important work at Winchester—the royal palace, the college, and Wolvesley Palace; but his three most important public buildings were the two hospitals at Greenwich and Chelsea and the palace at Hampton Court. These works are so well-known that detailed description is unnecessary, and yet it is as well to recall to our minds the great qualities in all three of these important schemes. The general disposition of the open courts at Chelsea, with the wide cloister walk to the south, is a triumph of quiet yet dignified building, completely appropriate to the purpose of this noble refuge for our soldiers. The chapel is one of the most perfectly conceiv interiors from the hands of Wren, and the principal roo in the governor's house is justly praised for its beaut At Greenwich Wren had to incorporate the buildin erected by his predecessors, but he quickly grasped th magnificent opportunity presented by the site, and in th scheme which he devised, and which was subsequentl carried out, he reached the highest degree of breadth an largeness of design. The open square by the waterside wa led like a broad avenue between buildings, made fascinatin by their long colonnaded screens, and marked at the nea angles by lofty dome-covered towers, until the eye reste on Inigo Jones's Queen's House in the distance, and th rising ground of Greenwich Park.

At Hampton Court Wren's magnificent scheme entaile the destruction of the Tudor palace, and we may be gla for historical reasons, that it was not completed. Enough however, was done to exhibit the greatness of the design and to produce one of the noblest buildings of the worl from the contributions of two such entirely different period Hampton Court is largely of red brick, and in this materia Wren made his additions to Kensington Palace, includin probably the delightful Orangery. Among his public work in this material may be counted Morden College, Blackheath—a gem among almshouses—and perhaps Trinit Ground, Mile End Road, and many another building in th same manner.

One would like to have the privilege of compassing backward journey through the years and taking a pee into Wren's office when all his important works were in fu swing. If a magician could work such a miracle we migh find even greater evidence than we now possess of the fa reaching influence of his gentle and yet all-conquering pe sonality. To-day we pay our tribute of gratitude to on who deserved well of his country, and not only of his own but of all ages, for his memory will assuredly win immorta remembrance. In him imagination and a practical commo sense found themselves united. His skill as a builde always breathes the poetry of form, and his most engagin compositions have a genuine fitness for their purpose tha satisfies our desire for "commodity" in building. Englis architecture owes to him a debt of gratitude which onl our homage and gratitude can repay.

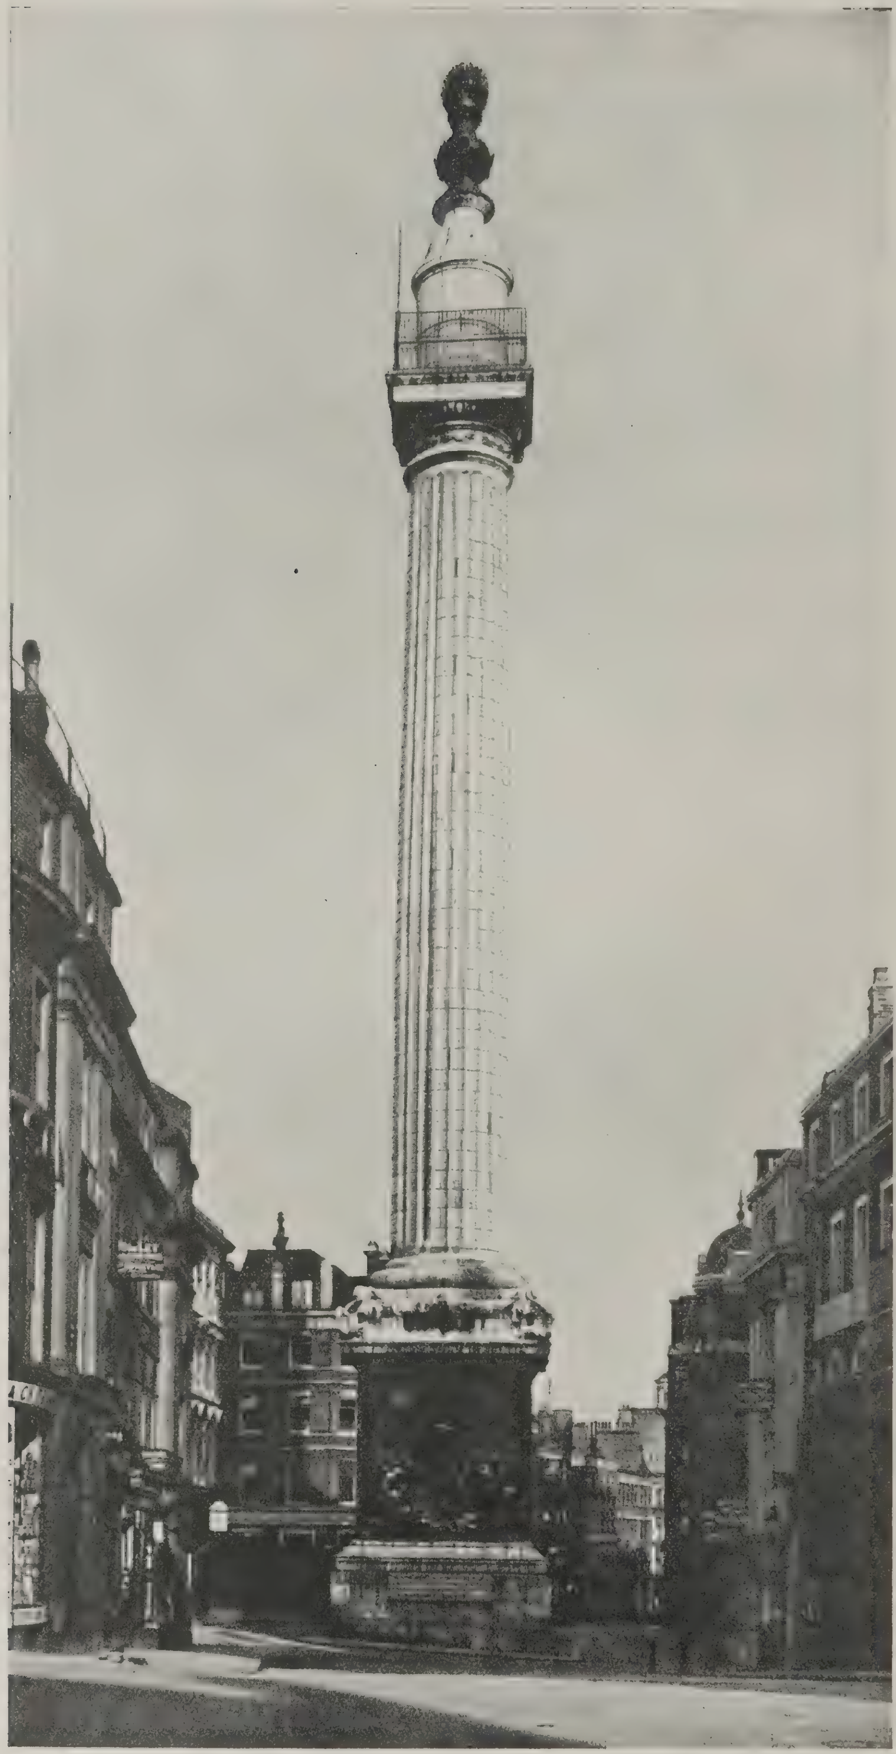
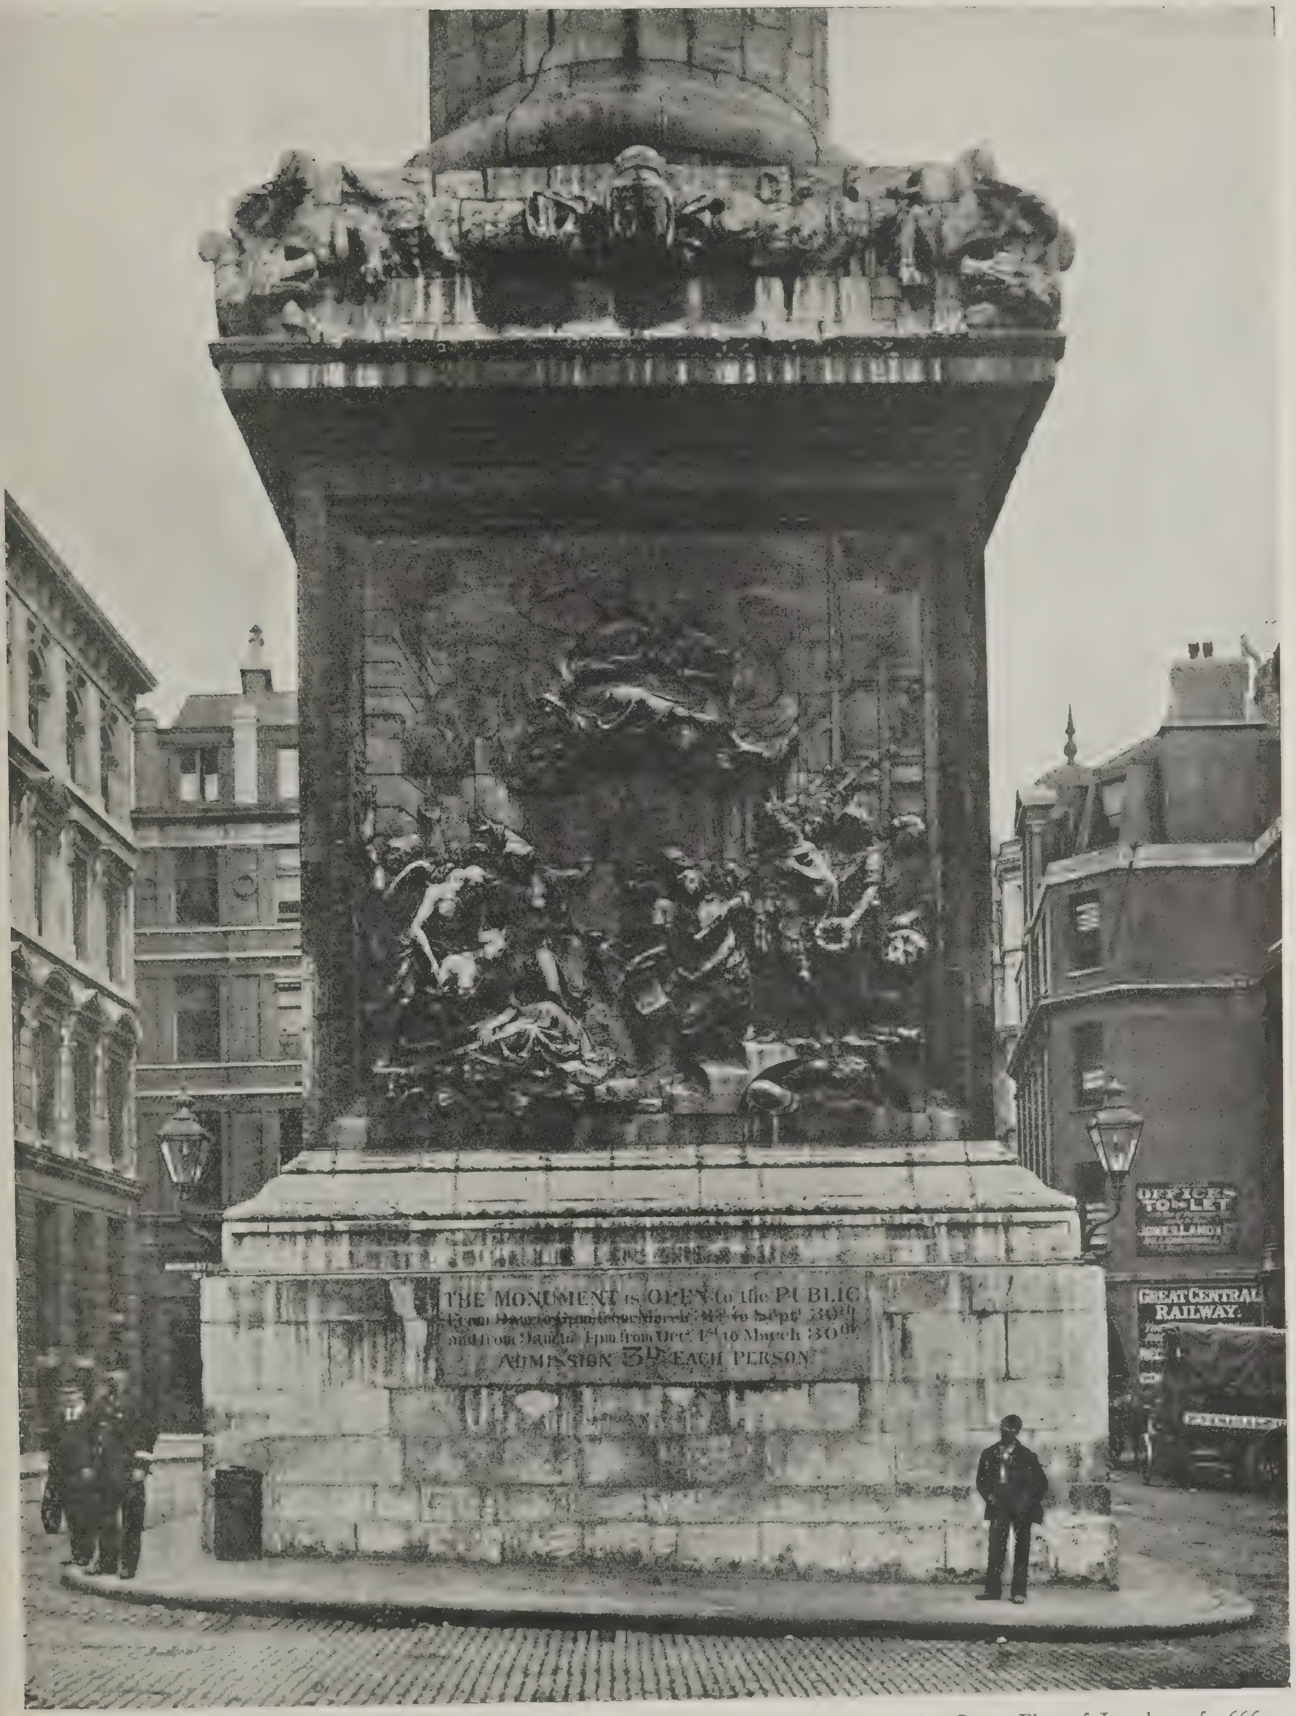
WREN'S COLLEGE OF PHYSICIANS IN WARWICK LANE, LONDON (NOW DEMOLISHED).



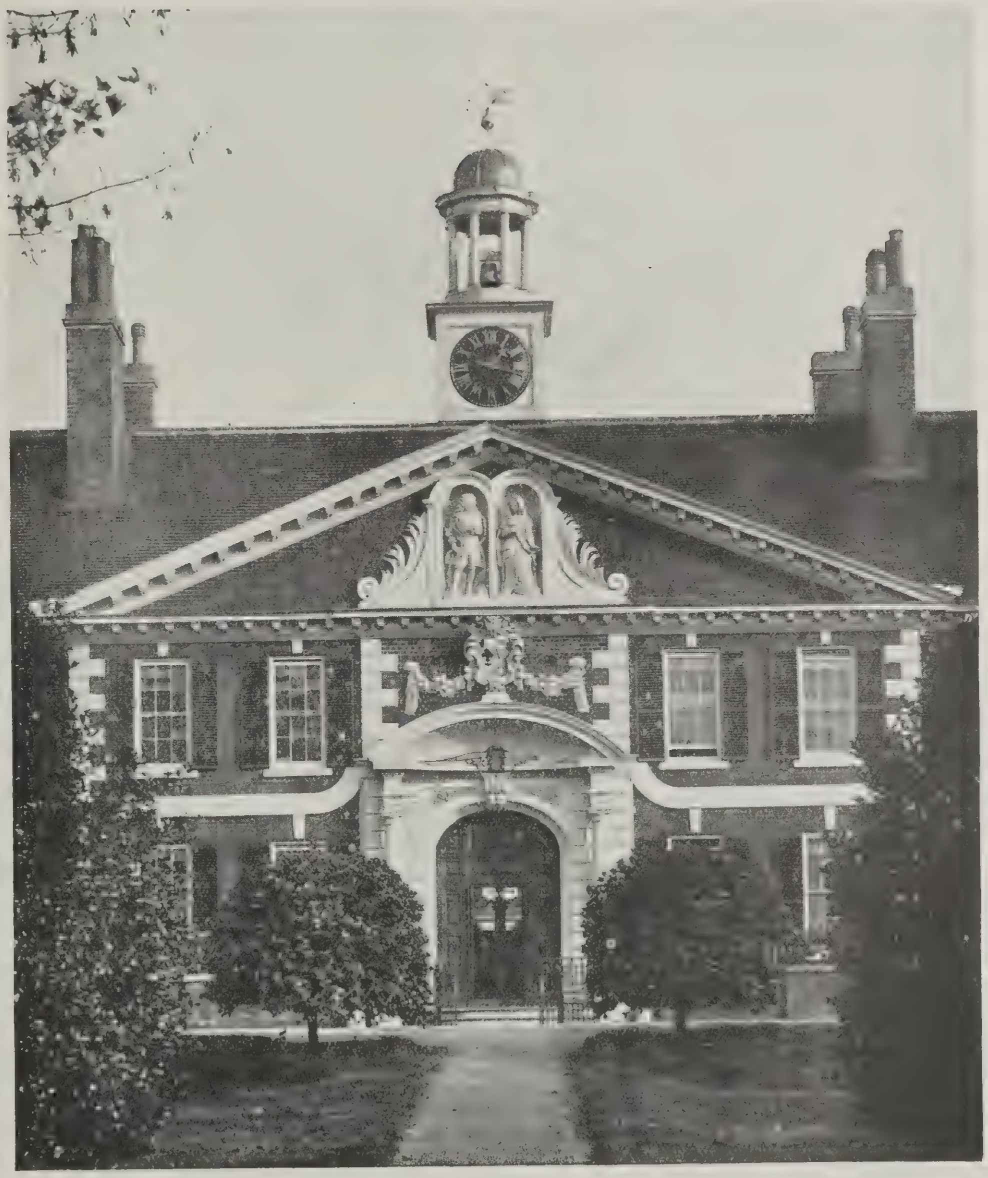
THE MONUMENT.

# The Monument: A Detail of the Base



This great fluted column of Portland stone, 202 feet high, was built to commemorate the Great Fire of London of 1666. The height of the Monument is said to exactly equal its distance from the baker's shop in Pudding Lane, where the fire began. The base bears inscriptions and allegorical reliefs; the large and curious relief by Cibber shows the destruction and restoration of the city.

# Morden College, Blackheath : A Detail of the Principal Entrance



Morden College, Blackheath, built in 1695, is one of Wren's most delightful works of a domestic character. It shows the apt employment of many of Wren's favourite features, notably, the broad pediment, the graceful lantern, and the generously proportioned doorway.

# Wren Once Lived There . . .

"The house to which this tradition clings is a fine example of the City architecture of the time; it embodies the idea of a private residence of a gentleman whilst men still lived in the City. From its design, detail, and general appearance, a careful observer would be strongly inclined to say that Wren built it, and not improbably built it for himself."—From an article in "The Architectural Review," "Wren's Reputed House in Botolph Lane."

WREN lived in many houses in his time. Great Scotland Yard (where once lived Inigo Jones), Hampton Court, Oxford, Greenwich, Clapham, St. James's, have all housed him in accordance with the proximity of his work. But for myself I like to think of him dwelling in the City, and walking down its narrow lanes.

. . . Walking down the lanes of the City, casting an appraising eye here, an angry glance there, and always dreaming of London as he would like it to be. . . . This thoroughfare he would make greater use of, that warren of slums he would sweep away, here he would raise a Renaissance spire, and there he would plan a palace for the King. . . . In the ways and byways behind the Monument, the soft footfall of that little, great man echoes still.

Whenever I walk through the City at night I think I meet Sir Christopher, sunk in thought, and seeing not at all the big business buildings and the huge warehouses of to-day. Regardless, wrapt in thought as in a veil, he thinks of that last talk he had with Gibbons; is perplexed in mind about the restrictions and petty interference of some cleric, or the Duke of York.

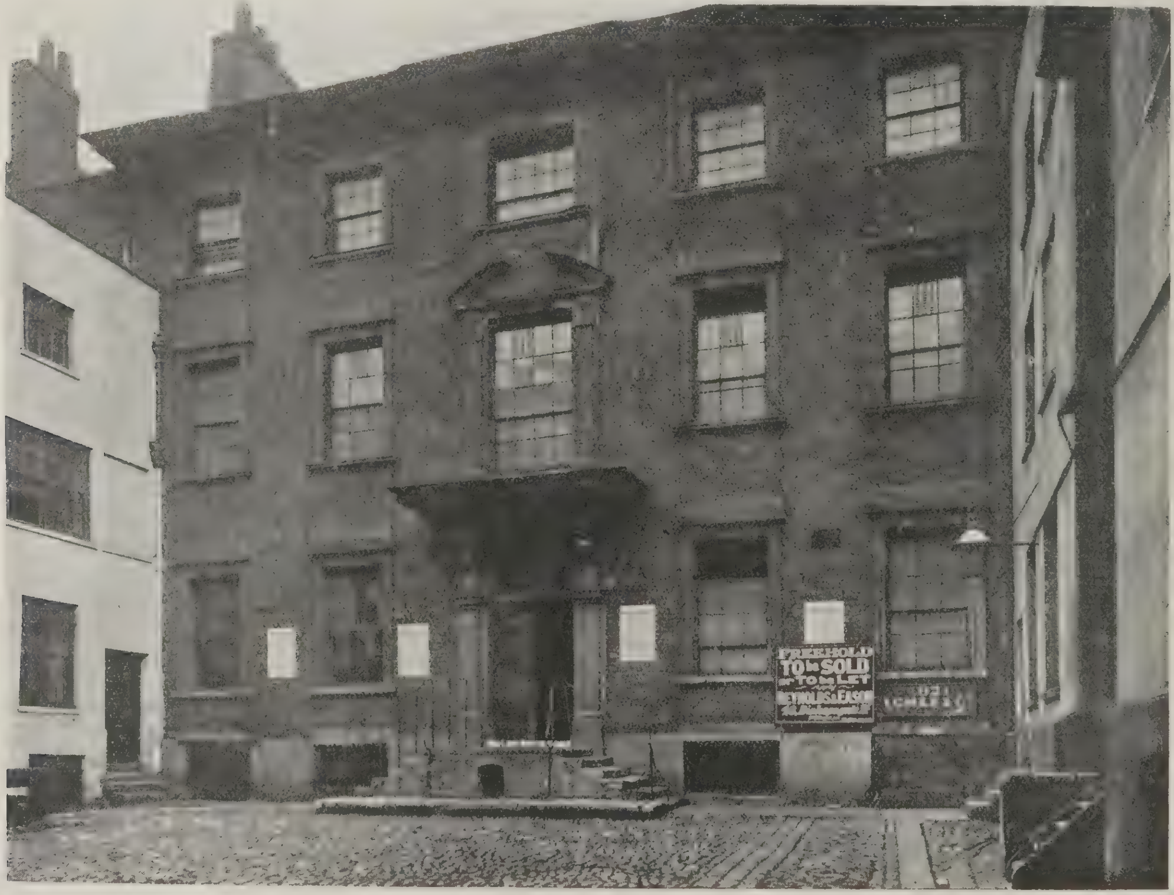
He turns along Eastcheap, and then down the steep Botolph Lane. He ascends the half-dozen steps which lead up from either side to his doorway and passes inside the house without the opening of any door.

—— But by day the big vans rattle over the cobbles, and the strong odour of drugs, corn, damaged oranges, and herrings assails the nose.

Visitors to Wren's house in Botolph Lane will enquire uselessly. It was demolished in 1906, and the fishporters and others who pass up and down the street know not where it stood. Its doorway with the arched fanlight and wide projecting hood; the broken pediment over the central window on the first floor, its "grand staircase" of oak, with the panelled and carved newels, its handsome chimneypieces and rich ceilings—these shall be found only in the measured drawings and photos of a score years ago. Sir Christopher himself must often have lifted that latchet? It is rusting now, no doubt, in the scrap-iron shed of some rags-and-bone dealer near by. And the doors, floors, and window-frames have been sold for firewood these many years.

Whenever I walk through the City at night, I still look to meet Sir Christopher, turning down Eastcheap, and trying to find his house in Botolph Lane. I approach, and try to explain, but he hears me not. He is too absorbed in that argument with Gibbons; he is deaf to voices of to-day. And there falls not upon his ear even the noise of the housebreaker's hammer, and the crashes of the falling masonry of "the nineteen City churches" would disturb him not.

H. JOHNSON.



WREN'S REPUTED HOUSE IN BOTOLPH LANE, LONDON.
(NOW DEMOLISHED.)

# Wren's Plan for London after the Great Fire

### By Professor PATRICK ABERCROMBIE, M.A., A.R.I.B.A.

WREN'S plan for rebuilding London after the Fire is one of the stock examples of town-planning, a subject which suffers from the fewness of its historical parallels: it is a tock example, both of bold design and of lost opportunity of realization. In this way it serves as a timely warning of the danger that awaits schemes prepared to-day and approved of in high places (as Wren's was), but spoilt or even lost in execution through the lack of popular support and the direct undermining of interested selfishness.

But while Wren's plan is thus a commonplace of every town-planning text-book or even lecture, its exact reference to earlier and contemporary town-planning theory and subsequent practice is largely neglected. We know that Wren is frequently said to have got his architectural ideas from France; did he learn his town-planning in Paris? It is true that at about the time he was preparing the London plan Paris was considering turning her fortifications into popular promenades, though the first plan showing Bullet & Blondel's proposals was not published till ten years after the Fire. But without in any way belittling their great contribution to town-planning—the creation of the first circle of boulevards, or ring street—one must point out that no attempt was made to modernize the congested interior of the city of Paris for at least another hundred years. So that Wren could learn nothing there, unless it were that the park-planning of Louis XIV, with its insistence upon the straight avenue and the "Rond point" fired his imagination.

We must turn to Rome for a closer exemplar: there it may be said that Domenico Fontana, working for that progressive Pope, Sixtus V, and confronted with a problem very similar to Wren's—the re-planning of a derelict site—invented the modern straight city street, which pursues its logical way, emancipated from Roman and mediæval thraldom to the building plot. Fontana also established that true Renaissance feature, the vista, utilizing the mighty existing churches which he found to terminate his straight streets. But in spite of one's admiration for Fontana's pioneer work, it must be confessed that, looked at as a whole, it is a sketchy performance, full of unresolved details, such as the connection between the Via Babuino and the Via Sistina—so impossibly steep, that a later hand has there placed those glorious Spanish steps.

Wren had no more than a hint, then, even from Rome. He was faced with a problem much tighter and more contained than Fontana's desert city, straggling endlessly in all directions. Here was a defined area, burnt out by fire, hemmed in with the surrounding undestroyed city, with a frontage to the river from the Temple Garden on the west to the Tower on the east, the face of the City proper to the Thames. His plan had to fit into the existing approach streets at their point of contact with the periphery of the fire area: the Strand, or Fleet Street, and Holborn on the west, and that series of streets on the north and east that lead up to the old gates [Aldersgate, Cripplegate, Moorgate, Bishopsgate and Aldgate] and finally to Tower Hill, the open space behind the Tower.

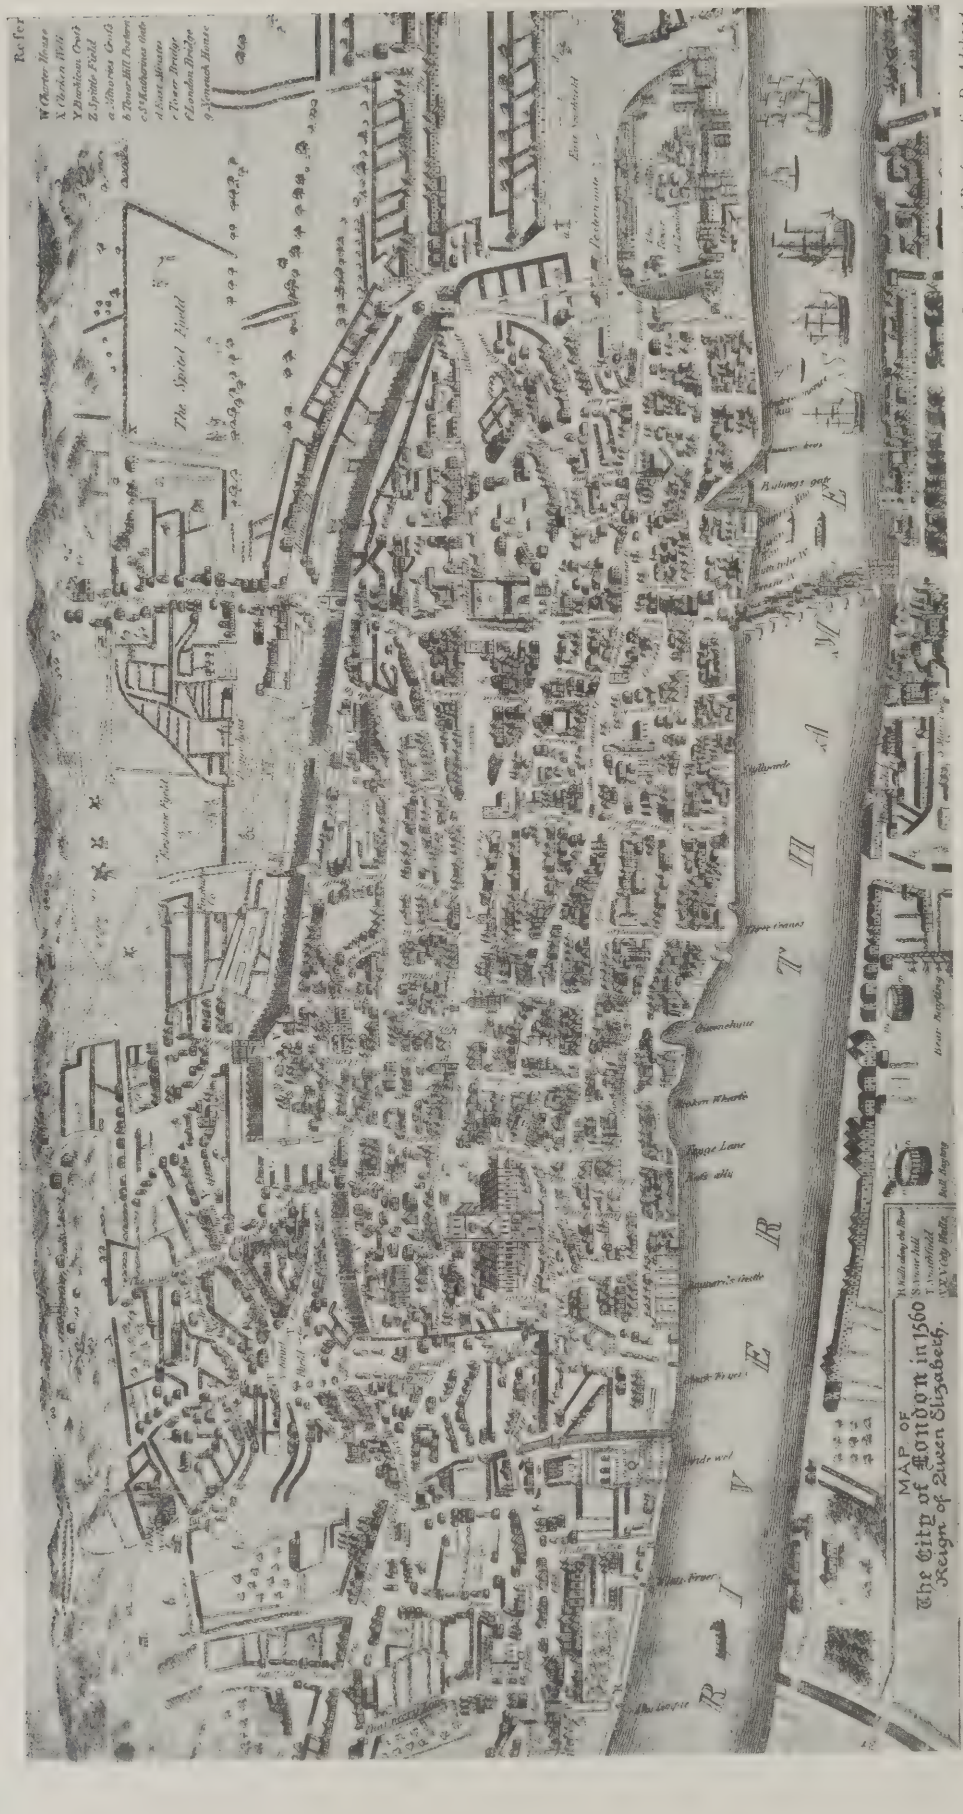
There were to be two major focal points, religious and commercial—St. Paul's and the Royal Exchange, each building occupying its original site. In general, of course, he aimed at and in his masterly way achieved the threefold requirements of all complete town-planning—convenience, health and amenity, the last in the case of the heart of a capital city becoming, naturally, magnificence. A casual scrutiny of the plan will show how easily these requirements are met and without any straining after rigid symmetry.

The road system is simple and direct: the main roads 90 feet wide, run chiefly east to west. Ludgate forks at St. Paul's, the southern leg forming the very necessary riverside-parallel street (with a smaller one nearer the Thames), and the northern leading past the Exchange (where it connects with Holborn) to Whitechapel: thus giving London its vital through route east and west. There is an admirable radiation to the approach of London Bridge and a lesser one to the Customs House. The secondary streets were to be 60 feet wide and the lanes 30 feet, but there were to be no culs-de-sac or courts.

As a town-planner of an architectural complexion Wren, while disposing his main traffic routes unhampered, did not neglect his building plots. His design herein affords an exact contrast with the plan prepared by L'Enfant, the engineer town-planner for Washington, a hundred years later; while no whit behind Wren in his main road system and in architectural magnificence of the general conception, L'Enfant seems to have completely neglected the building plot, placing his worst and even impossible shapes on his main avenues. Wren, however, moves with equal ease in his minor street plotting on the gridiron or radiating system: his western portion beyond the Fleet Ditch is radiating; his centre, squared; and his eastern, taking its cue from the focal point of the Exchange, is again radial. It all looks so simple that the consummate skill is hardly realized until one attempts to plan on similar lines and within similar conditions of existing streets. But it is impossible to find a single awkward block or a single road which has sharp or dangerous intersections. For this absolute control of all the practical elements of street and lot plotting Wren was indebted to no earlier planner of cities.

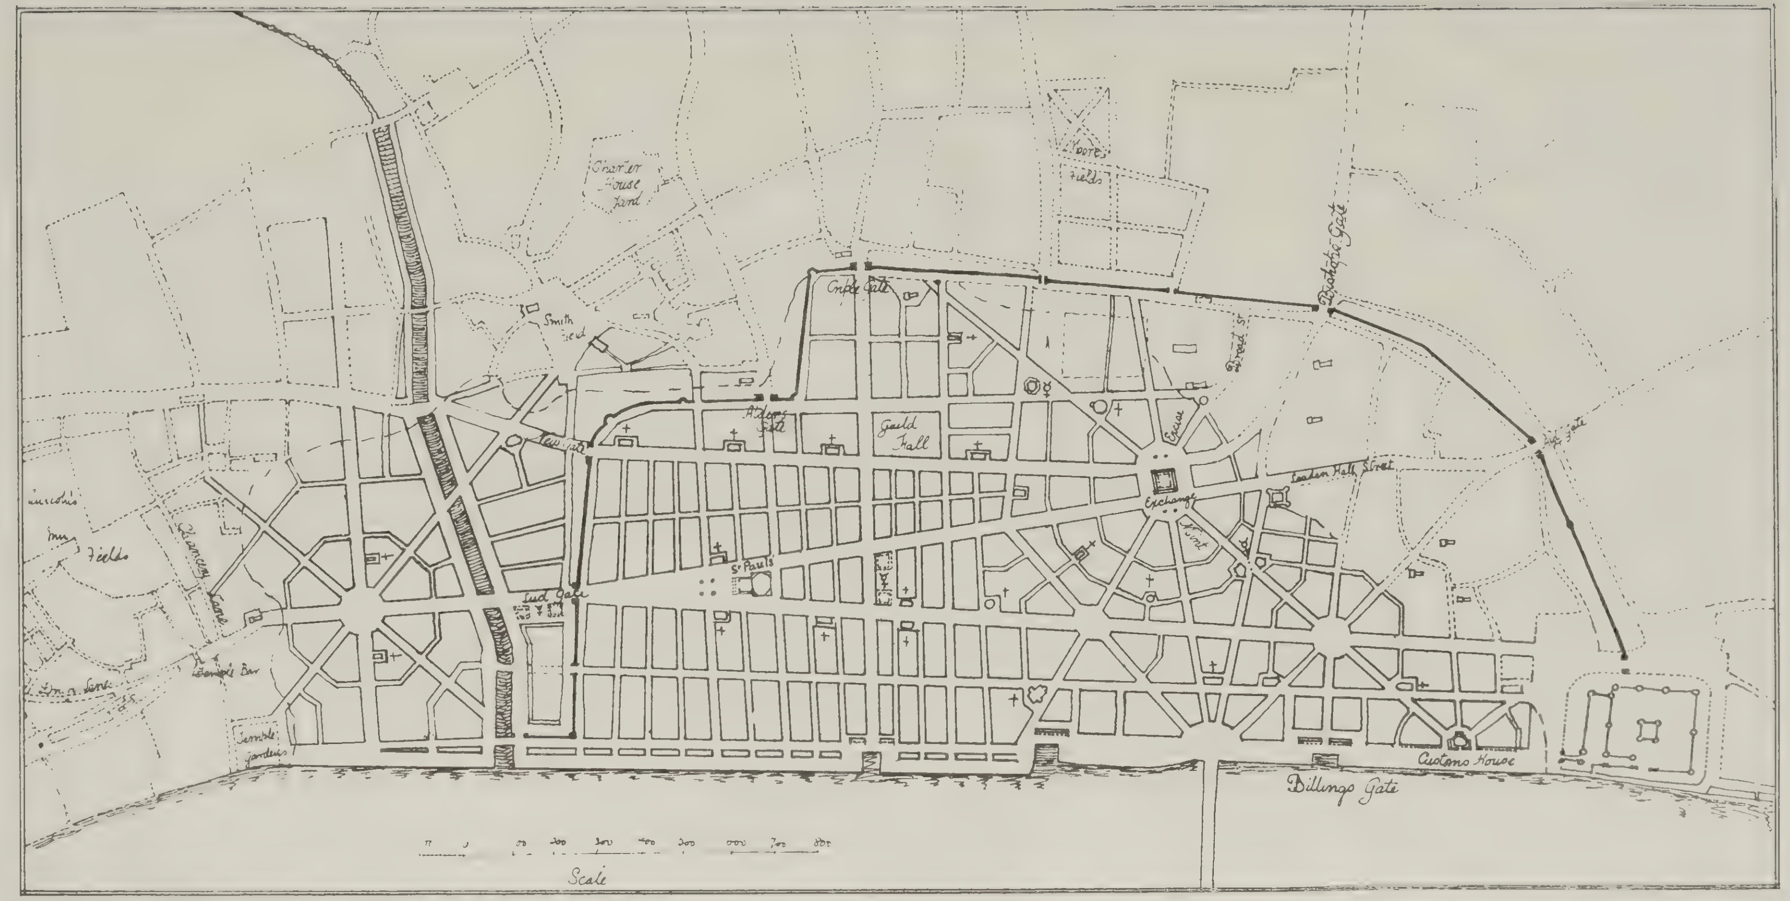
From the point of view of health, Wren no doubt considered that his wide streets and the frequent open spaces at their intersections (and possibly the markets) provided a sufficiency of light and air; and when one compares them with the old narrow, tortuous alleys and their overhanging houses, the contrast is immeasurable. He evidently did not consider small town parks or gardens suited to this heart of the capital, and even intended that churchyards, gardens and "unnecessary vacuities" should be placed outside the town—treated, indeed, in the same way as "all trades that use great fires or yield noisome smells." Probably, without any due provision for upkeep, Wren had seen that these small open spaces can become little better than ashpits, and he thought by placing them with the churchyards in a ring without the town they would have a chance of continuing clean and flourishing, and that they would also be some sort of check on the ever-spreading tendency of the city. Modern experience has taught us that grass and trees will grow in the very centre of a London that is far more confined than Wren's city would have been.

The magnificence of the plan need hardly be laboured. The two principal buildings are provided with splendid and dissimilar settings: St. Paul's is, as it should be, all leading up to the approach of the great west portal; the Exchange is the centre of a radiation of ten streets, four of them 90 ft. and the others 60 ft. wide. The triangular forecourt to St. Paul's would have been extremely effective: it is, in its publicity, as different as possible from the privacy of the approach to St. Peter's; St. Paul's is clearly the cathedral of London, set at the parting of two of her greatest streets—not the metropolitan church, cut off from the city, as in Rome, or in a country retreat, as at Canterbury. At the same time, Bernini's colonnades may have suggested the design in the Soane Museum, which shows Wren's piazza surrounded similarly.



By courtesy of Professor S. D. Adshead.

A MAP OF LONDON IN 1560.



Sir Christopher Wren's Plan for rebuilding London.

From a Drawing in the All Souls' Collection.

The remarkable thing about the other piazzas is that they take the form of the modern place occasioned by street intersections, and have no echo of the secluded monumental examples so frequent about this time on the Continent, such as the Places Vendome and Des Victoires at Paris. But though lacking the sense of enclosure of the Continental type, Wren was careful to give to all of his a satisfactory shape, and particular ingenuity is shown in the one designed for the head of London Bridge, where, owing to his retention of the site of the Royal Exchange, the connection to London Bridge could not be in alignment with it.

The river front was to have a magnificent quay, treated in two parts: the eastern section near the bridge and Customs House was the wider for commercial use; the western section was to take the form of a terrace, upon which faced the halls of the City companies.

Wren also gave careful study to the streets themselves: he closed the vistas of many of the smaller roads with churches, and he intended to add interest to the wide thoroughfares by designing great triumphal arches on the sites of all the old gates, of which that at Ludgate was to be the chiefest, in honour of the founder of the new city, Charles II. The view from this arch would, of course, have been the great scenic effect of the plan. One must visualize St. Paul's, flanked with smaller churches, situated just in front of the portico; then, in the middle distance, each of the forking streets has its pair of churches (enriched, we will suppose, with typical Wren spires), and finally, if the traffic would permit it, in the distance the terminal arches to Aldgate and the Tower.* The picture to-day is very different, possessing, it is true, the fortuitous beauty of picturesqueness. And it is very necessary to remember that the spire of St. Martin's, which stands as so conspicuous a foil to the dome and tower of the cathedral, was designed by Wren himself. Finding he was debarred from one extreme of regular beauty, he wisely went to the other extreme of sharp contrast.

Of the fate that befell the plan as a whole it is not necessary to say more than is contained in the well-known words of his son.

"The practicability of the whole scheme, without loss to any man or infringement of any property, was at that time demonstrated and all material objections fully weighed and answered; the only, and as it happened insurmountable, difficulty remaining was the obstinate averseness of great part of the citizens to alter their old properties and to recede from building their houses on the old ground and foundations; as also the distrust in many and unwillingness to give up their properties, though for a time only, into the hands of public trustees or commissioners till they might be dispensed to them again with more advantage to themselves than was otherwise possible to be effected, for such a method was proposed that by an equal distribution of ground into buildings leaving out churchyards, gardens, etc. (which were to be removed out of town), there would have been sufficient room, both for the augmentation of the streets, disposition of the churches, halls and all public buildings and to have given every proprietor full satisfaction, and though few proprietors should happen to have been seated again directly upon the very same ground they had possessed before the fire, yet no man would have been thrust any considerable distance from it, but placed at least as conveniently and sometimes more so to their trades as before. By these means the opportunity in a great degree was lost of making the new city the most magnificent as well as commodious to health and trade of any upon earth, and the Surveyor being thus confined and cramped in his designs it required no small labour and skill to model the city in the manner it has since appeared."

It is fortunate that we have an alternative plan, prepared at the same time and under exactly similar conditions, for there is no better touchstone of the quality of a piece of work than someone else's effort. It would seem that, unknown to him, Wren's great friend, John Evelyn, set to work on a plan simultaneously; the general confusion resulting from the fire may have prevented their comparing notes. Wren saw the King first, who approved his plan: Evelyn was pleased to find coincidences in their schemes, and it is suggested that the King asked Wren to embody some of Evelyn's details.

But the truth is that Evelyn's plan is as feeble as Wren's is fine: it is a mere piece of pattern-making, and shows the difference between the work of a cultured amateur and of a skilled technician.

---

* These terminal arches and the two pairs of churches are shown in John Gwynn's engraving of Wren's plan, but do not appear in the original drawing in the All Souls' Collection. They might, however, doubtless have been added in execution, though, of course, Leadenhall Street was not destroyed.

# The Toll of Wren's City Churches

*Of the* 107 *parish churches existing in the City at the time of the Fire,* 86 *were burned down. Of these,* 35 *were never rebuilt.* 51 *were actually re-erected, and of these* 18 *of Wren's buildings have been destroyed. The Bishop of London's Committee now proposes to demolish* 19 *further churches,* 13 *of these being either by Wren or containing something of his work.*

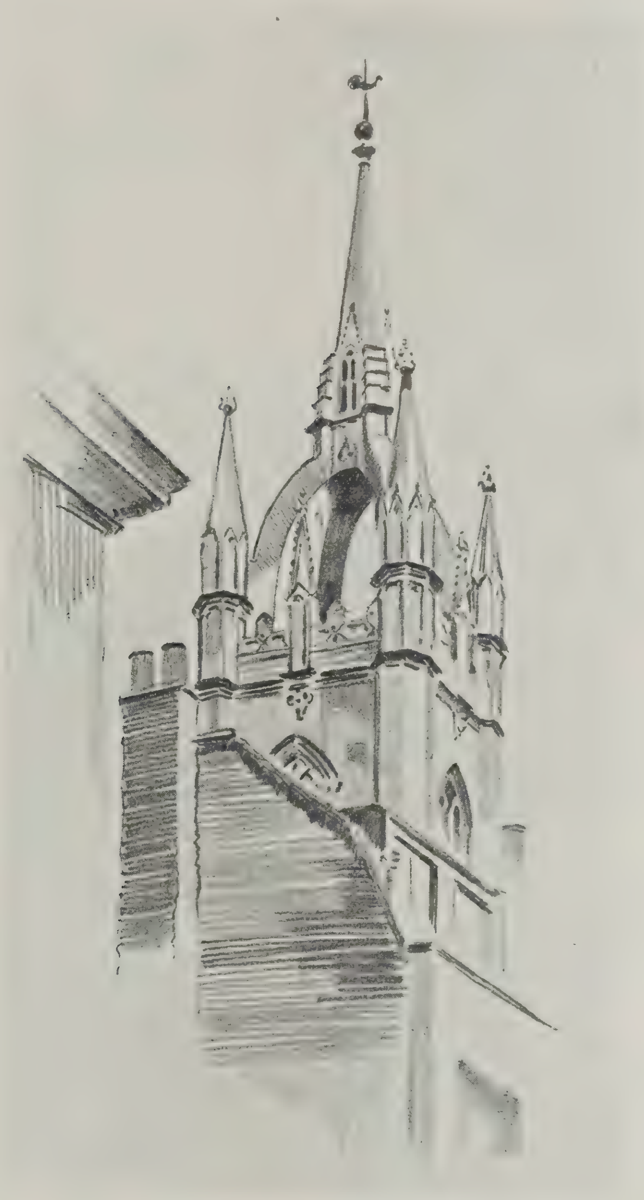
# Wren and his City Churches

## By E. BERESFORD CHANCELLOR, F.S.A.

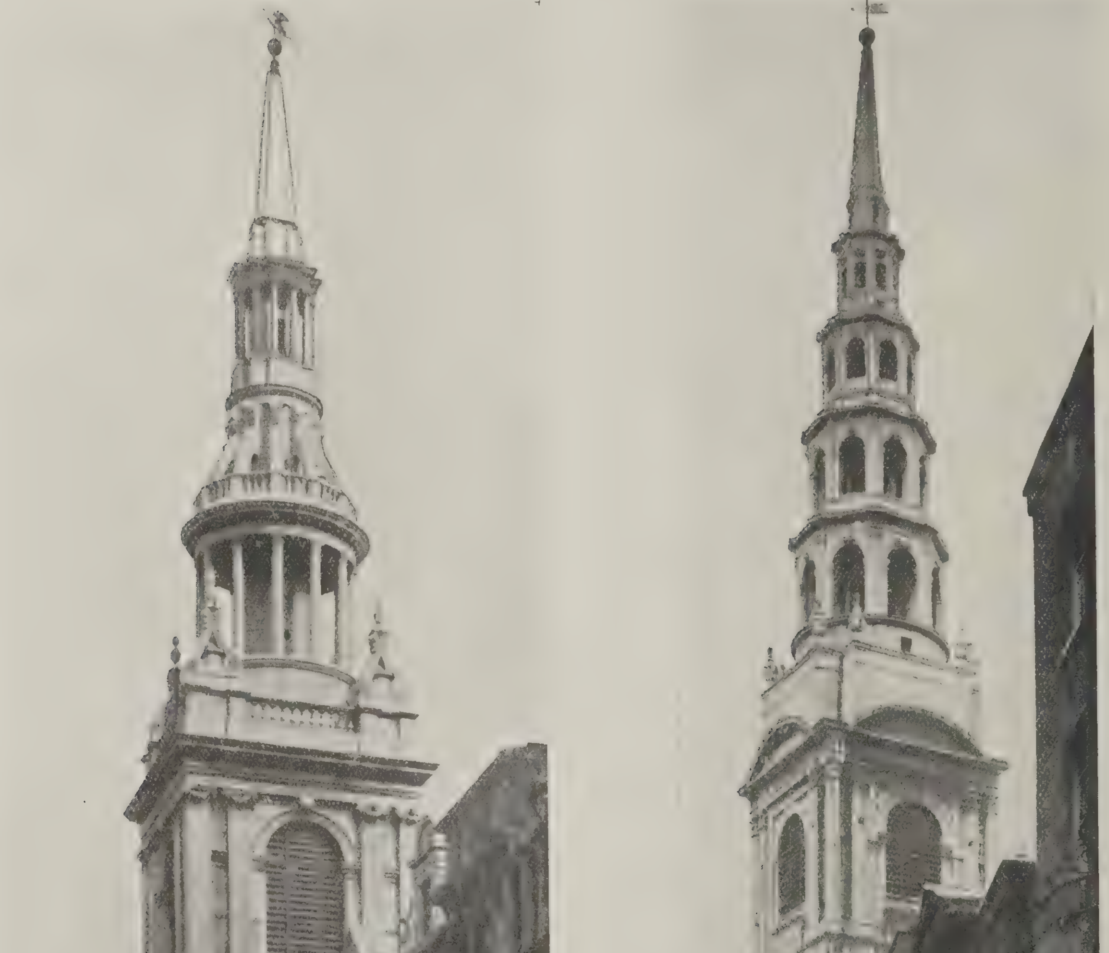
SIR CHRISTOPHER WREN is our national architect. His fame dominates that of any of the other designers who have worked in Great Britain. To most people even Inigo Jones is known relatively little in comparison; Chambers and Gibbs even less. The one building in London to which the man-in-the-street can, without hesitation, assign an architect's name is St. Paul's. Who, outside the limited circle of professional architects and antiquaries, can say off-hand who designed St. Martin's-n-the-Fields, or St. George's, Hanover Square, or the Law ourts, or the Imperial Institute? But every one knows vho built St. Paul's, from the child who has been brought p on the well-worn riddle to the woman of fashion who inds herself out of her bearings east of Charing Cross.



THE TOWER AND SPIRE OF ST. DUNSTAN'S-IN-THE-EAST.
*(From a sketch by W. H. H.)*

In the annals of our native architecture Wren occupies he same outstanding place as does Wellington as a soldier, elson as a sailor, and Shakespeare as a poet. London is ull of the monuments of his genius, and his masterpiece oars above the city's buildings in the same way as its reator's fame surpasses that of all native competitors. One has only to imagine what London would be like denuded of Wren's foremost achievement and that forest of spires, tapering to the skies like so many lovely exhalations, to realize for what he was in "the beauty's heightening" of our city.

Had Wren's comprehensive scheme for the rebuilding of London after the Great Fire materialized, it would have been found that he had anticipated many of the drastic and effective improvements which have, since his day, taken place. He would have given us buildings as noble as Somerset House, streets as wide as Portland Place, spaces as vast as Trafalgar Square. But it was not to be, and the active brain of one of the foremost architects in the world was restricted to the production of its one outstanding masterpiece and the reconstruction of innumerable small churches on impossibly limited sites. Nothing, however, proves the variety and originality of his mind better than the use he made of these opportunities. He, indeed, took occasion by the hand, and left to a wondering posterity so many evidences of his tireless



ST. MARY-LE-BOW ST. BRIDE'S.

TWO OF WREN'S FINEST SPIRES.

ST. LAWRENCE JEWRY

activity that London is literally studded with the landmarks of his consummate achievement.

As I must limit myself to a few words about the city churches, there is no space here to speak of the noble cathedral which dominates them. I may, however, remind the reader that its first stone was laid in the June of 1675, that the choir was opened for service in 1697, and that the dome was completed in 1710. Three things have to be remembered in this connection. The first is, that when he produced the earliest and, as many thought, the finest design for the new cathedral, Wren had only been once abroad, and then only as far as Paris; secondly, that he designed the spires and reconstructed or rebuilt the bodies of his city churches during the period in which he was engaged on his greatest undertaking; thirdly, that at least seventeen of these churches have been destroyed for one reason or another, or, I dare say, for no really good reason at all, during a period ranging from 1831 to 1905.

Of these I may mention St. Christopher-le-Stocks, pulled down for the extension of the Bank; St. Benet-Fink, destroyed when the Royal Exchange was created; St. Olave Jewry (1887); St. Dionis Backchurch (1876); St. George, Botolph Lane (1905); St. Michael, Wood Street; St. Mildred, Poultry (1872); St. Michael, Queenhithe (1876); St. Bartholomew-by-the-Exchange (1841); St. Antholin, Watling Street (1875); All Hallows the Great, Upper Thames Street (1896); St. Mary Magdalene, Old Fish Street (1886); St. Benet, Gracechurch Street (1867), and St. Michael, Crooked Lane (1881).

When Wren began the rebuilding of the churches destroyed by the Fire, he was faced with one of the greatest difficulties with which an architect has to contend—restriction of space. The destruction of the city in many cases left walls standing, and the reconstruction was limited to the erection of fresh churches on the original sites and often bounded by the original foundations. Most of these sites were exiguous to an extraordinary degree, and Wren, who showed what he could do when this was not the case, as with St. Paul's, and, in a lesser degree, with St. Clement Danes, was shackled in this respect as perhaps no architect of his calibre has been before or since. In judging many of the interiors of Wren's churches this fact must not be overlooked. Rather is his remarkable treatment of the spaces at his disposal, and the ingenuity with which he surmounted difficulties, to be wondered at. This is specially the case with St. Stephen's, Walbrook. Here, in consequence of a variety of reasons, into which I need not enter, the exterior is plain almost to baldness. As has been well said, " never was so sweet a kernel in so rough a shell;" for the interior is masterly. There may be, to the purist, " a lack of convincing strength," as it has been called. This will, no doubt, strike the trained eye, but to the ordinary man the beauty, the amazing sense of space conveyed by the architectural achievement will be as patent as it was to Canova, who once remarked that he would gladly journey from Italy to England again to gaze on its effective charm.

Another example of the ingenious way in which Wren treated the limited spaces to which he was confined is to be found in St. Lawrence Jewry, especially in the vestry, with its lovely cornices and its wonderful wreathed doorway, both due to his designs.

Again, many of the churches were rather what he could make them, with limited funds, than what his genius would under more favourable conditions have evolved. Thus, when the money available would not run to stone, he had perforce to construct many a spire in lead. Even in these instances he created beauty, if not the beauty he dreamed of or which he achieved in other instances. Sometimes, too, brick had to be used instead of stone for the bodies of the churches, as in the case of St. James's, Piccadilly, and St. Andrew's, Holborn, buildings not dissimilar from each other in external appearance and having an internal similarity, which they share with St. Andrew's-by-the-Wardrobe in being galleried.

But whatever the form, whatever the material used, whatever the exigencies of space, Wren somehow contrived to give to the least impressive of his city churches some special characteristic by which his touch can be identified. Whether it was in the outlines of the building itself, or in its decorations; in a gallery here or a staircase there, a doorway or an altar-piece, we come upon his distinctive note, his unmistakable hall-mark. Since his time nearly all his churches have suffered a change from what they were when they emerged fresh from his hand. The old high pews have been lowered, the original high pulpits have been truncated, the position of seats has been changed, and there are practically none in which, were Mr. Secretary Pepys to enter, he would not be bewildered by strange alterations and unaccustomed alignments.

Again, stained glass, often of horrific character and almost terrifying colour schemes, has been in some cases substituted for the original plain glazed windows, while many a Wren church presents a certain coldness and crudity because of the removal of panelling which once gave a warmth and richness to the interior. What the eighteenth century and the early nineteenth did in this respect is unspeakable.

One thing, however, has been left untouched by the restorer and innovator; I mean the beauty of Wren's incomparable spires and steeples. These remain as one of his most precious legacies to posterity. And of them those of Bow Church and St. Bride's are, by common consent, the most perfect. It was once affirmed by William Morris that Wren designed his spires and steeples as a setting for the supreme glory of St. Paul's: a sort of constellation around the moon of his genius. But this could hardly have been, because, as I have pointed out, his new

churches arose on sites already chosen for their predecessors, and no particular arrangement on his part was possible.

No, although seen from a height, say, from his own monument, these tapering witnesses to so many centres of divine worship appear like stars clustering round an outstanding luminary, it is in their individual beauty, their amazing variety, their perfection of form and proportion, that their chief charm and attraction lies. Whether it be exemplified in those four Gothic examples with which Wren—who seems to have shared to some extent his century's disdain for what he called "saracenic"—crowned the churches of St. Mary Aldermary; St. Michael's, Cornhill; St. Alban's, Wood Street, and St. Dunstan's-in-the-East; or whether it be in that "madrigal in stone," as Henley called the steeple of St. Bride's, or the greatest marvel of all, that wonderful spire which rises from Bow Church, nothing can stale their infinite variety, no familiarity can wholly dull their perennial appeal.

Wren's steeples and spires may be regarded as the swan song of his amazing genius. For nearly all of them arose many years after the churches they glorified had been completed. It was ten years before that of Bow Church was finished; fifteen before St. Bride's received its consummation in those monotonous tiers from which all sense of monotony seems to be banished. In other cases much longer intervals elapsed. But before the old man, laden with glory, literally fell asleep at Hampton, they had all arisen further to attest the greatness of which St. Paul's remains the outstanding proof.

# The Renovation of St. Paul's

## By MERVYN E. MACARTNEY, F.S.A., F.R.I.B.A.

THE fears of those experts who were of opinion, a few years ago, that a very serious task awaited the repairers of St. Paul's Cathedral have been more than justified; and in particular the south transept has been discovered to be in so shattered a condition that the cement used to strengthen and solidify the walls has found its way out, in several cases into the street and gardens beyond. The present article, however, deals with the completion of the repairs to the south-west pier of the dome, which marks a primary stage in the work of restoration at St. Paul's.

It is now possible for anyone to observe the extent of what has been practically the rebuilding of this vital support of the dome. The whiteness of the substituted stones shows distinctly how the 3,000 cubic feet of new masonry has been inserted. It has only been possible to carry out this work by using the greatest care to avoid disturbance of the enormous weight of 8,000 tons which it is calculated that each pier carries. Any sudden withdrawal of a large extent of support might have involved most serious dislocation of pressure and created an alarming condition of affairs.

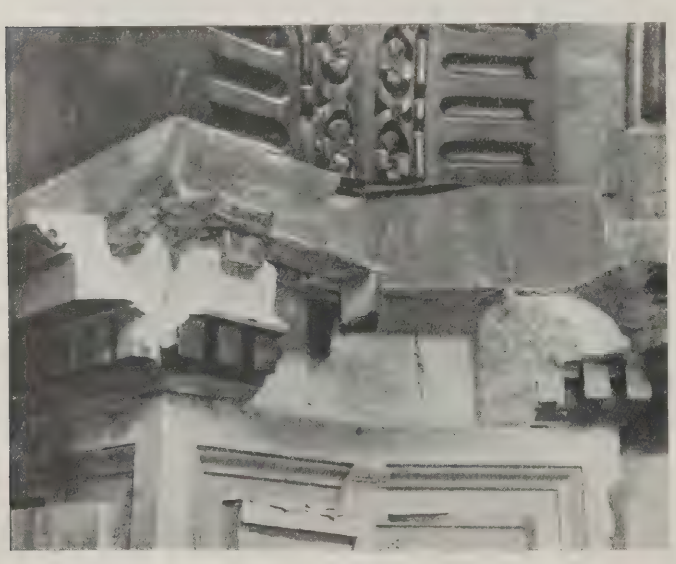
It says a great deal for the care and efficient workmanship of the artificers, contractors, and expert advisers that no perceptible settlement has occurred during the progress of the work. It would be untrue to say that no feelings of alarm have existed while these operations have been proceeding. But, fortunately, so much diligence has been exercised that no untoward accident has marred the steady march of restoration during the years that have elapsed since the work was begun.

### *Work on the S.W. Pier.*

Many interesting facts have come to light, such as that the main stone on which the two arches pitch proved to be a huge block of Burford stone and not Portland which Wren employed in this pier. This stone was cracked right through. We know that great difficulties beset the builders in obtaining large stones, and evidently this block was utilized because there was no other of that scantling available from Portland. Its dimensions were 5 ft. by 6 ft. by 2 ft. 3 in. To replace it being impossible, the shattered portions, weighing 4½ tons, were removed, and as large a piece of Portland inserted as was practicable, which, grouted in cement, has made a sound base at this point.

A CAPITAL IN PROCESS OF RESTORATION.

Another discovery was the fact that a great many of the carved capitals were not the originals, but poor copies insecurely fixed to the stone behind them by cramps, dowels, and lead. In many cases so badly had they been fixed that they fell off on the slightest attempt to examine them. Although no positive evidence exists to show when they were executed, we may assume that they were of later date than Wren's building. No work of such a "shoddy" description would have been passed by Wren or Hawksmoor. When the full weight of the dome came on to the piers it caused serious shatterings of the stone walling, and it clearly went on during the first half of the eighteenth century, as the rubble filling of the piers dried and became compressed. The core or rubble filling is not of uniform quality. A great deal of the mortar was made with a lime obtained by burning chalk lime or shells. Had Wren used even a poorly hydraulic



THE SPRINGING OF THE GREAT ARCHES UNDER RESTORATION.

STONEWORK OF CAPITALS CUT AWAY FOR RENEWAL ime he would have had a much more satisfactory agglome-ate. Considering the extraordinary aptitude of his genius or experiments, more particularly in chemistry, one is lost n wonder that he should have used such a poor cement, specially as he was always lauding the "fine Roman nanner" and meant himself to "build for eternity." That e was imposed on by some of the contractors is likely; we now that there were eight or nine, not all of them of the ame excellence as the Strongs. For instance, in the construction of the S.E. pier the work is not nearly so good as hat of the S.W. pier, the mortar is worse and the masonry f a very inferior character. To improve the power of resistance of the filling in the S.W. pier the method was mployed of solidifying by liquid grout. By this means it s believed that in addition to the 2 ft. of reliable stonework n each side of the pier, we have consolidated at least an xtra 6 in. of the core and possibly 1 ft. Taking a mean of in. this means that the reconstituted work on the pier epresents about half of the sectional area of the pier (i.e., ft. on each face=4 ft., and 9 in. of grouted core on each ace=1 ft. 6 in.—total, 5 ft. 6 in. out of 9 ft. 6 in.).

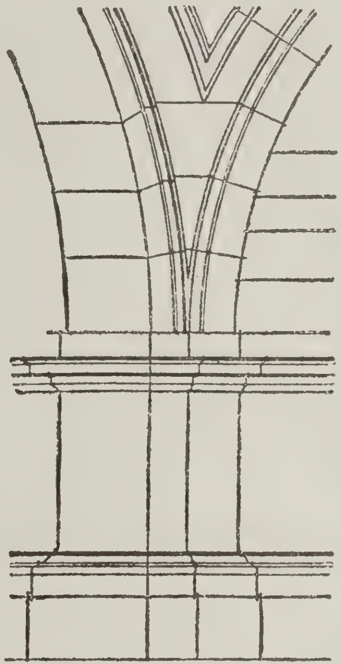
9'·0"
CRYPT · FLR ·
4'·6"
0 1 2 3 4 5 10 15 FEET



SPRINGING OF GREAT·ARCHES
SHOWING· HORIZONTAL· COURSES.

Another discovery was the method of construction of the uilding. The piers were built up with set-offs—that is to ay, the masonry was reduced in area as the work gained eight. The foundations are set on a bed of very hard clay nd consist of two layers of stone each 2 ft. thick and spreading out 4 ft. all round the crypt-piers. The piers in the rypt are set back—i.e., reduced from this to 16 ft. × 22 ft. his size is carried up to the impost or moulding from which he vaulting of the crypt starts. We discovered that at his point—i.e., the level of the impost—the piers were set ack or reduced 2 ft. They then continued perpendicularly ill within 2 ft. of the floor of the church. At that point hey went back to the face of the pier. I am indebted to Mr. Somers Clarke, my predecessor, for the valuable suggestion that on investigation it might be found that the vaulting was inserted subsequently to the main building of the walls and piers.

### *Mylne's Restoration of* 1781.

The Rev. R. S. Mylne, a great-grandson of Robert Mylne, a Surveyor of the Cathedral from 1765 to 1821, and a member of a family of masons for several generations, informed me that he had deposited the accounts, etc., connected with St. Paul's left him by his ancestor in the library at Lambeth Palace.

From these documents, which I was able to inspect through the courtesy of the Archbishop, I gathered much useful information. We learn from them that there had been serious destruction of the stonework, and that it had been covered up in an unsatisfactory way. Owing to the faulty system of repair, it was determined to carry out a complete restoration about 1781 and to close the Cathedral for nearly two years. Mylne seems to have used a large amount of stone veneer in his repairs, and also iron cramps. Owing to the formation of rust some of the masonry has cracked and split in all directions. We have removed every iron cramp and dowel so as to safeguard the public from all danger of falling stone as far as this pier is concerned. These papers of Mylne refer to some of the works carried out, such as the iron bands forged by "ships' anchor smiths" and the "compensation" worked on the mouldings and on the main cornice level to disguise the settlements over the four arches of the transept. Evidences of these works are there to this day.

One more discovery may be noted, though strictly a professional one, and that is that in the construction of the main arches Wren built the voussoirs at the springings of the arches on a level bed with only a short portion of the stone worked to a radius.

The urgently needed reparation, of which the first stage was completed in February 1919, occupied five years of unremitting labour.

We have learnt much as to the condition of this pier, and in particular we have come to realize that a bolder method of procedure than has been hitherto possible would save both time and money. By employing steel centering the work could be materially quickened and expense saved. The difficulties of working so as not to interrupt the services would be enormously lessened and the ever-present fear of failure eliminated. Further funds are required to press on the work, and it is for the public to come to our aid. The cost of labour and of material has practically doubled since this restoration was initiated, and without a substantial response the very necessary repair of the fabric may be considerably delayed. At this great moment in its history St. Paul's may well look for the offerings of many who are grateful both for its own marvellous escape from the perils of war and for the help which it gave to the nation in its time of trial.

[The foregoing article is quoted from "The Times." In connection with the reparation of St. Paul's, it may be mentioned that the bulk of the work has been done by Messrs. Dove Bros., Ltd., of Islington, who have also been responsible for repair work in many of the City churches.]

# The Bi-Centenary Celebrations

TWO exhibitions have been opened in London in connection with the bi-centenary of the death of Wren. One is being held at the R.I.B.A. Galleries, Conduit Street, and the other at the Public Record Office, Chancery Lane.

At the R.I.B.A. there are drawings and photographs, illustrating Wren's work, and books, letters, and other relics. The exhibition is open daily until March 3 from 10 a.m. to 6 p.m. (Saturday 10 a.m. to 1 p.m.). The exhibits include a model of Pembroke College Chapel (which was probably Wren's earliest known work as an architect), original contracts for the stone used for St. Paul's Cathedral and Greenwich Hospital, interleaved copies of the "Parentalia," original drawings of Hampton Court, drawings of Greenwich Hospital believed to be originals by Wren, Wren's measuring-staff, and the flowered waistcoat in possession of the Library of St. Paul's Cathedral. Among those who are lending valuable exhibits are H.M. Office of Works, the Admiralty, the Guildhall Library, St. Paul's Library, the Royal Society, Pembroke College, Cambridge, the Bath and Portland Stone Firms, Ltd., Messrs. B. T. Batsford, Ltd., Miss Lucy Phillimore, the Rt. Hon. John Burns, Hon. F.R.I.B.A., the Dean and Chapter of Westminster, and many others. The exhibition is open to the public without charge.

The exhibition arranged by the Public Record Office is open to the public between 2 p.m. and 4 p.m. (except Saturdays and Sundays). Autograph letters of Wren, original drawings, and other contemporary documents are on view.

## Visits to Buildings

Members of the Selborne and London Societies and the R.I.B.A. have paid a visit to Wren buildings in the City. Canon Alexander met them at Amen Corner, and kindly showed his residence, No. 2, one of the row of canons' houses that were erected when the Royal College of Physicians moved from the site after the Great Fire. Of its origin, he told the story of King Charles II having sent to the Dean and Chapter to borrow £1,000, which, to their unspeakable surprise, the King paid back. They were warned that this could only mean that the Sovereign intended coming again for a larger sum, and they had best get rid of the money in building. The forecast proved true when Charles asked for £5,000, but by that time the canons' houses were rising, and the funds being exhausted thereby, the cathedral body had regretfully to decline the honour of the loan. The house has many charming features.

Sir Banister Fletcher received the company at the Temple, and conducted them to various buildings which, by record or tradition, are associated with Sir Christopher Wren. Notable are those in King's Bench Walk, and he pointed out No. 5, Lord Mansfield's old residence. The entire row, till the late Georgian additions are reached, dates from Wren's time. The cloisters were shown as a piece of Sir Christopher's domestic architecture, and Lamb Building facing, on the topmost floor of which Pendennis had his rooms. Crown Office Row, where Charles Lamb was born, was later, but Restoration houses were seen in Essex Court, New Court, and elsewhere. Finally, opportunity was given to inspect the gateway of Middle Temple, an adornment given to Fleet Street by Wren. Whilst in the City, the party had passing views of a number of houses in Cheapside, Milk Street, and Great Tower Street that have survived from the rebuilding of London after the Great Fire.

## Christopher Wren—the Man

At the R.I.B.A. last week, Mr. Gotch gave the first of the new series of Thursday public lectures, reading "A Note on the Life of Sir Christopher Wren."

Mr. Gotch's lecture was far more than a "Note." It was a singularly charming and intimate revelation of a Wren hitherto unknown, of a very human person possessed of parents and uncles, of a strong-minded sister, of a family of his own.

We catch a glimpse of Wren courting. "Madam, your very affectionate and devoted servant"—and off comes his three-cornered hat with a magnificent flourish. A little man, this Wren, but a person of vast dignity, of grave demeanour and sober speech. We wonder if that marvellous brain of his left much room for heart in his composition. Certain it is that neither of his wives lived long.

Mr. Gotch made it very clear that Wren was before all things, a scientist. Architectural greatness was in a manner thrust upon him. We learn of his inventions: an astronomical instrument at the age of thirteen; an artificial eye, a weather-clock, a pen to write double. This last was pirated, and the protest of the outraged inventor proves that he was, after all, human.

Lastly, there is pathos in the dismissal of the old man in his eighty-seventh year from the post of Surveyor-General, which he had held so long and honourably.

But his work was done, and he had earned a rest.

## Wren Lectures

On March 1 at 5.30 p.m. Mr. A. E. Richardson, Professor of Architecture, will deliver a public lecture, with lantern illustrations, on "The Public Buildings of Sir Christopher Wren" at University College. Tickets may be obtained on application, enclosing stamped addressed envelope, to the Secretary, University College, London (Gower Street, W.C.1).

A University Extension lecture on "Wren and his Works" will be given to-day by Sir Banister Fletcher, F.R.I.B.A. at the Central School of Arts and Crafts, Southampton Row, W.C., at 6 p.m. The lecture will be illustrated by means of plans, photographs, and lantern slides.

## Fancy-Dress Ball

On March 9 the Architectural Students of London will hold a fancy-dress ball and carnival in the Galleries of the R.I.B.A from 9.30 p.m. to 5.30 a.m. The profits will be devoted to the St. Paul's Cathedral Preservation Fund. Tickets, including refreshments, 15s. each, can be obtained from: Mr. F. R. Yerbury (Organizing Secretary), The Architectura Association, 34–35 Bedford Square, W.C. Mr. J. O. B. Hitch, Architectural School Royal Academy; Mr. K. Cheesman Royal College of Art, South Kensington; Miss A. M. Hargroves, School o Architecture, University College, Gower Street, W.C.

## Wren a Member ot the H.A.C

An interesting fact in the life of Sir Christopher Wren was his membership o the Honourable Artillery Company. He joined the Company in the year 1676, and his signature is to be found upon the old vellum roll of members of the regiment In view of Wren's connection with the Company, a detachment of three officers and twenty men in church parade order attended the memorial service at St Paul's on Monday last.

# Architecture and Architects in India

## By H. V. LANCHESTER, F.R.I.B.A.

ADDRESSING a meeting of the R.I.B.A. last week, Mr. Lanchester said : The architect at home n put himself in possession of quite a mprehensive knowledge of the history Indian architecture. The works of erguson, Vincent-Smith, E. Havell, d others, not to speak of the publicaons of the Indian Archæological Dertment, would enable anyone interested form a fair idea of the complex inences under which this art has exessed itself.

I will pass on to a cursory review of the chitecture in general. The two main fluences that have dictated architecral forms are timber construction (inuding bamboo) and the rock-cut chamrs and temples. We must date the rmer as earlier than the latter, as even the rock-cut work there are many dications of wooden construction and e earliest stonework is handled on milar lines.

The rock-cut work initiated a vigorous d strongly characterized type of design ry definitely retaining the effect of ratification, which enabled most comex treatment of decoration to be emoyed without loss of strength and ability in the general effect.

The arch took a place in Indian archicture late in its development; how far was an indigenous development and w far imported is still a matter of gument. While the question is clearly pable of settlement, the scope for vestigation is too wide to be dealt with the moment.

To our taste most Indian buildings are er-enriched, but I would point out at those enrichments all have a meang to the Indian mind, and that they are t barbaric but proportioned and disibuted on a strictly architectonic basis. think you will agree that no style ows a higher standard of skill than the indu architecture up to the seventeenth ntury in the distribution of masses, e proportions of solids and voids, and e surface treatment with a view to conasting the plain and enriched.

We all recognize that the general strucre of a building must be dictated by the quirements it is to fulfil and the marial employed, but this structural heme, though it may not be falsified by s adornment, does not dictate inevitably e exact form in which it shall be exessed architecturally, much of this epending on the feelings and traditions hich obtain in regard to architectural xpression as understood locally or ationally. In many parts of India these aditions are still so strong that I cannot nceive of any course as a right one that eglects or ignores them. At the same me, it is difficult to see how the architect ained on European lines is to remodel is technique so as to base his methods f expression on those with which he is nfamiliar. He can only be expected to e able to do this if he substitutes as his ain objective the study of architectural evelopment in India for that of architecral development in Europe, regarding e latter, which one can hardly advise ould be neglected, as an illustrative commentary on the general history of his art.

I see no inconsistency between Indian architecture and the buildings which are in demand there at the present time. It is so flexible in form that the variations involved in the structure of modern buildings are less rather than more in comparison with those demanded in Europe. It is true that the basis of design in India has always been geometrical rather than arithmetical—how, indeed, could the mistri have memorized complicated plans unless by this method?—but it is all to the good if we can ourselves build up our schemes on such a basis. Many of the best modern designs owe something to such a method, and we have only to look at some of the finest plans of recent times to see this. Perhaps that of the Hotel de Ville, Paris, is one of the most illustrative examples.

I will pass on to the very vital question of the future of architecture in India. In recent years a very small proportion of the larger buildings reach a high standard, and many are far below mediocrity. To such an extent is this the case that those who appreciate architecture for its own sake generally advocate the restoration of the mistri to his position as designer. Now I have indicated the difficulties of adopting such a course, but at the same time I feel it is disastrous that advantage is not taken of the existence of a body of men possessing in such high measure genuinely artistic perception. The trouble has been that those responsibie for building have been incapable of appreciating the essentials of architecture and have framed their methods in such a way as to exclude the collaboration of the mistri. It is true a vernacular treatment is often adopted, but this is done in such a way as to foredoom the design to failure by defining everything on hard-and-fast lines and insisting on these being adhered to by the workmen.

The Englishman goes to India when his training is supposed to be completed, and then gets very little time to familiarize himself with essentials of Indian architecture, while the training of the Indian follows much too closely that of the European. If, instead of this, there were architects who had from the first thought of their work only in terms of the Eastern styles, styles that in India only demand a somewhat further fusion to reach a definite basis that could be considered classic, we should have a body of men who could prepare designs in which the suggestions made by, and the workmanship of, the mistri would fall into their places, the first adding interest to the design generally and the second ensuring beauty in the execution of the detail. The difficulty of employing the non-literate but skilful artist would disappear when the directing mind is sympathetic to his employment.

We find no difficulty at home in engaging artistic craftsmen whose work will, we think, be an enhancement to our designs, but the degree to which the similar man has in India been excluded from all important works would hardly be believed by those who have not looked into this question.

The buildings organized by us have no sculpture, painting or metal work of artistic merit, though all these crafts are among those in which India has for long excelled, with a tradition always linking them up to architecture widely different from our own traditions in this respect, where it is always something of an effort to bring the sister arts into due relationship. The time seems to be approaching when the architect will have a chance of establishing himself in India, as there is a strong feeling against the continuance of departmental control of works in place of such as could be effected by private agency. This feeling is partly due to a justifiable dissatisfaction with the results of departmental efforts and partly to the aspirations of the nationalist party, who believe that the Indian is prejudiced by official methods. Personally, I rather doubt if the Indian will find any immediate monetary gain by the abolition of official methods, as he himself contributes the bulk of the staff and has always been accustomed to this type of organization, but in the long run I think it is unquestionable that the substitution of individual effort for an official routine will be to the advantage of both the European and the Indian in bringing to the front those who are best qualified and spurring them on to do their best instead of smothering initiative under a mass of unintelligent regulations. You will, however, gather from what I have said, that in my view the architect for India should have a distinctive training, and that if this Institute is taking steps to offer membership to those who pursue their studies in India, the qualifications should be considered in the light of Indian conditions.

### *Discussion.*

In proposing a vote of thanks to the lecturer, Mr. James Ransome, F.R.I.B.A., formerly architect to the Government of India, said it was very difficult for Europeans to really understand the architecture of the East, because they saw it from such entirely different points of view.

Mr. Herbert Baker, A.R.A., seconded, and said the lecturer had touched on the question of the services of the mistri and their control of building work. He certainly thought they were successful on the simpler buildings, but when it came to larger work one had to remember that their methods were rather slow. With regard to the future of Indian architecture, that depended upon the political situation and upon the finding of some blend between East and West. He thought there was a great opportunity for architects who would appreciate the situation and start from the elemental and simple forms.

Prof. Beresford Pite said : If they could but enlarge their architectural conceptions to the breadth of the British Empire he ventured to think that their ideas on architectural education would have to be extended too—the sooner the better.

Sir Lionel Jacob, K.C.S.I., and Capt. George S. C. Swinton also spoke.

# Societies and Institutions

### *Birmingham Architectural Association.*

Professor S. D. Adshead, M.A., F.R.I.B.A., in reading a paper before the Birmingham Architectural Association on "The Architect and his Place in Municipal Town Planning," described the powers of local authorities under the Town Planning Acts of 1909 and 1919. The administration of the Acts took place in four stages. Professor Adshead said that the legal and financial aspects had killed the imaginative part of town planning. Mr. R. Savage, F.R.I.B.A., presided at the meeting.

### *Architecture as a Fine Art.*

Mr. R. Langton Cole, F.R.I.B.A., in delivering a lantern lecture on "Architecture as a Fine Art" before the London Institution, called attention to the rising interest in architecture. He said that one might exist without pictures or sculpture, but one must have a building of some kind in which to live and to carry on one's work. He suggested that all architecture might be looked upon as an art, in which the artist sought expression of his idea, just as the painter or sculptor. If this were done, the public would gain greatly by experiencing from a successful design the emotions which the artist intended to produce. He asked his hearers to keep their eyes open, to watch for effects among even the most familiar surroundings, and if they would do so, they would find that good architecture added another pleasure to life.

### *The Institution of Heating and Ventilating Engineers.*

Referring to the education of the engineer at the annual general meeting of the Institution of Heating and Ventilating Engineers, Mr. John Watson, the new president, said he thought they would agree that the facilities now offered were much in advance of anything previously available. He mentioned the recently issued pamphlet "Advice to Intending Students," which set forth the courses of study for each year of a minimum six years' course. He was convinced that, at the age of twenty-one or twenty-two years, any intelligent youth who had followed the prescribed course would be well informed in general knowledge of elementary engineering science, and in the basic facts of heating and ventilation. It was hoped that more and more youths would take advantage of the facilities offered as time went on. Prof. W. E. Garner, M.Sc., read a paper on the combustion of fuel in boiler furnaces.

### *Sheffield Architects at Dinner.*

The annual dinner of the Sheffield, South Yorkshire and District Society of Architects and Surveyors has been held at Sheffield. Mr. J. R. Wigfull, the president, was handed a gold watch on behalf of the members as a mark of appreciation of his services as secretary for many years. At the dinner the society had the privilege of entertaining, as Lord Mayor, one of their own members—Alderman W. C. Fenton.

The presentation to Mr. Wigfull was made by Mr. Paul Waterhouse, the president of the R.I.B.A. He referred to the necessity for friendship and unity between architects, and mentioned how the Royal Institute in London looked to the provinces for advice and help. Making the presentation to the president, Mr. Waterhouse said that Mr. Wigfull was the living embodiment of that unity and good fellowship to which he had referred.

Mr. Wigfull expressed his particular appreciation that the gift should be made to him by Mr. Waterhouse. He mentioned that he had been a member of the Institute for more than thirty years.

Mr. F. E. P. Edwards, the Sheffield City architect, proposing "The Arts and Crafts of Architecture," said they, as architects, frankly acknowledged the debt they owed to the skilled craftsmen who gave effect and being to the designs which would otherwise remain merely castles in the air.

### *The Auctioneers' Institute Registration Bill.*

Speaking at a gathering in London of the Kent, Surrey, and Sussex Branch of the Auctioneers' and Estate Agents' Institute, the president of the Institute (Mr. James S. Motion) said the council had worked very hard on the subject of the Landed Property Practitioners' Registration Bill, and Mr. E. H. Blake, the secretary of the Institute, had rendered most valuable assistance. He was gratified to be able to announce that the Bill had been tabled by Sir Edgar Chatfeild Clarke, M.P., and that in all probability the measure would have its first reading on April 27. A large number of members of Parliament had promised to support the Bill, and he thought it had some prospect of becoming a material fact.

### *The Norfolk and Norwich Association of Architects.*

At the annual meeting of the Norfolk and Norwich Association of Architects held at Norwich, the following officers and members of the council were elected for 1923: Messrs. E. T. Boardman, F.R.I.B.A. (president); G. J. Skipper, F.R.I.B.A., J. W. Cockrill, A.R.I.B.A. (vice-presidents); E. W. B. Scott, A.R.I.B.A. (hon. secretary); E. H. Buckingham, A.R.I.B.A., C. Upcher, S. J. Wearing, A.R.I.B.A. (council members); A. T. Wright (associate member of council); J. O. Bond, Lic.R.I.B.A. (hon. auditor). In addressing the meeting the president, Mr. E. T. Boardman, said that his advice with regard to housing was to get back to the ordinary channels. Housing should be carried out by architects and builders free from State control. He suggested a possibility of the land being bought by the public authority and let very cheaply for housing purposes. The prizes for the competitions for measured drawings and sketches, awarded to C. J. Messent, A. E. Warren, and G. S. Buckingham, were then presented. It was announced that two free public lantern lectures would be given at the Technical Institute on February 16 and March 2 respectively, and that an exhibition of architectural photographs would be held in the spring. The membership now totals sixty-three.

### *An Architects' Assurance Scheme.*

The council of the Architects' Benevolent Society have developed a scheme whereby they hope, with the co-operation of the profession, materially to increase the society's funds, and enable it to grant better assistance to applicants for help. Briefly, the scheme is that the society should act as an agent for life and other assurance, and that the commission obtained should be shared by the society and the insuring architect. Full particulars of the scheme may be obtained from the hon. secretary, 9 Conduit Street, London, W.1. Architects who effect their insurances in this manner will not only act in their own best interests, but will, at the same time, give loyal support to the less fortunate members of the profession. The society is the only philanthropic organization in the United Kingdom solely devoted to the assistance of architects or their widows and orphans, who have fallen on evil days.

### *Leeds and West Yorks Architects at Dinner.*

The annual dinner of the Leeds and West Yorkshire Architectural Society has been held at Leeds under the presidency of Mr. Eric Morley, of Bradford. Among those present were the Lord Mayor of Leeds (Alderman F. Fountain), Mr. Hugh M. Butler, M.P., Mr. Paul Waterhouse (R.I.B.A.), Sir Michael Sadler (vice-chancellor of the University of Leeds), Alderman Charles Lupton, Sir Edwin Airey, Messrs. Francis Jones (president of the Manchester Society of Architects), Charles B. Flockton (past president of the Sheffield Society of Architects), F. L. Charlton (hon. secretary of the Society), Sidney D. Kitson, the Rev. D'Arcy Rudd, and Messrs. H. S. Chorley, W. H. Thorp, and A. Copson-Peake (president of the Law Society).

The toast of the "Houses of Parliament" was proposed by the Lord Mayor, and responded to by Mr. H. M. Butler, M.P. The toast of the R.I.B.A. (to which Mr. Paul Waterhouse responded) was proposed by Sir Michael Sadler, who observed that architecture was history, and a record of each passing phase of civilization. Like teachers, architects had to be loyal to the past, and at the same time ready to accept new ideas.

The toast of the Leeds and West Yorkshire Architectural Society was proposed by Alderman Lupton, who referred to the work of the Leeds Improvement Committee. Mr. Eric Morley (the president, Leeds and West Yorkshire Architectural Society) responded. The "Allied Societies" was given by Mr. T. Butler Wilson (a past president), and responded to by Mr. Francis Jones (president of the Manchester Society of Architects), who suggested a chair of architecture at Leeds University. Mr. H. S. Chorley (advisory architect of the Leeds Housing Schemes), proposing "The Guests," declared that in spite of complaints, new houses had been put up in Leeds, which would vie with those in any other town. Mr. A. Copson Peake replied.

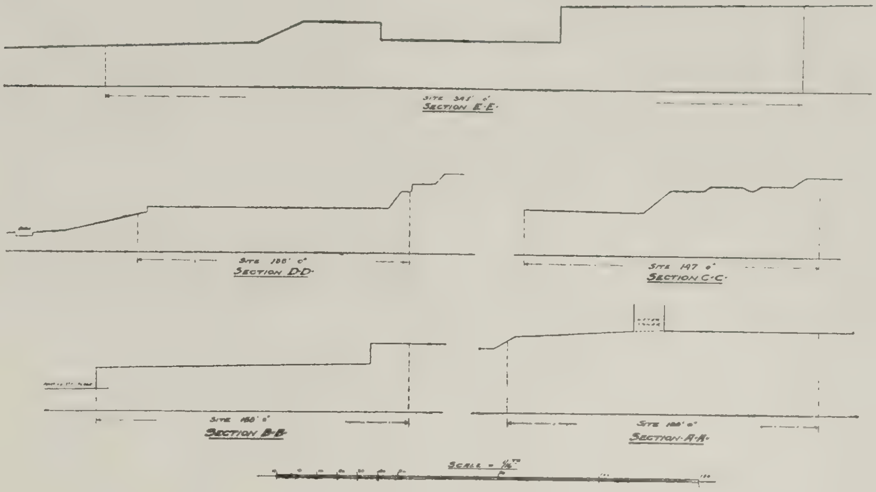
# Competition News

## he New Bournemouth Pavilion

The accompanying drawings show the e and the levels of the ground upon iich it is proposed to erect the new ›urnemouth pavilion. Sir Edwin oper, F.R.I.B.A., is the assessor. Par- ulars of the premiums, etc., are pub- hed in the "List of Competitions ›en" on page 421.

The pavilion is proposed to be erected the Westover Gardens and on the site the Belle Vue Hotel, between the estover Road and the Pier Approach. ie main entrance will be from the for- er, and the lower floor entrance from the ter. A small pumping station and iter tower on the ground may be in the iy of the proposed building; in this case ovision must be made by incorporating em in the building.

The building is to be of a substantial aracter and of stone, brick, concrete, d steel, or other equally permanent aracter, the design and treatment, how- er, being indicative of the purposes for iich the building is intended. Com- titors should keep in mind the fact that e view is seaward to the south and ith-west over the Pier Approach, and stward over the Pleasure Gardens and e Bourne stream, and that the main trance is north-eastward to Westover Road. These elevations are, therefore, of importance. All refreshment rooms should be planned so far as possible on these sea and garden fronts. The cost of the scheme must not exceed £100,000, including plaster, marble, or other decorations. If competitors should consider the sum inadequate, they must state so in their report, and indicate by one colour upon the plans what portion they can erect for the sum of £100,000.



LEVELS OF SITE.

The drawings required are as follows:—

Plans of each floor, two sections and all elevations to 1-16th in. scale (and perspective from the south-west corner), and a block plan of the site with any suggested development of the ground and approaches that the competitor may care to propose. This plan to be to the same scale as block plan supplied to competitors.

The drawings must be finished in black and white, sectional parts being blacked in, but all arrangements must be clearly indicated, including the seating. The perspective drawing is to be rendered in black and white, the building in the drawing measuring not more than 18 in. long.

The sizes of the rooms and corridors must be clearly figured, also the heights on sections.

Each drawing is to be mounted on a strainer without margins, and no identification mark, motto, or name to be attached thereto.

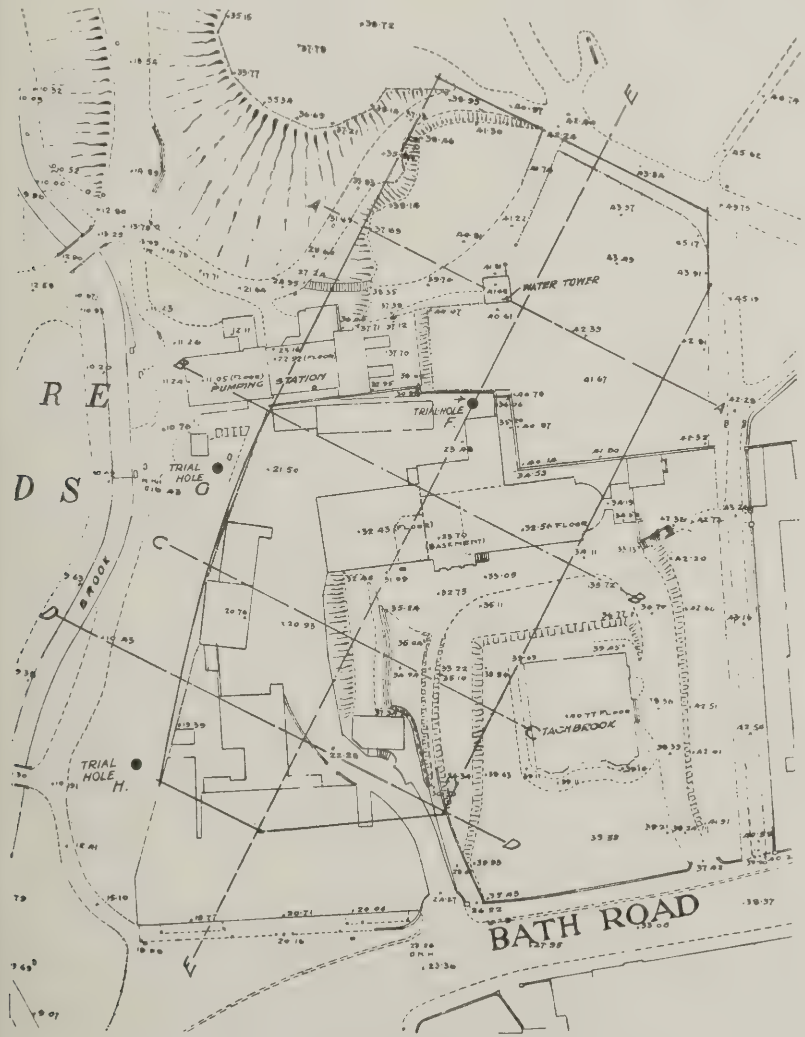
Accompanying the drawings there must be a short report stating the kind of material proposed to be used, particulars of the accommodation, and the cubical contents of the building given in three items, viz. : lower floor, concert hall, rest of the building, and the rates per foot cube at which these several parts could be erected, and the total cost of the building. The cubing is to be calculated from the top of concrete foundation to half-way up sloping roofs.

Following is the suggested accommodation drawn up for the general guidance of competitors :—

Lower Ground or Pier Approach level: large refreshment room (licensed—dispense counter only); service rooms; kitchens (luncheons and teas); lavatories —extensive; store rooms and cellars; three offices and as much store and workshop accommodation for the beach undertaking as can be provided economically in planning; heating chamber; administrative staircase only to floors above; separate public staircase from pier approach to main floor.

Messanine floor : green room and dressing rooms for hall; scenery and chair stores; toilet for staff and artistes; music store and band room; tea balcony round lower ground floor refreshment room with service.

Main floor (Westover Road level) : Concert hall with gallery, to seat 2,000, and with stage to accommodate first class



PLAN OF SITE.

orchestral, operatic, and dramatic performances, with such necessary dressing rooms, etc., as are not provided elsewhere, and provision for a bioscope operator's box. Provision must be made for the getting in and taking out of stage scenery and a sunk orchestra should be arranged in front of the stage for dramatic or operatic performances that can be covered over when not required for that purpose, forming additional floor area. In the hall provision must be made for an organ to be played from consoles. Careful consideration must be given to the acoustic properties of the hall. Three offices should be provided near the main entrance for administration purposes, together with small bureau of information. Turnstiles are to be arranged between the concert hall and other parts, so that each can be worked independently. Grand entrance vestibule from Westover Road, and cloak and adequate lavatory accommodation; billiard room (3 tables); reading room; lounge with balcony, having sea and garden view, to accommodate 250 persons. Tea and refreshment room on sea front with such service, dispense and kitchen not otherwise provided, and extensive balconies enclosed with glazed sashes on sea and garden fronts. (These rooms and balconies to seat about 500.) The floor of the main room is to be of hardwood, suitable for dancing. Messrs. Broad, Babbs and Dockerill, F.S.I., of London, and Bournemouth, have been appointed quantity surveyors.

The levels of the three Trial Holes marked F G and H on the block plan are as follows :—

| | Surface Level. | Bottom Level. |
|---|---|---|
| Trial Hole F .. | 24.19 | 20.20 |
| ,, G .. | 20.44 | 11.77 |
| ,, H .. | 18.98 | 9.55 |

## Cork Municipal Buildings

Each design in this competition (particulars of which are given in the List of Competitions Open) must be illustrated by the following drawings :—

(*a*) Block plan to a scale of 88 ft. to 1 in.; (*b*) a plan of each floor of the entire scheme; (*c*) not less than two elevations, to a scale of 16 ft. to 1 in.; (*d*) sufficient sections to illustrate the buildings; (*e*) a detail of a portion of the front to ½ in. scale.

The successful author will be required to prepare a perspective view at his own cost. The drawings are to be in black and white only, and may be either in pencil or ink. The floor areas in the plans to have a grey wash and the walls and sectional parts in both plans and sections to be a darker tint of grey or black. The elevations and detail may be shaded in wash if desired. The dimensions and floor areas of all rooms to be figured on the plans and the heights on the sections. No drains need be shown. All drawings are to be mounted on strainers without margins.

Following is the schedule of accommodation. Unless otherwise stated the figures given in parentheses are to be taken as about the area required in sq. ft. :—

A. Council Chamber, Committee Rooms, etc.—1. Council chamber, seating accommodation for fifty-six members, eight officials, six reporters, and general public (fifty seats); 2. Members room adjoining (400); 3. Room for deputations, interviews, conferences, etc. (300); 4. Lord Mayor's private parlour (500); 5. Office for Lord Mayor's typist and administrative work (300); 6. Committee room (800); 7. Committee room (450); 8. Committee room (450); 9. Kitchen for use in connection with committee rooms (350); 10. Lavatories (for use of members only). (The whole of the above accommodation is desirable on the first floor, with the exception of No. 9, which may be on the second floor. Nos. 6 and 7 should be so arranged that they may be thrown into one for receptions, conferences, etc.)

B. Town Clerk's Department.—1. General office to accommodate three assistants with counter and screen for inquiries (450); 2. Ante-room between town clerk's and Lord Mayor's room (300); 3. Town clerk's private room (450); 4. Spare room (200); 5. Small store and book room (150). (The whole of the above accommodation is desirable on the first floor.)

C. Secretary of Committees.—1. General office to accommodate a staff of three with inquiry counter and screen (400); 2. Secretary's private room (300); 3. Spare room for records, stationery, files, etc. (150). (The whole of the above accommodation is desirable on the first floor.)

D. City Engineer's Department: City Engineer's Offices.—1. General office to accommodate five clerical assistants with counter and screen (500); 2. Engineer's private room (300); 3. Drawing office with inquiry counter (500); 4. Room for plans, files, samples, catalogues, engineering instruments, etc. (250); 5. Spare room for stationery, records, and possible increase of staff (250). Highways' Department: 6. General office to accommodate staff of eight with inquiry counter and screen (400); 7. Outdoor inspectors (250); 8. Superintendent's private room (240); 9. Spare room for records, books, stationery, etc. (180). Waterworks Department: 10. General office to accommodate three assistants with inquiry counter and screen (350); 11. Office for six water inspectors with compartment screened off for their superintendent (250); 12. Spare room for stores, stationery, tools, and implements (200); 13. Service men and pipe layers (twelve on staff) (250). Outdoor inspectors: 14. Building inspector's office, 150; building inspector's clerk, 150; foreman of sewers, 150 (450); 15. One spare room for gangers, implements, etc. (200); 16. Hackney car inspector, 150; street inspector, 150 (300); 17. Foreman of lighting (150); 18. Room for staff of nineteen lamplighters (350); 19. Store room for oils, mantles, fittings, and implements (150). (Nos. 1 to 9 inclusive may be on the second floor, Nos. 10 to 12 inclusive may be on the second or ground floor, Nos. 13 to 19 inclusive to be on the ground floor, No. 14 to be one room partitioned, No. 16 to be one room partitioned.)

E. City Treasurer's Department. — 1. General office to accommodate a staff of nine assistants with counter and screen for inquiries (700); 2. Treasurer's private room (300); 3. Strong room for current records and documents (150); 4. Spare room for possible increase in staff (300); 5. Store room for stationery, documents etc. (150). (The above accommodatio may be provided on the first or secon floor.)

F. Rates Department.—1. Chief rat collector and deputy (300); 2. Genera staff office for a staff of five, with a inquiry counter and screen (500); 3 Room for two collectors (250); 4. Stron room (120); 5. Spare room for franchis work (200). (The above accommodatio may be provided on any floor. If place on the ground floor a separate entranc would be desirable.)

G. Public Health Department. — 1 General office for clerical staff of fiv assistants with inquiry screen and counte and with compartment for lady inspecto screened off (400); 2. Office for a staf of nine sanitary sub-officers (outdoo inspection staff) (550); 3. Private roo of executive sanitary officer (300); 4 Medical officer of health (300); 5. Offic for: (*a*) outdoor superintendents; (*b* shop inspector; (*c*) meat inspector; (*d* drain tester (300); 6. Room for two superintendents of domestic refuse collectio (250); 7. Spare room for stationery records, filing, etc. (150); 8. Store fo samples of food and drugs, utensils, etc (150). (The above accommodation ma be placed on the second floor. No. 5 t be in one room sub-divided into compartments for *a*, *b*, *c*, and *d*.)

H. City Analyst's Department.— 1. One principal room (600); 2. On room (350); 3. Office with inquiry counter and screen (200); 4. General stor room (700); 5. One spare room (150) (The above accommodation may be place on the ground floor.)

I. Gas Testing Department.—1. Offic with inquiry counter and screen (150) 2. Meter testing room with suitabl entrance for delivery of meters from carts etc. (500); 3. Room for photomete calorimeter for testing quality of ga (750); 4. Small office for records (200) 5. Bacteriological laboratory with inquiry counter and screen (400). (Th above accommodation may be placed o the ground floor.)

J. Weights and Measures Department.—1. One room for testing instruments with suitable entrance for th delivery of weights, measures, and scale out of carts (750); 2. Office for superintendent (150); 3. Special room for saf keeping of standard weights and measures etc. (150). (The above accommodatio may be placed on the ground floor.)

K. School Attendance Department.— 1. General office for staff of five wit inquiry counter and screen (450); 2. Committee room (300). (The above accommodation may be placed on the groun floor.)

L. Strong Rooms, etc.—1. Tow clerk (250); 2. City treasurer (250) 3. Rates department (250); 4. Publi health (200); 5. Secretary of committe (200); 6. City engineer (150); 7. Wate works (150); 8. General muniment roo (500). (The above accommodation, together with some space for genera storage, to be provided on the groun floor.)

M. Public Assembly Hall for Concert Lectures, Meetings, etc.—1. Auditoriu with gallery to seat an audience of 1,8 persons; 2. A platform for concerts, lectures, meetings, etc., to accommoda 150 persons; 3. Dressing rooms and lavatories for both sexes communicating wit platform; 4. Kitchen, etc.; 5. Meetin m for bazaar, concert and other organ- ıg committees (500); 6. Cloak rooms l lavatories for the public.

V. General.—Caretaker's apartments: consist of living room, sitting- m, kitchen, etc., and three bedrooms, ich may be arranged wherever most venient, but must have a separate rance from the street. Hall porter, : A small porter's room and telephone m to be provided. Lavatories should provided on each floor for male staffs l heads of departments, and a retiring m for females with lavatory to be vided on first and second floors. Open places are desirable in offices of heads lepartments, living rooms, etc. Other ms may be heated from a central tem. A passenger lift should be pro- ed.

## st of Competitions Open

| te of very. | Competition. |
|---|---|
| ch 31 | War Memorial in Crow Nest Park, Dewsbury. Assessor, Professor C. H. Reilly, O.B.E., M.A., F.R.I.B.A. A copy of the conditions together with plans of the site may be obtained on application to Mr. H. Dearden, A.R.I.B.A., Borough Surveyor, Town Hall, Dewsbury, on payment of one shilling. |
| 15 | Buildings for the Polytechnic Institute, Reval. Premiums 200,000 marks, 150,000 marks, 100,000 marks. Apply Office National du Commerce Exterieur, 22 Avenue Victor Emmanuel III, Paris. (8e) The competition is an International one. |
| 1 | New Municipal Buildings and Town Hall, Cork. Total cost not to exceed £120,000, Assessor Mr. Lucius O'Callaghan. F.R.I.A.I., A.R.H.A. The successful competitor will be appointed to carry out the work. Second and third premiums £200 and £100 respectively. Apply Mr. William Hegarty, Town Clerk, Cork. The competition is limited to architects living and practising in Ireland. |
| 30 | Bridge over Nygaardsstrommen in Bergen. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, S.W. 1. |
| ate | Concert Pavilion, Bournemouth, to seat 2,000. Estimated cost £100,000. Assessor, Sir Edwin Cooper, F.R.I.B.A. Premiums: £300, £200, and £100. Apply Town Clerk, Municipal Offices, Bournemouth. Deposit £2 2s. (cheque). |
| ate | The Crown Agents for the Colonies, acting on behalf of the Government of the Straits Settlements, invite competitive designs for the reinforced concrete work required in connection with the construction of a new general post office at Singapore. Tentative designs, for which no fees will be paid, are required in the first instance, from which it is proposed to select a design and specify its adoption in the contract for the construction of the building. The firm whose design is so adopted will be subsequently engaged to prepare full detail plans, specification, quantities, &c., for an approved fee. Drawings can be seen and further details of the competition obtained from the Crown Agents for the Colonies, 4 Millbank, Westminster, S.W. 1, quoting Z/Straits Settlements 5664. |
| ate | Five shops for the Prestwich Co-operative and Industrial Society. Premium 75 guineas. Apply General Manager of the Society, Warwick Street, Bury New Road, Prestwich, Lancs. |
| ate | The following prizes are offered in connection with the Manchester Building Trades Exhibition to architectural students: Measured drawings—first prize, £40; second prize, £30. Architectural sketches—first prize, £20; second prize, £10. Sketches submitted may be in any medium, and must not exceed twenty. The Exhibition will be held in the City Hall, from March 6 to March 17. |

## Parliamentary Notes

Y OUR SPECIAL REPRESENTATIVE.

### *Housing Bills.*

hree Housing Bills have already been ɔduced into the House of Commons. first seeks to amend the enactments relating to the housing of the working-classes and the acquisition of small dwellings; the second to prolong the duration of, amend and restrict the operation of certain provisions of the Increase of Rent and Mortgage Interest (Restrictions) Act, 1920, and any enactment amending that Act; and the third to amend the latter Act, with respect to the notices to increase rent given thereunder.

### *Housing Policy.*

During a debate, Mr. Ramsay Macdonald, the leader of the Opposition, criticized the Government's housing policy, and expressed the hope that the recommendations of the Majority Report of the Departmental Committee on Rent Restriction would not be followed. The only solution of the problem, he said, lay in building more houses.

Sir Douglas Newton raised the question of housing as affecting the rural dweller, and urged that the present procedure should be simpler. "We do not want a lot of architects," he said. "We do not want elaborate plans. We have bodies like the building committees of the county councils, who are quite qualified to deal with plans and can look at a plan from the point of view of safety and sanitation and the other requirements of country districts, and if only some means could be devised by which the dole could be given in return for some building service, house rent could be reduced to the cost of the material used in building the houses, plus, perhaps, the labour employed in excess of the dole."

### *State-aided Schemes.*

At question time, Sir W. Joynson-Hicks informed Mr. T. Thomson that the late Government's assisted housing scheme was limited to 176,000 houses. All these had now been allocated, and there was not at present any margin available for redistribution.

Replying to Mr. Trevelyan, Sir W. Joynson-Hicks said that the number of houses erected or in course of erection under the State-assisted scheme and under the private builders' grant was as follows:—

| | |
|---|---|
| By local authorities and public utility societies .. .. | 176,000 |

## Town Planning Schemes

To afford practical help to local authorities with regard to town planning the Minister of Health has issued a set of suggestions in the form of model clauses for incorporation in the schemes. The clauses show that it is not intended that the details of estate development should be fixed and stereotyped in the scheme itself. The latter settles only the main outlines of development, i.e., the most important roads and the building lines on them and open spaces, and the allocation of areas to their main uses, industrial or residential, as the case may be. Site-planning and estate development are recognized as matters in which the initiative should rest largely with the owners, subject to reasonable control and guidance on the part of the local authority, and not be settled beforehand for them. The clauses only indicate the general form which schemes should take, and do not in any way relieve local authorities of the duty of fully consulting owners and other interests concerned in determining the actual features—roads, building lines, density standards, etc.—to be included in a scheme.

## Law Reports

### Ancient Light Dispute

*Brisley* v. *Vandersteen.*

Feb. 2. Chancery Division.
Before Mr. Justice Eve.

This was an action by Mr. Geo. Brisley, the owner of premises situate at High Street, Dover, against Mr. Albert Vandersteen, the owner of premises situate at 109 High Street, Dover, to restrain him from erecting at the rear of his premises any building or addition to his premises so as to constitute a nuisance to the plaintiff or to interfere with the access of light to the plaintiff's house or his furniture show rooms.

Mr. Gover, K.C., for plaintiff, said his client claimed ancient lights with respect to his parlour, kitchen, and show room.

Mr. Wm. J. Jennings, architect and surveyor, of Canterbury, gave evidence in support of plaintiff's case.

For the defence Mr. F. E. Hayward, of Dover, and Mr. Wm. Woodward, of Woodward and Sons, London, gave evidence to the effect that there would be no appreciable diminution of light to plaintiff's premises as the result of the erection of the buildings.

His Lordship said he had to decide whether, if the defendant was allowed to proceed in the way he proposed to do, he would obstruct the light from the plaintiff's premises so as to leave him no less light than he had the right to in the ordinary enjoyment of his kitchen. He was quite satisfied that so far as the kitchen was concerned there would be a material interference with the access of light, and that plaintiff was entitled to an injunction. With regard to the parlour, he had also come to the conclusion that there would be such interference with the access of light as to give plaintiff a good cause for action. His Lordship said he regretted that on the occasion when Mr. Hayward and Mr. Woodward attended on the premises to make their experiments an invitation to be present was not extended to Mr. Jennings and plaintiff's solicitors, as it might have led to some mutual arrangement to obviate the injury which plaintiff alleged defendant was bound to inflict upon him. That course, unfortunately, was not taken, and the experiments that were made did not therefore affect his Lordship's mind to the extent they ought to have done. He would grant an injunction restraining the defendant from erecting, continuing to erect, or permitting to remain erected, any part of what had been called the first-floor story of his building, so as to darken, injure, or obstruct the access of light to the plaintiff's kitchen and parlour windows so as to thereby cause a nuisance to the plaintiff. Defendant would pay the costs of the action, and there would be liberty to apply as to a mandatory injunction in respect of the building as at present erected. His Lordship said that on this point a meeting between Mr. Hayward and Mr. Jennings might be of assistance.

# The Water-colours of the Late Sir Ernest George

An exhibition of the water-colour drawings of the late Sir Ernest George, R.A., has been opened at the Fine Art Society Ltd., 148 New Bond Street, London. It contains about 150 water-colours depicting all parts of the British Isles, the Continent, India, Egypt, and other countries, and a series of sketch-book albums. Sir Ernest George was a great traveller, and seems to have made water-colour drawings of nearly all the places he visited. Some of the earlier work shown dates back to the "seventies." The sketch-books are of exceptional interest. Each one is devoted to one country and contains about fifty drawings. The exhibition will remain open for about three weeks.

Mr. E. Guy Dawber, F.R.I.B.A., has written the following appreciation :—

Ernest George will always be known as one of the most eminent architects of the Victorian era, although to a more limited public his name will be associated with his water-colour drawings and sketches. Here he occupied a position pre-eminently his own, and in his way was without a rival, and may justly be ranked amongst the best architectural draughtsmen of his time. The picturesque and romantic always appealed strongly to him, and for more than half a century, generally twice a year, he wandered abroad to sketch amongst the old cities of Europe. His output was prodigious, and his energy extraordinary, working before breakfast and most of the day filling his sketch-books and doing his beautiful drawings, a relaxation to him from an equally arduous life in London as an architect with a large and varied practice.

His naturally bright and cheerful temperament is reflected in his work, which is always clean, direct, and without the least affectation. He was a brilliant draughtsman, with a wonderfu gift of selection of subject and a powe of elimination of everything that detracted from his picture, and though h was a rapid worker, yet none of his drawings are hurried, and his slightest sketc shows that he carried through and completed his scheme of composition.

To sit beside him, as I have, and watc him put on paper with marvellou rapidity and precision a difficult and complicated subject, always selecting an grouping it with intuitive knowledge o what made a picture, was a useful, i depressing experience, though he wa always ready with kindly suggestion t help in one's own difficulties.

Perhaps his most fully develope period was between 1880 and 1900, whe he had gained from years of experience great facility of expression and breadt of colour, and during these years he pro duced his most characteristic work.

# The Acoustics of the Auditorium

## By G. A. SUTHERLAND

For his second lecture at University College, London, on The Acoustics of the Auditorium, Mr. G. A. Sutherland took as his subject "Good Acoustics and the Structural Conditions Necessary for their Attainment." He discussed the problem in so far as the size of the auditorium and the materials used in its construction were concerned. In the course of the lecture he said : Reflection ensures adequate loudness everywhere in a room with no dimension very great, and where the speaker faces the whole audience. At the same time it produces reverberation or slow decay of the sound. If this decay lasts for three seconds for a word spoken in an ordinary tone of voice nine syllables will be heard simultaneously and the result will be indistinctness. For speech reverberation should be reduced to the minimum consistent with adequate loudness. In a small room there is no difficulty here, and the reverberation should lie between half and one second. In a larger room a longer period of about 1·8 is tolerable, probably because in a large room a speaker expects to have to speak more slowly.

In music the case is slightly different, some prolongation and blending of the notes being desirable and giving what is known as fullness of tone. For chamber music 1·1 seconds, and for orchestral music 2·3 seconds are satisfactory. In concert halls complaints from musicians are more often on the score of inadequate than of excessive reverberation.

Besides loudness and reverberation, reflection may in larger rooms produce an echo, a defect that occurs when the reflecting wall is more than 37 ft. away. In this case the direct and reflected sounds succeed each other at an interval of more than one-fifteenth of a second and are heard as separate sounds. Even when the wall distance is 30 ft. there will be confusion, though not a discrete echo. In the case of a curved wall sound foci are produced, and there will be points of undue intensification and of comparative silence. Echoes are inconsistent with distinctness, and sound foci, even when not combined with echoes, are inconsistent with uniform loudness. For satisfactory results echoes and sound foci must be eliminated as completely as possible.

The general principle underlying the cure of reverberation is the introduction of material that will absorb the sound. The reverberation in an empty house is well known, as also is the improvement that can be effected by introducing porous hangings and wall coverings.

Exhaustive experiments in America have examined the relative absorbing powers of different materials used in building, and a formula has been developed which enables the reverberation period for a sound of given intensity to be calculated in advance of construction. If T is the time of reverberation, A the total absorbing power of the room and contents, and V the volume of the room,

$T = {\cdot}05\ V/A$ if the measurements are in feet,
or $T = 164\ V/A$ if the measurements are in metres.

The value of A is calculated by multiplying the different surface areas and units in the room by their appropriate coefficients, some of which are given below.

| | |
|---|---|
| Open window .. .. .. | 1·000 |
| Glass .. .. .. .. | 0·027 |
| Brick wall in cement .. | 0·032 |
| Brick wall painted two coats | 0·017 |
| Plaster on lath .. .. | 0·034 |
| Plaster on tile .. .. | 0·025 |
| Wood sheathing .. .. | 0·104 |
| Felt 6.6 cm. thick .. .. | 0·75 |
| Audience per square metre .. | 0·94 |

These coefficients are ratios and are the same whether feet or metres are used. In the case of units the following are some of the values (the figures given first are for feet and the second for metres).

| | | |
|---|---|---|
| Audience, per person .. | 6·34 | 0·44 |
| Ash chairs, per chair .. | 0·016 | 0·01 |
| Cloth cushion, per seat .. | 1·95 | 0·13 |

The first building to which the calcul tion was applied before construction w the new Boston Music Hall, which in th way, although seating 1,000 more pe sons, was designed to give the same reve beration period, viz., 2·3 seconds, as t Leipzig Gewandthaus, famous for its go acoustics. It is interesting to note th if the Gewandthaus had been reproduc in the same materials but on an enlarg scale the reverberation period would ha been 3·0 seconds and would have be considered excessive. Thus a scale co is not necessarily an acoustic copy.

As the absorbing power of a substan is found to vary for different notes, d tortion of complex musical tones m be produced by introducing absorbe material. The balance to be struck in case of this sort must be determined musicians, and it would be useful to ha the judgment of musical authorities this point collected in a suitable form

The prevention of excessive reverbe tion by the introduction of suita material has been successfully acco plished amongst other places in the Lit Theatre in New York, and in St. Pau Cathedral in Detroit, the difference this respect between the original desig and the final corrected ones being sho by reverberation curves. The meth adopted was illustrated by lantern slid Similar illustration was given of one many cures after construction in the ca of the House of Representatives in t Rhode Island State Capitol in Providen

The apparently incompatible deman of speech and music as regards reverbe tion in a hall that is to be used for bo can be met by the use of resonant mater such as wood panelling in the neighbo hood of the orchestra. This gives fulln of tone without excessive reverberati The effects of resonance have, howev not been adequately studied in a sci tific manner.

# Correspondence

## Loading of Office Buildings

SIRS,—With reference to Mr. Percy J.
aldram's letter and other correspondence
at you have published bearing upon
e relationship of architect and builder,
e former wide division between the
ofession and its executants no longer
ists. This must be recognized by all who
e in touch with modern building move-
ents. To give but one recent instance;
contract with which I am concerned
ntained some intricate joinery construc-
n. The architect—a man of wide
perience—handed us a skeleton detail
th the remark, "I should like to have
e opinion of your technical staff as to
e detail of this construction." This
inion was given with pleasure.

In the old days it was rare for the
hitect to consult the builder. The
cepted relationship was simply, "The
ilder was there to do as he was told."
e movement of to-day is for the builder
be looked upon as an expert in con-
uction, and the architect is more and
re inclined to consult the builder
er technical problems. This should
vays be possible provided the builder
es not presume and exaggerate his
oper function.

Touching upon the remarks made as to
he opportunities of young architects
ning into physical contact with those
ces which they are supposed to con-
l," I may say that builders are from
ne to time honoured by visits to their
rks and jobs in course of construc-
n by the students of the architectural
ools. In the view of many these visits,
m the student's point of view, are too
requent.

The vast amount of construction now
course of progress in central London is
mful of interest to the student. It
uld seem that on free Saturdays he
uld be well employed in taking the op-
rtunity for inspecting, not only the actual
ilding, but the materials in course of
nstruction in the works. W. M. HILL.

## Registration

SIRS,—With reference to Mr. Perks'
ter in your issue for February 21,
. Perks must surely be labouring under
elusion about the interview I had with
drafting committee.

It seems to be Mr. Perks' intention to
nvey the impression that the Society
Architects were fully conversant with
details of the Registration Bill from
rt to finish.

Personally I cannot see that any useful
rpose can be served by mentioning my
me at all, and although I was at the
neral meeting and heard him say the
ne thing there, I thought the matter
s too trivial to justify taking up the
ne of the meeting in contradicting the
tement, but now that it is repeated in
Press, and is likely to create a wrong
pression not only amongst the members
the Society of Architects themselves,
t also amongst our other friends who,
hough not actually on the Society's
ister, approve and morally support the
ciety's activities, I feel I ought not to
ow inaccurate statements to go un-
llenged.

Towards the end of July, 1922, I received a communication from the R.I.B.A. that a sub-committee had been formed for the purpose of drafting a Registration Bill, and then were desirous of having an "informal" chat with me in my capacity as Mr. Sadgrove, and NOT as the "President of the Society."

In due course an appointment was made, and I met the following gentlemen: Messrs. Perks, Cross, Hubbard, Shepherd, Flockton, Gilbee Scott, and McAlister at 3.30 in the afternoon of August 10, 1922. Very little indeed was said about the Bill. Three resolutions only were mentioned to me, and these were not fully debated for the simple reason that the subject was turned to a dissertation on the relationship between the R.I.B.A. and its Allied Societies. I happened to be aware at that time of certain restlessness, etc., in that department, and suggested it would be better that they should first of all put their own house in order—of course, it was not exactly in those words, but that was the effect of it.

Mr. Perks, at that meeting, asked Mr. McAlister whether what I had said was correct, and Mr. McAlister replied in the affirmative.

It was arranged that the three resolutions above referred to should be sent to me for consideration. In due time I brought the matter before the "Society," and I believe Mr. Butler, the secretary, wrote to the Institute to the effect that the Society had not got enough information before it to enable it to express any helpful views, but were ready and willing to consider any draft Bill which might be submitted.

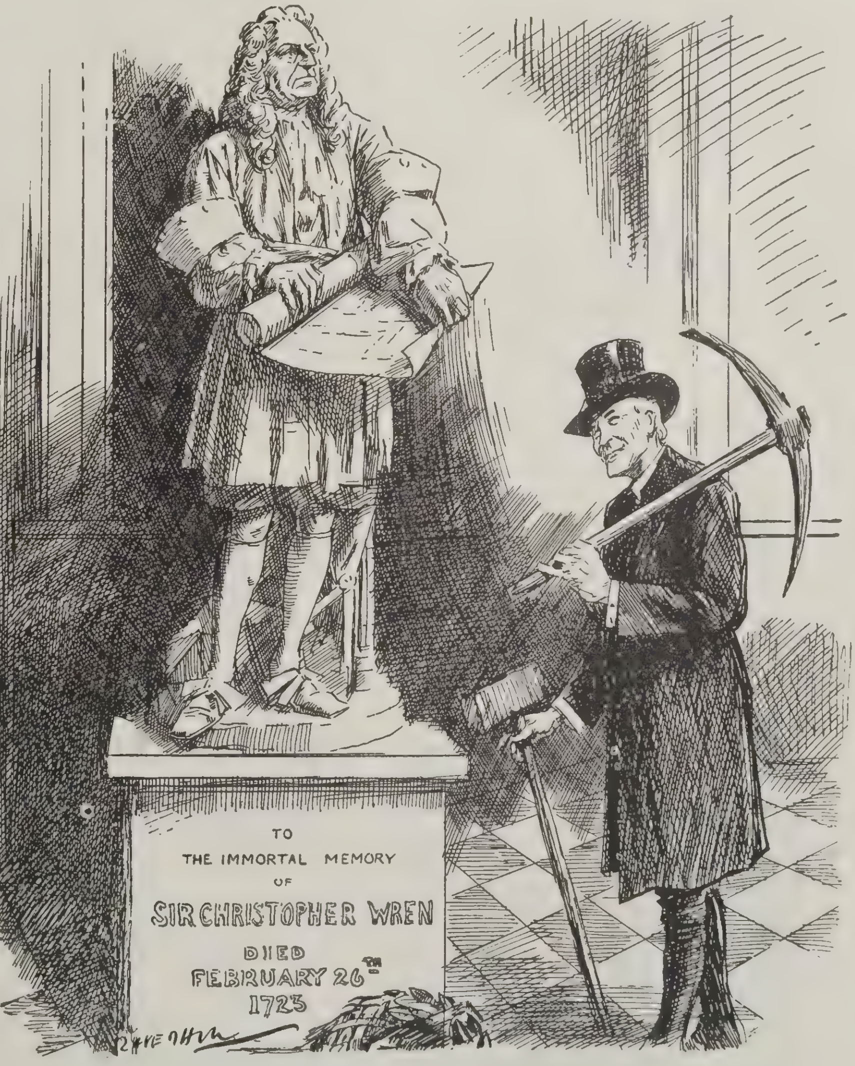
No answer was received to that, no draft Bill was ever sent, and the first time the Society knew anything of the clauses of the Bill was when it appeared in print in the R.I.B.A. "Journal."

In short, the Society knew absolutely nothing of the contents of the Bill, and it is consequently very misleading when Mr. Perks or other members of his committee make statements or convey inferences to the contrary.

Even there is exaggeration in Mr. Perks' remark about the "very friendly afternoon" which he says they had in Mr. Sadgrove's company. I arrived at 3.30, and was away again before 4.0, and I did not stay to tea. Of course, it was a friendly afternoon—what there was of it. Why not? I know every member of the committee personally, and they are all exceedingly nice men.

I am not annoyed because Mr. Perks has happened to make a misleading statement: he has forgotten, that is all, and what is more, I feel convinced he will receive my correction in the same good spirit as that in which it is made.

EDWIN J. SADGROVE.



*Reproduced by special permission of the Proprietors of "Punch."*

HAPPY THOUGHT.

The Bishop of London: "Ah! Wren! Great man! What can we do to honour his Bi-Centenary? I know. Knock some of his churches down!"

## Liberty's New Premises

Everyone walking along Regent Street will be attracted by the new contractor's board erected on the scaffolding for Messrs. Liberty's new premises, Tudor House. We give an illustration of it below, because the usual contractor's board is not a thing of beauty, and also we believe this to be one of the ways of making a new building of real interest to the public. Incidentally, it is an excellent advertisement both for the firm of contractors and their clients, and we congratulate them on this fact.

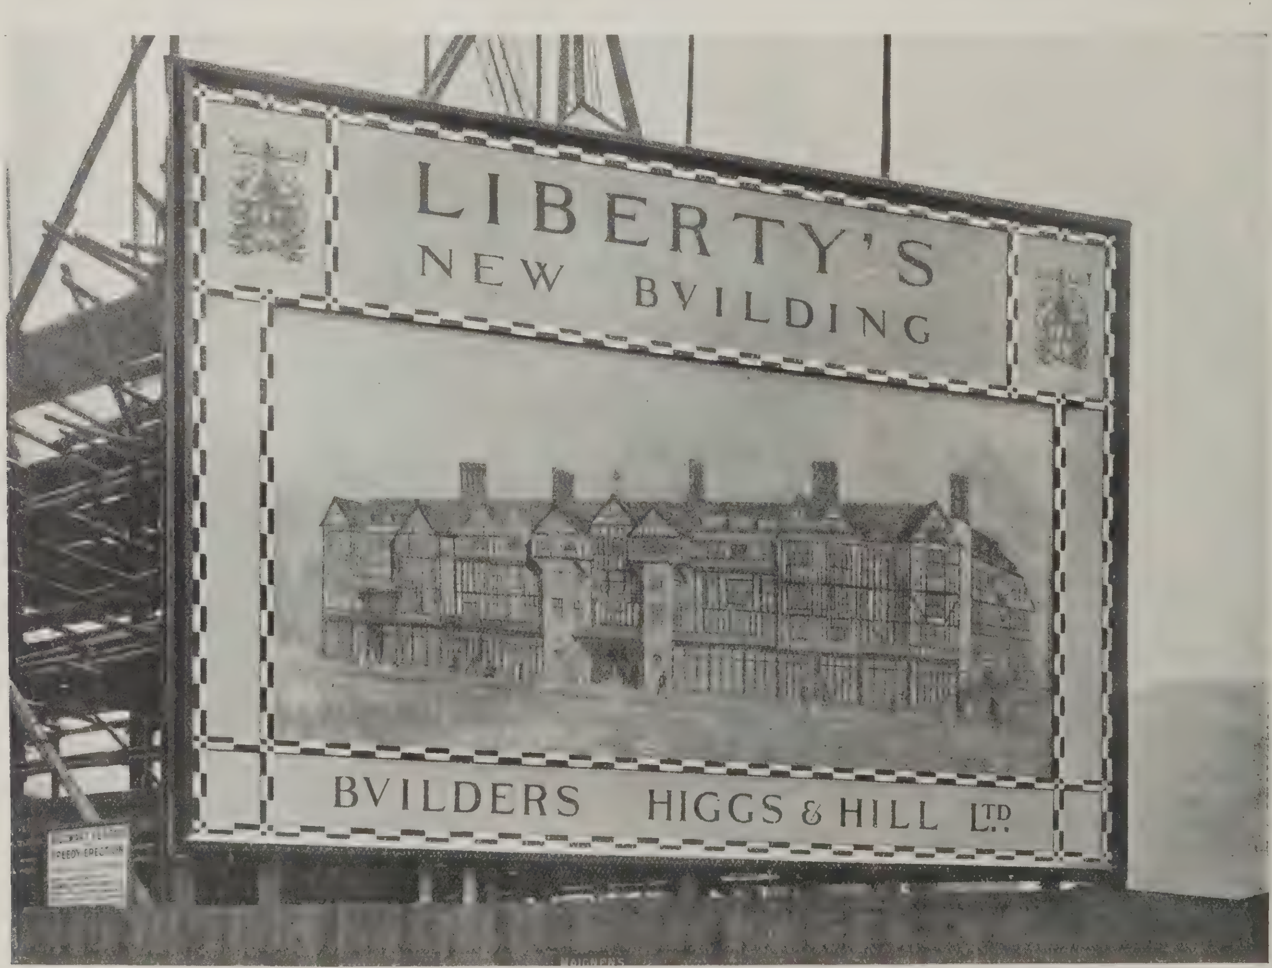
Like many other large business concerns to-day, Messrs. Liberty seem aware that there is far more real interest obtained, and therefore far more advertising value gained, by a well-designed and finely executed announcement than a display that is simply composed of huge lettering. Moreover, by showing a cleverly conceived rendering in somewhat romantic form of their new building they are taking the public into their confidence from the beginning of their enterprising departure, and they are creating the type of interest that will bring people flocking into their new building the moment it is opened. We are informed that the huge picture cost over £200, and it is money well spent.

## Electric Fittings and Appliances

In the new Birmingham premises of the Metropolitan-Vickers Electrical Co., Ltd. —Daimler House, 33-34 Paradise Street— the firm have brought together the general engineering office, the supply department offices, and the showroom and stores. The main showroom, on the ground floor, contains a comprehensive display of the electric fittings manufactured at the Birmingham Fittings Works, Harcourts, Limited, a subsidiary of the Metropolitan-Vickers Company. A large number of these fittings show the highest possible artistic merit. The designing staff are at the disposal of the architect, and all those interested in illumination in drawing up special schemes and evolving special designs to meet particular requirements. In this room are also shown heating and cooking apparatus together with other domestic appliances, the manufactures of the Metropolitan-Vickers "Cosmos" factory at Brimsdown. A portion of the showroom at the rear is laid out as an electric kitchen for the purpose of demonstration. Prominence is also given to the Radiophone sets manufactured by the company at Trafford Park. The general offices are adjacent to the showroom, and the basement provides ample storage accommodation for the large stocks of fittings and accessories which the company make it a practice to carry, in order to be able to give the best possible service. There is access from the main lobby of the building to a trade counter department in the basement, where the whole of the wants of the electrical trade in accessories are catered for. Here also is a second showroom in which the more industrial applications of electricity are displayed. An attractive exhibition is made of fractional horsepower motors, a representative selection of control gear, and a complete range of fittings for workshop, factory, and street lighting. The Glo-clad system of wiring, a product of Messrs. W. T. Glover & Co., Ltd., an associate company, is also adequately displayed. At Daimler House the Metropolitan-Vickers Electrical Co., Ltd., are in a position to meet every requirement of the electrical industry.

## Wren Period Mouldings

One of the foremost firms to carry on the tradition of the woodwork of the Wren period in this country is Messrs. Samuel Elliott and Sons (Reading), Ltd. Plates have been compiled by this company from authentic sources to delineate the wood mouldings of all the best periods, and the firm have now reproduced these mouldings for the benefit of their customers. In the Wren period there are mantelshelves, skirtings, dados, architraves, cornices, modillions, and panelling and other mouldings from such important buildings as Chelsea Hospital, No. 3 Clifford's Inn, Trinity and University College Chapels, Oxford, the Old House, Birmingham, St. Alfage, Greenwich, and other sources. The selection has been made with great care, and the sections have been accurately measured. The contours of the mouldings are correct in outline, though in a few cases modifications have been necessary at the backs of the mouldings to adapt them to modern constructional requirements. Other mouldings reproduced in a similar manner are of the Elizabethan, Jacobean, Georgian, Adam, and Louis Seize periods. A portfolio of the plates entitled "Authentic Mouldings" may be obtained from the company at Reading. In a foreword Mr. H. Austen Hall, F.R.I.B.A., writes: Architects will welcome a work of reference that provides a sound basis for design and encourages a closer adherence to some of the models of the masters of the past.



THE CONTRACTOR'S BOARD ON MESSRS. LIBERTY'S NEW PREMISES, IN REGENT STREET, LONDON.

# Book Reviews

### *An Electrical Pocket Book.*

To the larger section of the public the
ost notable advance in electricity has
een with regard to "wireless," but the
ther branches, although perhaps not so
opular, have also made great headway.
n the pocket book under review many
dditions have been made to bring the
hole of the information in line with
e latest requirements. Thus the trac-
r section has been completed by a
escription of the application of electric
ower to railways, the wireless telegra-
hy and telephony section has been re-
ritten by an expert; and the chemical
gineering section has been revised by
r. W. R. Cooper, M.A., M.I.E.E. The
ctifier section has been amplified to
clude the recent advances in high-
ower rectifiers, and the electric welding
ction to include progress in art welding.
he other sections have also been re-
ised and extended. This year has been
notable one in the history of the book
that it has passed from the hands of
s founders into new direction and con-
ol. The book is one of the most useful
at has come to our notice, and it is to
e hoped that its reputation will be main-
ined under the new control. The pocket
ok is edited by Mr. Conrad Arnold,
.M.I.E.E., and contains in addition to
diary, a buyers' guide and technical
ctionaries in French, Spanish, and
ussian.

"The Practical Engineer Electrical Pocket Book and
ary for 1923." Edited by Conrad Arnold, A.M.I.E.E.
enry Frowde and Hodder and Stoughton, 1 Bedford
ree, Strand, W.C.2.

### "*The Construction of a House.*"

Ever since the war, periodically the
ewspapers have given us accounts of
ow Mr. X has built his own house.
ometimes, even, it was a Mrs. X—or
en a Miss. And certainly these houses
ave stood up long enough at least for
em to have their photos taken, and,
rhaps, more was never required. But
the young builder is ambitious, and the
ouse is intended for living in rather than
r sale, we would ask him to study one of
e recognized building construction text-
ooks—finishing up, say, with Mr. Charles
ourlay's "The Construction of a House,"
which work Messrs. Batsford, Ltd.,
ave just published a second edition.

And no time will have been wasted, for
only fourteen pages of text and forty
ates of details and plans, Mr. Gourlay
ts the whole subject. And had the
thor set out to describe the construc-
on of a cottage, instead of a small man-
on with study, conservatory, tower,
lliard room, etc., the number of pages
ight have been halved.

Mr. Gourlay defines his purpose as
the presentation of a complete set of
refully designed plans and working
awings of an entire building, the
neral intention being that the student
ould prepare a similar set of drawings
r a building of his own design," and
so doing obtain a more complete
owledge of all the varied processes
ich are involved in the construction
buildings than if he were to attempt
attain this end by the study of de-
ched portions which do not form one
mplete design.

The author hopes that architects and
ntractors connected with any of the
ilding crafts will find this work useful for reference, and especially for assisting them to explain details connected with the art of building to young men under their charge.

During the twelve years which have elapsed since the publication of its first edition, we feel sure that Mr. Gourlay's hopes have been fulfilled.

H. J.

"The Construction of a House." By Charles Gourlay, B.Sc., F.R.I.B.A. London: B. T. Batsford, Ltd., 94 High Holborn, W.C.1.

### *The Decorators' Diary.*

Some important alterations and additions have been made in the twenty-first annual volume of "The Decorators' Diary and Trade Year Book." One of the most important is an exhaustive article on decorators' book-keeping, and specimens of the various account books which a decorator and builder should keep.

The list of painters' specialities has always been a very useful feature of this Year book, as decorators are not infrequently called upon to estimate on work described in a specification which calls for the use of a certain speciality with which they are not acquainted, and the name and address of the manufacturer is in each case given as a result of careful enquiry from every manufacturer of paints, oils, varnishes and kindred products in the country. The list may, therefore, be considered as quite up-to-date and comprehensive. The telegraphic addresses and telephone numbers have in a like manner been corrected.

The lists of painters' prices were calculated at 2s. 3d. per hour, the rate current when the 1922 volume was sent to press. Since that time the rates of wages for painters have decreased considerably, and they now vary from about 1s. to 1s. 8d., with a strong likelihood of their being changed again in the next few months. Under these circumstances, it has been deemed advisable to let the old prices stand, and to provide a table by means of which the price of any piece of work can be adjusted according to the rate of wages paid. This will render the price list adaptable for every place in the country. The diary is published by "The Decorator," 326 Bank Chambers, 329 High Holborn, W.C.1. Price 5s. net.

### *The L.C.C. Survey of London.*

The London County Council will shortly publish through Messrs. B. T. Batsford, Ltd., of 94 High Holborn, W.C., the eighth volume of its Survey of London, dealing with the parish of St. Leonard, Shoreditch. The volume will contain a wealth of historical information, fully documented, besides many illustrations of old houses and other buildings, which, by reason of their antiquity, associations, or architectural interest, are deemed worthy of being recorded in permanent form. The earlier volumes of this undertaking, which perhaps are not so well known as they deserve to be, deal with the parishes of Bromley-by-Bow, Chelsea, St. Giles's (including Lincoln's Inn), and Hammersmith.

## Decorative Woodwork at Victoria and Albert Museum

The Victoria and Albert Museum has recently acquired a valuable collection of decorative wood-carving, numbering upwards of 350 examples, which was formed during the course of many years by Sir Charles Allom, and has now been presented by him and by Lady Allom, as a memorial of their son, Lieutenant Cedric Allom, Royal Field Artillery, who died of wounds at Ypres in 1917.

The collection includes a considerable variety of panels and portions of panels, frames of doorways and windows, pilasters, capitals, and other details of decoration, many of them showing indications of the original gold or colour. It ranges in date from the Gothic period to the end of the eighteenth century; and, though the predominant styles are French of the times of Louis XIV and the Regency, later French work is well represented as well as English decoration of the seventeenth and eighteenth centuries.

In many cases, types hitherto unrepresented in the museum collections are now made available; and, as a whole, this generous gift furnishes far more than the nucleus of an index to the study of the art of decorative wood-carving during the periods covered, and, for this reason, will be of the greatest value to students and craftsmen. The collection is exhibited for the present at the west end of the west hall of the museum.

*Abstracts Published.*

189038.—Scaffolding.—Pitou, E., 507 Fifth Avenue, New York, U.S.A.—In suspended scaffolds, the attachments for the hoists are flexibly connected to the cross frames and secured against lateral and longitudinal displacement. The hoisting ropes 7 are suspended from cantilevers 6 and are connected to winches 8 on each side of the cradle, the winches being of the hand-operated ratchet type with a ratchet stop 12. Each winch is carried in a U-shaped frame *a*, the lower portion of which passes around a spacing block 16 with two rounded offsets, and is secured between the members 14, 15 of a transverse bearer or put-log. The frames and blocks may be disposed transversely of the cradle, in which case the members of the bearers are close together and the frames enclose the ends of planks, or they may be disposed longitudinally of the cradle, as shown in Fig. 5, but in each case there is a loose fit between the U-bearer and the ends of the spacing block so as to allow of flexibility.

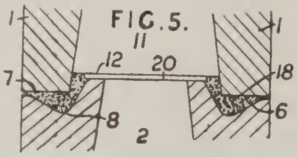

FIG. 6.

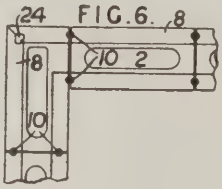

The above particulars are specially prepared by Messrs. Rayner & Co., registered patent agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

## The British Industries Fair

The British Industries Fair, 1923, organized by the Department of Overseas Trade, has opened at the White City, London. Concurrently with the London Fair a Birmingham section, organized by a special committee drawn from the Birmingham Municipality and the Chamber of Commerce under the auspices and support of the Department of Overseas Trade, is being held at Castle Bromwich. In the catalogue of the London Fair, which has just been issued by the Department, the names of the exhibitors, all of whom are British firms displaying their own manufactures, number nearly 800. The catalogue also includes alphabetical lists of the exhibitors in English, French, Spanish, Italian, Portuguese, Danish, Swedish, and Dutch, and a large amount of information of the greatest value to the visitor. Admission to the Fair is by invitation of the Department only, and is restricted to bona fide buyers for home and overseas markets. A special train and motor-bus service has been arranged for visitors who wish to visit both sections. The Fair is open daily, Sundays excepted, from 10 a.m. to 6 p.m., until March 2.

## Architects and Country House Lighting Sets

(*Contributed.*)

At the present time one of the most important problems encountered by the architect in connection with country houses is that of selecting the system of lighting. The advantages of electric light are obvious, and the initial cost of an electric generating plant is low, but many architects are still strangely unfamiliar with these plants, and depend almost entirely on the advice of their electrical contractor. The number of lighting sets on the market is legion, but in selecting a plant there are some important points which should be considered.

Of the three main types—hand-controlled, semi-automatic, and fully-automatic—it can be said in general that the engineer will always prefer the first because, although it needs most time and attention, every function is under the user's control. But for the small house, where in many cases the plant is being operated by a non-technical owner, the semi-automatic type gives the minimum of trouble and is the most suitable. The set can be started up from a switch—like a car with a self-starter—and when the battery is charged the engine automatically shuts itself down.

Simplicity of control and accessibility of working parts are important. It is better by far to have all the electrical gear on the front of the switchboard, where it can be seen, and where it is easily accessible. With regard to fuel, petrol is clean and avoids the necessity of a separate fuel for starting up and running; but paraffin nearly halves the running cost, and where a really efficient vaporizer is used it is perfectly satisfactory.

These points with regard to general type, drive, simplicity of control and accessibility, and fuel, are all insignificant when compared with those of (1) reliability; (2) running costs; and (3) first cost.

Reliability is a *sine qua non*, and the best way to secure this is to select a maker with a reputation for excellence, and one who is prepared, not merely to sell a set and decline further responsibility, but who is willing to give service, and see that the set is giving the utmost satisfaction after it is installed.

It should be remembered that running costs include not only the price of fuel, but also that of lubricating oil—a point which is often forgotten—and repairs.

In starting up a lighting set by the standard battery charging type of plant, the engine will be required to run only for a few hours once or twice a week on nearly full load.

# A Test for Town Planning: The Kent Coalfields

THE question as to the extent to which it is possible to preserve tracts of country of particular natural beauty inviolate against industrial developments is a delicate one. It is clear that there be no rule for general application. Industrial enterse cannot be put before all other considerations, neither, the other hand, does it do to take a firm stand on æsthetic, timental, or romantic grounds. Granted the need for ustrial development, and the consequent exploitation natural resources—and those who will not grant this form inority that would completely change the structure of organization, nay, our very ideals and outlook—the stion must be faced on broad national lines. What is t for the nation must be our consideration, and the fare of a nation is built of manifold conditions, of which y access to beautiful, unsullied country is not the least. tract of country may be of such particular beauty that presence of whatsoever natural advantages for indusl exploitation would not justify its destruction. On other hand, where the land in question has not this que distinction, and where there are other ample open ricts, to forbid mining operations or similar activities ld clearly not be in the best national interests. Under conditions, however, should such development be wed to proceed at random and without careful planning. country is full of warnings, the result of past folly, shness, and lack of foresight. The very essence of n planning as a science and as a branch of the humani- is to protect us against such things. To take an analogy n international politics, just as we should rightly say t the League of Nations had failed if it ever permitted ther great war to devastate a continent, so, too, we uld say that town planning as an organized activity failed if it ever permitted the chaos of the midlands to at itself in any part of the country. Neither example, it be understood, is the theory challenged; but its pracl application has failed under a severe test of current irs.

t seems that in Kent there is likely to be afforded such st, failure adequately to deal with which will stultify n planning as a practical help in coping with the daily culties arising naturally from the system of our organiza-. It is no new knowledge that parts of Kent are rich oal, and there has been sporadic exploitation for some . There is now, however, a definite danger that a new chaotic industrial area may grow up. Londoners have ys regarded the *home counties* as an extended recreation nd; as a place of easy access for solace from the mune oppression of the metropolis; but this fact cannot lude development of a particular area in one of them, e governing circumstances are sufficient to justify such elopment.

he first question to be decided, therefore, is whether or no the development is to proceed at all. And this should be considered on the lines suggested at the beginning of this article: Is the district unique for beauty or other reasons? Is it on reasons of communal health, mental or physical, essential that it retain its present rural character? Is the putative richness of its mineral deposits sufficient to justify the spoliation of its beauty? These are the main broad aspects of the matter. We think the verdict would be in favour of development, but were this so, it is quite certain that a rider would be added to the effect that such development must be on pre-arranged and orderly lines. And herein lies the danger. Development has begun on anything but orderly lines.

Most of the activity is in the neighbourhoods of Tilmanstone, between Canterbury and Dover, of Chislet, between Canterbury and Margate, and some of the companies concerned some time ago put forward proposals for the formation of public utility societies, which were to provide a great number of houses. The plans were well considered, the lay-outs of some being on lines used with success in other mining areas whereby the backs of the houses face service roads, and the fronts, with their gardens, are approached by a common footpath. The schemes, however, never matured, and only a few houses have been built, more or less at random. The development of a new industrial area, however, is much more than the mere provision of houses of whatsoever superlative quality. There is only one way by which the matter can be satisfactorily dealt with, and that is by means of a joint scheme prepared by a competent person or persons who will take into consideration all the various factors which synthesize an industrial area.

A conference should be convened at which the various local authorities, the colliery owners, and all interested parties are represented; a committee should then be formed and the services of a town-planning expert retained. A joint scheme should then be drawn up, which would regulate both the immediate and the future development of the area on broad and comprehensive lines. We have already seen by the report of the Doncaster committee how thorough such a survey can be made, and although conditions are not the same, for Doncaster itself with its railway works formed a nucleus which is lacking in Kent, the Doncaster report is a valuable guide.

If no action is taken by the authorities and parties concerned, it is sincerely to be hoped that the Ministry of Health will move in the matter. Under section 47 of the 1919 Act the Ministry has power to compel an authority to prepare a town-planning scheme. Surely this is an occasion when such power might with ample justification be employed. The matter is urgent, and calls for immediate action. These are days of quick development, and in a short time decisive steps are taken which can only be altered at great cost. The opportunity has then been lost, and the development, instead of being confined to certain pre-ordained districts breaks out like a virulent pox all over the countryside. And if this happens there is nowhere that the blame can be laid. Each colliery may be developed on the best lines for its immediate requirements and expectations, and with due consideration for its employees, and at present it is difficult to expect private enterprise to do more. Unless there is one local authority of sufficient importance or whose interests are sufficiently affected to induce it to convene a conference, disaster and chaos lie ahead.

Londoners (perhaps thereby typifying the nation) are notoriously apathetic, and it is they most of all who will bemoan the promiscuous industrializing of Kent. They, therefore, more perhaps than those in the immediately threatened neighbourhoods, must raise their voices in protest. They must agitate through the columns of the Press and through Parliament. Even if the danger is not so imminent as we imagine it to be, the district still calls for a regional survey and a regional plan, for if, as experts assure us, the district is rich in minerals, development cannot be indefinitely delayed. Safe in the knowledge of the existence of a finely-conceived, comprehensive scheme, which confines industrialism within reasonable bounds, and of the determination to enforce it when the time comes, we can await such development with equanimity. Failing this, we fear the worst.

---

## The Wren Banquet

The Wren Commemoration Banquet at the Hotel Victoria was one of those epic events that linger long in the memory. It was entirely pervaded by the spirit of Wren, whose pallid bust occupied a pedestal in the middle of one side of the chamber. Mr. Waterhouse had committed formal words to paper (and very eloquent words they are), but he was indubitably right in disregarding them and speaking, as he himself said, “from the heart.” Both Sir Reginald Blomfield and Mr. Mervyn Macartney followed this admirable lead. What the addresses may have lost in literary precision they undoubtedly gained in spontaneity and freshness. Freedom from the shackles of the written text enabled Mr. Waterhouse to bring in many effective incidental touches. For example, quoting the metrical criticism :—

“Would God that Wren's immortal hand
And more than mortal brains
Had built St. Mary's in the Strand
And not St. Clement Danes,”

Mr. Waterhouse commented drily that there was more Wren than Gibbs in St. Mary's. His description of the Warrant Design as one of Wren's sly jests was another illuminating touch. Nor was the speech lacking in the dramatic note, as when Mr. Waterhouse declared his belief, “as a Christian and an architect,” that Wren knew of the homage being done him that night. Masterly in its appraisement of Wren and his work, the speech had the true ring of oratory. It was worthy of the greatness of the occasion.

## Wren's Plan and a Critic

A distinguished architectural acquaintance recently observed to us that it was a fortunate thing for London that Wren's plan was never carried out. His reasons for this remarkable and somewhat reactionary view were : (1) That the continuity of London's arterial tradition would have been broken; (2) that Wren's plan has much of the gridiron monotony that makes the typical American city so uninteresting; and (3) that the genius of the British people expresses itself most naturally in makeshift, improvisation, and compromise. That these arguments have a certain amount of truth in them cannot be denied; but they are not entirely convincing. It may be said in reply to (1) that, although many of the mediæval characteristics of London's plan still remain, street widenings, new thoroughfares, and minor remodellings have entirely changed th general aspect of the City's face; in reply to (2) that convenience and good circulation are desirable principles o town-planning, and should not be sacrificed to picturesqueness; and in reply to (3) that if Wren's plan had bee adopted, later generations would not have had to expen millions of pounds on improvement schemes. A ba past is no excuse for a bad future. We must learn t learn from experience, even at the sacrifice of some of ou cherished national prejudices. We still feel regretful tha Wren's plan remains only on paper.

## The Architecture Club's Exhibition

The Architecture Club is to be heartily congratulated o its first exhibition, which is now being held at Grosveno House. Here is a first-rate show of photographs of moder architecture. Though primarily intended for the enlightenment of the general public (hence the absence of plans an drawings), it is full of interest for architects, who are hereb strongly urged to go and see it. The exhibition shows a least three things : (1) That English architects are stil supreme in domestic design; (2) that there is a marke improvement in what, for convenience, may be calle “monumental” work; and (3) that we are not behind an other nation in the photographic representation of architecture. In our opinion, this show is quite up to the hig standard of the exhibition of American architecture whic created such a stir here a few months ago. (Let it be said incidentally, that Burlington House could pick up quite few tips from Grosvenor.) For the guidance of those wh are not too well up in the topography of Mayfair, may w say that Grosvenor House is in Upper Grosvenor Street within a stone's throw of Park Lane.

## A Dangerous Client

Clients, no doubt, are of all sorts and conditions, but the may be roughly classified under the familiar headings o good, bad, and indifferent. The good client, of course places himself unreservedly in the hands of the architec and never interferes. But he is rare; we greatly fear tha the bad predominate, with a small leavening of the indifferent. But a bad client is not necessarily dangerous *Au contraire,* he or she may be distinctly entertaining There is the story of the lady who, dissatisfied with th designs of her architect, took a hand herself, and gave th builder some plans of her own. It is recorded that when th builder found that the chimney flues of the ground floo had no connection with those of the first, that the staircas had been left out, and that the only way to include th bath room was to hang it out of a window on chains, h went behind a tree and wept like a child. Then there is th well-authenticated episode of the country architect an his lady client who, after some disagreement about roofin materials, became involved in a heated argument; the lady unsettled by the menacing demeanour of the architect ultimately beating a hurried retreat down the High Stree crying nervously, “Slate!” with the architect followin behind frantically waving a pantile in the air and shoutin vehemently, “Tile!” About such clients there is nothin particularly dangerous. They either amuse or annoy yo —as you happen to be a disinterested spectator or th outraged architect himself. It has been left to Mr. St. Joh Ervine, the distinguished dramatic critic of “The Observer, to hold the threat of murder over the head of the luckles architect. Mr. Ervine would like to build a theatre—a ideal theatre—and he sets forth his views in detail, concluding : “The whole business of acoustics and heating wi be scientifically discussed before the theatre is built, and the architect fails to design a theatre in which it is possib to hear without strain and to sit without being half suffocated, or frozen, or blown out of one's seat by the draugh I will personally wring his neck for him.” Mr. St. Joh Ervine would be a dangerous client.

# The Architecture Club

## An Exhibition of Contemporary Architecture

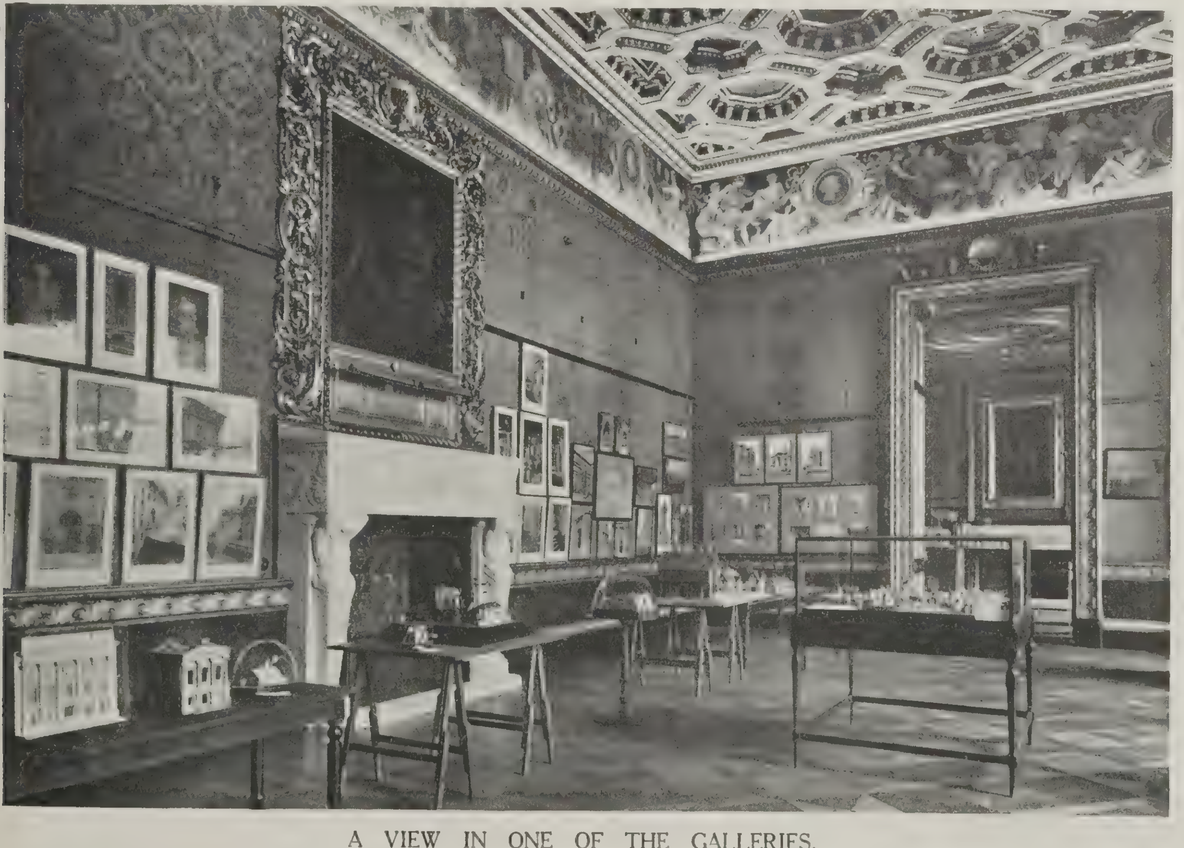
N an interview, published in "The Observer" of February 25, Mr. J. C. Squire, the President of the Architecture Club, explained the main objects of the promoters of this exhibition. "We think," he said, at if the public come to see it, as they ought, interest the best work being done will be greatly stimulated; t persons about to erect buildings will realize better n they have ever done in the past the importance of ploying the best available talent, as well as the fact that most conveniently designed buildings are usually the st beautiful; and that architects themselves will be isted to realize more precisely along what lines the ditions of the art are developing. It is obviously more ortant than ever to put up good new buildings at a e when there seems to be a mass attack of vandals on good old ones."

here can be no doubt that this exhibition will be a rked success and will have great educational value, not y for the general public, but for architects themselves, it is to be hoped that in future years the Architecture b will hold similar exhibitions of this and of other ds, for what is most needed in architecture at the sent moment is publicity, and the right sort of pub- ty. We want to make architecture a subject of general versation. That is the very first pre-requisite for the e prosperity of our art. It was therefore a good idea the part of the committee to institute lantern demon- tions every day during the exhibition, and if, after se demonstrations, the lecturer encourages the members is audience to ask questions, even welcoming any signs rgumentativeness on their part, he will be performing a y valuable service.

he Duke of Westminster has kindly lent the ground r of Grosvenor House for the exhibition, and the hand- e rooms form an admirable setting for the photographs models. Before making a detailed reference to the dern work which is here shown, it may be well to mention the historical section, which consists of a collection of models (some collected by Lady Constance Hatch and Lady Murray) of mediæval taverns and houses, complete representations of old towns, and several admirable Tudor and Queen Anne specimens.

With regard to the general arrangement of the photographs, it is clear that the committee must have had a difficult task, for they were faced with an old dilemma, with which every organizer of an exhibition of pictures must be familiar. Ought the photographs to be arranged by subject, that is to say, ought all the domestic work to be grouped in one place, the shops in a second place, the public buildings in a third, and so on; or is it better to arrange the designs by the artists' names, so that we can compare the work of Mr. Smith with that of Mr. Jones or of Mr. Robinson? Both methods of classification are instructive, but, unfortunately, they cannot be simultaneously adopted. At Grosvenor House there is a happy compromise in that the second method of portrayal has determined the general arrangement, but as in many instances the architects specialized in one type of work it has been found possible to have a certain amount of grouping by subjects also.

In my commentary upon the individual exhibits I propose to treat of the domestic work first, and shall make no apology for beginning with Sir Edwin Lutyens, for he is the only living domestic architect of whom it can be said that he has founded a school. Some of the houses here shown must be familiar to all who are acquainted with Sir Lawrence Weaver's book on Lutyens. Two of them, "High Wall, Gullane," and "Little Court, Tavistock," have always seemed to me the most charming houses that Sir Edwin Lutyens ever did, his simplest and most effective compositions with their plain fronts and massed chimneys on either side. Among notable designs worthy of close inspection I may mention Messrs. Detmar Blow and Ferdinand Billeray's "Wilsford Manor," and several



A VIEW IN ONE OF THE GALLERIES.

others by this firm of architects. "Drakestone, Stinchcombe, Gloucestershire," by Messrs. Milne and Phipps, is an admirable design in which the stone wallage of a large but rural house is beautifully treated. "Sherfield Court, Hants," by Gerald Wellesley, shows how thatched roofs are not necessarily associated with cottage work, but upon occasion can be fittingly employed in large houses treated in an almost formal manner. Two exquisite designs by the late Captain Winter Rose, M.C., are sure to attract attention. "Wolmar House, Marlow Common," is one of those long, symmetrical façades with low-pitched roof which lend themselves to quiet and dignified treatment, while his interior at Upton House, Cambridge, with its white walls and large simple panels shows an admirable taste of a kind which is thoroughly English in character. Mr. Philip Tilden has had full scope for his opulent talent at Port Lympne, where Sir Philip Sassoon has given him great opportunities, and his charming colonnaded interior court, the octagonal library with central table, and the spacious bathing pool in a formal setting are good examples of his style. Messrs. Baillie Scott and Beresford's "House near Windsor," shown by a model, is a most satisfactory design in the Georgian manner, and is interesting as an example of the gradual conversion to classic ideals which during the last twenty years has occurred in the minds of many English architects who started practice apparently with the intention of disregarding such ideals as completely as possible. "St. Anselm's Vicarage, Kennington," by Messrs. Adshead and Ramsey, with its broad, low front, and row of seven windows with green shutters, is a delightful composition; and the quadrangular block of "Old People's Dwellings, Duchy of Cornwall," by the same architects, shown in photographs and also in a beautifully executed plaster model, has an exactly appropriate character. We now come to that part of the exhibition which treats of "The Housing of the Working Classes," and it must be immediately admitted that the examples are extremely well chosen. Foremost among them is Messrs. Adshead and Ramsey's "Courtney Square, Kennington," one of the very few designs of outstanding merit which owe their origin to the urgency of "the housing problem." Here we have *urban* cottage architecture, in contradistinction to the extremely *rural* types which have been scattered all over the country in such profusion even in localities which were urban in character. No project of "slum reconstruction" should take place without reference to Courtney Square, which should be an important factor in reconstituting the right tradition of cottage building in our towns. At Dormanstown Messrs. Adshead and Ramsey show simple groupings of cottages distinguished by long roof ridges and a total absence of gables facing the roads. The resulting effect of reticence is most pleasing. Messrs. Hennal and James, on the Swanpool Estate, show an appreciation of the values of street architecture in the ordered composition of houses. Mr. Louis de Soisson's quadrangular group is quite one of the best things in Welwyn Garden City, and proves that admirable effects can be obtained from the simplest architectural motifs when these are skilfully handled.

Those who are interested in shops will probably first turn their attention to the striking model of Messrs. Peter Robinson's corner block at Oxford Circus, which is to be built from designs by Messrs. T. P. Clarkson and Austen Hall. This is a particularly interesting model because it shows four sides of a building, all of which required separate treatment, and far better than a drawing could do it enables us to appreciate the skill with which the different elevations have been made to harmonize with each other. Here the ever-recurring problem of the shop-front has been given special consideration, and Messrs. Clarkson and Austen Hall have arrived at an original solution of it whereby the shopkeeper's demand for a wide expanse of glass has been satisfied without any sacrifice of constructional proprieties. In the front on Oxford Street, which may be considered the principal one, the shop window is advanced about a foot in front of the façade, and extends over the whole centre part, leaving solid abutments as supports at each side, which are united by the mezzanine story abov a plane, rectangular piece of wallage punctuated by win dows, and this whole mezzanine story can be regarded a an immense transverse beam supporting the superstructur When this factor of stability had once been established th architects were free to adopt a columnar treatment for th upper stories. The unsatisfactory effect which would hav resulted if the columns had rested almost immediatel above a large sheet of glass can easily be imagine Students of the modern shop-front will also find much t interest them in Messrs. Richardson and Gill's notabl example in Leadenhall Street, here shown in photograp and also in Messrs. Heal and Son's premises, Tottenha Court Road.

Among office buildings the chief place in this exhib tion is taken by Mr. Corbett's Bush Terminal Buildin Aldwych, shown in an exquisite model which must attrac a great deal of interest, for it is sure to excite both admira tion and criticism. It will be admired on account of th remarkable elegance of its composition in which the element of an enormous fabric have been admirably harmonize It will evoke criticism on account of the audacity wit which a merely commercial structure presumes entirel to overbear one of the most beautiful and famous London churches and raises to the skies a massiv cupola which in this country, where civic values are sti respected, would normally be preserved for some publ building of exceptionally great importance.

The Clive Building, Calcutta, by Mr. Goodhart-Rende has already earned the reputation of being one of the be buildings in that city. Mr. Edward Maufe, in his Lloyd Bank, St. Albans, has preserved the character of bank This is easier to accomplish in a small bank than in a b one, as Messrs. Mewès and Davis's Parrs Bank, which also illustrated here, shows very clearly. When the ma offices of the bank are surmounted by many other storie in which, of course, the solidity of the ground stor cannot be maintained, a certain loss of character is inevi able. The ideal has only one main floor, like the old Bar of England. Shell Corner, Kingsway, and Astor Hous Aldwych, by Messrs. Trehearne and Norman, are interestin examples of modern office blocks. Three attractive mode are illustrative of public buildings. Messrs. Lanchester ar the late A. E. Rickards's "Westminster Hall" shows t design as originally conceived with the two cupolas whi the Middlesex Hospital vetoed, using their privileges in t matter of ancient lights. Sir John Burnet's extension to t British Museum is, perhaps, the most beautiful model at t exhibition, and shows the long row of Ionic columns to gre advantage, although it provokes the reflection, as does t original, that the treatment of the three doors is not sat factory, the central one especially appearing to be an aft thought, for it is inserted in the interval under the two centr members of the colonnade which ignores this central entran entirely. Mr. Austen Hall's Metropolitan Water Boa building is a most successful composition and has just t appropriate character. Australia House, by Mr. Marsh Mackenzie, has been invested with the architectural digni to which its subject entitles it. The New Parliament Buil ings, Winnipeg, by Mr. Frank Simon, a big, domed buil ing in the American tradition, is an imposing design. university buildings only one is shown, Professor Reill Students' Union, Liverpool, in which the refinement Greek detail is displayed to great advantage. And a pho graph of the elegant war memorial at Accrington by t same author will attract attention among the other memor designs which are hung in the long gallery to the right the entrance hall.

The visitors to this exhibition will find a great deal admire, but very little to criticize, for the Selection Co mittee of the Architecture Club has performed its ta extraordinarily well. For, granted that the volume of go contemporary work is too large to be shown in its entir at Grosvenor House, there must be remarkably few exhib which even a most exacting critic would wish to exclude

# The Bi-Centenary Banquet

## Architects of To-day Pay Tribute to Wren

ELOQUENT tributes were paid to the genius of Sir Christopher Wren at the bi-centenary celebration dinner held by the R.I.B.A. at Hotel Victoria, Northumberland Avenue, on nday, last week. It was stated that messages had n received from many distinguished societies, including Architectural League of New York and the Fine Arts deration of New York. Immediately after the Royal sts addresses were given "in honour of the immortal mory of Sir Christopher Wren." The President gave ome observations" on his character and genius, Sir ginald Blomfield, R.A., spoke on "Wren, the Artist and Man," and Mr. Mervyn Macartney referred to "Recent vestigations at St. Paul's Cathedral."

## Mr. Paul Waterhouse on Wren's Character and Genius

In the days of our great grandfathers' grandparents longer ago and no less, there lived and died in s England of ours a man so rich in the double thright of aptitude and industry that he surpassed level even of his cultured fellows in at least three ections. Each of these directions was in itself no simple th of knowledge.

He was a man, moreover, blessed by the heaven which d so endowed him with those three further gifts by ich alone man can hope to win in battle against the itations of time. He was granted not only longevity mind—a treasure far greater than mere length of days—t only an early ripening which it would be irreverent d untrue to call precocity, but also, and above all, portunity.

The three directions, or three roads of energy, were: ssic knowledge—the humaner letters, science in the se of universal physiology, and, for a crown of great ry, architecture.

I suppose that no greater nor more humbling honour uld fall to any man of my craft in my day than to be sen, by whatever accidents of time and circumstance, lead his brother craftsmen in an act of homage to the er-flowering memory of that more than great man—ren, Sir Christopher.

But in fact the honour has been added to, for our grimage of architects, its numbers swollen by the usands who were with us this afternoon in thought, not in body, was graciously increased by the presence distinguished men whose mission and desire it was to resent the great universities of Oxford and Cambridge, Royal Society, and younger bodies, which, if they nnot claim to have been spectators of Wren's life and rticipators in his activities, at least offer their thanks d praise on lines of entirely kindred sympathy. Specially lcome was the spontaneous and almost impromptu resentation of those trans-Atlantic brethren, the chitectural League of New York, between whose soul art and ours no ocean rolls.

I have been driven by a logical process, as convincing it is incorrect, to the conclusion that to-day's hero, man whom to-day we celebrate, was just four times as at as the men to whom we normally ascribe greatness. expose my process, for though I have discarded its in of reasoning as vicious, I am entirely confident of virtue of its result.

t begins by generously sacrificing one of the three mains into which I have partitioned the mental activities Sir Christopher. I cast his brilliant and fascinating tinity into the same scale as his architecture. Both, after all, are but the modes of an expression. The same study, the same play of brain which empowered him to master the syntax, etymology and orthography of architecture, give him the force to make his own the orders and elevational composition of Roman speech.

Against this I array his mastery of the universe of science, his pre-eminence as an astronomer, his acknowledged leadership in the realms of physics, mechanics, meteorology and chemistry.

In acknowledging these powers we find him to be not merely a man of two-sided knowledge—that, indeed, is rare enough—but of double superiority. He outran his companions on both courses.

We must go further. True as it is that no success in adventure exists without skill in discovery—or, rather, that creation does not thrive without nourishment—it is a fact known to all scientists and to most artists that successful and industrious research is not always accompanied by successful invention. Nor does archæology necessarily lead to art.

Here, however, was a man in whom the deepest powers of absorption went hand in hand with the brightest faculties of production.

*Ex nihilo nihil fit*, how true. But nothing, alas! can come out of something, too. *Parturiunt montes*, well and good; but, however, the answer to kind enquiries is simply *Mus*.

The mountains, for all the hidden ore that swells their depths of knowledge, have sometimes but a ridiculous monosyllable as their contribution to the world's progress.

Wren in his architecture and his science was a very Janus. One countenance faced the past with the sure smile of a conqueror; the other, Alexander-like, shot its glance of expected victory on the world of posterity. It matters not that his methods of learning in architecture were apparently miraculous, that no pen has recorded, perhaps no eye saw, his days of study; the past was his sure captive, and we, the posterity towards which his keen old eyes were strained, are his happy captives, too.

No need for me to interpret these metaphors into history, for indeed the history is before you all, and most of my hearers know it better than I do; but it is clear, is it not, that no man's architecture was ever more truly based on acute knowledge of the language of the past—a Latin or Romance past if you will—and it is certain that only by profound study of the work of his predecessors in the worlds of scientific discovery could any natural philosopher have illuminated his age with such brilliant original and inventive work.

I judge, then, that had Wren, by loss of early maturity, loss of opportunity, or by early death, so limited his energies that he could put forward one only of his four claims he would have won his niche among the great—if he had merely been an archæologist, an architect, an inventor, or a man of research.

On these grounds I hail him as a fourfold champion. But, brother architects, there is another road to our conclusion; and those of this distinguished company who have won their merited distinctions on other battlefields than ours will forgive us if for a few brief minutes we claim the whole gamut of Wren's "harp of diverse tones" as integral parts of his amazing victory-chant in architecture.

This may seem presumptuous on our part. That it should so seem is contrary to reason. Believe me, my non-architectural friends, what we claim for architecture we do not, we dare not, claim for architects. No architect worthy of the name would ever deem himself wholly worthy. All of us know that the mountain we climb is a Parnassus with a cloud-capped brow. Its summit is beyond our eyesight, and the path thereto is at its highest untreadable.

Far be it from me to suggest that Wren's corn-sowing drill, his apparatus for producing fresh water at sea, his disinfectant fumigator, his barometer, his self-registering thermometer or his rain-gauge were necessary adjuncts to his output as an architect, though I have little doubt that his diplographic pen found a place on his specification desk, while his special level and his cure for smoky chimneys were definitely what we should hail as boons to the office.

But emphatically I do say that the mind which was so equipped as to be able to devise such things, and still more the mind that mastered those deeper mathematical, geometrical and astronomic themes, which I do no more than mention here, was a mind which could make the highest flights of such a scientific brain ancillary to the mistress art of architecture.

Wren was a prince, an emperor, among constructors. Very few pocket-books of formulæ can have been of any use to him, for he was above and beyond them. We marvel at his daring, but it was a daring inspired and fortified by knowledge. The work he did—even if it be proved by other speakers to-night that he was over-bold—was not the work of foolhardiness, but of hardiness in scientific bravery. And it is certain that we are wrong in attributing merely to the skill of his undoubtedly skilful operatives the marvellous success of his genius in surmounting difficulties of gravitation, durability and span.

In the presence of certain notable scholars may I venture to come back for a moment to my association of Wren's Latinity with his architecture. We are a generation, probably the last generation in this country, of which some can remember the writing of Latin verse. There are some here who can recall that performance with pleasure, and they will remember how very close as an exercise of the brain that pursuit lies to the practice of architecture on traditional or classical lines.

There is necessary for its performance a good knowledge of the medium and a reasonably full vocabulary. These are acquisitions which a young schoolboy seldom has in generous measure. The Inges, the Ronald Knoxes, the Pembers are rare.

But given these—I may explain that they were not given to me—the game is a glorious game. There is an idea to be expressed, to be expressed if possible with dignity, and to be expressed, moreover, in symbols, counters, words of fixed significance and of fixed metrical value. Their disposition as sentences is governed by the strictest of rules. Moreover, though there is generally an umpire at hand, no rule of this game can be bent to suit the writer's difficulties, for the committee that framed them was dead and buried in or about the year zero A.D. A solecism is the writer's bankruptcy, a false quantity or a false concord is his death.

I would not say that the rules of architecture are as harsh as that, for our language, ancient as it is, is a living tongue; and we can breathe into it such little changes of syntax, such little shiftings of accent, and (but very sparingly) such timid inventions of new words, or of new meanings for old words, as make the difference between a Shakespeare and a Tennyson. But this small privilege of licence—a licence which must never quench the recognizable melody of the old and ever-ageing tongue—can never obliterate the astonishing likeness between the literary and the architectural arts, both of which have to achieve their expression in the language of our forefathers.

That Wren should have been a good Latinist is, I admit, less remarkable than that he should have been a much more than good architect.

Dr. Busby, though but at the beginning of his long career, was no doubt already an expert with that instrument on which he became a world-famous soloist. In any case, Westminster stood for good Latin, and young Christopher left, at the age of fourteen, with a Latin equipment far better than that of a good second year Oxonian of our day.

In architecture, it is true, Wren had personal advantages. His father, Dean though he was, and a very manifold incumbent, was no mean amateur in architecture, and no inconsiderable patron. A seeming paucity of first-rate professionals, and a very high level of knowledge in the standard of that acquaintance with architecture which was the adornment of many a non-professional connoisseur, made it comparatively easy for a gentleman of Wren's superlative culture to glide—almost to drift—into what we should call practice. And so, though Wren's earliest openings were surveyor-like, in our limited sense of this word, it is scarcely with surprise that we find him embarking under his father's patronage on the Pembroke Chapel at Cambridge, and under that of his own University, the Sheldonian Theatre. Scarcely, again with surprise, do we find these two buildings to be, if tentative, at least scholarly. None, however, of these explanations will annul the marvel of so rich a maturity of architectural knowledge in a mind whose energies had been spent—one had thought absorbed—in the career of an accomplished leader of scientists and *literati*. Mark how at this stage that Providence which seemed ever ruling his destiny towards completeness came to his aid. The Plague sent him to Paris, no bad school of architecture, in almost divine preparation for that fuller life of architecture into which he was to be flung by fire. And if we admit here an intervention which seems superhuman, may we not acknowledge also that it was the Divinity which shaped his end that kept him from the realization in stone of the warrant design for St. Paul's?

And now, having praised his perfection, may I ask you to glory also in his imperfection?

You will have experienced, if you are an acute student of architecture, one, two, or perhaps three disappointments in connection with Wren's work. There will be a building, or perhaps part of a building, which seems to you not indeed a blot on Wren's fame, but a slight dimness in his brightness. Your first thought on feeling the pain of this discovery will have been a very proper stab of self-reproof.

I am not sure that such an attitude is not the right one, for of Wren it may nearly be said that

> "The very errors of his master mind
> Were greater than the virtues of mankind."

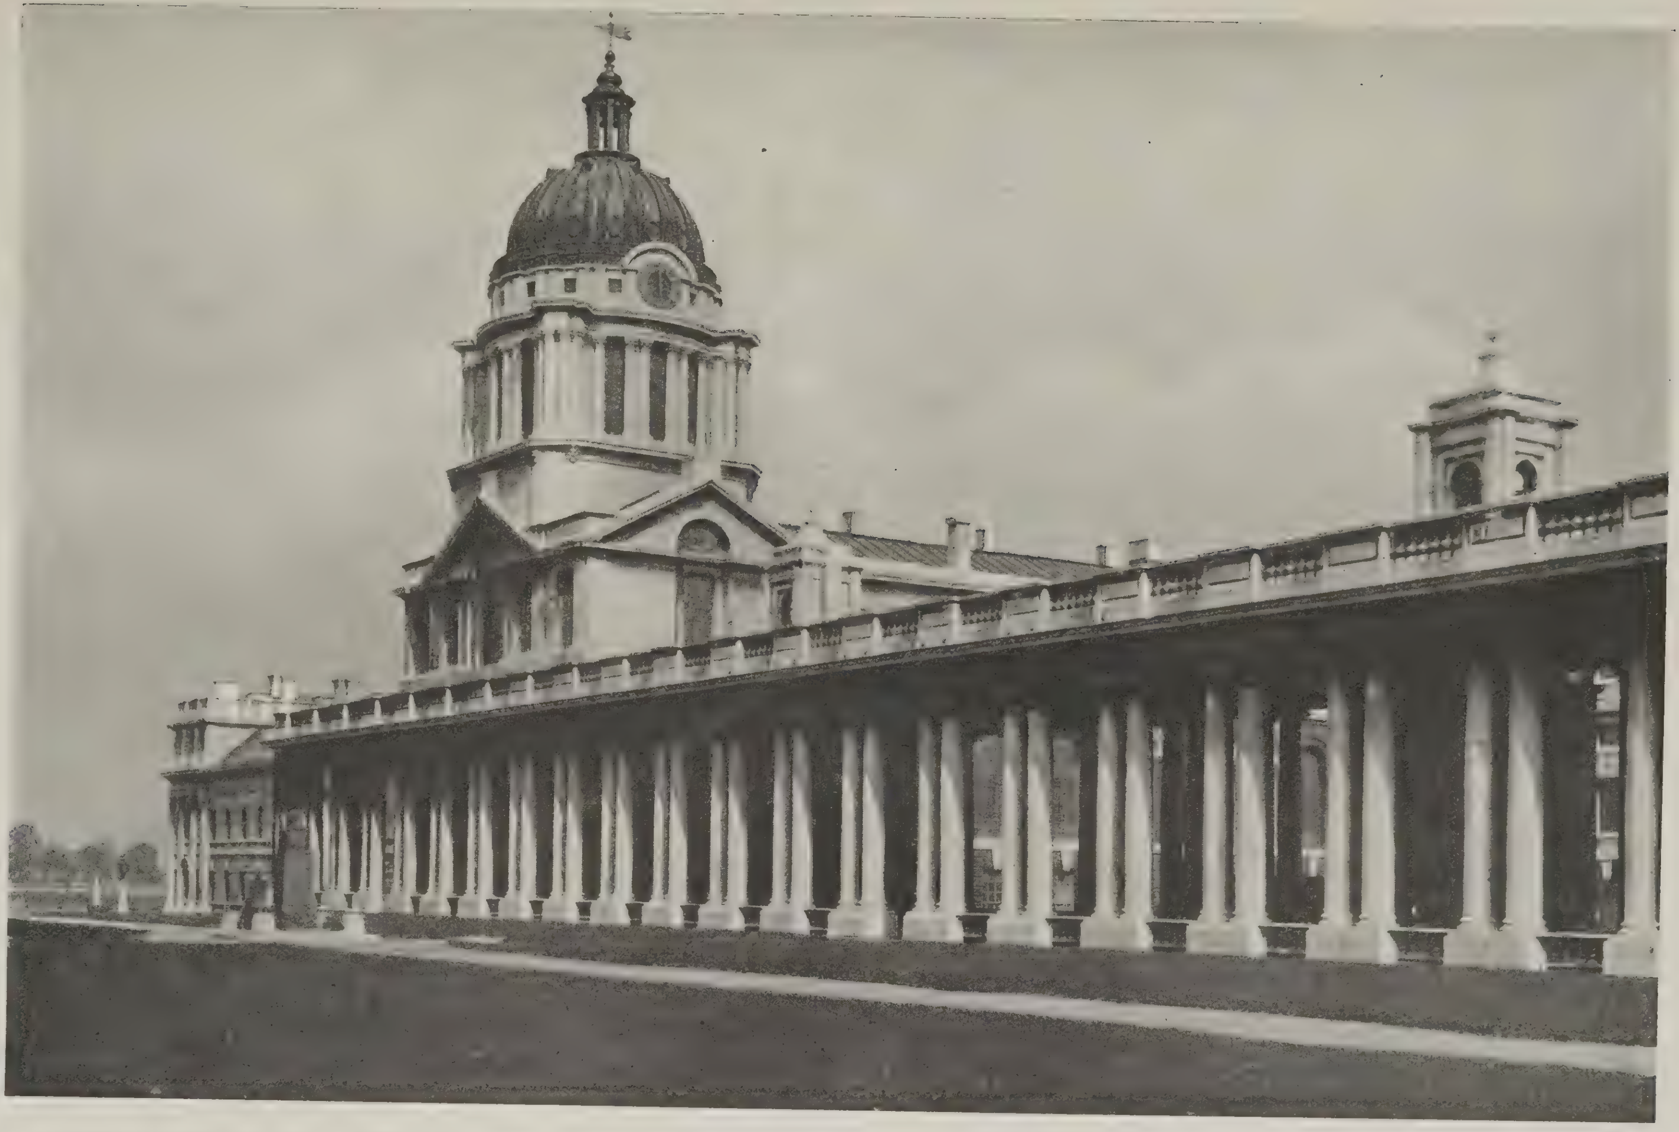
But there is a happier way. Had any lesser mind than Wren's been forced to make performance follow so close on the heels of learning, what, think you, would have been the number of his trespasses? And Wren, whose great knowledge was for ever getting greater, what think you was his judgment on the things that trouble you? Depend upon it, brother architects, that grand old man in his latter days could have taken you round London and shown you in his own work more errors than eve you or I should find. So when we see these things, these very few, and pride ourselves, however regretfully, on the keenness of our critical vision, let us cast aside that pride and those regrets, let us leave our judgment unspoken among our fellows, and let us, without smothering ou opinion—for opinions are always worth forming—let u keep the matter as a secret between ourselves and Wren. In such secrets held close with great minds of the past there is strange happiness.

I end with what I believe to be the thought of us all. We to-day pay reverent homage to a man so dowered wit the gifts of genius and with the spirit of industry that his leadership in the field of natural science found no equal save in his supremacy as an architect; one, moreover, whose culture in classic literature was balanced by character so gentle and alluring as to win this outburst from a contemporary:—

"It was doubtful whether he was most to be commended for the divine felicity of his genius or for th sweet humanity of his disposition."

# Monumental Architecture. 8.—Greenwich Hospital

Sir Christopher Wren, Architect



Greenwich Hospital is, perhaps, Wren's most stately work. At Greenwich Wren had to incorporate the buildings erected by his predecessors, but he quickly grasped the magnificent opportunity presented by the site, and in the scheme which he devised, and which was subsequently carried out, he reached the highest degree of breadth and largeness of design.

UNIVERSITY OF ILLINOIS

# Sir Reginald Blomfield, R.A., on "Wren : The Artist and the Man"

I have been asked to make a few remarks on Wren, and the first thing that occurs to me is the eccentric methods that have been adopted to celebrate the bi-centenary of his death. The Bishop of London, advised by one noble lord and urged on with some truculence by another, proposed to celebrate the occasion by demolishing some nineteen or twenty of Wren's City churches; thus reversing the Hebrew custom of first stoning your prophet and then building a shrine to his memory, and saving us from the necessity of further burdening our memory with the work of the past. Our methods here, at any rate, are more genial; following, apparently, the precedent of Guy Fawkes, we are celebrating the bi-centenary of Wren's death with festivities, this excellent dinner to be followed, I am told, by a dance somewhere else: a little unusual, perhaps, yet there can be no doubt what we mean by it. It is a mark of our admiration and affection for the memory of one of the greatest artists England has ever had.

Wren's career, in a way, was an amazing anomaly; I doubt if any other architect has ever been placed in a position of first-rate responsibility on such an absolute minimum of technical training. It is a remarkable fact that, out of the six leading architects of the seventeenth century, two (Wren and Perrault) started as amateurs, and the third was a sculptor who prided himself on translating sculpture into terms of painting and treated architecture as so much modelling clay. Wren himself was born in a good position, highly educated in the Humanities, which then included science. He was regarded as a prodigy of learning and ability while still an undergraduate. From Wadham he proceeded to a fellowship at All Souls. He was appointed Gresham Professor of Astronomy in London before he was twenty-four, and Savilian Professor at Oxford very soon afterwards. By the age of thirty he was recognized as one of the leading scientific minds of the day by John Evelyn and all the intelligentsia of the time.

With the Restoration came his chance. The fortification of Tangier had to be considered. Poor old John Webb, an able and experienced architect and the last representative of the Inigo Jones tradition, was forgotten; and the work was offered to Wren, who declined it, but was promised the reversion of the office of Surveyor-General, and in fact succeeded to it a few months later—a job even more flagrant than that by which Jules Hardouin Mansart superseded Lepautre at Clagny, for here was Wren placed at the head of all the architects of the time in England and entrusted with most important duties, though all the architecture that he had done so far was an unimportant college chapel at Cambridge. So far, in fact, he had received no systematic training in architecture at all, yet instead of beginning at the foot of the ladder he started on the topmost rung.

A man of less confidence in his own consummate ability would have been daunted; not so Wren. He wrestled with Serlio and Fréart, both very inaccurate writers, and in 1665 set off for his famous six months' stay in Paris, armed with excellent introductions, and fully determined to pick the brains of all the best French artists. This was the time when Bernini was struggling in vain to make headway against the well-organized opposition of the French architects, and Wren caught a glimpse of his designs, but it was a glimpse only. Wren also visited all the famous houses in and about Paris, but it is to be noted that the work he saw belonged to the older generation, soon to be superseded by Colbert's young men, and the brilliant staff of Louis XIV. Wren wrote to a friend that he was bringing home "all France on paper"; but "all France" could have been little more than the houses round Paris, as shown in the drawings of Silvestre and the elder Marot, and perhaps those interminable designs for ornament by Jean Lepautre; not much of a training for a first-rate architect, nothing approaching that of the French architects, or of Wren's great predecessor, Inigo Jones, who paid two visits to Italy, studying on the spot and making most careful critical and analytical notes on the architecture of the Romans, on Palladio and others.

The result of Inigo Jones's studies was that, at the age of forty, he was a most accomplished architect and was able to produce that little masterpiece of Neo-Classic, the Queen's House at Greenwich; whereas Wren, at the age of thirty-five, could do no better than the shapeless lump of the Sheldonian at Oxford, which in its technical incompetence and absence of feeling for beauty of line, of proportion, of composition, is perhaps the worst building erected in Oxford prior to the Gothic Revival. I need only call your attention to the south façade, facing to the schools, an ambitious attempt at a grandiose design by a very ingenious but most imperfectly trained young man. And in referring to this let me say at once that great artists are not to be judged by the experiments of their youth, but by the high water mark of their attainment; and I have called attention to this weakness of technique in Wren's earlier work because it makes the extraordinary mastery of his art that he gained in his mature days all the more remarkable. Moreover, technique, highly important as it is, is not the final criterion of Art. There have been artists who have made it so—the archæological classicists at the end of the eighteenth century, Ingres among painters and others; but technique is not an end in itself but a means to an end, the expression of the artist's ideas, ideals, and visions. One has to consider, further, the complexity of the problem that the architect has to solve. In the Parthenon, for instance, one finds the idea and its expression in perfect harmony, flawless and unimpeachable. But the Parthenon, based as it was on a long and well-understood tradition, was a simpler building to design than, let us say, the Thermæ of Rome, or St. Paul's Cathedral.

One may admit that Wren had not the perfect instinct for form and proportion of Inigo Jones, of François Mansart, of Jacques Ange-Gabriel; but he possessed, in a higher degree than any of them, inexhaustible invention and resource. His mind, of great natural acuteness, was trained to a fine razor-edge and went straight to the heart of matters. Consider, for instance, his scheme for the laying out of London. He may not have mastered the technique of architecture in his six months' stay in Paris, but no Frenchman could have helped him to that masterly scheme, in which he anticipated most of the theories of our modern town planners, the linking-up of buildings, the axis line and the radial treatment, the conception of the City as a whole and not as a collection of details. Consider, for example, his streets, ninety feet wide for the main thoroughfares, sixty for the secondary ones, and thirty for minor roadways.

Nearly a hundred years later, when the great competition for the improvement of Paris was held, the French architects had not got beyond 36 ft. as a maximum, and except in Portland Place we have not yet reached 90 ft. One finds the same versatility and quick grasp of conditions in the City churches. Wren had to design them under most difficult conditions of site, time, and money, yet how admirable they are! The great French churches of the seventeenth century are fine in their way, but there is a deadly monotony about them; as one French writer puts it, the Jesuit church rears the same implacable façade in every land and under every sky. They had lost the secret of the Parish Church, their churches were useless as models for Wren; and all he found in England of recent church building consisted of the Caroline churches in which degenerate Gothic struggled with bastard Classic. Wren had to find his own way. He took as his data the strictly practical conditions of the churches, and these he translated into forms characteristically English, availing himself of the full paraphernalia of Neo-Classic, yet weaving into it reminiscences of earlier work, so that these towers and steeples were not exotics, but spoke at once to the English people in a language that they recognized as their own, and they preserved that individuality and that kindly character which in England is of the essence of a Parish Church.

I have pointed out the inadequate training that Wren received in architecture; he was under no master: indeed, he himself was his own master. Few men have had his opportunities of learning the art of building from their actual design and execution, but few, if any, have ever made such an amazing use of their opportunities as Wren did. Not only was Wren's a master mind, but he possessed the modesty of the true artist, who thinks of his work before he thinks of himself. He probably realized his own mistakes long before anybody else, and the rapidity of his development was due to his incessant criticism and analysis of his own work, learning from his own mistakes, accumulating vast stores of knowledge from his actual experience on the scaffolding of his buildings. Where other men have advanced by slow and laborious stages, Wren advanced *per saltum*, and the most extraordinary instance of this is St. Paul's Cathedral. Wren appears to have made several designs. There was his own favourite one, rejected by the clergy with some justice, inasmuch as though pleasantly reminiscent of some of the projects for St. Peter's, it was quite unsuitable for the purpose of the Cathedral. Then there was the utterly preposterous Warrant design, that nightmare conception of a huge dome, truncated half-way up, on which was to be reared a drum and another dome, which again was to have its top cut off and to be continued in a telescope steeple in six stages. This was the design " pitched upon," as the Royal Warrant put it, as " very artificiall, proper, and usefull." And my impression is that the authorities, being wholly ignorant of architecture, tossed up as to which of the designs they should select. Yet it was from this most unpromising start that Wren began and carried through to completion the glorious building of St. Paul's Cathedral as we now see it.

It was the same with nearly all Wren's buildings, they are so much finer in execution than as shown in his draft designs; and the reason is that Wren's splendid genius was constantly at work, playing round his building, criticizing and correcting. St. Paul's has been treated with contempt by a famous poet, whose criticisms of architecture were inspired less by any knowledge of the art than by anxiety to prove certain theories of political society. I have the greatest admiration for that poet in other regards, but when he came to deal with architecture he seems to me to have parted company with common sense and the facts of history. If ever there was an architect who thought in terms of building, that man was Wren.

One or two reflections occur to me as the result of my meditations on Wren's career. The first is in regard to the training of an architect. It is the custom generally to start the technical training of students early, either directly in an architectural school, or in a modified and rather more generalized form at one or other of our universities; the inevitable result is that general education has to be cut short, and this omission can never be made good in later life, because the aim of good education is not to cram in knowledge, but to train and discipline the mind while it is still malleable. Wren is the most conspicuous example of an architect who did not take up the technical study of architecture till he had completed an unusually thorough course of general education; and he supplies the most convincing evidence in favour of the gymnastic theory of education. It may be said that Wren was exceptional. To that I would say, this only proves the folly of the prevalent theory that anybody with sufficient training can become an architect, and that all you have to do is to supply the crude material to our costly State-aided and other machines, turn the handle often enough, and out comes the architect.

I would say, on the other hand, that the natural endowment necessary for an architect is rarely found, and that it was the existence of this in Wren that was the other factor in his amazing skill. The other thought that occurs to me is that of the man behind the architect. We are too apt to believe the fanatics who impress on us that modern architecture is a mechanical affair without a soul of its own. I do not believe it. An architect can express himself in his art; indeed, he can give himself away. And one finds the meticulous man meticulous in his work, the small man small, and the great man great: and this is where Wren was so splendid. In all his mature work one finds the quality of the man reflected, not only in his resourcefulness and invention, but in a certain fine balance of intellect. His was a cheerful, sunny nature, friendly, companionable, and humorous, and it is this that endears his work to all of us as something peculiarly and intimately English. One does not think of him as one does of Jules Hardouin Mansart, elbowing his way to the front, flattering the great, trampling on the weak, and ending up with a marquisate and £30,000 a year, and the contempt of most of his contemporaries. One thinks of Wren in his dignified old age, visiting his masterpiece once a year, " as well pleased to die in the shade as in the light," and showing in misfortune the same dignity as he had at the height of his career, a man who in his life had enjoyed the affection and admiration of all the best men of his time; and to whom in his death one might apply those famous words of Pericles, " The whole earth is a shrine to the memory of illustrious men."

## Mr. Macartney on " Recent Investigations at St. Paul's "

Mr. Mervyn E. Macartney, F.S.A., F.R.I.B.A., Surveyo to the Fabric, gave an interesting account of the " Recen Investigations at St. Paul's Cathedral." He first calle attention to the foundations, which were very shallow Soon after the building there was a slight settlement, bu he did not think it had increased much since. Recentl they had been down to expose the foundations, but so fa as they could judge there was no great settlement. The found what they did not expect—that large stones place there belonged to Inigo Jones's portico, as they had classic mouldings. They found that the layer of clay was mois The eight piers of the dome tilted towards the dome are very much like a man standing on tip-toe. There was als a slight inclination of all these piers towards the sout and the river, and they found that all through the Cath dral. It was not very much. The next thing they foun was a distinct tilt of the dome towards the south-wes He believed that it started very early and that they trie to compensate it afterwards, because it was only 1½ in. the level of the Whispering Gallery, and 96 ft. off the flo of the Cathedral. They also found that the dome was n circular, but it was a very fine ellipse, and was 6 in. wid from north to south than from east to west. Consequent there was a slight break in the dome at each end. He d not know how to explain it, except that he thought th the pressure of the dome was equal all round, but t supports of the nave and of the choir were heavier th those of the north and south.

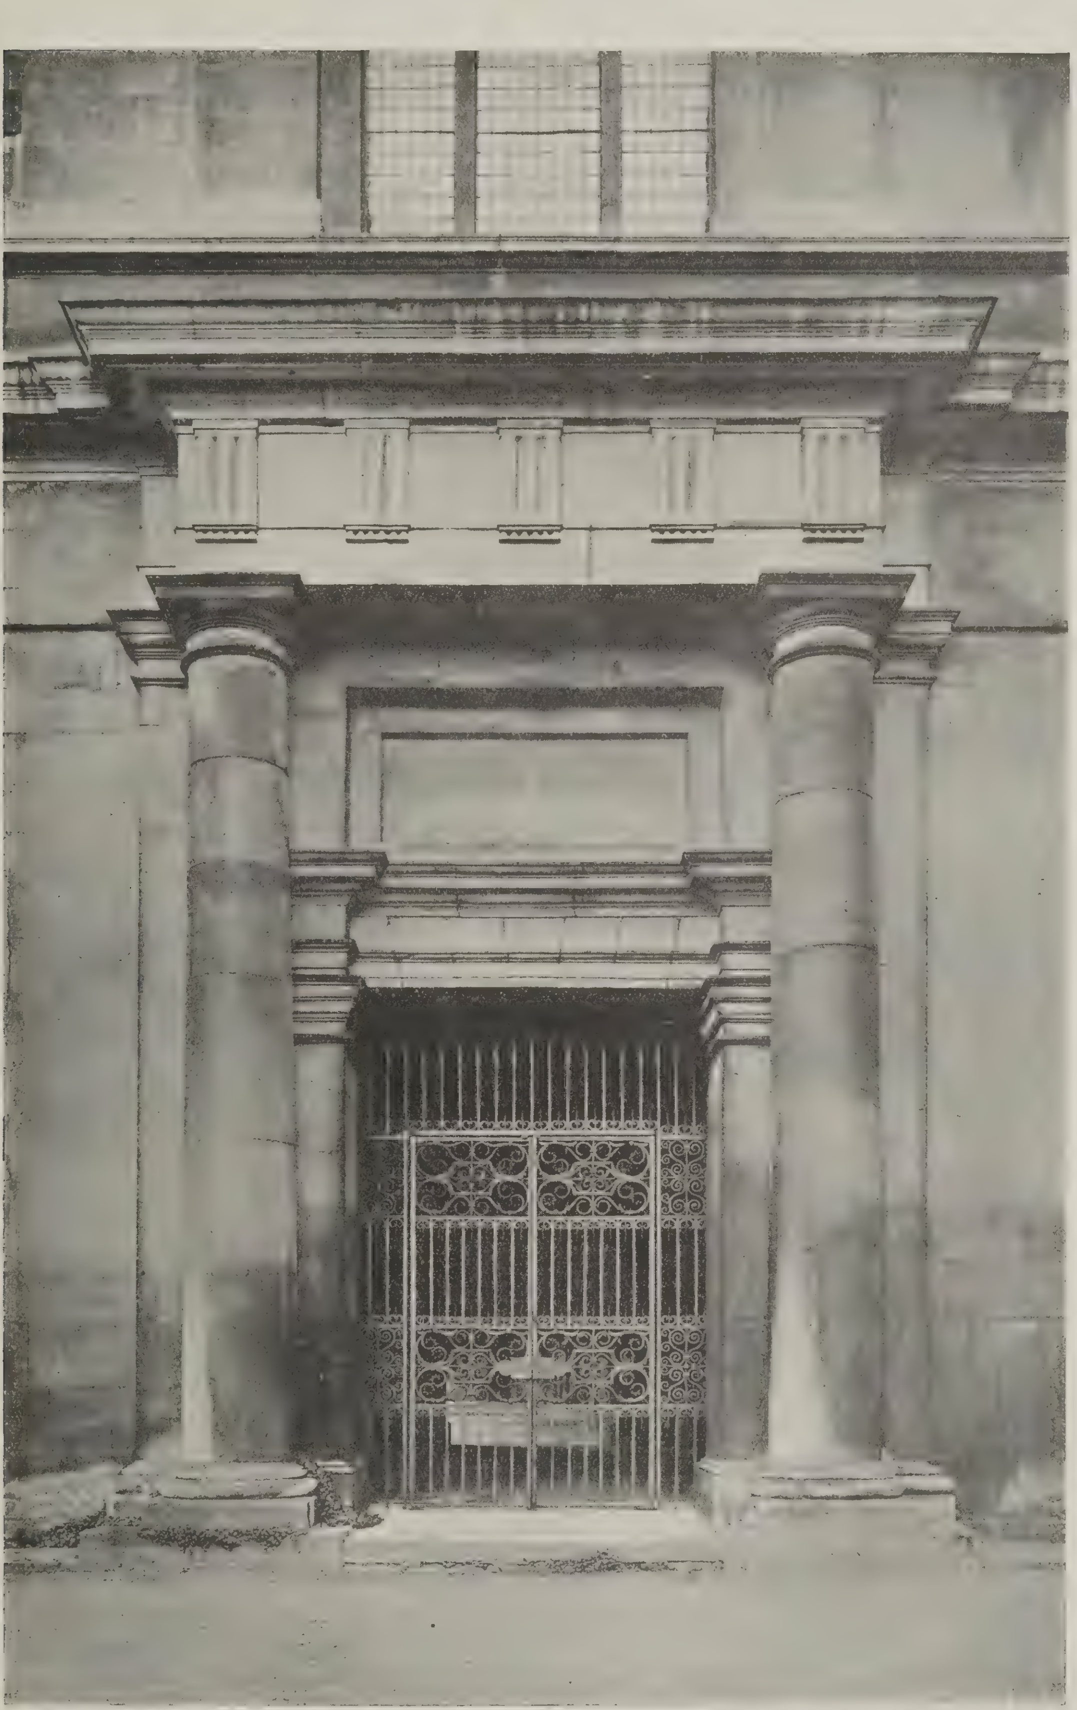
There was a good deal of veneer in the building—som of it in very bad condition—fastened on by iron cramp which had rusted through. During the years 1807-9-1 while Wren was still in charge of the work, it was estimat that as much as 18,000 ft. super of stone was used up repairs. Strong was the builder at that time.

The stonework of the lantern was also in very b condition. The vases upon it, which were hollow, we found to have perished 1 in. on each surface. The ster of the vases were consequently very frail. Wren apparent did not reckon upon the wasting of the material. T vases had now been tied up to prevent their falling abo the heads of the public.

In his introductory remarks Mr. Waterhouse ackno ledged the debt of the Institute to Mr. H. M. Fletcher

# Architectural Details. 44.—Doorway of Trinity College Library, Cambridge

Sir Christopher Wren, Architect



Wren's own words concerning the details of Trinity College Library are worthy of note here: "Wee are scrupulous in small matters and you must pardon us; the architects are as great pedants as Criticks or Heralds."

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

connection with the bi-centenary arrangements. He also spoke of the splendid way in which the allied societies had rallied around them. Speaking in French, he referred in graceful terms to the presence of M. de Saint-Maurice, Membre du Conseil de la Société des Architectes Diplomés par le Gouvernement, and of M. Augustin Rey, Société Centrale des Architectes Français. M. de Saint-Maurice replied.

Lord Balfour then proposed the health of the President, which was toasted with much enthusiasm.

## The Guests at the Banquet

Following is a list of those who were present at the banquet :—

Adams, Mr. Maurice B.
Adshead, Prof. S. D.
Alexander, Canon S. A.
Allardyce, Mr. H. W.
Anderton, Mr. F. R.
Ansell, Mr. W. H.
Archbishop of Canterbury, His Grace the.
Armitage. Mr. Edgar
Ashley, Mr. H. V.
Askwith, The Rt. Hon. Lord.

## The Service in St. Paul's

The service held in the afternoon in commemoration of Christopher Wren, in his own St. Paul's Cathedral, which, as Dean Inge observed in his address, is "among all his enduring works his chief monument," was attended by a large assemblage of people.

Just before half-past two the processional cross was borne slowly up the nave, preceding the procession in which were the Lord Mayor, with all his retinue, and the Bishop of London, the rectors of some of the City churches, followed by a long procession of architects headed by Mr. Paul Waterhouse, president of the R.I.B.A., carrying a laurel wreath to lay on Wren's tomb. Sir Aston Webb walked beside him. Lord Crawford, First Commissioner of Works in the late Government, was there. The hymn, "Blessed City, Heavenly Salem," was sung as the long procession moved up the nave.

The service was short and simple. A beautiful anthem was sung, the work of Maurice Greene, who was organist at St. Paul's in the early-eighteenth century, when its walls were white and fresh from the masons' hands.

The Dean took his text from the passage from Haggai which had formed the special lesson: "The glory of this latter house shall be greater than the glory of the former, saith the Lord of hosts : and in this place will I give peace, saith the Lord of hosts."

The safety of the Cathedral concerned the national honour, the Dean said. St. Paul's was still the noblest monument of its builder, and Wren himself would say, "Preserve St. Paul's; make it safe for a thousand years, as my memorial, so long as the Church of England, broad, wise, and tolerant, remains the true expression of the English people." In conclusion, the Dean drew a grave warning from the words of his text, "In this place will I give peace." It was only too probable that another European war would see the end of this and of many other memorials of Wren's genius.

The service ended, the procession made its way to the simple tomb wherein Wren lies in the crypt. Its flat stone, bearing his name, rises hardly a foot above the floor, and on the side wall is the famous inscription. Around the tomb the company stood grouped. Mr. Paul Waterhouse first deposited thereon a wreath of laurels bound with violet velvet, and read out the inscription it bore, as follows :—

In thanksgiving to Almighty God
for the talents, industry, and blameless life
of
Christopher Wren,
in reverent homage to that great man's name and memory
and
in profound admiration for his mighty works
we architects of Britain
lay this wreath on his tomb.

On behalf of the Société Centrale de Architectes Français, M. Augustin Rey deposited a bronze palm. Speaking in French, he said: "In the name of the architects of France, I place this palm on the tomb of a great artist, a great citizen, and a great patriot." A wreath from an allied French architectural society, in which white lilies were conspicuous, M. Rey next placed on the stone.

The Architectural League of New York, by the hands of Mr. Candler Cobb, of the American Embassy in London, also paid the devotion of a wreath. It bore the words :—

"In appreciative memory of Sir Christopher Wren, whose work marked so distinct a step in world architecture, and to so large a degree influenced the colonial architecture of America, this wreath is offered in loving memory by the Architectural League of New York, and is placed here by the representative of the American Ambassador, Mr. George Harvey."

[Reports of other celebrations are given on page 456.]

# The Acoustics of Council Chambers

## By HOPE BAGENAL: with an Illustrative Design by R. E. ENTHOVEN

THIS class of auditorium presents special difficulties in practice owing to the fact that as a rule the number of persons present is relatively small in proportion to the air volume of the building. A large council chamber may have an average attendance of 200 persons, whereas a theatre *of the same volume* would seat a thousand nightly or five times as many. Now as the value of A (the total absorbing power of the auditorium) is largely contributed to by the audience this means that in the case of the council chamber the value $\frac{V}{A}$ (where V is the air volume) is relatively large, and the reverberation corresponds to the value $\frac{V}{A}$. This means that large areas of permanent absorbing material (felt or felt substitutes, acoustic plaster or absorbent tiles) must be provided in suitable positions in order to meet the initial difficulties of reverberation and reduce the energy condition of the room to a figure suitable for the speaking voice. This is not easy when a hall of lofty height and therefore of large volume is already built. The volume of the hall, therefore, must be kept as small as possible in the original design.

The acoustic requirements in an auditorium of this class, in order of importance, are as follows. First, members of an English assembly must be able to make themselves heard from every member's seat in the house, because it is the custom to speak from seats and not from a centrally placed rostrum. Second, members of the Press must be able to hear every speaker clearly from whatever seat he may be speaking from in order that they may report speeches and inform the public. Third, the relatively small section of the public present at a debate must be able to hear from the public galleries as well as possible after the first two requirements have been satisfied.

How can these requirements best be met?

In regard to the first, the main difficulty consists in the fact that following the custom of addressing the house from any seat, the relative positions of speaker and audience are being continually changed. This means that it is impossible to design for a fixed source of sound, as can be done for lecture-rooms and assembly halls. Also there must generally be a number of the audience seated behind the back of the speaker. Now the disadvantage in a large hall of having seats behind a speaker is that he is at a loss where to direct his voice, and is liable to turn his head in order to make his points, which causes confusion just when clearness is required. To meet these difficulties, as many useful reflectors as possible should be designed, normal or approximately normal, to every seat in the house. Of these reflectors the ceiling is undoubtedly the most useful and should be of a hard, smooth material. But in order to ensure that the length of any given *reflected* sound path shall not exceed the *direct* sound path by more than 80 ft., the height of the ceiling should not be more than half that figure, that is, 40 ft. (The figure 80 ft. is the distance sound will travel in one-fifteenth of a second, the minimum interval detected by the human ear.) Unfortunately, a monumental height is usually required for this class of auditorium, but a high ceiling not only (as already pointed out) inevitably increases volume and, therefore, reverberation, but in addition will cause long reflected paths of sound and, therefore, redundancy. A practical warning against high ceilings is the case of Sir Charles Barrie's House of Commons. The Commons, after the burning of the old palace of Westminster in 1834, were accommodated in a temporary wooden structure, admirable acoustically and having a comparatively low ceiling. Barrie's houses suffered by comparison. The result of the complaints was that in the case of the Commons a glass ceiling was placed below the elaborate Tudor roof. The ceiling of the Lords remains as originally designed. The House of Commons was greatly benefited by the alteration and is now moderately satisfactory. The Lords remains notoriously bad.

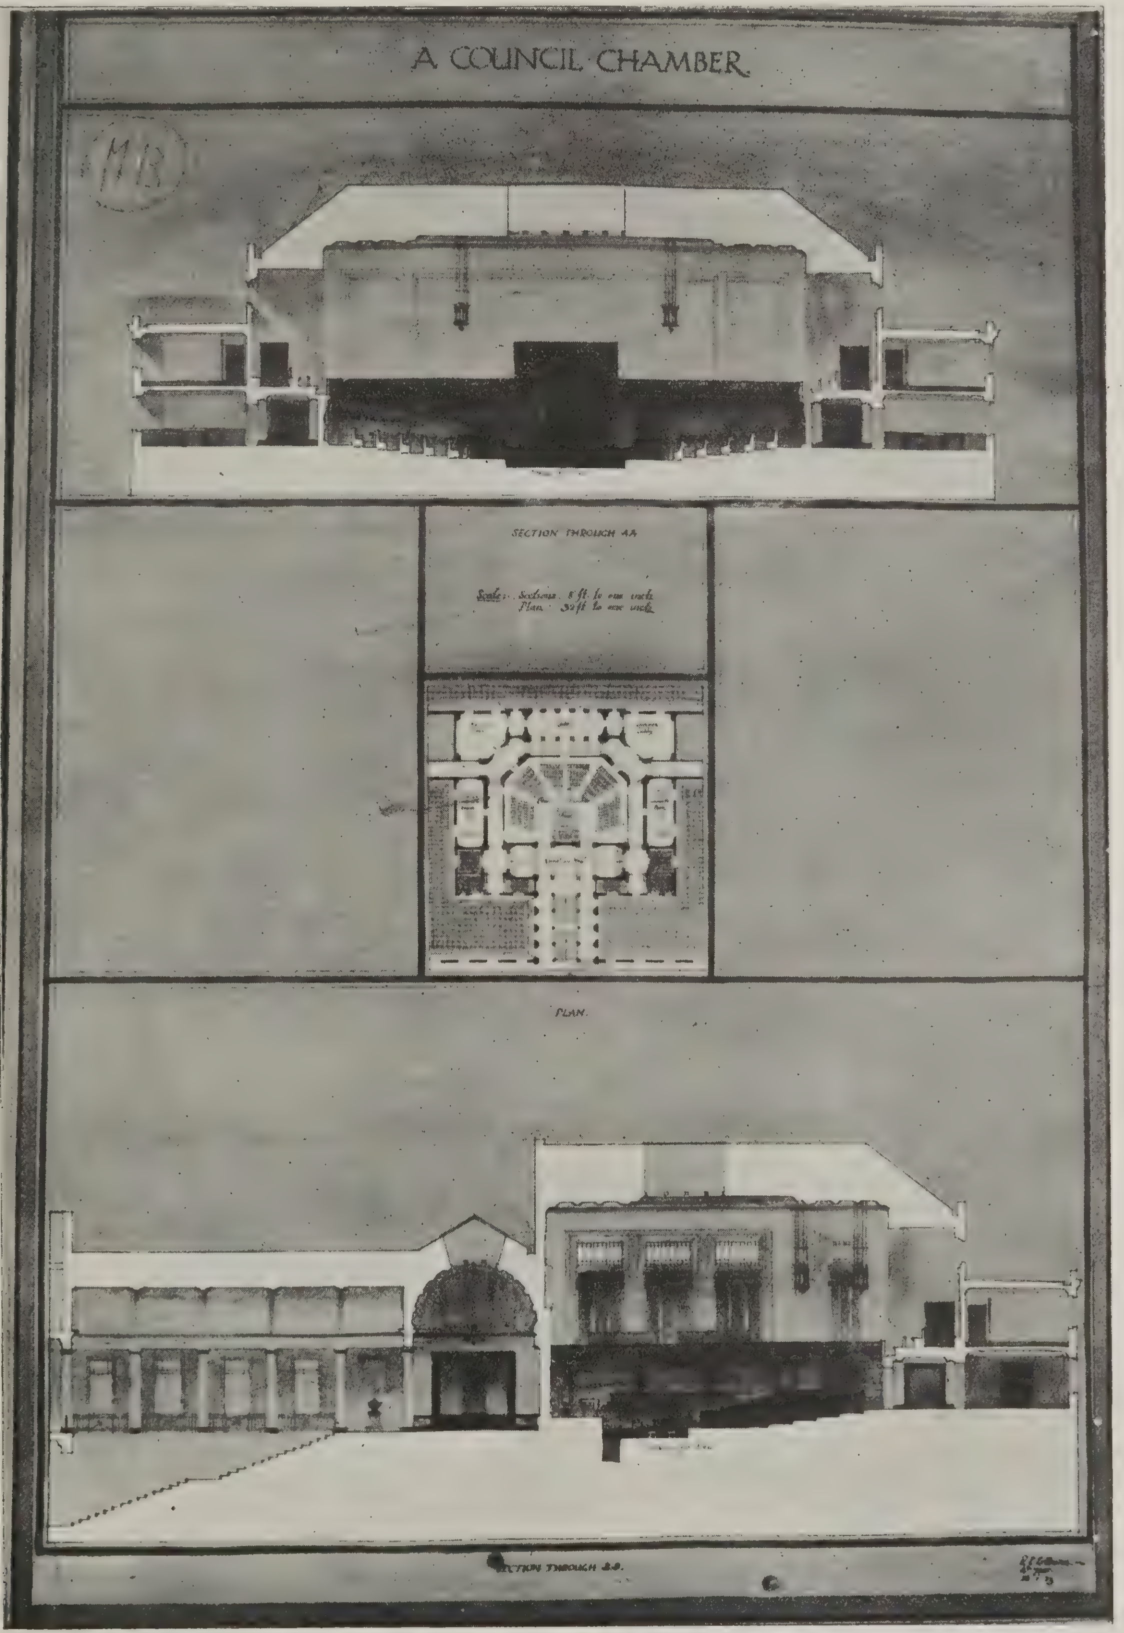
In addition to the ceiling reflecting surfaces can also be arranged on plan. Additional reflected sound paths within the permissible limit of length can be provided by making a reflecting wall or screen surface, to which all front-bench speakers, addressing the president in the ordinary way, could direct their voices. A good position for such a reflector would be the wall along the diameter of a semicircular or semi-octagonal plan behind the president's chair. Where, however, the oblong or committee-room plan is employed, as in the House of Commons, useful reflectors could be designed behind the benches along the side walls. Front-bench speakers of necessity have a larger number of persons seated behind them, and therefore reflections thrown behind them from a wall in front of them are of considerable value. The oblong plan for English practice has much to be said for it acoustically, but will accommodate only two parties conveniently. The advantage of having a rostrum position to which all speakers must come in order to address the house is a twofold one; first, a speaker has all his audience in front of him, and, therefore, useful reflecting surfaces can be designed to right and left of the rostrum position; and, secondly, a single direction is given to his voice, to which he becomes accustomed. The Chamber of Deputies in Paris, the Reichstag in Berlin, and other European parliament houses, all of great height, are acoustically workable mainly because a central rostrum position is used for speaking.

In the design of a council chamber on acoustic principles by the fourth-year students of the A.A. Schools, several excellent schemes were submitted. Mr. Enthoven's is illustrated in this issue. The ceiling has been placed at a height of 38 ft., and from the acoustic diagrams it can be seen that a beam of sound is provided by it to every possible seat for every possible position of a speaker. His plan, semi-octagonal, provides a reflecting surface also along the diameter behind the speaker's chair. This reflecting surface ought not to be at a greater distance than 40 ft. for any speaker, from the same reasoning as applies to the ceiling height. On the short section this is not a danger, but as can be seen on the long section, in a council chamber of large size the reflected paths become greatly in excess of the direct paths for members speaking from back seats. This difficulty can be overcome, as in Mr. Enthoven's design, by tilting forward the panelling, so that reflections are depressed and are not returned upon the speaker.

The second requirement in order of importance, namely, the position of members of the Press, requires a new point of view on the part of designers. It is not sufficient nowadays to allot one of the least satisfactory galleries to reporters. Every member's seat on the floor of the house, as we have said, may become a source of sound, but members of the Press cannot move about to advantageous positions; they should, therefore, be located on the floor of the house in a mean position for good hearing with a door of their own giving rapid access to the lobbies. At the Reichstag in Berlin, the reporters' tables are on the floor of the house in front of the president. A reporter who wants to ask a question of a member in the lobby after a speech should be able to dissociate himself rapidly from the writing tables without disturbing his colleagues. In a loftily situated gallery the members of the Press are too far from the lobbies, and in some cases have inevitably to disturb their colleagues when leaving. In the House of Lords it is well known that hearing in the Press gallery is so bad that it is only possible for reporters to inform the British public of a debate by working together in groups and collecting syllables. In the design illustrated, the Press have been laced on the floor of the house immediately in front of the resident, in an area slightly sunk, surrounded by a brass ail sufficient to mark off the area without screening ound, and are provided with a staircase and access of their wn which should communicate directly with the lobbies.

For the third requirement public galleries should, if ossible, form part of the main cell of the auditorium, as in he House of Commons, and should not be placed in deep ecesses. Where recesses are used they should be wide and hallow and without a screen of columns. A deep gallery vill not only add to the volume of the auditorium and there- ore to the reverberation, but may also provide long reflected paths of sound. A criticism to be made upon the design illustrated is that the gallery seats are within recesses. The recesses, however, have been made broad, they are not screened with columns, and beams of sound from the main ceiling reach the seats situated within them.

The acoustic analysis of Mr. Enthoven's council chamber is set out in table form on his sheet of diagrams; and the figures for the reverberation are given below it. First, the reverberation is calculated for a full attendance of members, but with the walls above the panelling left as plain plaster finished in the ordinary way. Under these conditions the reverberation $t_1$ even for so restricted a



A COUNCIL CHAMBER ACOUSTICALLY DESIGNED.
BY R. E. ENTHOVEN, FOURTH-YEAR STUDENT, ARCHITECTURAL ASSOCIATION SCHOOLS.

volume, is just over two seconds, or about as much as is characteristic of a fair-sized church. This would mean that some eight or ten syllables would be heard simultaneously, and the result would be unsatisfactory for debate. To reduce this, felt screened by canvas in panels is designed at the back of the galleries where it will also have the effect of eliminating long reflected paths. This felt is taken as 1 in. thick on battens 3 in. from the wall, having a coefficient of 0·78; the canvas screen should be as thin as possible. But these panels are found by no means sufficient to reduce the reverberation to the figure suitable for debate. The large panel on the wall above the chairman might have been felted, but instead the entire wall surface above the wood panelling has been taken out in an absorbent masonry tile similar to the American akoustolith tile, having a coefficient of absorption in the register of the speaking voice of nearly 50 per cent. When the absorption units from this source are added in, the reverberations $t_2$ and $t_3$ corresponding to conditions (1) of full attendance, and (2) a quorum of twenty, respectively, are found to be reduced to 1.1 seconds and 1.3 seconds.

(*Note.*—The figure for the coefficient of absorption per person where foot units are used given in the table, namely 6.34, is the figure originally given for $C_4$ by Sabine in "The Brickbuilder," January 1914. In the "Collected Papers" the figure has been changed to 4.72. In the case of a council chamber where the audience factor is a small one the error is not serious, but where a theatre or concert-room is being analysed for reverberation care should be taken to use the later figure 4.72.)

The resonance effect of the wood panelling, at most very small for speaking voice conditions, has not been considered in this design. The panelling has been used simply as a reflector in *the regions where reflecting surfaces are required*. The secret of successful acoustic design in this difficult class of auditory is to get maximum loudness in the region of members and Press, and above that region to reduce energy conditions to the lowest possible. The whole building, restricted in height, should function as a sound box. The old method of designing a tall building, reproducing church conditions in reverberation, and accommodating a few unfortunate Pressmen aloft in a kind of triforium, has caused too many discomforts and should be brought to a reasonable reform.

# Architecture in the Lay Press

## A Regent Street Relic

I wonder whether it is the intention of e Office of the Board of Works, which oks after the Crown property in Regent reet, to save just one building to show posterity what Regent Street looked e when it came in all the glory of new ucco fresh from the hand of Nash ?

It is a matter well worth considering, the architectural authorities of to-day ink sufficiently well of Nash's work, to commend the preservation of a single ample. The corner building, which one retains a fragment of the original azza of Piccadilly Circus, is what I ould choose, but I suppose it will be crificed to its site value, which must be ormous.—A Londoner's Diary, in "The vening Standard."

## Bush House

A distinguished painter has recently an interview drawn attention to the il effect of American influence upon blic taste in matters of art—the subitution of crashing and squeaking ragne orgies for the melodiousness of our d-time dance music, the ousting of the gitimate drama by film absurdities, the Broadwaydizing" of our streets and uares at night by crude, dazzling, and aselessly moving electric signs. All is nerve-racking, hectic excitement and stlessness is destructive to the conmplative mood needed for the apprecian of art. America, he maintains, is ping us with the dangerous drugs of its oduction and is blunting our senses d dulling our æsthetic perception.

Yet there is one art in which America veals none of that restlessness of spirit. deed, modern American architecture nds supreme for massive dignity, reseful grandeur, and nobility of propor n. It is no exaggeration to say that nerica has added the only significant apter to the history of architectural delopment since the days of the late Reissance. And, strange to say, until the ffoldings were removed from the huge ilding on the island site between the rand and Aldwych to reveal the impos pile of "Bush House," scarcely a ce of American influence had pene ted into English architecture.—An chitectural Critic, in "The Observer."

## ‘An Interest in Architecture"

Somewhere I have seen it stated that Architecture Club, whose first exhibi n opens at Grosvenor House on March was formed to create an interest in hitecture. That seems to me the ong way of putting it, because an erest in architecture needs no creating. is the one artistic interest that nobody avoid. Everybody who builds, buys, s, rents, or wants a house or a flat, is erested in architecture, whether he ows it or not. The only question is ether or not his interest, besides being ctical and unavoidable, shall also intelligent, and that is where the hitecture Club comes in. It aims at ouraging the plain person to choose unavoidable house or flat with the e discrimination with which he oses his equally unavoidable meals. The superstition that you can have a house and avoid architecture is, I fear, partly due to architects themselves. . . .

There are, of course, different kinds of architecture, just as there are different kinds of writing. You do not expect the same qualities in a trade catalogue as in a poem, and you do not expect the same qualities in a factory as in a cathedral. But, in either case, you do, or should, expect qualities according to kind. In all cases you expect the qualities which are summed up in "fitness for purpose." Here there is another snag. People say : "Give me a house that suits its purpose and I don't care how it looks." Vain aspiration! Because if there is one thing certain in this mortal life, it is that looks are an essential part of efficiency. In short, there is no escape from the dilemma that the moment you touch building you are involved in architecture, and the only question that remains is whether the architecture shall be good, bad, or indifferent.—C. M., in "The Saturday Westminster."

## Wren's Fame

This is a lonelier renown than Nelson's. The man who knows Nelson's name should be able to add to it that of Admiral Drake or bold Admiral Benbow. Though his history book be clean forgotten he can tell you a word of Admiral Beattie or Admiral Keyes. Yet I believe that many a man, bidden to speak of famous architects, would stop with Sir Christopher Wren.

You might ask him who built that banqueting house in Whitehall, who built the Bank of England, the Police Office at Scotland Yard, the church of St. Martin in the Fields ? You might tell the names of Gibbs and Hawksmoor, of Soane and Norman Shaw, without wakening a memory in him. There is Mr. Ralph Knott, whom I saw walking the other day in the Strand. What is the house that Mr. Knott built ? Can one Londoner in a hundred answer smartly to that question ? But Sir Christopher Wren——

No doubt of it. Sir Christopher had good fortune. His very name is one of those lucky names that can never be lost in a biographical dictionary. You hear it once, and it is memorable for ever. How it towers above such names as James Gibbs or William Chambers!—"The Londoner," in "The Evening News."

## The City Churches

To speak of St. Paul's itself would be like saying a few words about "Hamlet." Nobody needs them. For some decades of the last century the Gothic revival cast a trifling obscuration on the fame of Wren's most august work. It is better realised now that neither Gothic nor classical architecture needs, for its own glory, any detraction from that of the other. You can admire Durham or Salisbury all the more fully, as well as wisely, if you also enjoy the tranquil magnificence of St. Paul's. A much graver danger, however, than any passing belittlement now hangs over the fame of Wren. A large number of his City churches have lost nearly all their resident parishioners since his time; their original function is gone; in many newer parishes of the diocese of London money for church-building, and especially for the payment of a living wage to the clergy, is badly needed; and the sites of the empty Wren churches are extremely valuable. The difficulty is genuine and acute. It is not fair merely to call the Bishop of London a Philistine for proposing to sell the sites and so condemn Wren's priceless works to destruction. He has his clergy—many of them in dire want—to look after. And yet it would be horrible to see these beautiful and irreplaceable things pulled down by the housebreakers and carted away as rubble. The destruction of the cathedrals at Ypres and Arras in the war was a lesser aggregate loss of fine architecture to France and Belgium than this would be to England. We can see, as yet, no way of escape. But for a few very rich men of imagination and public spirit the opportunity would be a splendid one. It is as if a large part of the Turner collection at the National Gallery had, for some reason, to be publicly burnt unless someone would come forward to ransom them for a good many thousand pounds apiece. The Bishop of London could no doubt find some subsidiary ecclesiastical use for the dispeopled churches if the money value of their sites could be subscribed. The crisis is urgent, and the only perfect tribute that the bi-centenary celebrations could offer to Wren's genius would be the raising of a sum large enough, not to set up a monument to him, but to preserve all the splendid monuments that he left of himself.

"The Manchester Guardian."

## An Ideal Theatre

Some day, when I inherit an enormous sum of money, I will build an ideal theatre. It will stand on an island site which really is an island site, and I will try to find an architect who knows something about architecture to build it. The whole business of acoustics and ventilation and heating will be scientifically discussed before the theatre is built, and if the architect fails to design a theatre in which it is possible to hear without strain, and to sit without being half-suffocated or frozen, or blown out of one's seat by the draught, I will personally wring his neck for him. Half the theatres in England were designed by men who ought to be prosecuted for obtaining money under false pretences. In my ideal theatre every seat will be comfortable and bookable. And that reminds me. If anyone has a hundred and fifty thousand pounds about him, I'd like to have it. My ideal theatre will then become a reality.—St. John Ervine, in "The Observer."

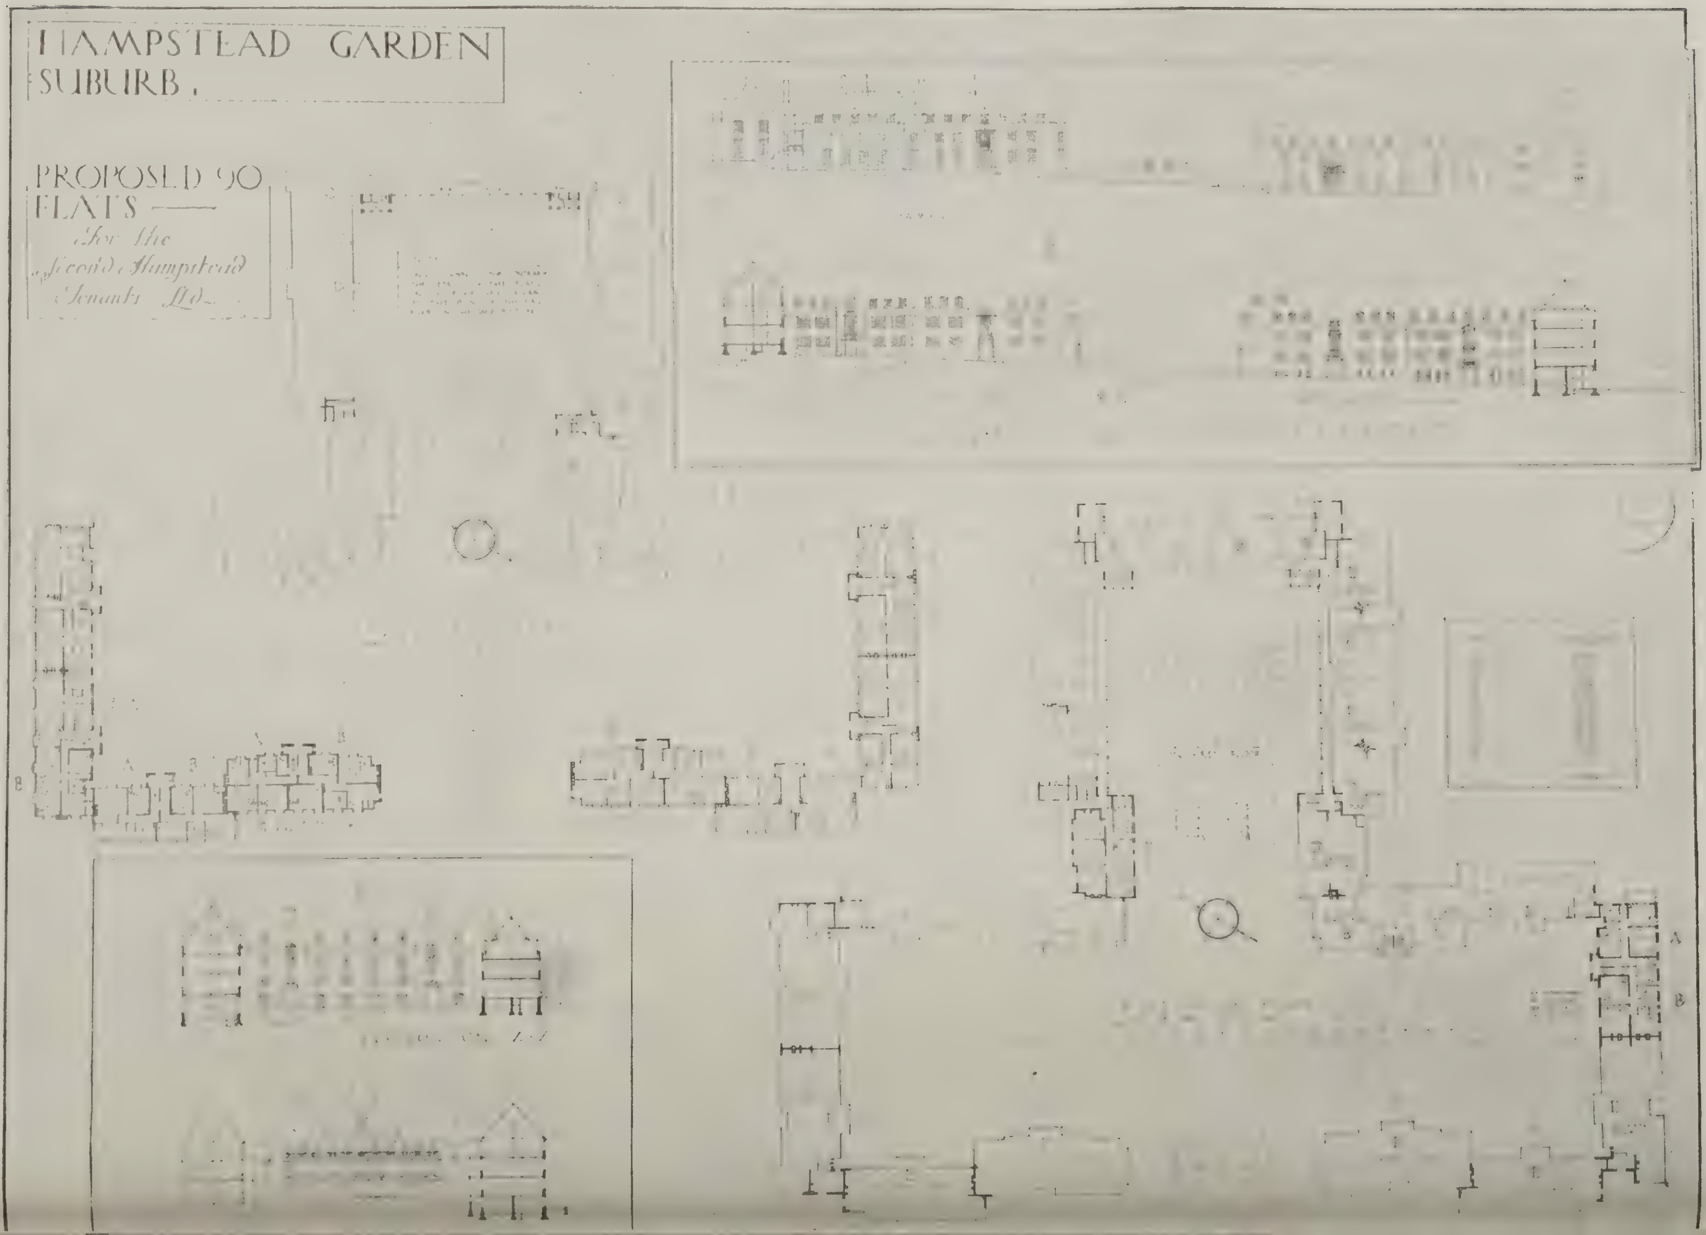
## The Architectural Press

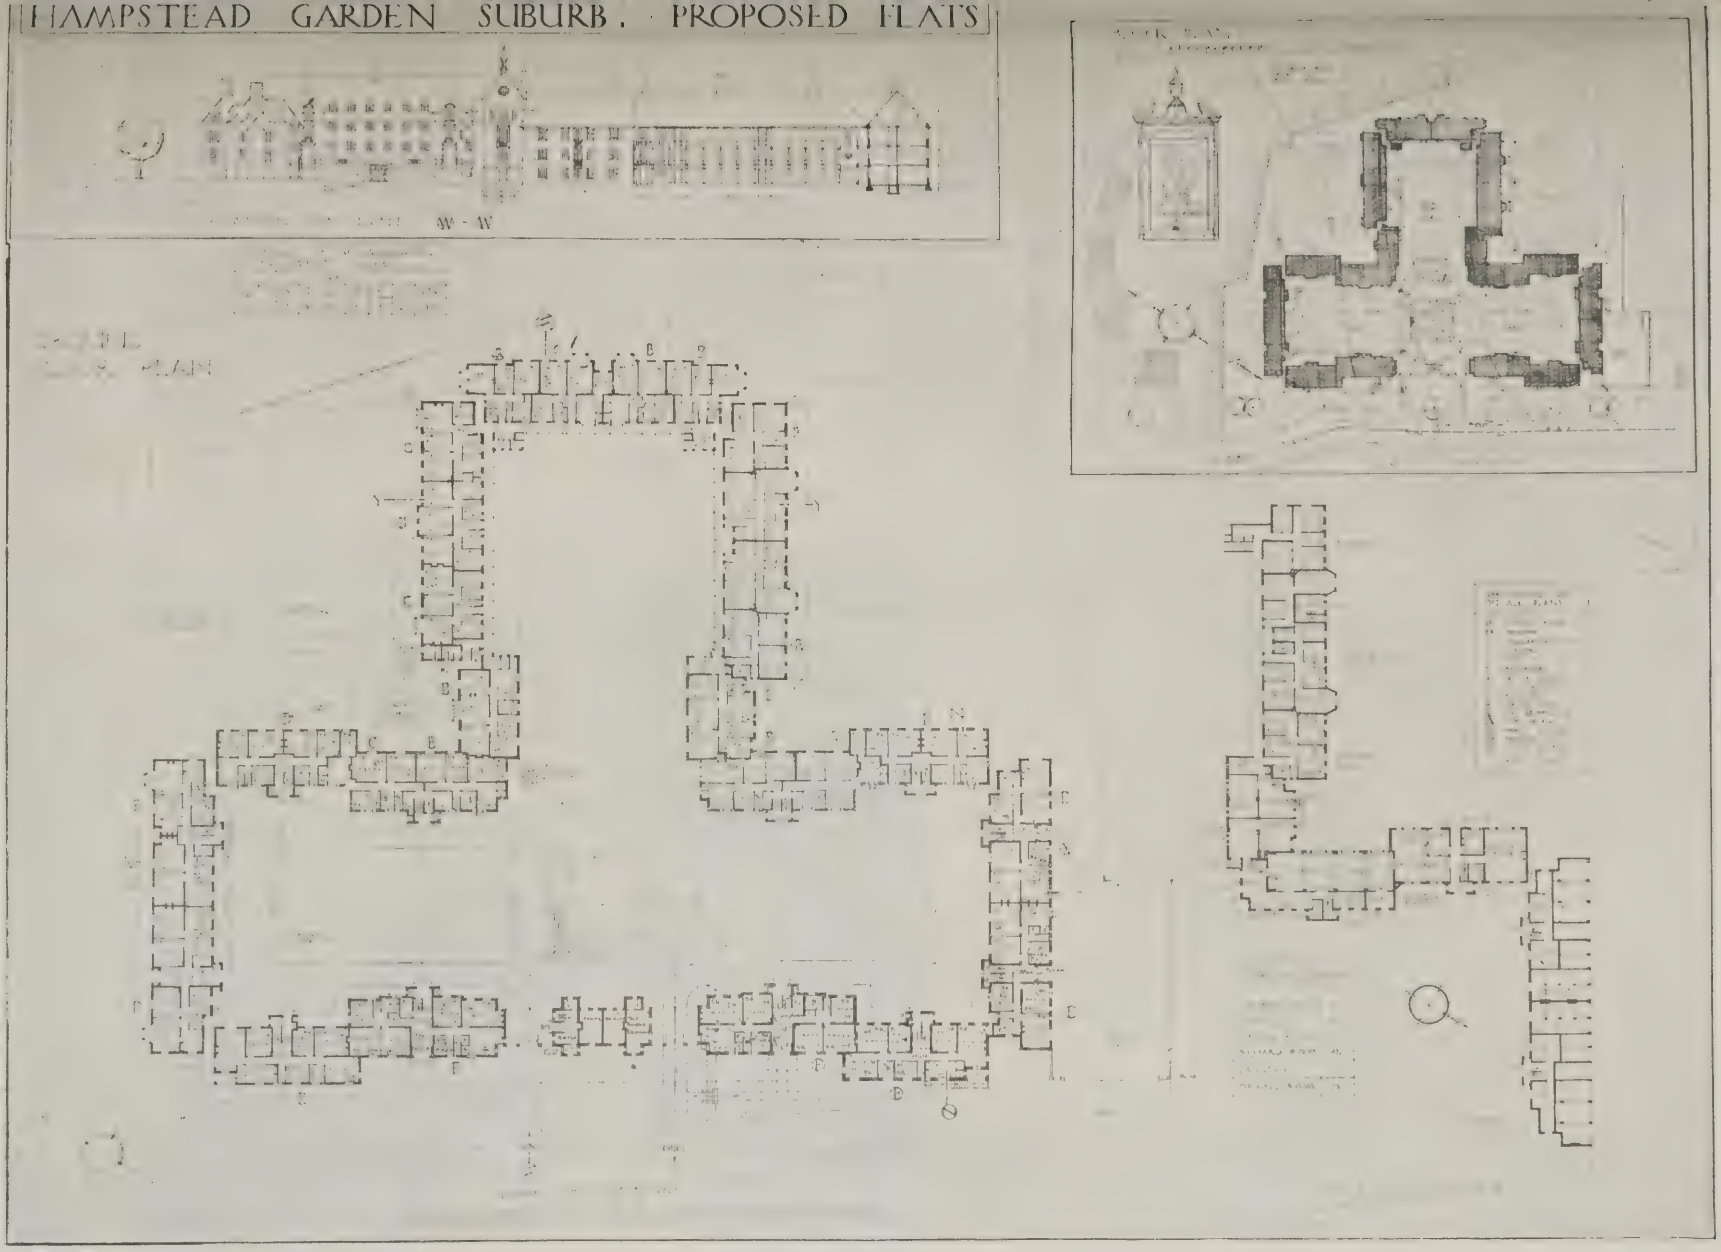
If the art of architecture continues to be chronicled in the excellent fashion of the technical journals, etc., of recent months, the public will yet comprehend precisely how much London owes to Wren.

"The Nation and the Athenæum."

# Hampstead Labour-Saving Flats Competition: First Premiated Design

J. B. F. COWPER, A.R.I.B.A., Architect





This design has been placed first in the £1,000 Competition, promoted by the Second Hampstead Tenants Ltd., for the lay-out and planning of a group of ninety labour-saving flats. Messrs. L. Rome Guthrie, A.R.I.B.A., John C. S. Soutar, L.R.I.B.A., and Edmund J. Cooper were the Assessors. Some critical notes, and illustrations of the second and third designs, will be published next week. Further particulars of the Competition appear on page 461.

# Ryde Concert Pavilion Competition

## The Winning Design

THE accompanying illustrations show the design of Messrs. Thomas Spencer and M. R. Martin, AA.R.I.B.A. which has been awarded first place in the Ryde Pavilion Competition. The second premium was awarded to Messrs. P. J. Newby Vincent and D. West, and the third to Mr. Geo. T. Morris.

In the conditions of the competition it was stated that the subsoil of the site is composed principally of sand underlying loam, the whole of it being "made up" ground. The site was reclaimed from the foreshore between forty and fifty years ago. The building is to be of a completely modern and ornamental style and such that will add beauty to and be in keeping with beautiful surroundings.

The dimensions of the proposed structure must be such that, when completed, it will have seating accommodation for at least 850 persons within the main concert hall. Apart from this accommodation, provision should be made for a suitable tea room for the sale of refreshments, etc., ladies' and gentlemen's cloak rooms and conveniences, stage, artists' dressing rooms, together with the necessary conveniences. It is desirable that an ornamental veranda shall either completely or partially surround the whole of the structure.

Owing to the position of the proposed structure being such that very fine views can be obtained of the Solent and Spithead, it is desirable that in connection with the scheme should be embodied an open-air roof veranda or balcony, on which if necessary teas and refreshments could be partaken. The floor of the main hall is to be suitably sprung as a dancing floor. The total cost of the structure is not to be more than £10,000.

The authors of the winning design, in the course of their report, state: We have purposely kept the building as low as possible so as to cause little or no obstruction to the view from the houses on the south side of the Esplanade and Dover Street. Owing to the close proximity of the railway tunnel, we have avoided placing the building nearer than 30 ft. to the same, therefore no damage can be caused to the tunnel due to the erection of the proposed building.

The exterior of the building is designed in the Italian Renaissance style, adapte to suit modern requirements and decora tive detail, with an entrance portico o the full Doric order of architecture. A similar but simplified order is continued around the whole building as a verand or colonnade. The main entrance is a the south-west corner of the buildin facing the Esplanade towards Pier Street and from the entrance vestibule access i obtained to the whole of the public part of the building. The pay office also i placed in this position and the whole o the entrances, i.e., to the concert hall tea room, cloak rooms, lavatories and staircases to the roof garden, can b supervised by one attendant.

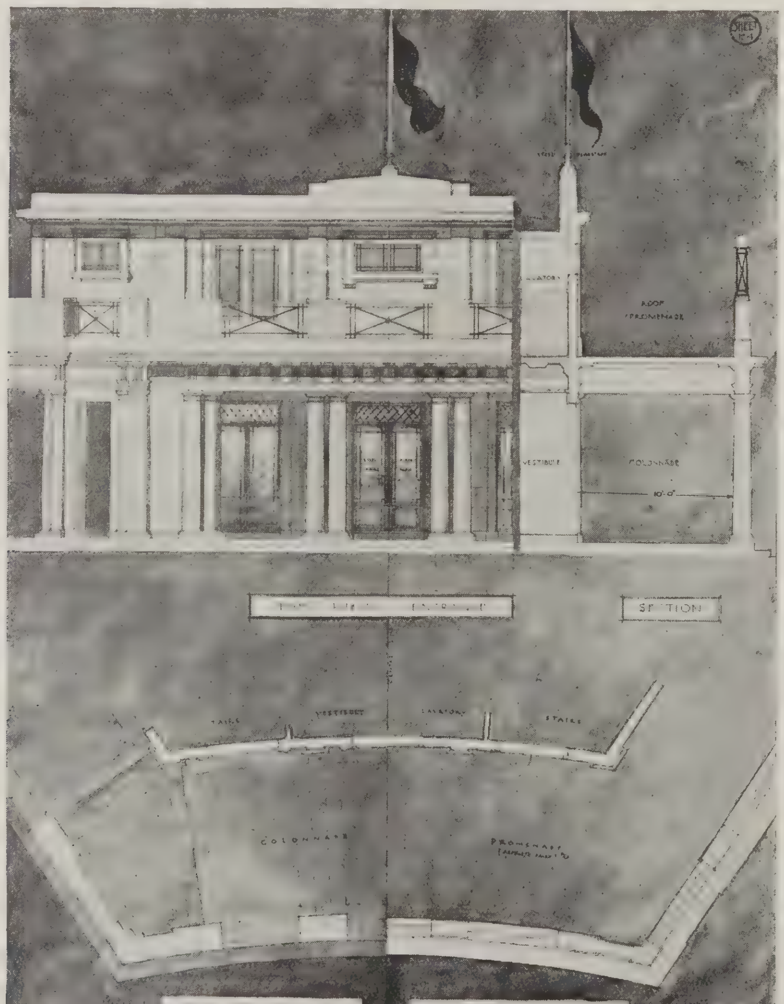
A spacious crush lobby is provided between the vestibule, concert hall, and tea room, which will allow ample room for cloaking and free circulation, and so prevent crushing when visitors are dispersing. The cloak rooms here provided are for the use of persons inside the building only, and will be fitted up to meet modern requirements. There are separate cloak rooms for male and female.

The concert hall is designed of the most suitable proportions, so that the stage is visible from any part of the hall Acoustic properties have also been fully considered. The hall provides seating accommodation for 850 persons upon chairs, full allowance being made for the necessary gangways. In the side walls are large double folding doors which can be folded back flat against the walls. With this arrangement the hall can be thrown open to allow a full circulation of air during the hot weather Additional seating can therefore be provided along the colonnade and out on the lawn if required. Similar double folding doors are placed in the wall between the concert hall and tea room, which room can also be used for additional seating accommodation in the case of concerts, or as a sitting-out room when dances are being held.

The hall is placed at the extreme eastern end of the site so as to be as far as possible from the noise of the railway and the traffic on the roads, also to give a full view of the beautiful lawn and gardens. The floor of the hall will be specially constructed for dancing.

At the far end of the hall is the stage, measuring 36 ft. wide and 16 ft. deep, specially constructed with a sloping surface, back to front. This stage will permit a full orchestral concert, and is of ample dimensions to accommodate scenery for theatrical performances. Immediately off the stage and at the same level are two property rooms for the storage of theatrical scenery, and another larger scenery store with sliding doors is provided at the rear of the stage. In connection with the stage and adjacent thereto separate retiring rooms have been provided for male and female artists, each with complete lavatory accommodation.

Underneath the stage and with the floor slightly below the level of the hall floor is a chair store, capable of storing



THE PUBLIC ENTRANCE.
T. SPENCER AND M. R. MARTIN, AA.R.I.B.A., ARCHITECTS.

ut 1,000 chairs. The panelling forming front of the stage will be made so as to 1 and chairs can thus be handed ctly into the store, thereby permitting hall to be cleared in a few minutes.

he tea room is designed to adjoin the with double folding doors in the side ls as before described. With this ngement tea and refreshments can artaken of in the open air on the colon- e or on the lawn, which is 20 ft. wide ront of the tea room. The kitchen is ed in a central position, and from it ly service is obtained to all parts of the ding, including the hall, tea room, tea gia, and by lifts to the Italian roof len. The kitchen will be equipped 1 modern gas apparatus, suitable for aring light refreshments, teas, etc. aspect of this room is north-west and, efore, will not be unduly hot during mer weather. A separate entrance lso provided.

he loggia at the northern end of the ding is 74 ft. long and 20 ft. wide, rlooking the sea. It is enclosed with e folding glazed screens so as to afford tection during inclement weather. loggia is large enough to permit of a tion being taken for a continuation he colonnade without causing obstruc- to those sitting on the loggia. The n colonnade or veranda completely ounds the building, along which per- s can promenade without being in- venienced by wet weather.

he Italian roof garden is approached two staircases from the entrance ibule. A portion of the roof garden ut 10 ft. wide immediately over the nnade provides a continuous pro- nade. The central portion, which is ed above the promenade and ap- ached by short flights of steps, affords lendid tea garden, where refreshments be partaken without interruption n those walking round the garden. m every part of the roof magnificent vs of the Solent and Spithead are seen. connection with the roof garden and the top of the staircases, separate tories are provided. There are also good stores for chairs and tables to used on the roof garden.

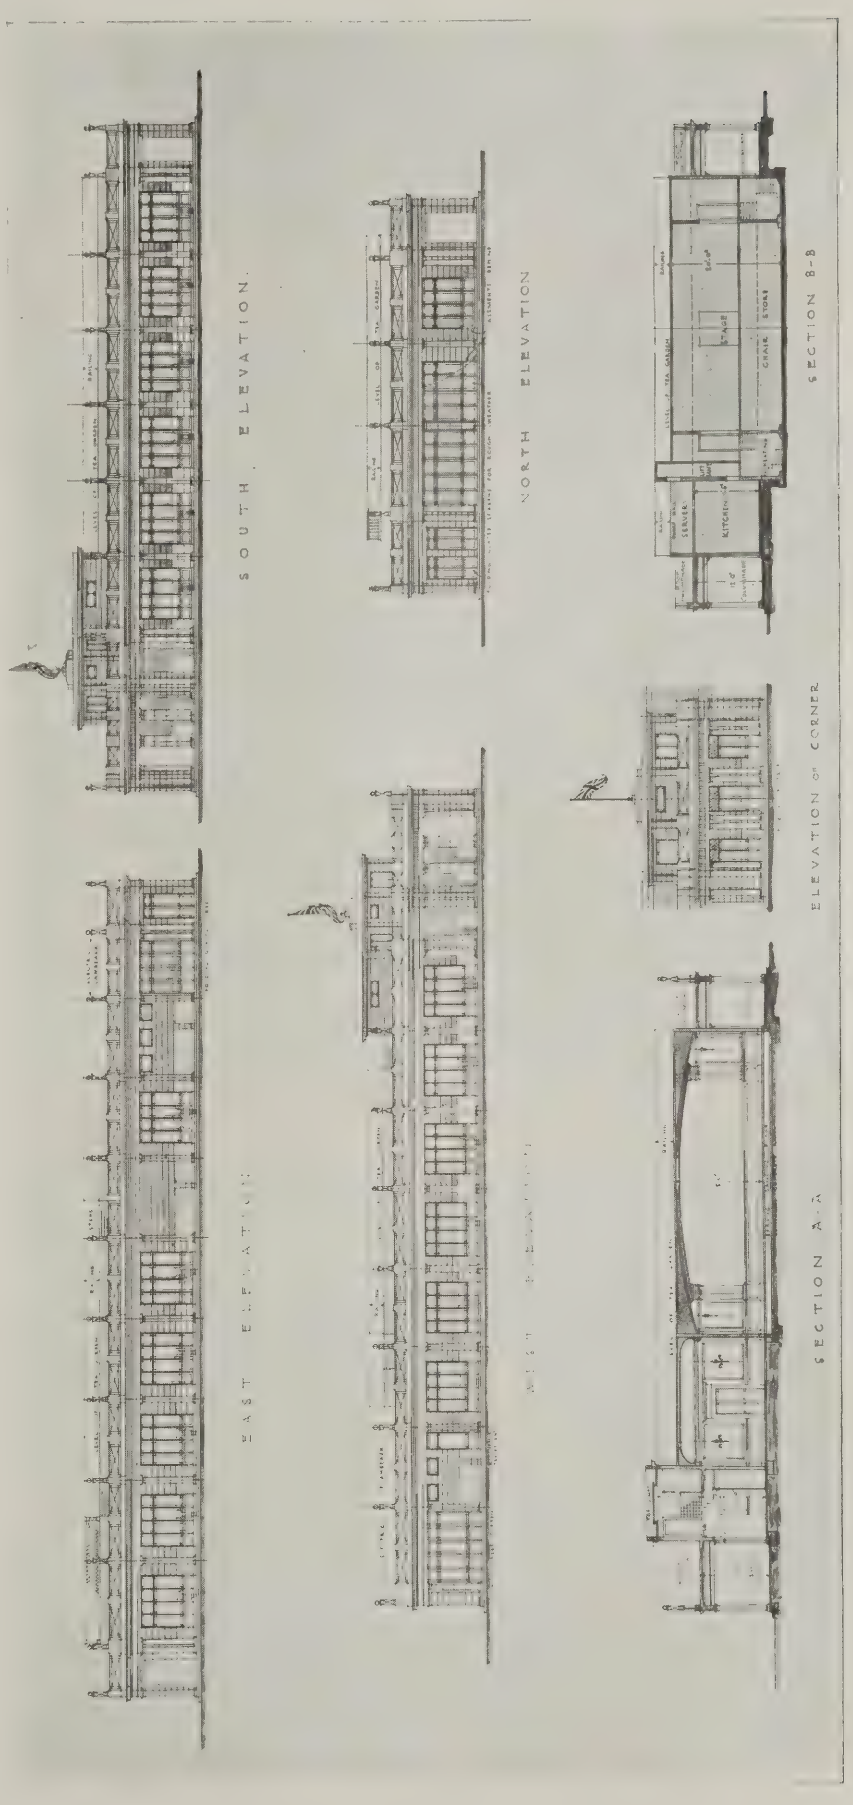
n view of the nature of the subsoil which the building is to be erected, and sidering the exposed position of the ding and close proximity of the sea have consulted our engineers and are ised that the building should be con- cted of reinforced concrete, the whole he building resting on a raft of con- e reinforced with steel bars so that centrated loads are avoided, and the ssure uniformly distributed over the le site.

he concrete surfaces are to be rendered h Portland cement stucco of natural ne colour and lined out to represent ual stone jointing. The building as gested in our scheme is, therefore, igned accordingly.

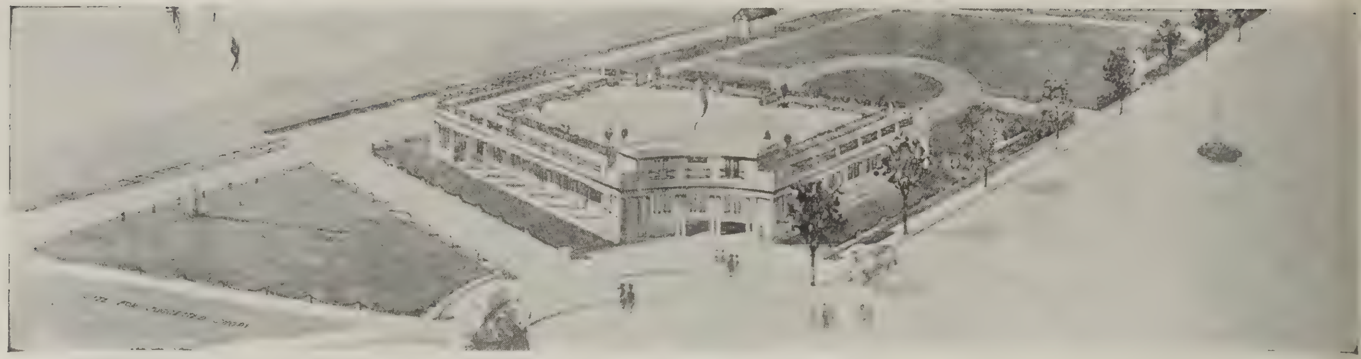
he roof flat surfaces will be covered h asphalt, so as to render them abso- ly watertight and also afford a good face for walking upon.

Vith the exception of the glass screens losing the loggia all the windows and rs are on the inner wall of the colon- e, and thus protected against weather, reby affording economy in mainten- e. Local materials are to be used oughout where possible.

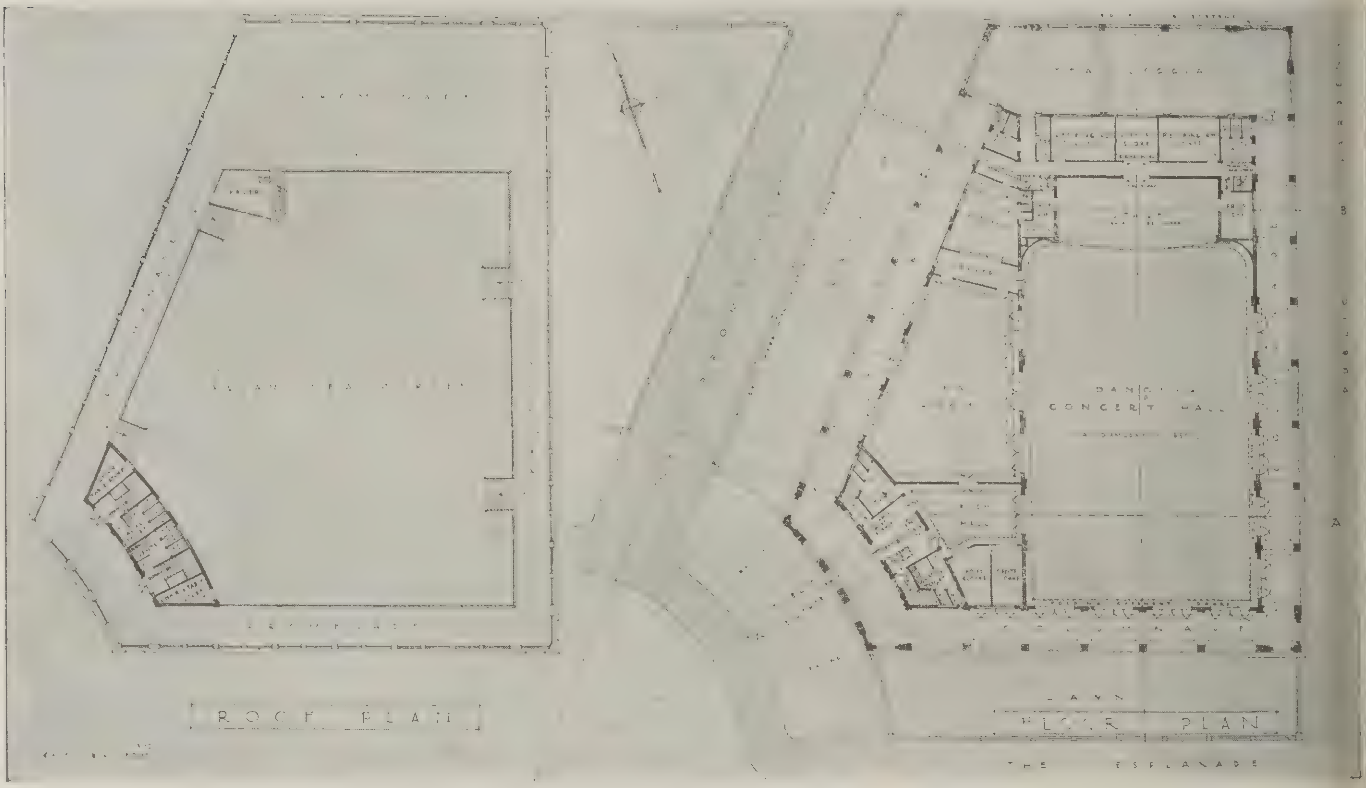
he system proposed is the low-pressure

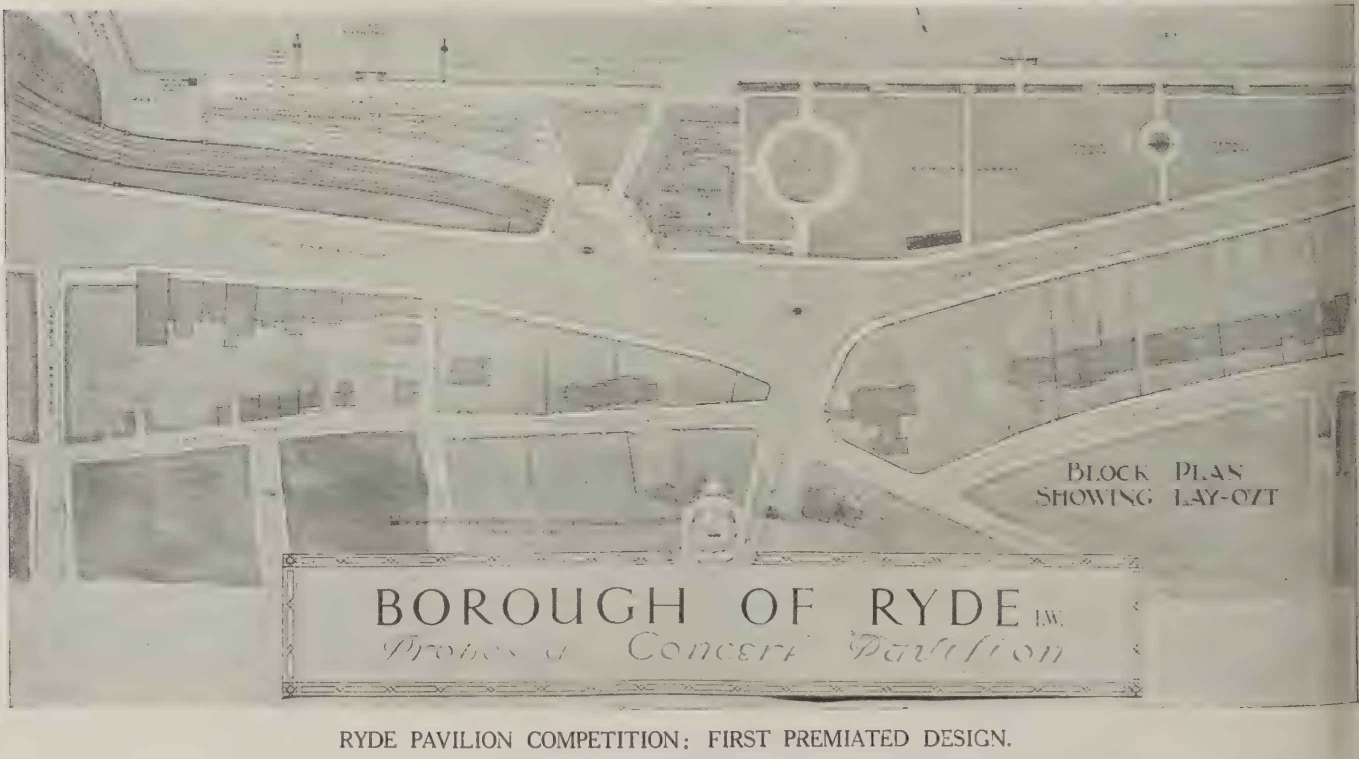


RYDE PAVILION COMPETITION FIRST PREMIATED DESIGN T. SPENCER AND M. R. MARTIN, AA.R.I.B.A., ARCHITECTS.



PERSPECTIVE BIRD'S-EYE VIEW





RYDE PAVILION COMPETITION: FIRST PREMIATED DESIGN.
T. SPENCER AND M. R. MARTIN, AA.R.I.B.A., ARCHITECTS.

water central heating apparatus with -iron sectional boiler and wrought- circulating mains.

he electrical installation is to be on conduit system, with the wiring car- in steel conduits, with proper dis- ution boards and efficiently earthed.

n the estimate of cost the figures are ed upon the actual cost of similar dings recently erected, special regard ing been given to the recent fall in es of materials and cost of labour. total cost is estimated at £9,955.

n conjunction with the erection of the ilion, we have carefully considered development of the land to the west of the site. We suggest for your further consideration that this land, which formed the entrance to the old Victoria Pier and the quay, can be made revenue producing by a lay-out similar to that shown on our block plan drawing. This land can be levelled by the removal of the slight gradient which led up to the entrance of the old pier, and the promenade thus extended as far as possible towards the horse-boat slip. By this means it would be possible to offer sites for beach huts facing the promenade, and the back portion of the site can be utilized for bathing boxes as indicated on the plan. Thus the splendid bathing which was once possible from the old Victoria Pier will again be available from the sea front. Further, there being very few shops in the immediate neighbourhood it is suggested that a block of six small, low, lock-up shops be erected. These could be let off at a rental and would be appreciated by visitors.

We have purposely formed a triangular lawn to the west of the pavilion so as to preserve the fine view of the sea when standing near the tunnel on the esplanade. The new promenade on the right will connect up with the old promenade and a narrower footway on the left will lead to the bathing parade.

## he Wren Bi-Centenary

*the Editors of* THE ARCHITECTS' JOURNAL.

IRS,—The Wren bi-centenary recalls mind the famous architect's plan for rebuilding of London on spacious l beautiful lines after the Great Fire. d private interests not suppressed Sir istopher's grandiose scheme of wide nues radiating from a central plaza, should not now be wrestling with a idred perplexing traffic problems, and idon would have rivalled Paris in possession of broad and tree-lined roughfares.

he moral is plain. In these days when uilding schemes are afoot in all our es, narrow individualistic preferences uld not be suffered to rule out bold l comprehensive conceptions of the y Beautiful.

annot some co-operative, general plan adopted for the laying out of broad ilevarded avenues, in which artistic our schemes should have their part? anks to the possibilities of glazed amics the streets of London may be ersified not only with natural verdure, also with tinted buildings, so that, the words of Mr. Halsey Ricardo, we y see reproduced in our façades and ise-fronts "the almond blossom hue t flushes the sea front of the Doge's ace and the stained amber and gold the façade of St. Mark's in Venice."

J. R. CLYNES.

## The Building Crisis

*the Editors of* THE ARCHITECTS' JOURNAL.

IRS,—It is to be regretted that the otiations between the building trade ployers and the operatives have re- ted in a ballot on the question of wages y. Would it not have been far better m the operatives' point of view had the in issue been one of hours?

o industry suffers such hardships as building trades. Much of the work is e in the open, with the result that the ratives are frequently handicapped by lement weather. In the winter their put is restricted owing to the fewer rs of daylight, and many of them lose great amount of time through rain, t or fog. It would be interesting to w the average wages paid to some he trades during the past few weeks. is doubtful whether they would bear iparison with the summer earnings. in the winter the cost of living is much greater, and more fuel and artificial light are burned. If the trade unions could be induced to allow the operative to work longer during the summer months, then he would be in a much better position financially to bear the loss sustained during the winter. Apparently the trade unions are dead against any alterations in this direction, the operatives being faced with a reduction of from 1d. to 2d. per hour or a strike or lock-out.

The employers are to be congratulated on waiving their original demand for a 20 per cent. reduction all round, and the extension of the working hours from forty-four to forty-seven. Rents are still high, with the possibility, if Government control ceases next year, of being much higher, and the cost of living still fluctuates. Last year the operatives suffered heavy wage reductions, and the original demands of the employers would doubtless hit them badly. In London to-day the wages of the skilled artisan are stated to be 74 per cent. above pre-war level, and the cost of living figure, as published by the Ministry of Labour, is 77 per cent.

"INTERESTED."

## The Architectural Setting of "Robin Hood"

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—Every antiquary must appreciate your correspondent "G. J. H.'s" critical contribution to the JOURNAL of February 21 on the Architectural Setting of "Robin Hood." If he, as an architect, is prepared to pass the architectural blunders and anachronisms and vote the film a good show, the student of costume and armour cannot do otherwise than follow his generous example.

The armour worn by the principals in the film is that shown in effigies and illuminated MSS. of about 1250, but it should have been subjected to drastic correction. The sword-belts and many of the other details are of about 1270–1300, while the vamplates upon the justing spears are late sixteenth century in fashion.

From the point of view of the student of armour, the worst blunder is Fairbanks's exhibition of diving and swimming in the moat in complete armour, just after the justing which opens the film. Such a feat is utterly impossible—it is ridiculous!

However, one must not labour the matter, but be thankful for a good, full-blooded, romantic story—with about as much pretence to historical and archæological accuracy as Sir Walter Scott's "Ivanhoe."

Let us hope that one day we may see an accurate historical film justifying the much-advertised employment of research directors, architectural, archæological and costume advisers, etc. Judging by recent results, their salaries are wasted money.

CHARLES R. BEARD.

## Architects' Fees for Abandoned Housing Schemes

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—The fees arranged by the Institute deputation and the Ministry are abominably inadequate. In many instances where the fees for the completed work would have run into four figures something less than £100 is offered, although three-fifths of the architect's work has been done.

The Ministry are also advising urban councils to refuse to pay *anything* in cases where the agreement with the architect is not under seal, although it is very doubtful whether an agreement for personal services need be sealed.

In others, where the agreement is acknowledged, and fees agreed for executed work (without mention of payment for abandoned work) the Ministry is also advising councils to withhold payment.

It is practically certain that architects would recover in both these cases, but the cost of suing a public body, with the rates to draw on, is so great that few would risk an action; on the other hand, if councils knew that architects were combining in an action a very different tone would be adopted.

"SCRUTATOR."

## Why not a Publicity Campaign?

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—We are greatly interested in the leading article published in your issue for February 14. The views expressed in that article entirely coincide with our own. At the present time the building trade is almost at a standstill, and a publicity campaign is urgently needed to revive building operations.

J. PARKINSON & SONS (BLACKPOOL), LTD

# The Wren Celebrations

Mr. Paul Waterhouse, P.R.I.B.A., has received the following letter from the Fine Arts Federation of New York :—

DEAR SIR,—The Fine Arts Federation of New York learns with much interest that the Royal Institute of British Architects is making arrangements for a "Commemoration Week" on the occasion of the bi-centenary of the death of Sir Christopher Wren.

The Fine Arts Federation desires to join you and your distinguished confreres in doing honour to the memory of the great architect, and takes sincere pleasure in paying tribute to the genius of Sir Christopher Wren and his splendid achievements.

The influence of Sir Christopher Wren and his school of architecture has been strongly felt in America, and it is with unfeigned gratification that the Fine Arts Federation expresses its deep admiration for one whose fame has in no way diminished since his death and whose works still proclaim him the greatest of British architects.

(*Signed*) ARNOLD W. BRUNNER,
*President.*
WM. LAUREL HARRIS,
*Secretary.*

The London Society sent a deputation to the National Portrait Gallery, and the Mayor of Westminster placed a laurel wreath before the portrait of Sir Christopher. Mr. Edwin T. Hall, F.R.I.B.A., gave an address.

The visits were continued to buildings by Sir Christopher Wren in London and elsewhere. A large party, composed of members of the R.I.B.A., the Selborne Society, and the London Society went to Cambridge, under the direction of Mr. Percival Ashton. First an inspection was made of the chapel and long gallery of Emmanuel College, and afterwards the party went to Trinity, the library of which is a characteristic example of Wren's work. Its features were explained by Mr. H. M. Fletcher (the Chairman of the Bi-centenary Committee).

The Master and Fellows of Pembroke College invited the guests to tea in their hall, and music subsequently in the chapel. Pembroke Chapel was erected in 1663–5, on a commission given by Bishop Mathew Wren, his uncle.

A delightful programme of sacred music of Wren's time, Purcell being the composer most largely drawn upon, was performed by an orchestra.

Among the provincial towns which celebrated the bi-centenary were Leeds, Cardiff, Glasgow, and Birmingham.

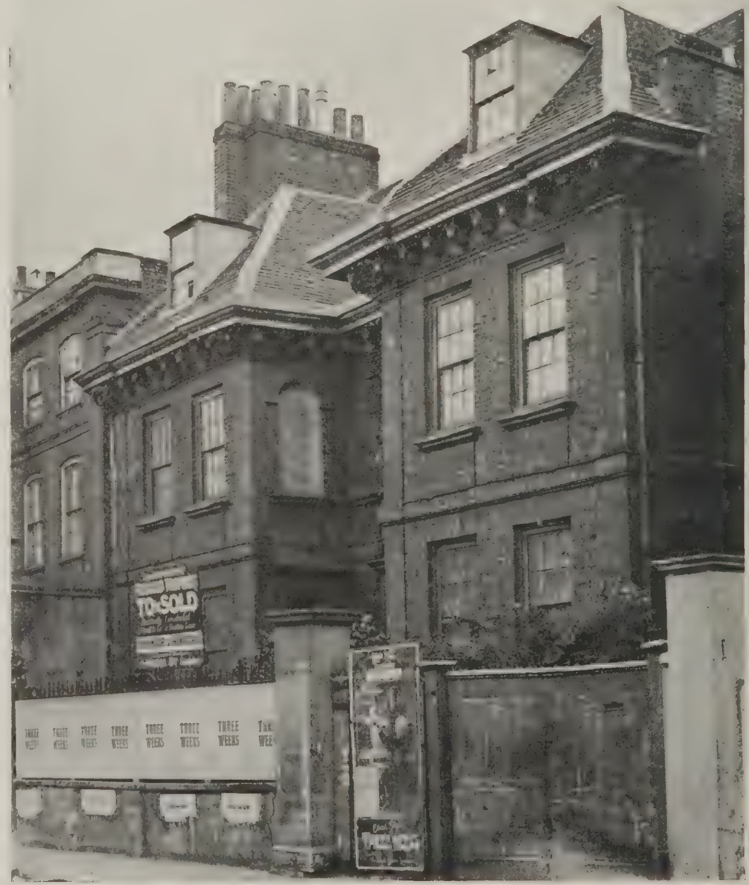
At Leeds a lecture was given on "Wren" by Mr. A. Hamilton Thompson in the Great Hall of the Leeds University. In the absence of Mr. Eric Morley (President of the Leeds and West Riding Architectural Association), Mr. W. H. Thorp presided, and there was a large audience. The lecturer, with the aid of some splendid lantern pictures, sketched the life and work of Sir Christopher Wren. On the motion of Mr. Sydney Kitson, seconded by Mr. G. W. Atkinson, thanks were expressed to the lecturer and chairman.

In Cardiff a public lecture was given on "Sir Christopher Wren" in the assembly hall of the Technical College under the auspices of the South Wales Institute of Architects and the Department of Architecture and Civic Design. The lecturer was Mr. W. S. Purchon, M.A., A.R.I.B.A., head of the department. Mr. Percy Thomas, O.B.E., F.R.I.B.A. (President of the South Wales Institute of Architects), occupied the chair, and there were about 300 present. The lecturer showed a number of examples of Wren's buildings in Cambridge and Oxford, drawing particular notice to the library of Trinity College, Cambridge, and Wren's correspondence with reference to that building and the new buildings for Trinity College, Oxford. Wren stayed in Paris in the latter half of 1665 with the object of escaping the Plague, and illustrations were shown of buildings which made a great impression on Sir Christopher; also of drawings of Bernini's design for the Louvre, which Wren wrote to say that he would have given his skin to possess. Illustrations were shown of the various types of secular buildings which Wren erected in London and the neighbourhood, culminating in the group at Greenwich Hospital, and of the plan which Wren prepared for the rebuilding of London after the Great Fire. Illustrations were shown of some of the fifty-two churches in the City of London which Wren either entirely rebuilt or entirely remodelled, and views were also shown of St. Paul's. A vote of thanks was proposed by Mr. T. Alwyn Lloyd, F.R.I.B.A., and seconded by Mr. J. H. Jones.

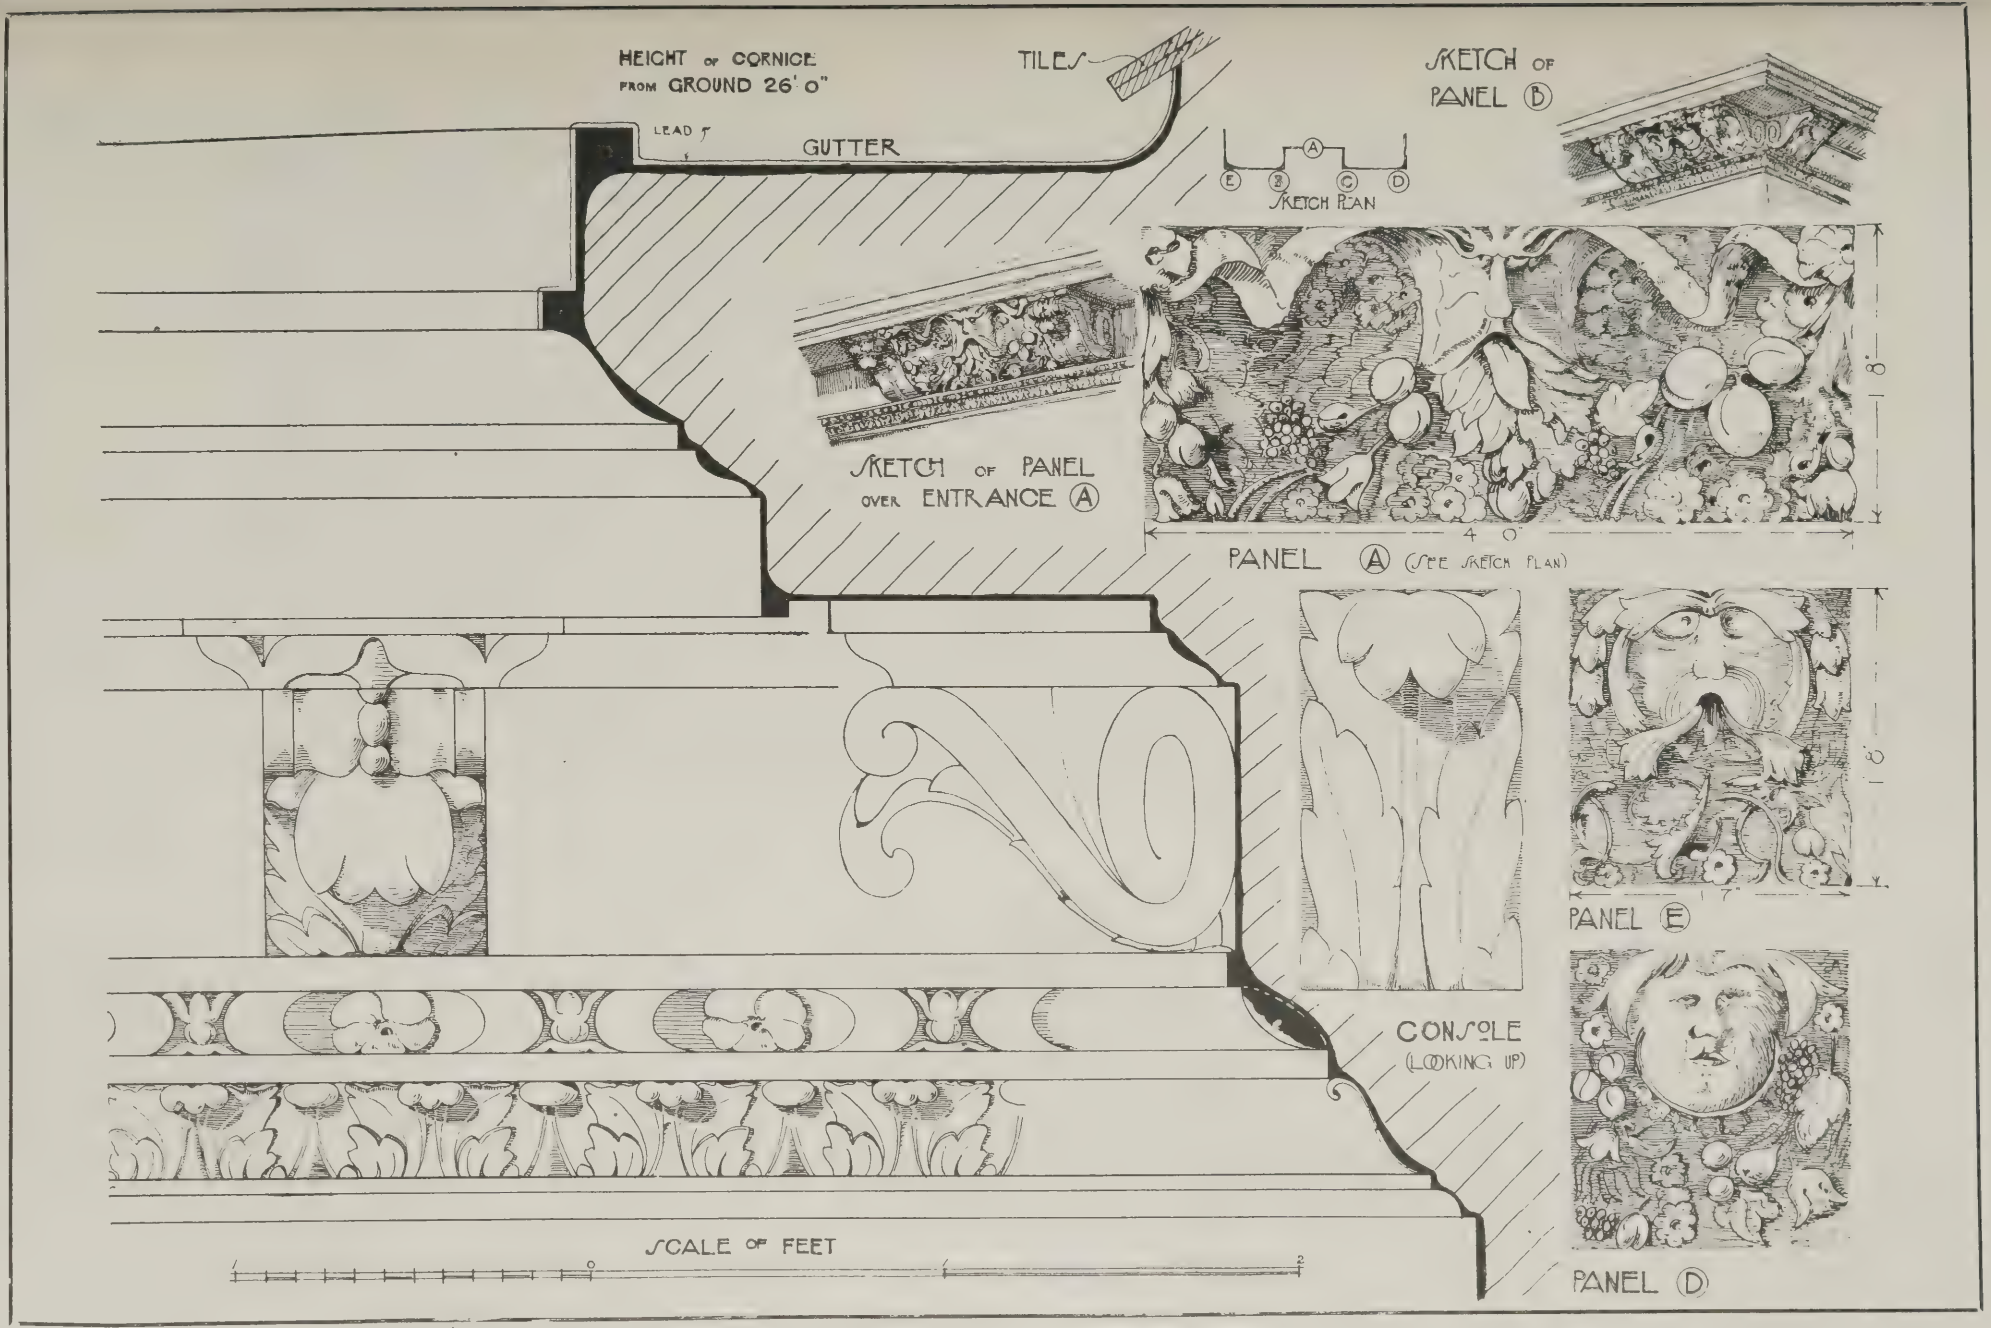
The Glasgow Institute of Architects (Glasgow Chapter of the Incorporation of Architects in Scotland) celebrated the bi-centenary by a dinner held in th M'Lellan Galleries. Mr. T. P. Marwick F.R.I.B.A. (President of the Incorporation of Architects), was the princip speaker, and in proposing the toast the evening he paid a tribute to th genius of Wren. He hoped that Wren churches would not be destroyed on me commercial grounds, but held in sacre trust for the nation. Mr. James Lochhea F.R.I.B.A. (President of the Glasgo Institute), presided. In giving the toa of "The University and Other Educa tional Institutions," Mr. George Paterson said it was unfortunate tha up till the present there was no Chair Architecture at the University of Glas gow. Professor Rait, who responde said he had been surprised that so f no one had suggested that the best wa to commemorate the Wren Bi-centenar would be to create a Wren Chair Architecture in the University of Oxfor in which the great architect had been student and professor. They could n claim to have such a Chair in Glasgow but they would be proud to welcome Chair of Architecture.

At a meeting of the Birminghar Architectural Association Sir Lawrenc Weaver, K.B.E., F.S.A., gave an illus trated lecture on "Sir Christopher Wren."

So far away as British Columbia th bi-centenary was celebrated. In Var couver the Architectural Institute British Columbia arranged, in the larges Anglican church there, a memorial se vice exactly like that held in St. Paul' Cathedral.



"WRENCOTE," CROYDON.
(*See Measured Drawing on opposite page.*)



"Wrencote," which stands in the Croydon High Street, is said to have been designed by Sir Christopher Wren. The proportions of the front are admirable, and the cornice is particularly fine. A photograph of the house appears on the previous page.

UNIVERSITY OF ILLINOIS

## ience and Art Scholarships for Londoners

The London County Council are pre- ed to consider applications for the owing scholarships from British sub- ts, provided their parents or guardians e in the County of London :—

. Intermediate technical or art olarships providing free tuition at ognized schools in London and, in ne cases, a maintenance grant, for dents from 16-18 years of age in gineering, technical optics, architec- e and building, chemical trades, art, . Candidates must possess scientific artistic ability and their general educa- n must be up to matriculation standard.

. Senior scholarships in science and hnology or art and artistic crafts pro- ing free instruction at full-time day rses at institutions of university rank at which advanced instruction in nce, technology, art, etc., is given. ey will enable students who are en- ed in trades or occupations, and have ended evening classes for at least two rs, to give up their day work and pur- a course of advanced instruction ted to their employment. In some es a maintenance grant, assessed on merits of each individual case, will provided, but it will not exceed £160 ear. If the candidate is over twenty- years of age and is self-supporting, or she must be ordinarily resident in ndon. Candidates must be not less n eighteen years of age.

. Free places at the Imperial College Science and Technology for candidates least eighteen years of age desirous taking a post-graduate course in mistry, engineering, etc.

. An "Archibald Dawnay" scholar- p in civil engineering of the value of o a year, providing training for two hree years at an approved polytechnic technical school for a student between een and eighteen years of age.

Detailed particulars may be obtained n the Education Officer (Technology nch) at the County Hall, Westmin- Bridge, S.E.1, or may be seen in the cholarships Handbook," obtainable n Messrs. P. S. King and Son, Ltd., nd 4 Great Smith Street, Westminster, V.1, price 3d. (by post 4½d.).

## he Trehearne-Norman Prize

his year the Council of the Society of hitects will award the Trehearne- rman Essay Prize (triennial, value £15) the best essay on The Influence of h Buildings on Civic Development. y British subject, male or female, y compete. The jury will consist Sir Ambrose Poynter, Bart., M.S.A., .I.B.A., and Mr. L. S. Sullivan, .A., A.R.I.B.A. The essay, to consist etween three and six thousand words, st reach the offices of the Society, Bedford Square, W.C.1, by May 1. must be typewritten on one side only quarto paper, and must bear a small elope attached to it containing the ne and address of the competitor, and claration that the composition of the y is entirely his own work. The essay should be written in sound and lucid English, and may be illustrated by means of diagrams in black and white. The prize-winning work, if of sufficient merit, will be published in "Architecture."

## Competition News

*Proposed Public Baths and Washhouses Competition, Greenwich.*

The president of the Royal Institute of British Architects has nominated Mr. Henry V. Ashley, F.R.I.B.A., as assessor in this competition.

*A Block of Five Shops for the Prestwich Co-operative and Industrial Society, Ltd.*

The following notice has been issued by the R.I.B.A. : "Members and Licentiates of the Royal Institute of British Architects must not take part in the above competition because the conditions are not in accordance with the published Regulations of the Royal Institute for Architectural Competitions."

## List of Competitions Open

| Date of Delivery. | COMPETITION. |
|---|---|
| March 31 | War Memorial in Crow Nest Park, Dewsbury. Assessor, Professor C. H. Reilly, O.B.E., M.A., F.R.I.B.A. A copy of the conditions together with plans of the site may be obtained on application to Mr. H. Dearden, A.R.I.B.A., Borough Surveyor, Town Hall, Dewsbury, on payment of one shilling. |
| April 15 | Buildings for the Polytechnic Institute, Reval. Premiums 200,000 marks, 150,000 marks, 100,000 marks. Apply Office National du Commerce Exterieur, 22 Avenue Victor Emmanuel III, Paris. (8e) The competition is an International one. |
| June 1 | New Municipal Buildings and Town Hall, Cork. Total cost not to exceed £120,000, Assessor Mr. Lucius O'Callaghan. F.R.I.A.I., A.R.H.A. The successful competitor will be appointed to carry out the work. Second and third premiums £200 and £100 respectively. Apply Mr. William Hegarty, Town Clerk, Cork. The competition is limited to architects living and practising in Ireland. |
| June 30 | Bridge over Nygaardsstrommen in Bergen. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, S.W. 1. |
| No date | Concert Pavilion, Bournemouth, to seat 2,000. Estimated cost £100,000. Assessor, Sir Edwin Cooper, F.R.I.B.A. Premiums: £300, £200, and £100. Apply Town Clerk, Municipal Offices, Bournemouth. Deposit £2 2s. (cheque). |
| No date | The Crown Agents for the Colonies, acting on behalf of the Government of the Straits Settlements, invite competitive designs for the reinforced concrete work required in connection with the construction of a new general post office at Singapore. Tentative designs, for which no fees will be paid, are required in the first instance, from which it is proposed to select a design and specify its adoption in the contract for the construction of the building. The firm whose design is so adopted will be subsequently engaged to prepare full detail plans, specification, quantities, &c., for an approved fee. Drawings can be seen and further details of the competition obtained from the Crown Agents for the Colonies, 4 Millbank, Westminster, S.W. 1, quoting Z/Straits Settlements 5664. |
| No date | Five shops for the Prestwich Co-operative and Industrial Society. Premium 75 guineas. Apply General Manager of the Society, Warwick Street, Bury New Road. Prestwich, Lancs. |
| No date | The following prizes are offered in connection with the Manchester Building Trades Exhibition to architectural students: Measured drawings—first prize, £40; second prize, £30. Architectural sketches—first prize, £20; second prize, £10. Sketches submitted may be in any medium, and must not exceed twenty. The Exhibition will be held in the City Hall, from March 6 to March 17. |

## Hampstead Labour-Saving Flats Competition

The assessors, Messrs. L. Rome Guthrie, A.R.I.B.A., John C. S. Soutar, L.R.I.B.A., and Edmund J. Cooper, have made the following awards in this competition : No .9 (1st premium), £500—Mr. J. B. F. Cowper, A.R.I.B.A., Olwyns, Wildwood Road, N.W.11. No. 11 (2nd premium), £300—Mr. George A. Rose, A.R.I.B.A., and Mr. A. V. Farrier, A.R.I.B.A., 56 Kings Road, Wimbledon, S.W.19. No. 35 (3rd premium), £200—Mr. Cyril A. Farey, A.R.I.B.A., Mr. C. Evelyn Simmons, L.R.I.B.A., Mr. A. Trystan Edwards, A.R.I.B.A., Palace Chambers, Bridge Street, Westminster, S.W.1. The first premiated design is illustrated on pages 450-51. Forty-two designs were submitted.

In the conditions it is stated that the group of buildings, which may be in two or three blocks not exceeding three floors in height, must contain : Ninety flats of varying sizes in approximately the following proportions—Type A : Ten flats with sitting-room and one bedroom. Type B : Thirty flats with sitting-room and two bedrooms. Type C : Twenty flats with sitting-room and three bedrooms. Type D : Fifteen flats with two sitting-rooms (or lounge hall and one sitting-room) and three bedrooms. Type E : Ten flats with two sitting-rooms (or lounge hall and one sitting-room) and four bedrooms. Type F : Five flats with two sitting-rooms in addition to lounge hall and four bedrooms. Certain areas were stipulated for the various rooms.

Each flat was also to have bathroom, w.c., kitchen-scullery, larder, and fitted wardrobe, and such other accommodations as the competitor may deem desirable. Each flat to have an open fireplace in one of the living-rooms, and in one of the bedrooms except in the flats with only one bedroom. In all other rooms provision should be made for ventilation in addition to windows, and for heating by gas fires or electric radiators. The other accommodation asked for included a central hall, for receptions and refreshments, lounge, writing-room, billiard-room, kitchen, and adequate offices, and in close communication with the above a small flat for the porter and sleeping accommodation for staff, a small laundry and drying room, an office near entrance for hall porter, with telephone exchange, etc., and ample room for boxes. Plenty of storage rooms which can be in basements or off staircases for letting to tenants who want box-room accommodation in addition to their flats, storage on ground floor near entrance for bicycles and perambulators, and lock-up garages for about twenty cars (some small for cycles with side cars) with separate approach road, and paved open space for washing cars. The ground not occupied by buildings was to be laid out for tennis, croquet, badminton and like games. In assessing the respective designs, the convenience for arranging these was taken into consideration.

All the designs submitted are being exhibited until March 13 at the New Workshops, Messrs. Garsubil, Finchley Road, Temple Fortune, N.W.11.

Mr. J. B. F. Cowper, A.R.I.B.A., was highly commended in "The Daily Mail" Bungalow competition.

# Book Reviews

## A Standard Method of Measurement

For many years the Surveyors' Institution and the Quantity Surveyors' Association (which bodies are now amalgamated) were accepted as the recognized authorities for deciding disputed points in connection with the measurement of building works. The frequency of the demands upon their services for this purpose directed attention to the diversity of practice, varying with local custom, and even with the idiosyncrasies of individual surveyors, which obtained. This lack of uniformity afforded a just ground of complaint on the part of contractors that the estimator was frequently left in doubt as to the true meaning of items in the bills of quantities which he was called upon to price.

In the absence of any statutory qualifications for surveyors practising in the United Kingdom, any person, up to the present, has been at liberty to describe himself as a quantity surveyor, and the public have no guarantee that he is qualified for that office. This fact has resulted in the issue of a considerable amount of unskilled work under the designation of bills of quantities.

Both the Surveyors' Institution and the Quantity Surveyors' Association were impressed with the necessity of securing greater accuracy of work and uniformity of method. The latter body, in 1909, with the object in view, appointed a committee who prepared and published pamphlets setting out the method of measurement recommended by the association in respect of these trades. The Surveyors' Institution also issued to its members circulars giving an authoritative opinion as to the correct method of measurement in the case of items in connection with which disputes had occurred. The desirability of co-operation between the two societies thus became evident, and a joint committee was set up in 1912 upon which was imposed the task of drawing up a comprehensive set of standard rules of Measurement of Building Works. In 1918 representatives of the building trades were added to this committee, four contractors being nominated by the National Federation of Building Trades Employers and the Institute of Builders. The joint committee were assisted in their deliberations by interviews with the representatives of certain trades.

The Standard Method of Measurement of Building Works drawn up and now issued in volume form, is stated in the preface to be founded upon the practice of the leading London quantity surveyors with certain modifications by way of alternatives, and not involving matters of principle, to suit the practice obtaining in other parts of the kingdom.

The publication of such a Method may be said to be epoch-marking. It should reduce litigation to the minimum, and—where one has to go to Law or arbitration—the path of the Referee will have been made smoother and straighter beyond compare.

"Standard Method of Measurement of Building Works." London: The Surveyors' Institution, 12 Great George Street, Westminster, S.W. Price 10s. 6d.

## "English Architecture at a Glance"

"Every man has a love for his own City, Town, or Village. As he wanders through the well-known streets after absence in other districts, the houses, shops, pavements, and lights speak to him of Home. And when there is a knowledge or even a rudimentary understanding of Architecture, every building stands revealed in a new light"—so writes the compiler of this volume in his opening words.

And, we might add, with what increased fondness does one think of the quiet village churches, and the old houses, when in foreign parts, if one has measured and drawn their every detail and knows the founts of inspiration from which they sprung. But to him who knows nothing of styles and periods, stone walls are apt to be thought of a little blankly—to him these sermons in stones are delivered in a foreign tongue.

The publishers of this little book* have set out to give the man in the street a new pair of eyes. Walking down the Charing Cross Road or along Oxford Street he may feel vaguely depressed, with a lifting of the spirit as he turns into Nash's Regent Street, with its generous curve, but as for knowing why, he will not guess. If he look from his window on a wet morning, and feel as wretched as the weather, he will know to what to ascribe such heaviness, but he has never been taught that a journey down Wimpole Street may have the same effect.

"The effect of environment upon mind, character, and perceptions has long been accepted, and great architecture has an inspiring influence and power—an influence felt by all," says the writer, and Aristotle said the same thing, but this is still news to "the man in the street." If there were "men in the street" in the old Roman days, it was known to them, but it has since been forgotten. And it is only by the publication of such cheap and useful hand-books as the one before us that it will again be brought to his mind.

It should be said that the book is strongly and tastefully bound in cloth boards and contains many sketches indicating clearly the features of the different styles. It is a marvel of cheapness and conciseness.

One must feel grateful to Messrs. Archibald D. Dawnay and Sons, the well-known constructional engineers, for their enterprise in the compilation of such a book.

* "English Architecture at a Glance: A Simple Review in Pictures of the Chief Periods of English Architecture." London: The Architectural Press, 27-29 Tothill Street, Westminster. Price 1s. net.

## A "Ready Reckoner"

It is nearly a century and a half since Hoppus issued his well-known Cube and Square Measurement Tables, and the fact that they still remain the Standard Tables for timber merchants and surveyors is high testimony to their general utility.

The requirements of the country, however, have enormously developed, and a more extended book of superficial measure tables is necessary for modern requirements. Tables are also wanted for ascertaining measurements in cu or square yards—the latter of which h become of importance in view of rece customs regulations.

The "Express" Superficial, Cube, a Girthing Reckoner is designed to supp these deficiencies, and combines in o volume detailed tables for every kind measurement in square or cube feet yards. The main superficial tables gi measurements up to 10 ft. by 100 with inches to 13 ft. by 13 ft.

This book is probably the most co plete of its kind issued at a modera price. All branches of the textile, co structional, and timber trades, as w as architects and estate agents, will fi it of the greatest service.

The publishers state this is the seven eighth reckoner issued by their firm.

"The (Express) Superficial, Cube, and Girth Reckoner." Gall and Inglis, Publishers, London Edinburgh. Price 2s. 6d.

## Spon's Pocket Price Boo

"Spon's Architects' and Builde Pocket Price Book" reaches, with 1923 issue, its forty-ninth edition. T whole of the prices have been revised accordance with the market values the date of going to Press, and show substantial, though long-waited for, duction on those of the last few yea As usual, the printing is excellent, and good paper, and, dry as may be the c tents to all who have not business the with, it is a pleasure to turn the leaves

## Tomb of Tutankhamen

The following extract is from a Play by ohn Leighton given before the Art orkers' Guild :—

SCENE : *The tomb of Tutankhamen at uxor.* A.D. 1923. *The tomb has been ened by excavators ; there is loud noise d darkness. The Guardian of the Tomb en appears in mystic light.*

(GUARDIAN OF THE TOMB speaks.)

e sons of decadence, behold your work !
ou that have dared to tamper with a Tomb
nd to disturb an ancient sanctity—
id you design to reconstruct the Past ?
ne Past shall play at reconstructing you !
is Tomb, an honour to its occupant,
rnished, as built, in token of respect,
ad lain in silence for three thousand years ;
ot all that time nor now, could I prevent
ne intermittent pilferings of thieves.
nothing sacred to your prying age ?
ay not the honoured dead be left to sleep ?
ust you because my brethren gave their best,
lding fine craft to rich material
nd finding a religious end for Beauty,
ust you strip Beauty of its great occasion
vorce ideas from their fashioned symbols,
nd make the form in which the symbol lay
ne mere exhibit of a cold museum ?

ur Art was Life, remained a living thing
beit dedicated to the Dead ;
hat Art is yours, that fumbles in the dust
hile leaving all untilled the fruitful soil ?
fle not treasuries of past inspiration !
t Reverence temper Archæology !
udy the ancient Craftsmanships, but scorn
ill adaptations from an alien age.
ek Craft and Beauty in the haunts of men,
nd in your lives, in Nature, your material ;
ork on and for the world that is around you,
shion things lovely for your daily uses,
rve your own gods with Hand and Heart and Soul.

ur hearts inspired our fingers for the task.
e wrought in due accordance with our times
nd what we did came aptly to our natures.
you propose to reproduce our forms
mindful of the working of our Spirit ?
our Spirit in your day, is yours to cherish.
vake your Spirit ! it will find a form.
our Pictures, Statues, and your daylight streets,
t them reflect the thoughts of your own age,
t them serve you in your own generation
nd not the irrecoverable Past.

nce you resolve to violate this Grave,
mplete your work and shatter our intent.
oat o'er your "treasures" ! Catalogue them ! Stun
our British Public in your daily Press
nd make the spoils of an Egyptian Tomb
thrilling subject for the breakfast table !
t all these treasures see the light of day,
(With due precautions in preservatives,)
Flash on the dimness your electric lamps,
Tear Tutankhamen from obscurity !
Reveal his State and his domestic life—
Discover what he was or wished to be
By estimation of his ornaments.
Gossip and reconstruct ! the field is yours !
I trust these heaps of plunder may provide
A fresh incentive to artistic feeling,
And help your Archæologists to solve
The great unanswered riddle : "What is Art ?"

## The Whitgift Hospital

The Archbishop of Canterbury led a deputation which waited upon Colonel Ashley (Parliamentary Secretary), at the Ministry of Transport, to protest against the threatened removal of the Whitgift Hospital at Croydon, in order to facilitate local street widening. Among the organizations represented by the deputation were : The R.I.B.A., the National Trust, the British Archæological Association, the Town Planning Institute, the Society of Antiquaries of London, the Royal Society of Arts, the Whitgift Hospital Preservation Committee, the Whitgift Foundation, the Society for the Protection of Ancient Buildings, the Royal Society of British Artists, the Croydon Natural History and Scientific Society, the Surrey Archæological Society, the Royal Academy of Arts, the London Society, the Commons and Footpaths Preservation Society, the South Eastern Scientific Societies, the West Surrey Society, and the London and Middlesex Archæological Society. Sir Aston Webb, P.R.A., and Mr. H. V. Lanchester, were among those present. Colonel Ashley, in reply, said that, leaving the hospital aside for a moment, he was in entire sympathy with the general views put forward. He entirely endorsed in general principles what had been said about the importance of the preservation of historical buildings in the life of the nation. From the through traffic point of view, there was no necessity to interfere with the Whitgift Hospital. He could not have said that a year or two ago, but the Ministry of Transport was putting a bypass round Croydon which would in all probability be opened for traffic at the end of the summer. It would be a few hundred yards shorter than routes through the town. Any sane motorist would not then wish to go through Croydon ; he would prefer to use the bypass, and save ten minutes. The Ministry were finding no money, however, towards the proposed alterations in Croydon, and so had no direct interest in what was going on there, and that particular work must therefore be left to local people. It seemed unnecessary to spend money on an alteration until one had seen what effect the by-pass would have on the traffic passing the hospital. He was about to receive a deputation from the Croydon Corporation, and the contentions of both parties would receive every consideration, but he had no power of veto.

## Parliamentary Notes

[BY OUR SPECIAL REPRESENTATIVE.]

### *"Decontrol" of Houses.*

After much questioning the Government have stated clearly their policy with regard to the "decontrol" of houses. The Prime Minister, in reply to a question by Mr. Pringle, said : It is proposed by the Government that all control shall cease in June 1925. As regards higher-rated houses, it is proposed that these shall be decontrolled in 1924, but the Bill will contain a clause that this shall only take place in the absence of a resolution to the contrary in either House of Parliament.

Mr. Linfield asked the Parliamentary Secretary to the Overseas Trade Department, as representing the Ministry of Health, whether he had obtained any estimates as to the probable number of houses that might be expected to be built in the two higher classes, under the Rent Restriction Act, between now and June 1924.

Sir W. Joynson-Hicks replied that the Government were of opinion that if their policy was carried out, the supply of these houses in 1924 should approximate to the demand.

Asked by Mr. Penny whether, in the new Housing Bill, he proposed to insert a provision to enable local authorities to make advances to builders during the course of erection of approved dwellings for persons who desired to own and live in them, Sir William Joynson-Hicks replied : Yes, sir.

Mr. Wise asked how many local authorities had adopted the Small Dwelling Acquisition Act, 1899.

Sir William Joynson-Hicks said that the Minister of Health had no information as to the number of local authorities who had adopted the Act, but fifty-six local authorities had obtained sanction to borrow money for the purpose of making advances under the Act.

### *Granite Imports.*

Replying to Mr. Lorden, Sir William Joynson-Hicks said that the quantity and value of granite, other than (1) setts and pavement kerbs, and (2) monumental and architectural objects, imported into the United Kingdom during the year 1922, and registered as consigned from Belgium and France respectively, were as follows : From Belgium, 136,451 tons, valued at £149,351 ; and from France, 20,350 tons, valued at £21,969.

### *Subsidy Grants.*

In answer to Mr. T. Thomson, Sir Wm. Joynson-Hicks said that the subsidy under section 1 of the Housing (Additional Powers) Act had been paid in respect of 39,161 houses, the total amount paid being £9,491,927.

### *British Cemeteries in France.*

Lt.-Col. Guinness informed Mr. Willey that the number of contracts in connection with the work in British cemeteries in France and Belgium which had been awarded to foreign firms was twelve, and to British firms, 297.

## Thames Valley Regional Planning Scheme

A joint town planning committee, consisting of representatives of local authorities situated within the Thames Valley, has been set up to co-ordinate the development of the several districts which together form this important sector of the Metropolitan area. The Committee have appointed Messrs. Thomas Adams and Longstreth Thompson to prepare an outline scheme of development for the whole region. This firm is acting in the same capacity for the West Middlesex Joint Town Planning Committee.

# Law Report

## Light and Air Dispute

*Wills* v. *May*.

Feb. 14. Chancery Division.
Before Mr. Justice P. O. Lawrence.

This was an action by Mrs. Clara A. Wills against Mr. John May, of Church Street, Croydon, for a mandatory injunction against the defendant, or in the alternative for damages on the ground that the defendant had so raised the height of his premises as to materially diminish, if not obliterate altogether, the ancient lights to the ground floor of plaintiff's premises at 117 Church Street. Plaintiff also complained that the defendant's building had seriously diminished the lighting of the first floor of her premises. Plaintiff owns several houses in Church Street. Defendant denied that his action had affected the rights of the plaintiff. With his denial of liability he brought into Court the sum of £75 as sufficient to cover any loss sustained by the plaintiff.

Mr. Charles A. Young, of Messrs. Douglas Young & Co., surveyors, of Coleman Street, E.C., Mr. Hugh Mackintosh, architect and surveyor, of East Croydon, and Mr. Douglas Young, gave evidence on behalf of plaintiff, and pointed out the reduction of light to the plaintiff's premises, and the depreciation in the letting and site value of the houses. They agreed that regard must be had to the possibilities of the future, seeing the progress of the neighbourhood towards one of an industrial nature.

Defendant's experts, Mr. E. S. Rodgers and Mr. H. Williams, of Croydon, declared that the lights of plaintiff's house had not been substantially affected, that structural alterations at a cost of about £50 would give it greater light than it had ever previously enjoyed, and that there was practically no depreciation in the letting or site value.

His Lordship held that it was not a case for a mandatory injunction. He came to the conclusion that structural alterations would make the house as comfortable as before, and awarded plaintiff £50 damages on that head. Damage to the combined sites he estimated at £100, and entered judgment for plaintiff for £150 damages and costs.

# Building Boom in Glasgow

At the last meeting of the Glasgow Dean of Guild Court the plans approved included several notable schemes promoted by the Corporation, chiefly the slum clearance proposal and the erection of 362 houses in London Road. This scheme involves a capital outlay of nearly £100,000. In addition, the Corporation secured power to proceed with the erection of baths and wash-houses at George Street, Whiteinch, at a cost of £50,000. The Education Department was also authorized to proceed with a new school at St. James's Road, the cost of which is estimated at £25,000. Another big scheme is that of extensions by Messrs. Macfarlane, Lang and Company, which represent an expenditure of £50,000.

# Mr. Shaw & Whalley Abbey

The following letter has been received from Mr. Shaw in response to an invitation from Father MacDonnell to contribute to the Whalley Abbey Fund :—

"No use asking me for money; I cannot pay both in meal and in malt. You do not make it clear whether you want funds to give a job to a contractor, or whether, like the monks of Buckfast, you propose to do the work yourself. Their amateur-built abbey has all the mediæval quality.—Faithfully,

(*Signed*) "G. BERNARD SHAW."

# Building Trades Wages

The text of the ballot paper issued to the building trade operatives states :—

1. I am willing to accept the employers' proposals for the stabilization of hours of labour and wage rates for twelve months on condition that the following wage rate alteration takes place, namely : Towns graded A, A1, A2, and A3, 2d. per hour; B, B1, and B2, 1½d. per hour; B3, C, C1, and C2, 1d. per hour. The labourers' rate to be not less than 75 per cent. of the craftsmen's rate.

2. I am against acceptance of the employers' proposals and am fully prepared to accept the consequences of rejection, either by strike or lock-out.

The proposed reductions will bring craftsmen's wages in London and all grade A towns to 1s. 6d. an hour. The rates in other towns will vary from 1s. 5½d. to 1s. 2d. Labourers' wages in London and A towns will be 1s. 1½d. an hour, and will vary elsewhere from 1s. 1¼d. to 10½d. an hour. Hours of work are to remain unchanged, viz., 44 hours a week during ten months and 41½ in December and January. The ballot papers are returnable to the unions on March 12 and to the head office of the Federation on the 14th.

Building trade operatives, numbering between 10,000 and 15,000, have ceased work in the Eastern Counties as a protest against a reduction in the wage rates of painters. Mr. R. Coppock, the general secretary of the National Federation of Building Trade Operatives, has given three reasons for the strike. He said (1) that the Eastern Counties employers were trying to impose wage reductions and working conditions that had not been nationally negotiated; (2) that, without waiting for the result of an investigation as to painters' wages, the Eastern Counties employers had resolved upon a differentiation; and (3) that the issue had been widened by an attempt to enforce a general reduction of wages of between threepence and fourpence an hour and an extension of the working week.

The secretary of the Eastern Counties Employers' Association has denied that, so far as the employers are concerned, the strike arises out of anything but the relation of painters' wages to those of other workers in the industry. "The Operatives' Federation," he said "has been quoting the figures of the original demand of the National Employers' Federation. The National Federation's demand has since been considerably modified, and in any case the present dispute has nothing to do with it, the painters' wages only being involved." It is understood that the Ministry of Labour is endeavouring to bring about a renewal of negotiations.

# Coming Events

*Wednesday, March* 7.

Institute of Builders.—Annual Dinne Edward VII Rooms.

Beaux Arts Committee.—Lecture an Exhibition, Society of Architects. 8 p.r

*Thursday, March* 8.

R.I.B.A.—"Architecture and Pain ing." By Mr. Walter Bayes, A.R.W.S.

### *Proposed Barnstaple Baths.*

Barnstaple Trades and Labour Council has suggested to the Town Council that consideration should be given the question of providing a bathing-place and baths by the conversion of the 6th Devon headquarters, town property, which will be shortly given up on the completion of the new territorial headquarters.

### *Harrow School Chapel.*

Harrow School Chapel has been enriched by a set of windows, the gift of Mrs. Wills, of Thornby Hall, Northampton, in memory of Major Edward Lyon, who died of wounds received at the second battle of the Somme. The windows were designed and executed by Sir Charles Nicholson and his brother, Mr. Archibald Nicholson.

### *New Swimming Bath for Birmingham.*

Alterations and additions are to be made by the Birmingham Board of Guardians to Marsden Green Homes, at a cost of £14,000. Further office, storage, and laundry accommodation is to be provided, and a new building, for use as a swimming bath in the summer and an assembly hall and gymnasium in the winter, is to be erected.

### *Sixteen New Churches for Liverpool.*

Three new churches are now being erected in the Liverpool diocese, and there are schemes in hand for thirteen other churches. This information was given at the annual meeting of the Liverpool Church Building Society by the Lord Bishop, who suggested that Liverpool churchmen would have to raise £50,000 in the near future for church building.

### *Sports Ground for a Wesleyan Church.*

The Priory Place Wesleyan Church, Doncaster, have decided to purchase five and a half acres of ground at the Doncaster end of Wheatley Park. The site will provide two football or hockey grounds, which can also be used for cricket in the summer, nine tennis courts, and ground for pavilion, etc. The scheme is estimated to cost £2,300.

### *School Chapel in Harrogate.*

The foundation-stone of a chapel for the Harrogate College for Girls has been laid by Major the Hon. Edward Wood, M.P., Minister of Education. The chapel is to be built with the materials of the old St. Mary's Church, Harrogate, which was abandoned by the Church authorities in 1919 owing to the unsafe condition of the building. The architects are Messrs. Taggart and Silk, of Belfast.

### *New Storage Reservoir for Blyth.*

A scheme to provide work for 200 unemployed is to be started by Blyth Town Council. It is a project to build a storage reservoir to hold three million gallons of water at High Horton on the pipe-line of Newcastle and Gateshead Water Company, who supply most of the water consumed in the Blyth area. The cost of the work is estimated at £15,000.

### *British Memorial Gift to Belgium.*

Britain, through the Imperial War Graves Commission, is presenting a British memorial to Belgium. This memorial is being erected in the large open space in front of the Palais de Justice, at Brussels. As the Commission is a Government Department, the actual details of the work were left to an executive composed of representative Belgians and Britons, whilst the task of designing and carving was given to Mr. C. S. Jagger, architect, and Mr. J. S. Tate, sculptor.

### *A New Café Royal.*

The Café Royal is to be rebuilt at a cost of between £400,000 and £500,000. The new café will be considerably larger than the present building, for all the floors, except the ground floor and basement, of some of the adjoining property are to be taken over and the height of the building is to be raised to 100 ft. There are to be eighteen banqueting halls and accommodation is to be provided for 5,000 people. The largest of these banqueting halls will seat 650 people.

# Rates of Wages in the Building Trades*

The following table, which is published in the first issue of THE JOURNAL for each month, shows the rates of wages of craftsmen (bricklayers, masons, carpenters and joiners, woodcutting machinists, slaters plumbers,* plasterers, painters †) and labourers in the building industry. The labour rates for London are given in the Table of Current Prices on pages xxiii, xxiv.

| District. | Grade A. | | Grade B. | | Grade C. | | Grade D. | |
|---|---|---|---|---|---|---|---|---|
| | Craftsmen. | Labourers. | Craftsmen. | Labourers. | Craftsmen. | Labourers. | Craftsmen. | Labourers. |
| | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. |
| North East Coast | 1 8 | 1 3 | — | — | — | — | — | — |
| Yorkshire | 1 8 | 1 3 | 1 6½ | 1 2 | 1 4½ | 1 0½ | — | — |
| North Western Counties‡ | 1 8 | 1 3 | 1 6½ | 1 2 | 1 4½ | 1 0½ | 1 4 | 1 0 |
| Midland Counties | 1 8 | 1 3 | 1 6½ | 1 2 | 1 5 | 1 0¾ | 1 4 | 1 0 |
| Eastern Counties | 1 4½ | 1 0½ | 1 4 | 1 0 | 1 3 | 0 11¼ | — | — |
| Southern Counties | 1 4½ | 1 0½ | 1 4 | 1 0 | 1 3 | 0 11¼ | — | — |
| South Western Counties | 1 8 | 1 3 | 1 6 | 1 1½ | 1 4½ | 1 0½ | 1 3½ | 0 11¾ |
| South Wales | 1 8 | 1 3 | 1 4 | 1 0 | — | — | — | — |
| Scotland§ | 1 8 | —¶ | 1 7 | —¶ | 1 6 | —¶ | — | — |

* In the case of towns printed in *italic type* below, the rates shown in the Table for craftsmen do not apply to plumbers.

† In Scotland, painters, Grade A towns, 1s. 6½d.; Grade B, 1s. 5½d.; Grade C, 1s. 4½d. Brechin, Forfar, and Montrose, 1s. 4d. Elgin, Forres and Nairn, 1s. 3½d.

‡ Excluding Liverpool and Birkenhead, where the rates are 1s. 10d. for plumbers, 1s. 9½d. for mason's fixers, 1s. 9d. for other craftsmen, 1s. 5d. for scaffolders, and 1s. 4d. for labourers.

§ Excluding Aberdeen, where the rates remain unaltered at 1s. 7½d. for masons, joiners, and plasterers, 1s. 8d. for slaters, and 1s. 9d. for plumbers.

¶ In Scotland, labourers are not included in the general grading scheme.

## Grading of Towns.

The localities in which the above rates have been reported to be in operation are as follows. In the case of localities printed in *italic type*, the rates shown in the above Table for craftsmen do not apply to plumbers. The rates of wages per hour in Londonderry are: bricklayers, masons, carpenters and joiners, slaters, plasterers, and painters, 1s. 5d. Newry: bricklayers, masons, plasterers, and slaters, 1s. 8d. Salisbury: Skilled painters and grainers, 1s. 2d., rough painters 1s. 1d., other tradesmen, 1s. 3d., labourers, 10d. Stonehaven: painters, 1s 4d. Keynsham: 1s. 7d. per hour for tradesmen and 1s. 2d. per hour for labourers. Sutherland: masons and plumbers, 1s 4d., joiners and painters, 1s. 3d., slaters and plasterers, 1s. 4d, labourers, 9d. Electrical Installation.—England and Wales (except Sussex district); also Belfast and Londonderry: Grade A towns, 1s. 8½d.; Grade B, 1s. 6¼d.; Grade C, 1s. 5d.; Grade D, 1s. 3¾d. Sussex district, 1s. 5d. Scotland, 1s. 5d.

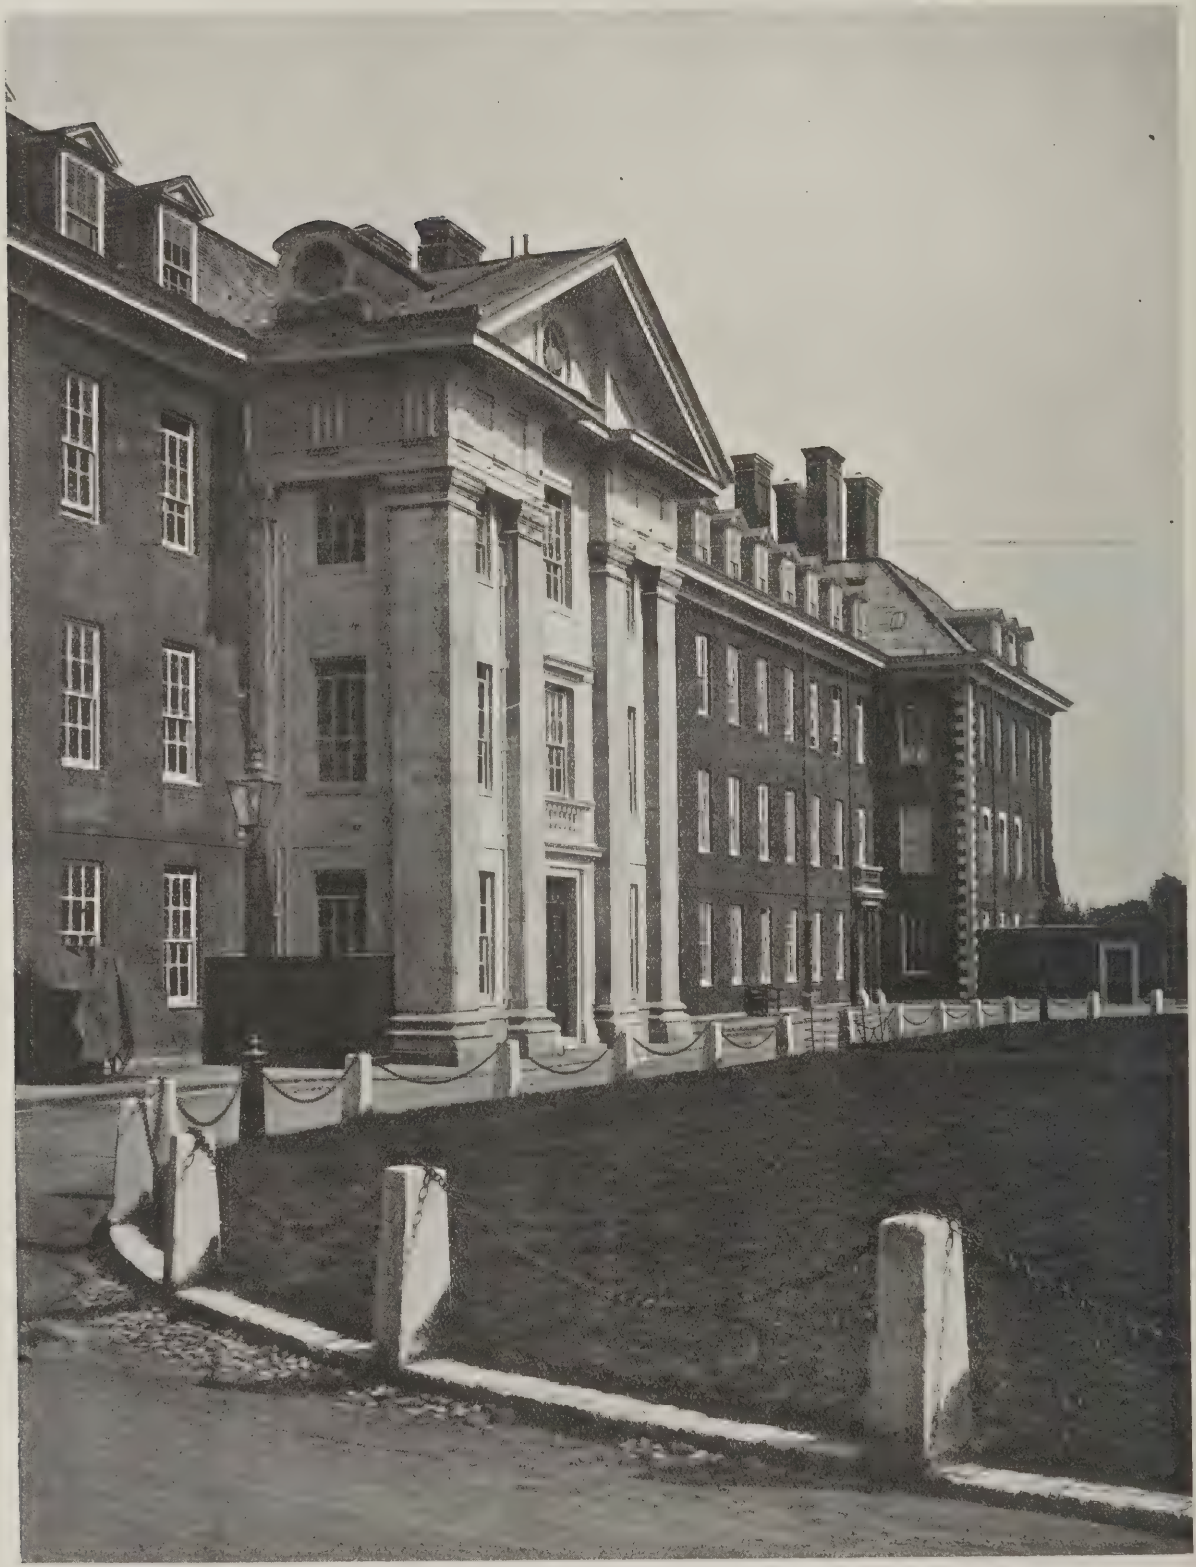
## Monumental Architecture. 9.—The Royal Hospital, Chelsea

### Sir Christopher Wren, Architect



Chelsea Hospital is now more famously known as the home of the red-coated Chelsea Pensioners than as one of Wren's most elegant works. Yet its simplicity and dignity are masterly; few, it has been said, could have combined such effect with so rigid an economy of material.

# Civic Pride and the Cinematograph

EVERYBODY will agree that the robust pride ordinarily exhibited by the individual in the place of his birth is one of the most admirable characteristics of human nature. It is true that this pride ' the native may occasionally induce him to exaggerate ie advantages of life in his own particular town; it may equently compel him to overlook its most obvious dis-lvantages; it may even develop along extravagant or ghly fantastic channels; but it is invariably sincere and uite ineradicable.

For example, the strange pride of the Londoner in the ctreme density of metropolitan fogs is well known, but a an from Manchester will obtain equal satisfaction in lating on the superior smokiness of his native air, when mpared with the atmosphere of all other cities. And it ay be recalled that a Liverpool man was recently fined rty shillings for calling out the fire brigade in order to ove to a sceptical acquaintance from Manchester that the iverpool brigade is the fastest in the world.

Again, no self-respecting native of Leicester would admit iblicly that Leicester could be compared unfavourably ith Nottingham, either in architectural achievement, itural environment, cleanliness, or county cricket elevens. native of Hereford might secretly deplore the lack of amcars in his own city, but he would never give expres-on to such thoughts when conversing with a citizen of 'orcester. And no one, except at considerable personal sk, would remark to a townsman of Swansea that Cardiff undoubtedly the most progressive municipality in 'ales.

Of recent years this development of civic rivalry has been eatly accentuated by the exploits of professional football ubs, composed principally of players who are not natives the towns they represent. In the near future it is likely be extended in quite a different direction, for the Glasgow orporation has recently authorized the preparation of a nematograph film dealing with its civic activities and, cording to an announcement in the Press, this film will ow "the municipal parks, the fire brigade, the electrical id tramway works, the treasures in the art galleries, the spitals, and other public institutions."

The effect of such an experiment in civic advertisement ill be awaited with some curiosity, for it is to be assumed at the exhibition of these official pictures extolling the erits of Glasgow will not be restricted to the theatres of at city. The example may prove a source of inspiration other municipalities and, should the cult of the civic m become popular, some very interesting developments ay be anticipated. Thus, it will at once become apparent at for Glasgow or any other city to circularize the rest the community with pictures carefully restricted to the rticular activities or attributes of which it happens to proud, is not nearly good enough. If the Glasgow orporation wishes to invite a fair and unbiassed com-rison of its achievements with the achievements of other ties, it should also order films to be prepared showing, y, a selection of the one and two-room tenements in hich at least 50 per cent. of its citizens reside at the present time. The Corporation may consider it unnecessary to include anything of this description in its present series, but when the idea of the civic film has really developed, it is obvious that each civic photographer will be commissioned to prepare films, not only of his own town, but also of other towns. The latter exhibited for purposes of comparison with the former, and accompanied by descriptive titles compiled in the breezy phraseology cultivated by cinematograph film producers, would undoubtedly prove of great interest, and "WHAT GLASGOW DID NOT SHOW US LAST WEEK !—SENSATIONAL OMISSIONS IN TWENTY REELS" has possibilities quite as thrilling and far more instructive than the most poignant drama of true love, revolvers, and revenge.

The anxiety of the Croydon Corporation to demolish the Whitgift Hospital is pathetic in its persistence, and in any contemplated cinematograph film dealing with its civic activities the Corporation might feel inclined to omit all reference to the vexed question. Fortunately the exhibition elsewhere of a series of pictures of the hospital would not thereby be prohibited, and in order to cater more particularly for picture-house patrons with exotic tastes, a film of "WHAT CROYDON PROPOSES TO PULL DOWN !" might even be followed by a specially selected Grand Guignol series depicting "WHAT CROYDON DOES NOT PROPOSE TO PULL DOWN."

If only the municipalities of Nottingham and Leicester could be induced to expose the civic deficiencies of each other through the medium of the cinematograph, the interest aroused in these rival Midland cities would certainly prove of greater assistance in the advancement of the civic achievements of each than the present pastime of indulging in cross-talk over a distance of five and twenty miles. And when both Nottingham and Leicester have attained such a degree of civic perfection that nothing further remains to be exposed on either side, it is not beyond the bounds of possibility that they might enter into coalition with the express object of bringing Birmingham up to date.

For some time it has been fairly obvious that the abnormally heavy doses of intellectual cod-liver-oil administered by publicists to the civic patient are not being followed by any appreciable decline in the popularity of prize-fights or brass-band contests, or racehorses, or guessing competitions. Whilst the housing problem, the transport problem, the smoke problem, and so many other problems of urgent civic importance are awaiting solution, the ordinary citizen really cannot be expected to exhibit an extravagant enthusiasm on hearing that excellent progress (on paper) is being made with these matters, but that in the meantime the provision of wirework waste-paper baskets for attachment to municipal lamp-posts has been definitely agreed upon, and the equipment of civic park-keepers in distinctive uniforms of a semi-military character is an accomplished fact. The jaded palate of the civic patient craves for something of a more piquant nature.

The preparation of what may perhaps be described as intellectual chutney is not an impossibility, and if it can be administered successfully through the medium of the cinematograph, the contention of the film syndicates that they have an educational as well as a recreational objective will be considerably strengthened. Producers of cinematograph films are said to spend astonishing sums of money on the erection of cardboard and brown paper cities, as backgrounds for their pictures. For the production of the civic film no cardboard is required. Everything is already in position, and if the various municipalities in the country do not feel disposed to emulate the example of Glasgow, an excellent opportunity will arise for the cinematograph syndicates to take up and develop the idea themselves.

The encouragement of civic rivalry is certainly not reprehensible if its result is likely to be of the slightest benefit to the community. And no one will deny that an accurate knowledge of what other towns are doing and what they are not doing is a very necessary asset to every citizen.

A popular interest in architecture is possible of achievement by the exploitation of popular methods, and popular methods are not necessarily vulgar methods. It is not suggested, for instance, that public interest in architecture would be intensified by the action of a band of zealots who might take a solemn vow to stand on orange boxes at street corners and harangue the passers-by on the corrections for optical illusion as observed in the Parthenon. But it is seriously advanced that a popular interest in all kinds of parks and fire-brigades and electrical and tramway works and art galleries and hospitals and other civic institutions is conducive to a popular interest in architecture, and from that point of view alone the experiment of the Glasgow Corporation is worthy of the greatest publicity and encouragement.

F. N. J.

## An Unfair Competition

An advertisement in "The Western Morning News" invites architects to submit plans for a proposed parish hall at St. Marychurch, the committee being "prepared to award remuneration only for the plans they adopt." The day for sending in designs has now gone by, but we cannot imagine that there has been any satisfactory response to this invitation. We hope that the committee will realize the extreme unreasonableness of what they are doing and forthwith promote a competition on sound and proper lines. We suggest that if they are unacquainted with the necessary procedure they should get in touch with the secretary of the local architectural society.

## Architecture and the Layman

Mr. Gilbert Frankau's title of "Architecture and Literature" may not have been completely fulfilled in the address that he gave last week at the Architectural Association, but at least it served as a useful peg on which to hang some rather random remarks, mostly critical, about architecture and architects from the layman's point of view. Mr. Frankau's chief points seem to be as follows: that the technical vocabulary of the architect is unintelligible to the layman; that present-day architecture does not reflect the character of the race; that labour-saving devices are a nuisance; that architecture is an individualistic profession somewhat in danger of Government control; and that there is much virtue in the jerry builder. Dealing with these points *seriatim*, we would say that every profession has its technical phraseology, and there is no reason why architecture should not have one. The public are not asked to learn the meaning of "entasis," "cyma reversa," "impost mould," or any other technical term. These are for architects alone. Then about architecture not reflecting the character of the race—well, if this is so, it is not the fault of architects; nor are architects to be blamed for labour-saving devices: these are mostly proprietary inventions, and some of them are excellent. Architecture, says Mr. Frankau, is an individualistic profession. But you m have too much individualism, which is worse than none all. The cult of individualism produced Piccadilly Circ and Queen Victoria Street, not to mention suburb Government control of housing did not destroy individ ality in architecture; on the contrary, it encouraged If Mr. Frankau would take a tour round the Governme housing schemes he would be astonished at their varie of architectural treatment. And last we have Jerry t Builder, who, generally speaking, is most unfairly disparage An architect of our acquaintance holds that he (Jerry) the greatest benefactor of the British race because his bad fitting doors, draughty windows, and leaky roofs ensu to all who dwell in his houses the healthy conditions open-air life. If Mr. Frankau has given us the point of vi of the man in the street, then that individual (if he is n really an abstraction) is a bigger problem than we thoug

## Broadcasting Architecture

Sir Banister Fletcher did good work for architectu when he broadcast an address on Sir Christopher Wren la week. It is estimated that over a hundred thousand perso listened-in on that occasion. How many of these "broa catchers" had listened to an address on architectu before? Very few, we imagine. Obviously wireless h immense possibilities from the point of view of arc tectural propaganda, and we hope that Sir Baniste pioneer effort will be followed up by a regular series addresses on architecture. Sir Banister was distinc happy in his choice of subject, and we imagine that very interesting sketch of Wren's life and work was listen to with much profit and pleasure by that vast, silent audien Certainly, if architecture is to be popularized, as we wish it to be, it must be dealt with in an interesting wa Few subjects have greater possibilities of boredom heavily handled. If the broadcasting of architecture widely taken up it might be wise, at first, to enlist the of some well-known public men, such as Mr. Chestert or Mr. Belloc, who could be relied upon to invest subject with the necessary attractiveness. For the d must be seasoned—at first, in any case; when the pub has been thoroughly "broken in" we may then get down the entasis of the Parthenon columns and the refineme of Decorated Gothic. Of course, the architectural possi lities of wireless do not end with the broadcasting of popu lectures. The time may possibly come when the Presid of the R.I.B.A. will broadcast his Presidential Addre comfortably seated by his fireside, with the entire army Fellows, Associates and Licentiates listening-in. Fo debate on Registration it would, of course, be necess for members to have their own transmitting sets to expl their various views. But all would be "sending," none "listening-in"! No! Wireless will never displ 9 Conduit Street.

## The Passing of the Morgue

The announcement that the Morgue is to be demolish is not likely to draw indignant protests from French arc tects, for it has little claim to architectural distincti but its disappearance will at least evoke "the pass tribute of a sigh." That grim little building beyond flying buttresses of Notre Dame is part of familiar Pa and nobody really likes to see familiar things of this s passing away. It was a saddening sight that of the hou breakers at work on old Newgate. The sinister associati of the Morgue have had a peculiar fascination for a cert sort of mind. The mad Méryon made it the subject of of his most morbid etchings; and it is not without sig ficance that Poe called one of his most horrible tales " Murders in the Rue Morgue." Soon the place will be o a memory. And surely the French are becoming less turesque in their nomenclature; there is a regretta prosaic flavour about that title of the new Morgu "Institut Médico-Légal."

# As Others See Us

## Architects Through a Novelist's Eyes

MR. GILBERT FRANKAU'S lecture at the Architectural Association last week took several surprising turns. "Architecture and Literature," the title of the paper, had apparently l the audience to expect an elaborate comparison between e two arts, enlivened, if the Fates and Mr. Frankau were nd, by the novelist's brilliant metaphor and pungent wit. What Mr. Frankau did say, however, had all the piquant arm of unexpectedness. We all love being talked to out ourselves, even if the discourse is not entirely com- mentary, and architects and students alike revelled in e orgy of home truths to which they were treated. The eaker thrust shrewdly, it is true, but at no time was his il without its button, and the twinkle in his eye belied e mordancy of his words.

It was, in fact, a thoroughly stimulating evening. To be iticized is good; to be able to reply to that criticism is tter, but even if we know in our hearts that the critic is tirely wrong, his unexpurgated opinion cannot but give od for thought. Not that one would wish to insinuate at this particular criticism was ill-founded; more than ce the speaker voiced what appear to be very real griev- ces on the part of the man-in-the-street. For the man-in- e-street it was who, in Mr. Frankau, found an able inter- eter and an ardent champion.

Before taking up the cudgels on behalf of ὁι πολοι, wever, Mr. Frankau dwelt for a little on the unimagined fficulties of the novelist in regard to architecture. He had visualize the plan of his hero's house, to describe the reet along which he took his morning walk, the country ansion he visited. And occasionally he found himself con- onted by the problem of equipping an ordinary room with many doors as Seymour Hicks used in one of his favourite rces from the French.

A new language, complained Mr. Frankau, was needed r architecture. If the novelist used architectural phraseo- gy he was unintelligible to the public. Why, he asked tterly, should *ornament* become *embellishment* in technical rlance? Architecture, in fact, required a new verbal chnique, and a committee might well be called in to duce its abstruse terms to honest Anglo-Saxon. The chitect should come off his technical high horse (at this age the speaker evidently mounted a steed of another riety) and realize that the public was vastly interested in uses, but not in messuages.

All professional men lived on and abused the public, and mplaints that the public "won't spend money" were iversal. The plain fact was that the public was their aster, and they were all, writers and architects alike, rking to the human animal character.

Here Mr. Frankau digressed to make the expected com- rison between the making of the book and the making the building, both based on a solid foundation; both ected for a definite purpose, through the stages of plans, affolding, construction, ornamentation, to their final opling with humanity.

This, however, brought the speaker back to his original ievance. Present-day architecture did not, he said, lect the character of the public—(voice at the back— ideous!"). That was a precise illustration of what he ant—the professional attitude of contempt for the public. was, he contended, a mistake to despise the public—a peless mistake. The man-in-the-street was not uneducated architects seemed to imagine; he both knew and appreci- ed what was good—in fact, he "ate" it, *when* he could get

Architects, Mr. Frankau hinted, might with advantage ulate the novelist, who built his book for a specific rpose, and aimed at the average individual who played f, ate roast beef, and went to sleep on Sunday. Person- y he believed in the public, and thought that architects should remember the people who paid for the houses and lived in them.

The mention of houses reminded the speaker of a further grievance. Modern houses, he said, were full of conveniences, but empty of comforts. They were noisy, and the present tendency was to save the servant and "strafe" the mistress.

The housing question was the problem of the moment, and the public was vitally interested, but architects stood aloof (has a professional assemblage ever before been openly accused of a deficiency of initiative?) whereas they ought to tell the public why they had not got houses. Mr. Frankau's own explanation was simple: "Scrap Government control. Till then industry is damned," and on this theme he elaborated.

There was a similarity between architects and novelists in that both felt the impulse to express their unhampered individuality. They must, however, be guided by tradition, and use it in relation to the public who paid them their wages. Above all, they should fight the tendency to intolerance. There was a tendency to scoff at everything modern, but it should be remembered that modern architecture was severely hampered by financial and labour difficulties.

The small builder especially deserved encouragement; above all, let the profession cling to individualism and fight for freedom from control.

A vote of thanks was proposed by Professor Richardson, who said that architecture, an elderly Cinderella, had discovered in literature her fairy prince. Architects found that literature played an important part in architecture, as every man who built wrote a book about it. Literature, from the Bible to Kate Greenaway in the seventies, had inspired architecture. But architects were the "medicine men," and it was for the public to take what they gave them.

Mr. Newton said he was offended by the assumption that architects were solely interested in housing, they were far more concerned with the expression of an idea. Let writers teach the public to seek for fine qualities in buildings.

Mr. Lawrence Dale thought that architects were inclined to disregard the public, but at the same time they should not pander to their vices. The same might be said of authors.

Mr. Manning Robertson, referring to Mr. Frankau's creed of individualism, thought that people should be restrained from annoying their neighbours, and ought not to be allowed to do as they like.

Mr. Moberly and Mr. Howard Robertson supported Mr. Frankau, who, in reply to Mr. Newton, said that he had dwelt on houses deliberately. People could not live in fields and go and look at council halls. He had tried to bring a breath of public air into the atmosphere of the common room. Planned towns were horrors. England was picturesque and beautiful, and expressed the character of her people.

Wishing to obtain further light on certain of the very intriguing suggestions made by Mr. Frankau, we sought an interview, which he was good enough to grant.

Asked whether he seriously considered that architects should take part in politics, as he had implied in his remarks on housing, Mr. Frankau repeated his contention—that everything that concerned the people ought to be of intimate concern to the architect. The profession was, he considered, far too "stand-offish," far too obsessed with lofty ideas of art. Architecture was nothing of the kind, he argued; it was a craft, and architects should come off their art-pedestal, mingle with the people, try to think and feel as the people thought and felt, and give it what it wanted.

He professed surprise at the dumbness of the profession in regard to its wrongs. Architects were admittedly not as busy as they might be, and yet their services were absolutely necessary if good houses were to be built. Why didn't they *do* something about it? asked Mr. Frankau; write, speak, agitate, anything rather than suffer in silence.

Asked whether his favourite doctrine of individualism had not very grave dangers, Mr. Frankau was emphatic in its defence. It must, of course, be governed by tradition, but within those limits every man should be free to express himself as he willed. If his building was fitted to its purp that was enough.

Mr. Frankau has evidently no use for pure art, lofty ideals leave him cold. Yet he is, on his own confessi a "best-seller." Fine craftsmanship no one would de him; what he does, he does extremely well, and demand for his work is enormous.

One wonders what would happen to English architect did it receive a leavening of his principles! E. N. B

# A Few Notes on Sir John Soane's Work

## By F. W. TROUP, F.R.I.B.A.

IN some respects Sir John Soane's buildings are so modern and up-to-date that we have to remind ourselves that exactly a century ago he was seventy years of age. He was an exceptionally practical architect, and it is curious to note how he combined his intimate knowledge of building work with the prevalent fashion of his day to be monumental, or to aim at that style by reproducing Roman and Greek monuments.

He suggests to my mind a likeness to Philip Webb, in the care with which he works out details and provides for the convenient working of whatever establishment he is called on to provide for. In all those high lantern lights, which surmount his domical rooms in the Bank of England, I believe that in every case the windows can be reached for cleaning without having to resort to ladders or scaffolding.

There are no windows or means of natural ventilation in those top-lighted rooms, except in the lanterns. To overcome this Soane built his supporting piers with flues in them. The heating of the building was done by means of large stoves placed where most effective, the smoke from the stoves being carried up one flue to a chimney, the flue in the next pier forming an inlet for fresh air. The rooms are now heated by radiators and I should imagine the ventilation has suffered from the change.

In Dulwich Gallery, another of Soane's works, we have a striking example of the knowledge and care he devoted to the proper lighting of these exhibition rooms. In no gallery in London can the glazed pictures be seen with less effort than at Dulwich. In fact, there are few galleries anywhere to equal Dulwich in that respect. His arrangement for the lighting has, however, been modified, and to some extent destroyed by modern alterations.

Soane's often quoted use of clay bottles or pots in place of bricks to build his domes is another example of his ingenuity. It was not an original idea, but it would not have been possible to carry these domes on such slender supports without this cellular structure, which must have reduced the weight to nearly half that of a solid brick dome. What a boon it would have been had the same idea suggested itself a century earlier to Wren. The Dean of St. Paul's would give a good deal now to be able to reduce the weight of the dome and of Wren's famous brick cone to one half their present weight!

Soane in his earlier training had the advantage of having been apprenticed to another practical architect—George Dance, Junr., architect of Newgate Prison. None knew better than Dance how to use his materials, and he was particularly sure of himself in the use of bricks. St. Luke's Hospital in Old Street is usually given second place in the order of merit among Dance's works—Newgate coming first. But in considering those two buildings, if we take into consideration the money that was at his disposal, I am by no means sure that the order ought not to be reversed. Just as Soane's domical rooms seem to me to be the prime architectural features of his design at the Bank of England, so was the brick vaulting at St. Luke's one of the most interesting features in that building. Although we have no evidence that Soane worked on the drawings for St. Luk Hospital, we know that it was finished five years bef Soane was appointed architect to the Bank of E land.

Much of the detail and finish of Soane's work see peculiar, and some of it even bizarre to our eyes. Bu make little of that. Very much of what some architects doing at the present day will fill our successors with won and possibly contempt 100 years hence. The trimmings architecture yield more quickly to the changing fash of the day—perhaps quicker even than the many reviv of styles through which we have passed within the last si years.

I have already referred to the custom in Soane's time reproducing ready-made orders and sometimes wh façades from Roman and Greek examples. Soane follov the fashion in this respect, and did it in a masterly way the exterior screen walls of the Bank. I am inclined think that his use of these classical features was not alw quite so happy in combination with the interior work t was so much more distinctively his own creation, althou one could readily quote both rooms and corridors where results were entirely successful.

The planning and arrangement of the various rooms parts of the building of the Bank of England are extrem fine, but in judging this particular part of Soane's worl must always be remembered that the site grew and enlarged from time to time until finally enclosed by surrounding screen walls. It was not a clean site on wh Soane had to work, else the general scheme would have b very different indeed from a man of Soane's calibre. So has been accused, or was accused at the time, of ruthl ness in his sacrifice of the work of his predecessor, Robert Taylor, but much of Taylor's work was what should call temporary structure, and I think Soane more than justified in what he did. In fact, he was re very conservative, and he showed great ingenuity in c bining previous work, provided it was sound work, with new additions.

All his own buildings, moreover, were permanent solid work, and little of it consisted of the lath and pla construction which Sir Robert Taylor used for his interi Even Soane's successor, Cockerell, who is responsible the large room in the south-west corner of the Bank, roo it in timber with lath and plaster ceilings, and within rec years the timber of this roof has had to be replaced heavy steel girders.

It is to be regretted that the proposed reconstructio the Bank seems to make imperative the sacrifice of so m of Soane's fine planning and the arrangement of his roo and courts—depriving us of what Lethaby described the only "Palace" within the boundaries of the City London.

It was from Lethaby, none the less, that came the suggestion that the way to deal with any rebuilding sche for the Bank, was to raise up a new structure or new bu ings, set back from and within those familiar screen w designed by Sir John Soane.

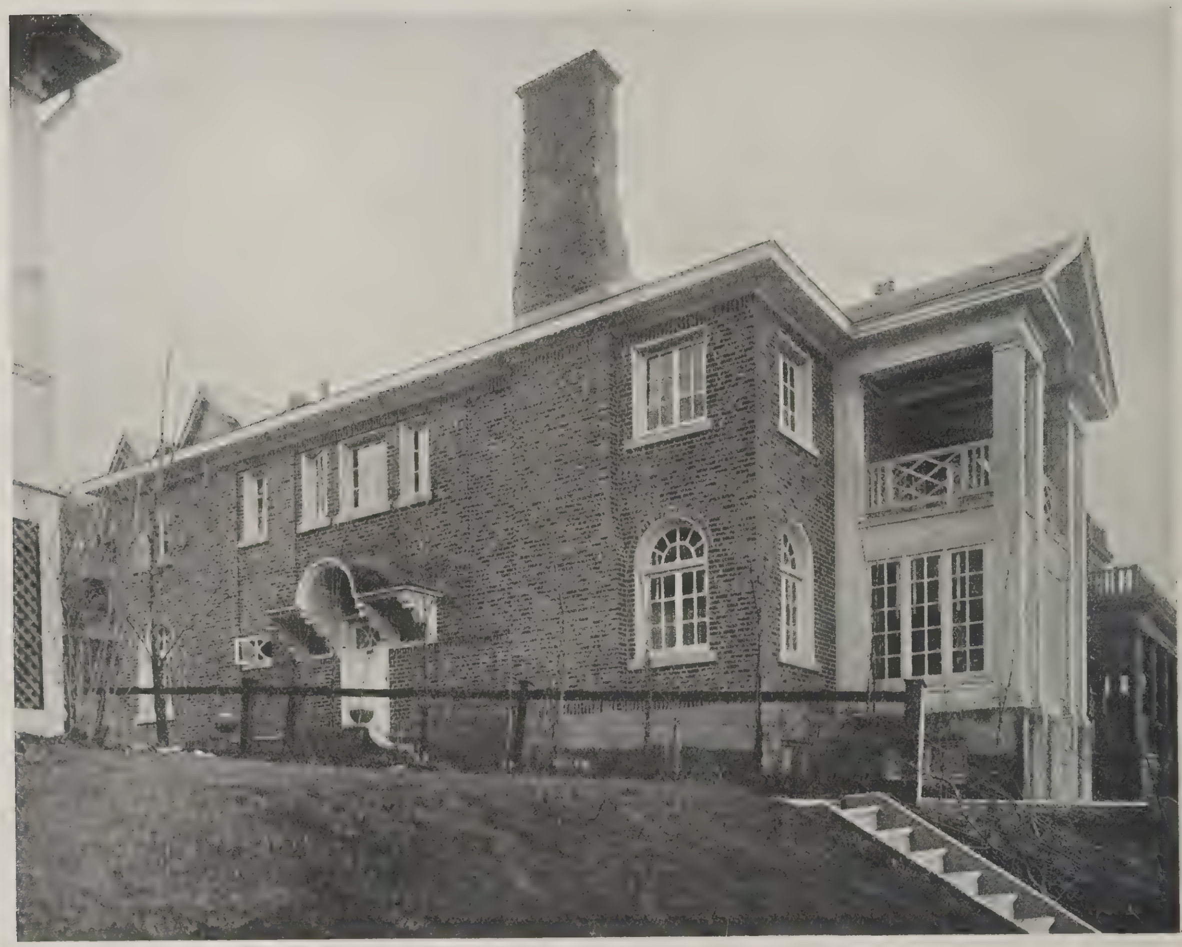
# Some Canadian Houses

### By SEPTIMUS WARWICK, F.R.I.B.A.

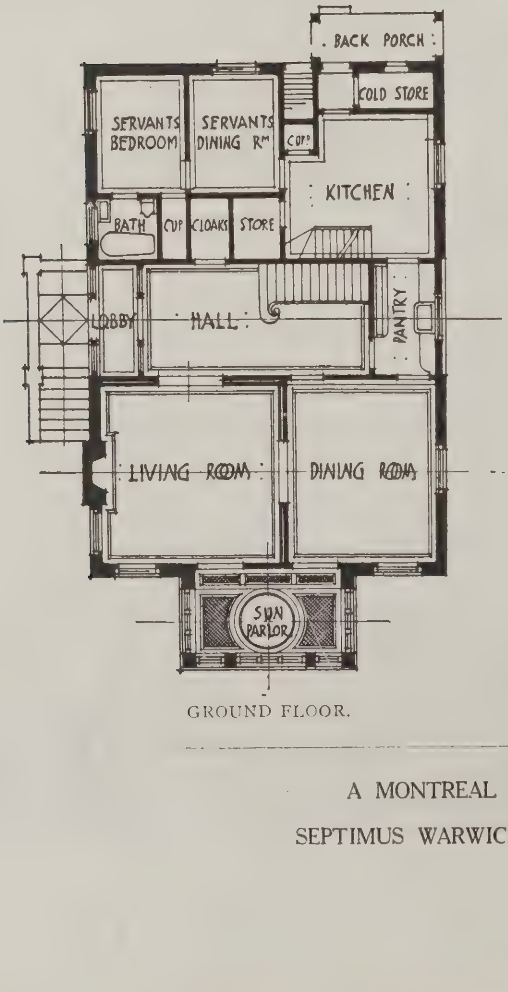
THE average Canadian house differs in several respects from its prototype in England. In the erection of the house no external scaffolding is used. It is the custom to build the lower walls concrete up to the ground-floor level, and when the ndations are prepared to erect shuttering all round the ernal walls, and to place the ground-floor joists in ition on this shuttering. The joists are then covered h rough boarding laid diagonally, and the platform thus med is used for pouring the concrete to the lower walls, storing the bricks, and for the bricklayer to work from. the work proceeds trestles with planks are erected on platform, and when the first-floor joists are built in another platform is formed of rough boarding and the work is carried on in a similar manner. The ceiling joists on the upper floor are again boarded over, and the roof is constructed from this boarding. The rough boarding is cleared off on each floor after the plastering has been completed, and hard wood floors are nailed direct to it to form the finished floor.

Only the external walls above the ground floor are of brick, the internal walls all being of wood. The chimney shafts, when not in the external walls, are built independently without brick cross walls. Central heating is always installed in the houses. The fireplaces are used mainly as architectural features, and are invariably

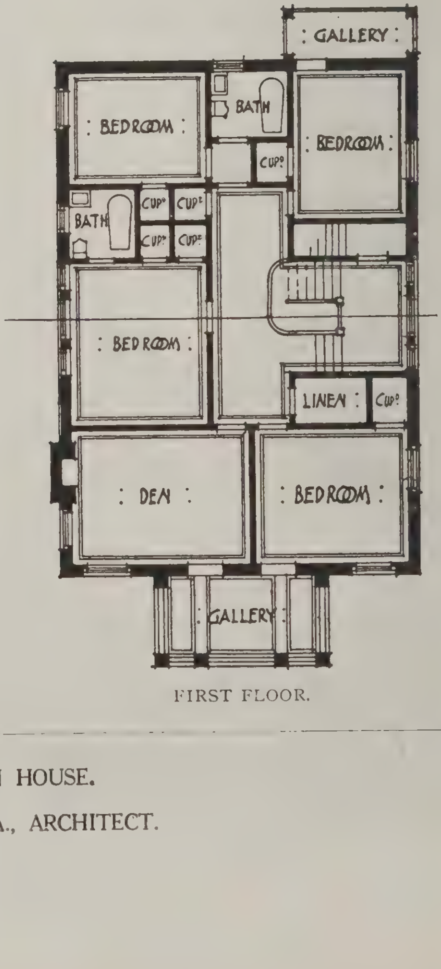
THE STAIRCASE IN A MONTREAL SUBURBAN HOUSE.



A GENERAL VIEW



GROUND FLOOR.



FIRST FLOOR.

A MONTREAL SUBURBAN HOUSE.

SEPTIMUS WARWICK, F.R.I.B.A., ARCHITECT.

rranged to burn wood logs. The roofs are designed in a mple manner without internal valleys on account of the ıow.

In the larger houses a slight steel construction is sed in the centre of the house, and in the smaller nes a steel beam is introduced for stiffness in the round floor, but wood construction is general internally bove this level.

The number of servants employed by the average anadian household is less than in England. The servants et higher wages and do more work, their duties not being pecialized to the same extent as in England.

A house similar to the one illustrated on opposite page ; efficiently run with one maid. The kitchens are planned lose to the dining-room, with a well-fitted serving-room etween. This serving-room is always a fair-sized room, ontaining a sink, etc., and numerous cupboards with lazed upper sliding doors and wood doors under. The ervant's bedroom, the bathroom, and the sitting-room are laced on the ground floor near to the kitchen; except in he larger houses, where the servants' accommodation ollows the English practice, and is placed in the roof, a nen shoot is provided with openings on all floors to disharge direct into the laundry in the basement. Wardobes as furniture are seldom used, cupboards being fitted o each bedroom instead. Each fireplace is provided with separate flue with an opening in the hearth, so that the shes can be dumped direct to the cellars.

All the houses on the upper level of Montreal have magificent views over the city to the River St. Lawrence. n consequence, an outlook-room facing south, and known s a sun-parlour, is invariably insisted on by the clients, nd in most cases this room becomes the main architecural feature of the house. These outlook-rooms, on ccount of cost, are built of wood. The architects' ingenuity is taxed to provide a satisfactory treatment as the rooms are generally of a good size and much too large in proportion to the rest of the house. Internally, however, when comfortably warmed, they form a very pleasing feature of home life. Placed between the living- or drawing-room and the dining-room they can be used for breakfast and tea, and for coffee after other meals. They are easily the most frequently used rooms in the house, and much care is expended on their interior decoration.

In the smaller country houses found along the lake shore the lower external walls are constructed of concrete or rough field stone, and from the ground-floor level both internally and externally in wood. In the house illustrated on page 477 the external walls are of 12 in. by 3 in. planking laid on end. This construction is not usual. Ordinary studding is generally used at 12 in. or 16 in. centres. In this case the house was on the site of some existing houses constructed in this manner, and the old timber was utilized in the new house. The external face of the wood was covered with tar paper, upon which weather-boarding was laid direct. The internal face of the wall was covered with B.C. fir panels laid on fillets, and the frieze and ceilings covered with Beaver Board with wood strips. A feature of most of these houses is made of a large veranda overlooking the lake.

The larger country houses are not very different on general lines to the usual English country houses. A notable exception is that sliding doors with large openings are used between the principal rooms and the hall and staircase, the ground floor thus becoming one large room, only divided from the servants' quarters with solid partitions. The windows of both the city and country houses are provided with double sashes, the external sashes being taken down during the summer and refixed every winter.

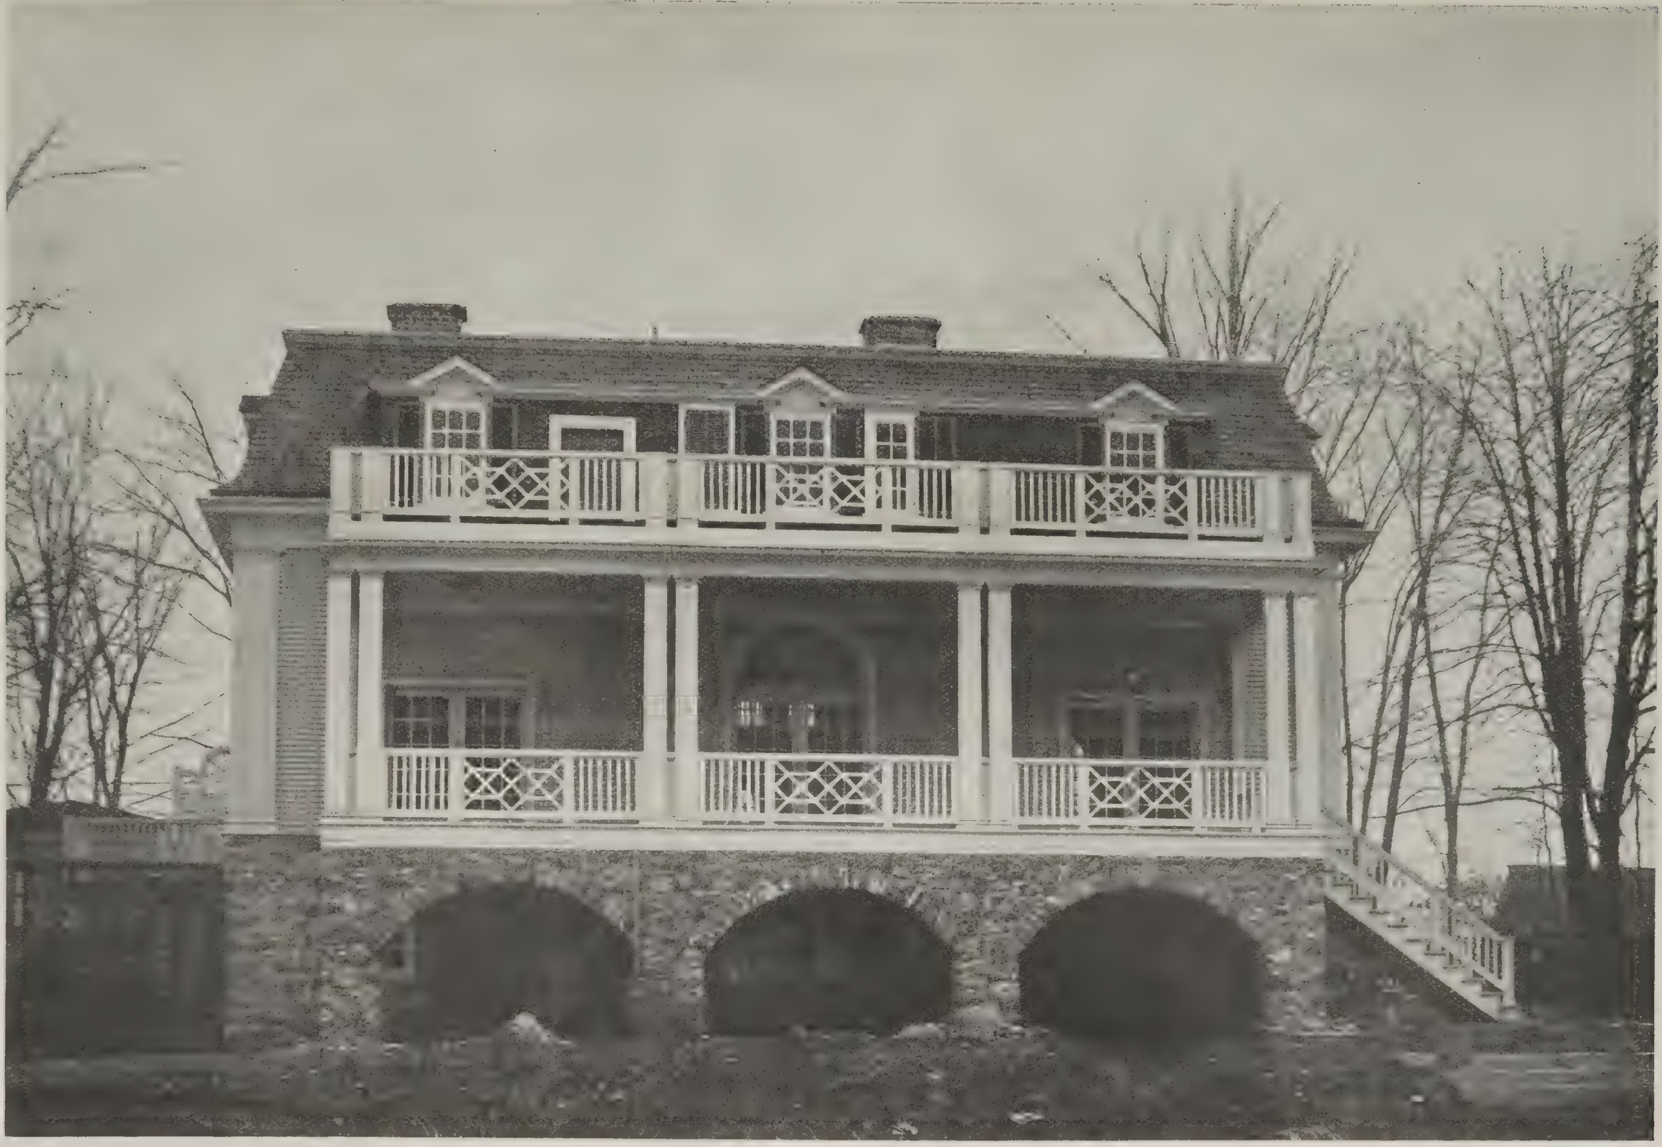
Septimus Warwick, F.R.I.B.A., Architect



A large veranda is a striking feature of most of the small country houses along the lake shore. The external walls of these houses are of concrete or rough field stone up to the ground-floor level and then of wood. In the house illustrated an unusual form of construction, described on page 475, was adopted.

THE PERGOLA.

# Binfield: A Recent Example of Garden Design

## OLIVER HILL, A.R.I.B.A., Architect

THE part of the gardens at Binfield illustrated in this article comprises a series of some half-dozen architecturally treated courts isolated by a natural ravine from the remainder of the grounds. hey are arranged in a setting formed of some fine groups f matured trees standing around the site of an old house hat had been demolished.

The intended idea was that this group of formal courts should form a kind of focal point amidst the much larger natural grounds and also become a pleasing approach to the park beyond.

A bridge was thrown across the ravine, and the first court comprises a formal setting of shaped walls in whitened 2-in. brickwork, to form a background to the magnolias, figs, vines, and other large-leaved varieties planted here.

The paving is constructed of panels of tile and turf having

shaped edging of Portland stone and black slate, with fillings of picked blue beach pebbles.

Long vistas in four directions centre through the next or green court.

From here rise the horseshoe stairs to the upper court with its circular pool, gazebos, and connecting pergola. Above this again is the tennis court with its fine setting of cypress-like cupressus.

Continuing through the centre court one comes to the pool court. The figure for the pedestal in the centre is not yet completed.

From the centre court, opposite the horseshoe stairs, a way leads through the undulating turfed and holly-edged semicircle, by receding levels, to the wild garden through a spinney, at the bottom of which lies a naturally formed water garden.

## The A.A. Exhibition

Some very beautiful photographs and other illustrations of gardens, old and new, including a number of Binfield, are now on view at the Architectural Association, Bedford Square. The exhibition includes work by Sir Edwin Lutyens, Sir Reginald Blomfield, Mr. Paul Waterhouse, Messrs. Romaine Walker and Jenkins, Messrs. Wratten and Godfrey, Mr. Clough Williams-Ellis, and Mr. Robert Atkinson, who also shows some delightful water-colours. Ther are old engravings of such famous English examples c garden design as Hampton Court, Hatfield, and Wiltor while the Italian school is represented by the Boboli, Florence, the Ville Carlotta, the Castellazzo dei Arconati, an the Villa Gamberaia, near Florence. The fame of France i well upheld by Versailles and Marly.

In addition there are some charming water-colour by Miss Ella du Cane, of the Generalife, Granada, and th Chateau Hydra, Algiers.

Altogether the show is a most excellent one. Ancien and modern are seen in close juxtaposition, and comparison are inevitable. Modern English work is, however, seen t great advantage. About those vast formal spaces of th French and Italian Renaissance there always seems to b something a little too overwhelming. Their very scal dwarfs the people who walk in them. The English traditio is much more in accord with humanity. Hampton Court in spite of its size, has a very homely look about it, just a the palace, to which it is the setting, has the appearance o a large, comfortable mansion.

Modern English work of the formal school has just th same charm. English architects have a way of handlin geometrical forms so as to give them a delightful sort o picturesqueness and informality. This is clearly shown i the A.A. Exhibition.

## The Policy of the School and the Work of the Students

HIS week we illustrate some representative examples of the work of the students of the University College, ndon, School of Architecture. To assist student at the outset of his career, a riculum has been arranged by the ool, not only to ensure training on a tematic basis, but also to obviate, as as possible, the inevitable hiatus that urs between ordinary school education l academic study.

t is recognized that building is as much art as it is a science, and that archits are artists who need to grasp not y the realities of the factors governing ir work, but also the technique assoed with each particular branch of it. is impossible, in so far as building is cerned, to define where art begins and ere science ends. An architect more n any other artist should be instructed associate his work with the conditions modern life; he must be familiar with underlying principles of the sister s of painting and sculpture. His wledge of building should be based n a close appreciation of history, lition, and research; moreover, regardthe scientific aspect of his profession, must be guided to regard construction being organic and functional and not eparate and independent theory.

he freshman entering the School is first instructed in means of expression: he attends lectures on draughtsmanship and presentation. These studies are followed by lectures on architectural history and theory illustrated by lantern slides, blackboard demonstrations, and diagrams, as well as by visits to the British Museum. At a convenient stage, a definite course of reading is arranged in connection with the departmental library and the Yates library, having as its aim a knowledge of architectural literature bearing upon the subject.

Directly a student becomes familiar with the rudiments of draughtsmanship, sketching, geometry, and perspective, and has attended the opening lectures on building construction, he is encouraged to prepare designs of an elementary character, and is brought to realize the principles characteristic of building throughout the ages.

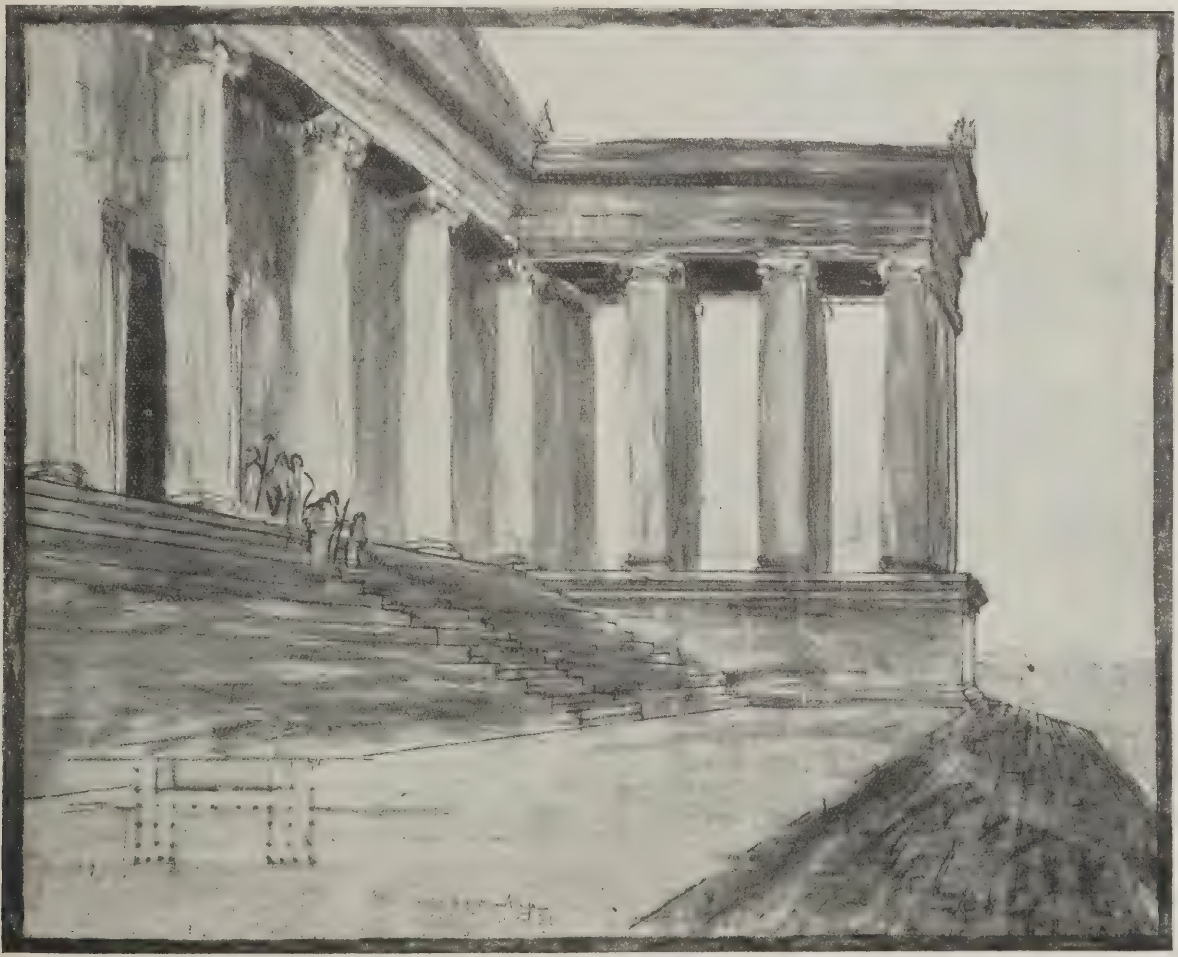
The whole of the first term is devoted to encouraging appreciative interest towards building on the part of the student, and to showing by the correlation of lectures and studio work how one branch is interdependent on another.

Work in the second and third terms follows closely on the lines of that previously undertaken, with the exception that the studies gradually become more advanced and more closely related. At all stages the lessons of tradition are pointed out and stimulus given for imaginative renderings. The summer vacation affords the student an opportunity to increase his knowledge of old work from the study of the list of buildings arranged for his guidance.

During the vacations, students have specific work allotted to them, which includes studying and sketching historical examples of art generally in London and the country.

By the time the student reaches the second year, he is ready to undertake simple essays in historical design combined with subjects in which prominence is given to construction. These studies widen the student's previous acquaintance with the architecture of Ancient Civilizations and extend to the Renaissance and modern times. Special lectures on these subjects, by Professor Gardner and others, have been arranged; also on the Theory of Composition and the History of the Renaissance in Italy, France, and England.

During the third year students taking the certificate course qualifying for exemption from the intermediate examination of the R.I.B.A. concentrate mainly on design and constructional subjects, and prepare a specified number of designs combining construction with require-



A MONUMENTAL ENTRANCE TO A SACRED ENCLOSURE.

SIX-HOUR SKETCH DESIGN: GREEK STUDY. BY H. M. ARMITAGE.

ments likely to be encountered in modern practice.

Work during the fourth and fifth years is confined to courses specially arranged for students taking the degree and diploma courses. In addition to advanced lectures on construction, structural engineering, and professional practice, students have to prepare designs at intervals to meet stated programmes.

Although architectural drawings are merely a means to an end and not the end themselves, the ability to express ideas on paper in a satisfactory and attractive manner is essential to the architect. Architectural drawing is fully dealt with in the architectural studio, but, in addition, students sufficiently advanced may draw from the life in the Slade School. The three great arts of painting, sculpture, and architecture are thus housed side by side. Painters, sculptors, and architects are sometimes called upon to collaborate, and would be more frequently so called upon if they better understood one another's work. The close association of students in the kindred arts should do much to promote such an understanding. Special arrangements have been made whereby architectural students can attend the Slade School to become acquainted with the principles governing decorative painting in so far as the subject is related to architecture.

Appended are the subjects set for some of the drawings illustrated :—

### FIRST YEAR.

*Study in Traditional Timber Construction : A Timber Barn.*—A design is required for a timber barn, of a floor area of 1,500 to 2,000 sq. ft. A door is to be provided on one or both sides of the barn, and an aisle or aisles may be incorporated if desired. Materials.—Roof and framing of walls to be of timber. Filling in or covering of walls to be of brick or wood. Roof covering to be thatch. The barn to be paved with some suitable flooring. Drawings required.—Plan side and end elevations and cross-section to $\frac{1}{8}$ in. scale. A cross-section to $\frac{1}{2}$ in. scale, and isometric details of the main timber joints to $\frac{1}{4}$ F.S.

Six-hour Sketch Design. *Greek Study : A Monumental Entrance to a Sacred Enclosure.*—Sacred enclosures were situated on small plateaux, rising above or overlooking the surrounding fertile plain, and having a steep approach to the main entrance, somewhat after the manner of those at Delphi, Athens, etc. A design is required for this main entrance. It should be treated in a monumental manner, befitting its function as a gateway to ground holding a peculiarly sacred and religious significance. Overall width

of actual gateway should be 35 ft.
45 ft. Drawings required.—A perspe
tive view in colour which must fill a
imperial sheet. A $\frac{1}{8}$ in. scale plan shoul
also be shown on this sheet.

### SECOND YEAR.

*Roman Study.*—The richest marbles
Africa, the finest bronzes of Italy, th
dyed stuffs of Tyre and the noblest worl
of Grecian artists have been collected
a Roman Emperor for the decoration an
furnishing of an audience chambe
where he will receive the ambassado
of foreign powers. He has chosen a si
overlooking the precipice on the sout
edge of the Palatine Hill. The approac
on the north side will be by a lor
avenue of trees, while on the south
terrace will give an extensive view
the Roman Campania. Besides the lar
reception hall, the building will conta
a room for the retirement of the Empero
and another of similar size for the use
the ambassadors. The area of th
reception room will be between 1,500 ar
2,000 feet super, and each smaller roo
is to be about two-thirds of that siz
Drawings required for sketch study, to
scale of $\frac{1}{8}$ in. to 1 ft. : (*a*) plan ; (*b*) elev

and pinned on the studio wall, ready for criticism. Finished drawings, same as sketch design, to be rendered in monochrome, and to be handed in to the Exhibition Room.

*Græco-Roman Study: the Pompeian House.*—A design for a house for a banker, a man of luxury, in the City of Pompeii is required. The objective is to show not only the domestic architecture of the period and the type of dwelling, but to hint at the art and life of the people. For this purpose the design must include the wall decorations, the mosaic and the general furnishings. The main lines of the typical house must be followed, but free scope is to be given to adapting the design to the needs of the client. The rooms round the atrium may be in two stories, and shops, which would be let by the banker, may be included if desired. The site is rectangular, and is situated at the junction of two streets. The width is 50 ft. and the length 180 ft. The entrance is to be on the narrow frontage. Drawings required: sketch plan of complete ground floor; sketch long section through atrium and peristyle: all to a scale of $\frac{1}{16}$ in. to 1 ft. section through tablinum, scale of $\frac{1}{2}$ in. to 1 ft. Peristyle and exodra to be rendered in colour.

THIRD YEAR.

*An Open-air Swimming-bath.*—A design is required for an open-air swimming-bath on an open and level site, at a popular health resort. Required: One general swimming-bath, about 4,800 ft. super, for mixed bathing. The building accommodation is to include the following: Entrance hall; office for tickets, issue of towels, etc.; office for clerks; lounge; restaurant and kitchen; seats for about 400 spectators of swimming rac etc.; judges' box; Press box; dressi boxes (about 25 ft. super) for 50 m ditto for 50 women; arrangements shower-baths for men and wome necessary lavatory accommodation baths and public; a small laundry; st rooms; some form of open tearoom (su as a loggia) overlooking the bath shou be provided. Drawings required: scale of $\frac{1}{8}$ in. to 1 ft. Sufficient drawi to explain the scheme. Detail to sc of $\frac{1}{2}$ in. to 1 ft. Sketch design to scale $\frac{1}{16}$ in. to 1 ft.

FOURTH YEAR.

*A Drill-hall and Headquarters Bui ing.*—A site has been acquired at the s of a suburban street for the erection o new drill-hall and headquarters build for a London territorial battalion. Si The site is shown in the diagram; back of the site is parallel to the str

ont. Light, other than top light, can
ly be obtained from the street front or
om areas within the site. An emergency
cit may be had at the back of the site.
he accommodation required is : General.
-(1) Drill-hall, approx. 10,000 ft. super;
) galleries to seat 200 spectators (two
cits from the gallery must be provided);
) entrance vestibule in which battalion
otices will be posted; (4) adequate
orizontal and vertical communications;
) adequate lavatory accommodation
roughout the building. Administra-
on.—(1) Orderly room; (2) small office
r colonel; (3) small office for adjutant,
close connection with the orderly room;
) armoury, approx. 500 ft. super;
) quartermaster's stores, approx. 500 ft.
per; (6) band-room; (7) quarters for
retaker; (8) boiler-room. Officers.—
) Officers' mess for approx. thirty
ficers; (2) ante-room, used as lounge
d in which officers assemble before
tering mess; (3) servery; (4) kitchen,
hich may be part of general or men's
tchen; (5) small changing rooms and
athrooms. Men.—(1) Canteen, in which
eals may be served, area approx. 3,000
super. In connection with the canteen
ill be: (2) a lounge; a raised stage;
airs will be substituted for the tables
hen a canteen concert takes place.

Barker, B.A., B.Sc., lecturer, heating and ventilating engineering; E. Sprague, A.M.Inst.C.E., senior assistant. Painting and Sculpture: H. Tonks, Slade professor; T. Borenius, Ph.D., professor, history of art; W. W. Russell, A.R.A., assistant professor; P. W. Steer, assistant professor; G. Thomas, assistant (sculpture). Archæology: E. A. Gardner, Litt.D., Yates professor. Hygiene and Sanitation: H. R. Kenwood, C.M.G., M.B., D.P.H., F.R.S.E., professor; A. G. R. Foulerton, F.R.C.S., D.P.H., lecturer; M. E. Delafield, B.A., M.B., B.C., M.R.C.S., L.R.C.P., D.P.H., assistant and lecturer, and the professors and lecturers in general subjects in the Faculty of Arts.

LIFE STUDY. BY G. L. MORGAN.

# Model Clauses for Town Planning

A GREAT many local authorities will welcome the publication by the Ministry of Health of this set of model clauses. Although still leaving, as is both right and inevitable, much to local discrimination, it affords a valuable indication of the lines upon which the Ministry desires town-planning schemes to be prepared. The publication is divided into two main parts: a set of clauses, preceded by an explanatory memorandum. The clauses themselves are grouped under six headings: General, Streets, Building and Building Lines, Reservation of Lands for Open Spaces, etc., General Convenience and Amenity, and Miscellaneous.

The first of these is a short section devoted to definition. The second covers all matters relating to acquisition of land selected for new streets or street widenings; charges, whether against the community at large or against the frontagers; relaxation of by-laws; diversion of highways. The suggested clauses are collated with the existing germane Acts of Parliament, viz.: The Private Street Works Act of 1892 and the Public Health Act of 1875. Much of the land earmarked for thoroughfares will not, of course, be required for such purpose for many years. In order, therefore, that such land may not become sterile the owners may erect buildings thereon with the permission of the authority and on the understanding that no compensation is subsequently claimed in connection with the removal of the buildings. It is suggested that three months' notice shall be given to persons interested in the land, and that at the expiration of the time the land becomes, according to circumstances, a public highway or a private street, in either case the authority have the right of entry. This is typical of the clauses comprising the section on streets, the whole of which are designed to enable the authority to keep a strict control over all street development and to obtain ready access to land dedicated to streets or street widenings.

Part III, Building and Building Lines, deals, of course, *inter alia*, with zoning. In this matter a useful discrimination is maintained, and zoning is divided into two kinds: zoning by density, and zoning by character. For the purpose of assessing the former the Ministry suggest the introduction of a system of "land units," the density of which is to be calculated in terms of dwelling houses for single families which are known as "building units," every class of building having its equivalent in terms of building units. The land unit is a loose measurement, the only indication of its extent being a maximum limitation of seven acres. The clauses suggest that the authority should organize a system by means of which owners can declare land units, and can thus ascertain in advance exactly what restrictions and limitations govern the development of their land, and where it is proposed to develop an area by the sale of building plots a plot plan can be previously submitted to the authority so that the exact number of buildings to be erected under the density restrictions can be ascertained and the proposed plot divisions approved prior to sale. The character zoning is a simpler matter. The various zones: residential, special business, special industrial, general industrial and business, etc., are indicated on the scheme map, and in regard to each zone buildings are grouped under three headings: buildings that may be erected without consent, buildings for the erection of which the authority's consent is required, and buildings which may not be erected. The only buildings which fall under the last heading are "buildings for noxious industry." Where application is made to the authority for erection of a building of a kind other than that which is predominant in the zone the authority must advertise its intention before giving consent in order that adjoining owners and interested persons may have opportunity to object. In this ection the Ministry fail rather to emphasize sufficiently the desirability of treet zoning, without which chaos will ultimately develop. The height of buildngs is dealt with, 70 ft. is suggested as a maximum height, with certain exceptions. Building curtilages are treated, and a model table is shown in which the percentage of the area within the curtilage which may be built over is governed by the character of the building and by its height. No terraces may include more than eight houses without a break of at least 6 ft. And no block shall be erected nearer the owner's boundary than 3 ft. The clauses dealing with Reservation of Lands for open spaces are few and simple; they contain schedules of the different purposes for which the land may be required, and the methods by which the authority can acquire it.

The fifth part, which is devoted to general convenience and amenity, is disappointing. It contains only four sections, which deal respectively with safety of traffic, preservation of trees, advertisements, and maintenance of private gardens, and few of the clauses in the sections contribute materially to an increased amenity. The traffic section, for example, might have contained clauses giving the authority power, if they thought fit, to insist upon the erection by any 'bus or tram undertaking of adequate stopping-place indicators, terminus shelters and seats, and receptacles for used tickets. There should be provision, too, for some sort of control over the design of buildings so as to prevent the terrible juxtaposition and lack of harmony in our streets which is one of the surest destroyers of amenity. The clauses dealing with advertisement, although giving the authority absolute control, since the first clause states that "no advertisement shall be displayed in such a position or manner as to injure the amenity of any part of the area," are insufficiently emphasized in the explanatory memorandum. There should be definite spaces for the display of hoardings and postings, and the defacement of buildings by pictorial or illuminated advertisements is to be utterly deprecated, for it is the absolute negation of amenity. Amenity depends also upon such things as the design of street lamps and tramway standards. Authorities should maintain strict control over such things. There should be clauses, too, dealing with the preservation of ancient monuments, buildings of historic interest, and features of particular natural beauty.

The last part of the publication deals, under the heading of miscellaneous, with agreements, boundary adjustments, recovery of expenses, appeals, compensation and betterment claims, the serving of notice and such like administrative matters which it is as well should be as uniform as possible in order to avoid anomalous situations between adjacent authorities.

There is no doubt that the clauses will be a help to authorities, but it is to be regretted that they are not made somewhat more comprehensive. A little time ago the Ministry of Health appointed a committee, under the chairmanship of Lord Newton, to consider the matter of smoke and noxious vapours abatement. A very full and reasoned report was issued. Yet, as far as we know, no action has been taken with regard to any of its recommendations. So long as we permit the very possibility of the existence of the dirt and fogs which, owing to the misuse of coal, darken all our cities and half the countryside, the achievement of any real amenity is an impossibility Surely no town-planning scheme is complete which fails to face this problem Yet in this publication there is scarcely an allusion to smoke. Bound up with the smoke question is the provision of alternative methods of heating, for it must be remembered that it is the domestic hearth rather than the factory furnace which is responsible for most of the trouble (2½ million tons of potential fue escape in soot from the domestic and 500,000 from the industrial chimney) Local authorities should give every encouragement to gas and electrical undertakings while at the same time protecting the public against exploitation. At all events it is to be hoped that all authorities wil be alive to the smoke nuisance. The government missed a stupendous opportunity for popularizing alternative methods of heating in connection with their housing schemes. On paper they urged gas installations, in practice they cut them out owing to their necessitating, in some cases, a slightly increased capita expenditure, and where a house is equipped throughout for soft coal consumption and gas, of course the cos must be increased, but soft coal consumption in the open grate must ceas before the town can be either healthy o beautiful, and it is sincerely to b hoped that no opportunities will b lost this time for mitigating the smok menace.

However, the general trend of th clauses, like the town-planning movemen itself, is to show that in all future development, be it a matter of roads, zoning density, or park preservation, the community as a whole is to be considered first, individuals afterwards, the civi renaissance which we all desire to see ca be achieved on no other basis.

Town Planning. Model Clauses for use in the preparation of schemes. London: His Majesty's Stationer Office. 1s. 0d. net.

# Hampstead Labour-saving Flats Competition

## A Criticism of the Designs

THIS competition dealt with a rather novel problem in planning. Not that flats have not been built efore, but, so far, the idea of formally corporating a communal centre had ever been seriously explored—in Engnd, at any rate. Sociologically speaking, is type is a halfway house between e collegiate system and the system of rge town flats. The kernel of it is the mmunal centre; perhaps the nearest pproach to it in England is Meadway ourt, built ten years ago in the Hamptead Garden Suburb. But there the rrangement for the communal service as more or less improvised afterwards. n this case, however, the idea of having communal centre was formally condered and competitors were asked to ear it in mind as a feature.

One thousand pounds were offered in rizes, and this, added to the magnitude f the job and the exceedingly interesting haracter of the planning involved, ttracted a demand for particulars from ver 130 architects. A bare 42 elected stand the rather gruelling test which is competition proved to be. But it is vident that the promoters have had ood value for their money. In these ays of financial stringency a problem f this kind is bound to be largely overned by strictly economic considerations, and a perusal of the drawings ubmitted shows that such considerations did operate in the selection of the inning designs.

Briefly stated, the promoters asked for o flats, ranging from type "A" (one ving-room and one bedroom) to type F" (three living-rooms and four edrooms), to be grouped in two or more locks; a central hall, with services; unge, billiard- and writing-rooms; parate quarters for staff and porter, arages, laundry, drying-room, and round laid out with tennis courts, etc. he elevations were to conform to the omestic character of the suburb, and ere not to exceed three stories in eight. The cost was to work out at s. 3d. per cubic ft. Emphasis was laid n the architectural treatment and also n the advisability of keeping the cost own. The site, beside being very regular in shape, had a drop of nearly 2 ft. from north-east to south-west. ltogether a pretty problem. As is ound to happen, a few competitors ent in obviously futile designs, but, on he whole, ingenious resourcefulness was hown. Naturally the consideration of dividual flats and even of the communal centre was dictated by the *arti* adopted, and it is astonishing o see the variety of grouping for the ifferent blocks.

The three winning designs face the eath extension. All three have plenty f ground bound within their buildings, nd all three make fine use of it. This as considered by their assessors the ight solution, but others are also worthy f notice. Nothing could better show the reedom left to competitors than the study of, for instance, the design submitted by Messrs. Lanchester, Lucas, and Lodge (No. 40), and the design of Messrs. Curtis, Hardy, and Garrard (No. 25). Messrs. Lanchester, Lucas, and Lodge elected to develop their buildings as near the edge of the site as possible, with a wide gap between the buildings nearest Hampstead Way and with the central hall on the highest level, facing south-west. Messrs. Curtis, Hardy, and Garrard, on the other hand, put their central hall on the lowest level, in the wing nearest Reynolds Close and facing north-east. But where the latter scheme is superior to the one already mentioned is in the simplicity of its massing. Their outside walling, and therefore their roofs, are plain and run along undisturbed.

Another design, illustrating yet a different part, is that of Messrs. Wyville, Home, and Shirley Knight (No. 42). Here orientation and low cost must have been the slogan; but we cannot help thinking that it went too far, and any such scheme, with such a decided perimeter, would sooner or later court trouble in its roof line, the ground fall being decidedly too substantial. This criticism, in fact, applies to all those schemes where the run of the buildings goes boldly either east and south-west, or east and north-west.

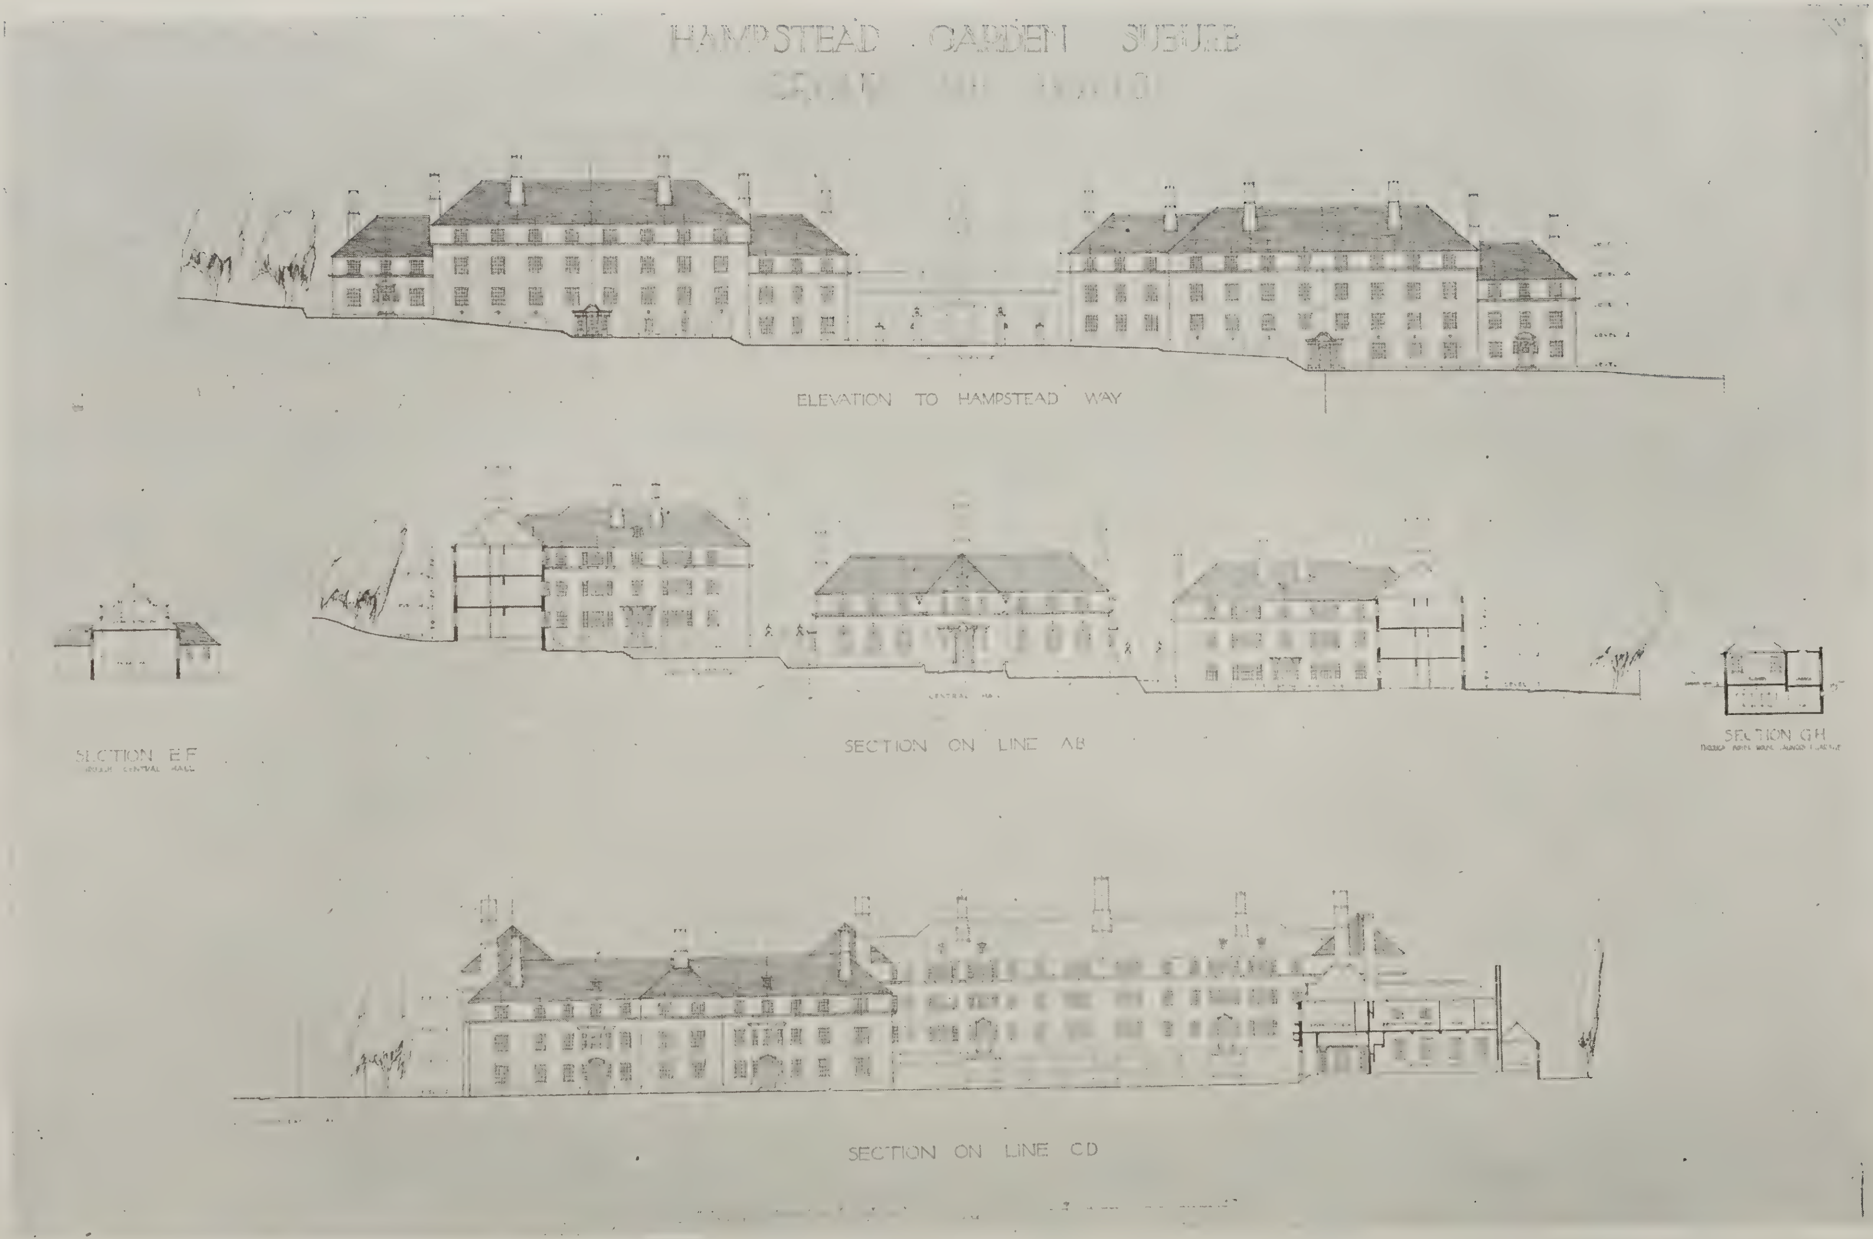
Many competitors did feel that depth-runs were needed to utilize the fall of ground, and that, of course, leads towards parallelogrammatic forms. Mr. Dunbar Smith (No. 38 and No. 36) tried this overmuch, and one cannot help feeling that both the nature of the flats to be erected and the ground configuration have been ignored and that the elbow-room available has not been made proper use of. Mr. Wontner Smith (No. 33) also felt the need of having long and short lengths at right angles to one another, but it is a pity he closed his left and right courts. Obviously cubical content compelled him to it. It is unfortunate that his scheme is so involved in plan, because his elevations, most admirably drawn, held promise of very fair prospects. The same adverse criticism must also be applied to Messrs. Morgan, Armstrong, Dawson, and Shearley's design (No. 39).

A likely and workable scheme is that of Messrs. V. O. Rees and G. Holt. It offers two large courts opening to the Heath, with a central block, facing south, and connecting them in the centre. As with a few other competitors—including the winning design—flats, or parts of flats, have been put in the roof, thus appreciably bringing down the cubing.

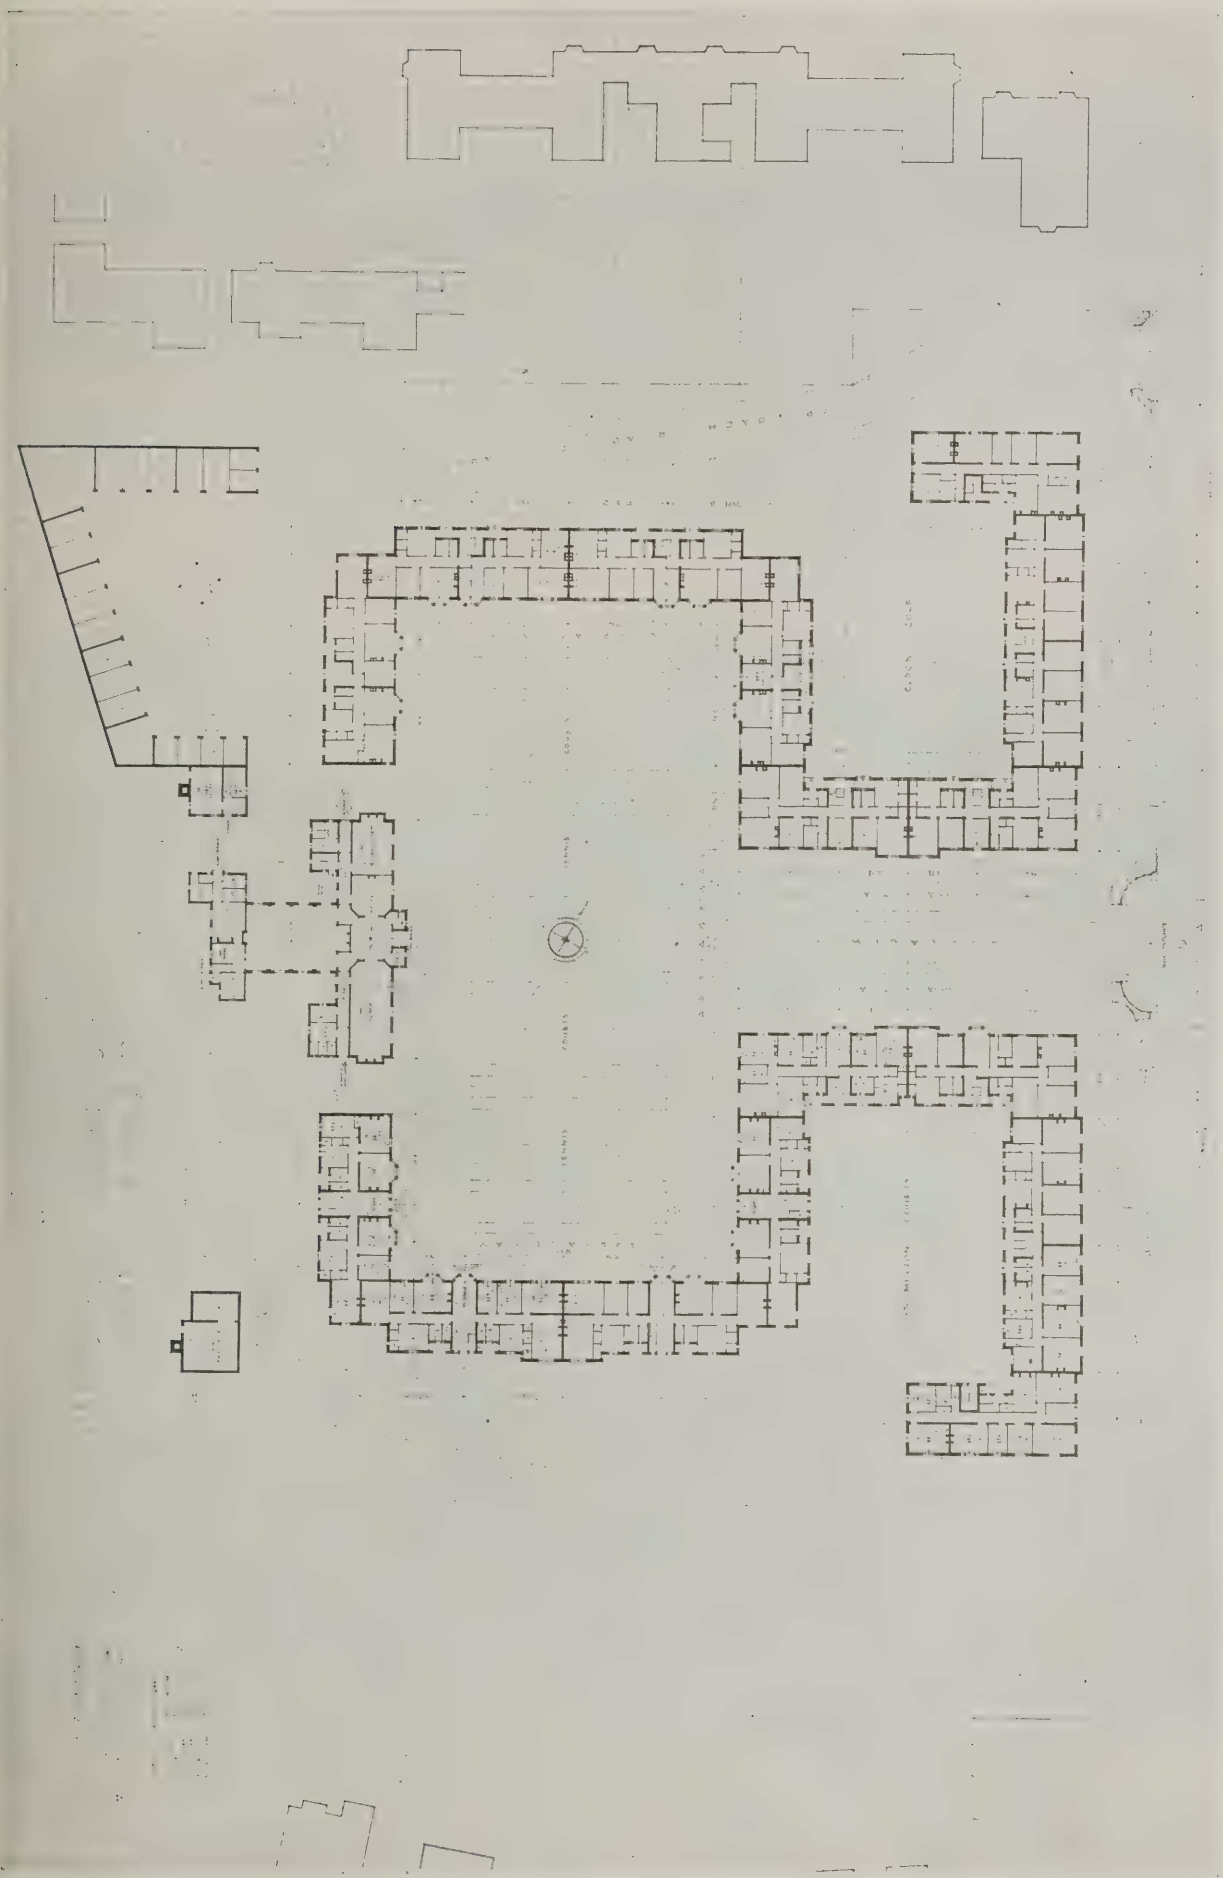
Let us come to the winning designs. Mr. J. B. F. Cowper, A.R.I.B.A., the winner, whose scheme is being carried out, and whom we congratulate, has certainly evolved a very able solution. His plan is extremely compact, but almost ruthless methods of compression have had to operate in order to bring down his cubing to the remarkably low figure of 1,177,760 cub. ft. This is the source of his strength with regard to the economic considerations and the source of his weakness with regard to good planning considered *per se*. He has sacrificed the opportunity of a straightforward central hall on the ground floor by squeezing it in the basement under the right-hand wing. He has further eliminated most of the communication between the flats and the communal centre, and he has established a whole floor in his roof, with the result that all the rooms on that floor, including living-rooms, will have sloped ceilings, the roof cutting into the rooms at a height of 4 ft. 6 in. There are also pleasanter elevations than his; but, this said, there is no denying that he most successfully faced all the demands put upon the competitors for an economical and workable scheme. His buildings are so planned that eight tennis courts, two Badminton courts, and one croquet lawn are provided. The space to be allotted to the open inner court is ample. The porter's office, prams, bicycles, and telephone exchange are gathered in one small central building next to the Heath, an excellent arrangement. All the flats are fed by sixteen staircases, the best flats nearest the Heath, yet facing south. Generally speaking, all the large flats are identically planned on ground and first floor, the smaller ones being put in the attic. Those troublesome party walls, by vertically running throughout, create units which in this case are given expression to.

The porter's flat, staff quarters, and box-rooms are also tucked away in the basement. Most of the flats are well lit. The fireplaces and flues have been carefully grouped, and the general planning is, indeed, very efficient. The walls will be made of Luton grey bricks, with dressings of red rubbers, the floors to be of Armoured Tubular construction. One of the points emphasized in the conditions was the labour-saving aspect of the flats. Mr. Cowper's devices in this respect are largely of a portable nature, and would be supplied by the tenants, but he provides for electric lifts in his main staircases. Cupboards to hold dustpails are provided on every landing. In other instances outside hand-lifts are provided direct to kitchen windows. The total cost of the buildings proper is brought down to the remarkably low figure of £74,000.

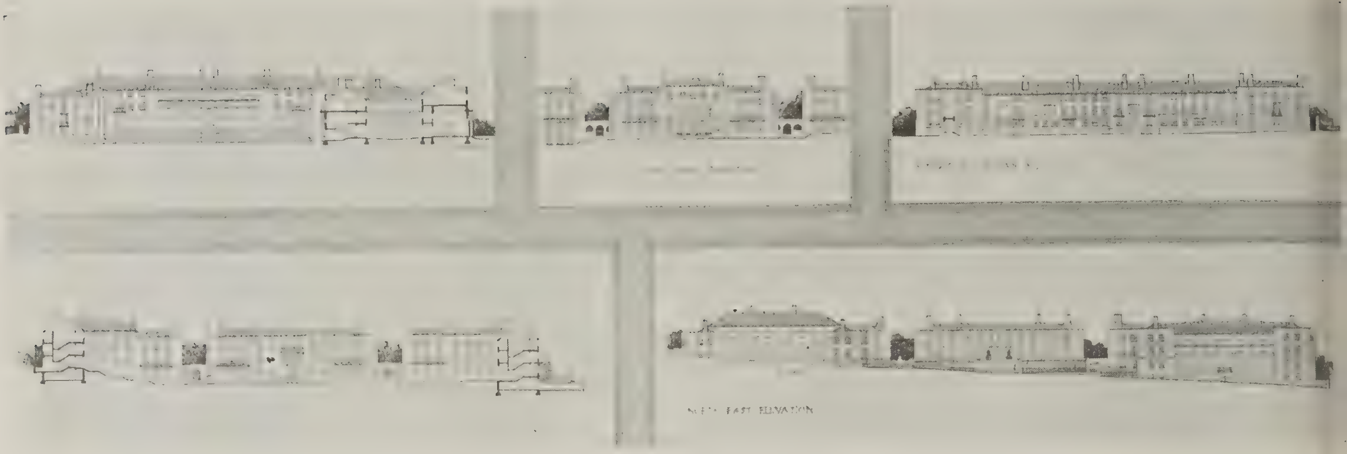
The second prize, awarded to Messrs. George A. Rose and A. V. Farrier, AA.R.I.B.A., has its large open court at the back, also facing the Heath, with four tennis courts. We observe that here the longest lengths of the buildings are designed along the contours of the land, and the shortest lengths possible across the fall, an arrangement preventing waste space in basements and avoiding expensive foundations. The garages and dust-shed are put away in the S.W. corner of the site. The laundry is wedged in between the service part of the central hall and the garages, with the boiler-house under. This is rather out of the way.

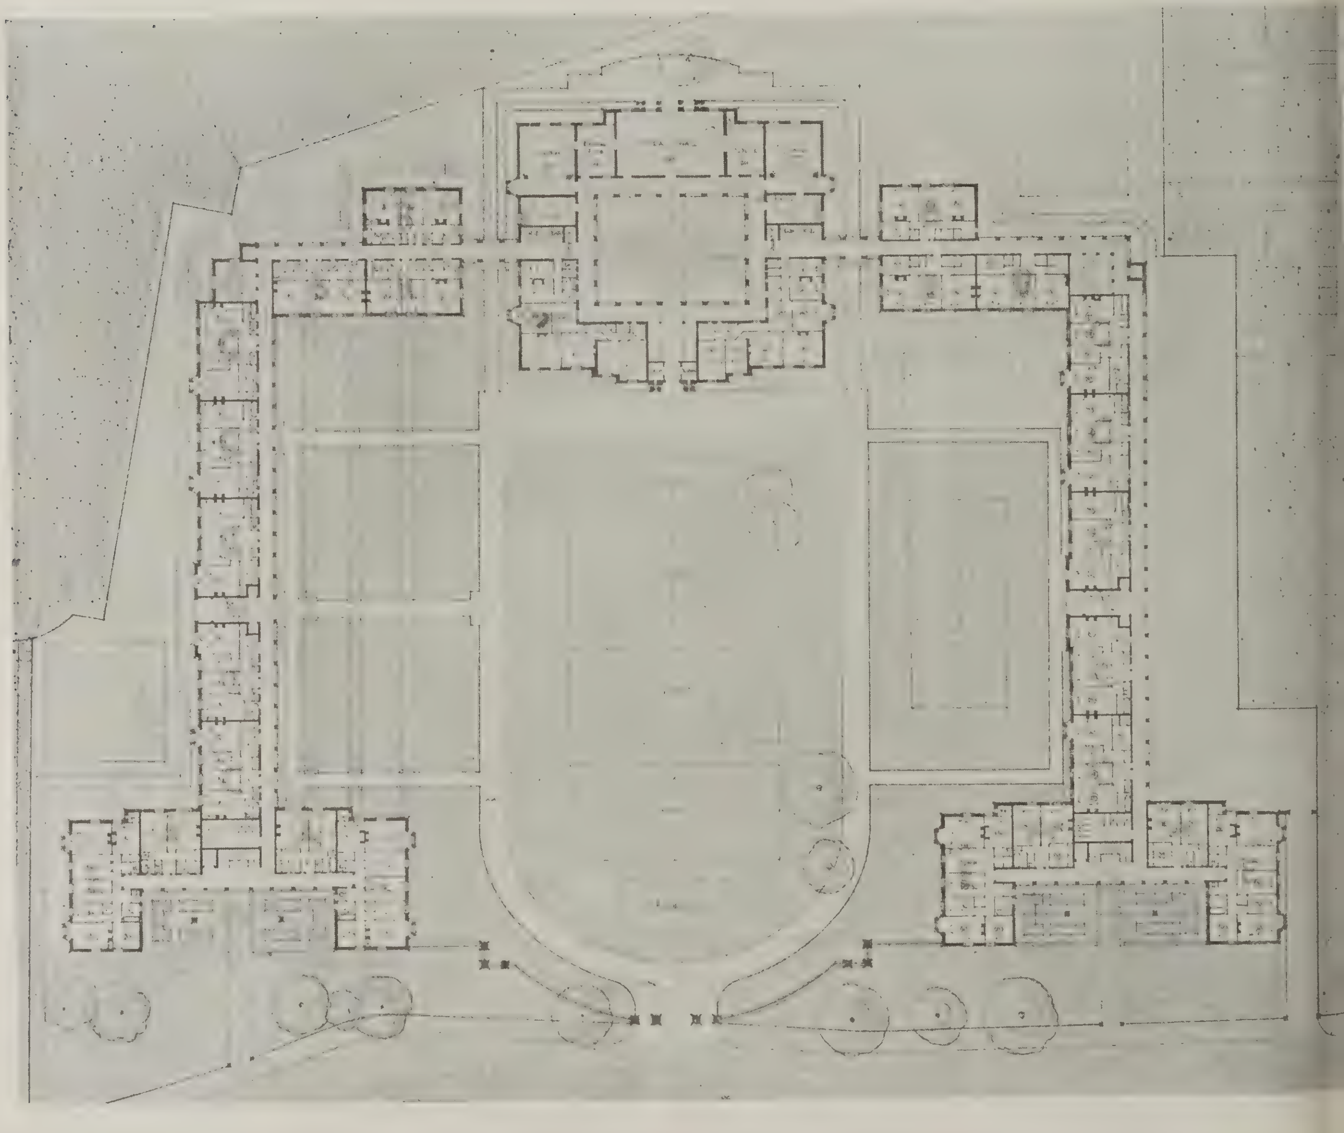


HAMPSTEAD LABOUR-SAVING FLATS COMPETITION: SECOND PREMIATED DESIGN. GEO. A. ROSE AND A. V. FARRIER, A.A.R.I.B.A., ARCHITECTS.



HAMPSTEAD LABOUR-SAVING FLATS COMPETITION: SECOND PREMIATED DESIGN. GEO. A. ROSE AND A. V. FARRIER, AA.R.I.B.A., ARCHITECTS.





HAMPSTEAD LABOUR-SAVING FLATS COMPETITION: THIRD PREMIATED DESIGN.

CYRIL A. FAREY, A.R.I.B.A., AND C. EVELYN SIMMONS, L.R.I.B.A., AND A. TRYSTAN EDWARDS, A.R.I.B.A., ARCHITECTS

cycles and prams take their chances
the entrance landing of each large
rcase, of which there are nineteen, so
nged that each performs the dual pur-
of serving the main entrance to flats
also to kitchen door. Tradesmen's
rcases only occur in connection with
largest types of flats, which are placed
hest from the central hall, their ten-
being least likely to use the hall.
ood point is the grouping together of
baths, w.c.'s and kitchen sinks on
side. Storage room is provided
asement and roof. The façades in
rgian style are very pleasant, and
scheme is, indeed, a very useful
ribution towards the planning of
flats.

The third prize, won by Messrs. Farey, A.R.I.B.A., Simmons, L.R.I.B.A., and Edwards, M.A., A.R.I.B.A., is on the whole the most architectural scheme submitted. It faces the Heath too, and has an almost too elaborate central block, which builds itself round a small open cortile. The flats are mixed together, and are fed by only seven staircases, those in the side wings feeding four flats each. We commend the clever way in which the larger flats, such as "D," have been put over and above the smaller ones, such as "C," by having the communicating corridor running throughout on the ground floor only. The central block is certainly a little extravagant, and it is doubtful if the two "F" flats get very much good light; their southern aspect is seriously interfered with by the other side of the Central Hall. The staff quarters are on the second floor, next to the kitchen.

A good view of the Heath can be obtained from all living-rooms. Sixteen flats facing S.E. have in addition sunparlours. The elevations have a very pleasant reticence of treatment, the effect being obtained by good proportions and fenestration. At first sight the rather flat pantile roof seems a little out of keeping with those of adjoining houses, but it has the great advantage of reducing the cubing.

G. H.

[The first premiated design was illustrated in our last issue.]

## e Degas Sculpture at he Leicester Galleries

he Degas show is a little world unto
f in the midst of London; a little
d of paradox and contradiction.
women are ugly; all sculpture is
ing; all drawing is sculpture; a
tor must be judged by his drawings;
holomé is a great sculptor because
as first a painter! I wonder if Mr.
ter Sickert, who writes the delicious
ce to the Degas catalogue, would
it that he is a great painter because
a great wit.

e old æsthetic demanded two things
e all others in sculpture: a static
and calm, unruffled beauty. There
no such things in the Degas show,
very piece, whether horse or woman,
ancing or dancing, rising or falling,
ing or leaning. There is no such
as gravitation now, or it might be
that these figurines defy it. Degas
e Einstein of sculpture.

r sculptors will—if they visit the
ition—look in vain for nuances
echnique; the nuances of feeling,
ment, esprit they will miss be-
they care less for these things.
is sculpture with anatomy sacrificed
e cause of something greater: free
ty; muscular and bony form sacri-
for movement, but movement
ing form which transcends anatomy,
et is true to nature all the time.

ere are people who say they value
ick water-colour sketch more than
ture because it registers an effect,
of movement of clouds or rain on
ing water. They are justified. They
he people who will see the beauty
ese sketches and models.

gas turned his figurines this way and
so that Mr. Sickert could see the
ettes of them thrown by candle-
Not so that the things themselves
be seen, but so that the shapes of
could be seen in a greater modula-
than any static pose, however mar-
sly modelled, could present them.
s knew the secret of projection, and
iscovery of the value of the silhou-
was the principle of his sculpture.
a discovery that is too little appre-
l; it is the basis of the plastic line.

Medardo Rosso, the Italian sculptor who drew Rodin into impressionism, claims for each of his sculptures that it is a moment's monument, and Degas must have had the same inspiration, but as he was in the direct line from Manet of the impressionists, he, as painter and sculptor, had a dual interest in the principle.

The value of this exhibition, for the artist, is in the evidence it provides of the interpretations by Degas of Manet's doctrine. It is obvious from these figurines that he did not follow Rosso, who realized impressionism as a matter of light and shade in sculpture, for Degas went direct for pure form in any light, in contradistinction to his practice in his painting.

There are about seventy pieces of these bronzes cast by Adrien Hébrard, the friend of Degas, of the Hébrard Gallery in Paris, of women and horses; of studies of movements and gestures.

## Nevinson Etchings and Drypoints

C. R. W. Nevinson is a tonic. His exhibition at the Leicester Galleries makes you feel well, and it makes you feel hopeful for English art. It astonishes, too, not because you did not expect Nevinson to justify himself, but because he has done so, for the expected, as has so often been said, seldom happens. I always thought that the level attained in previous exhibitions would be raised in the future. I believed when I saw the artist's first etching that there was the making of a fine future there. This was soon after the armistice, and I am delighted to find my belief justified in so full a fashion. There are nearly fifty prints on show, and the mere number of them is startling when you remember recent exhibitions of paintings and drawings; when you recall Nevinson's journeyings in America, his interviewings at home, his manufacture of epigrams, and his general activity. It must be ceaseless, and it reminds me of the grand style of production by which the old masters, and the new masters like Brangwyn, achieved so much.

The level of the previous exhibitions has not only been maintained, but the general level of the present show is very high. The show is full of accomplished things both in biting and in point work, and the architectural plates open up a new field; a new way of treating architecture; of seeing it; of recording it; and Nevinson's sensing of American architectural genius is true and his exposition of it effective. His translation of nature scenes is admirable, but this was to be expected from his work in this direction in colour.

There are a few cubist or post-impressionist things here, but the excursions of the artist into the realms of the future have done no harm to his style in rendering the things of the present.

## The Royal Society of Portrait Painters

There are lots of good pictures in this show and very few bad ones. A society cannot have as president Sir James J. Shannon without making itself worthy of the honour. The Royal Society does very largely and its standard improves. You cannot have members like George Harcourt, W. B. E. Ranken, R. S. Eves, Archibald Barnes, G. L. Brockhurst, and Sir John Lavery without having a good president, so the reaction is complete. Some of the younger members are coming on splendidly: Stanley Mercer is commanding a style of his own, Mrs. Granger-Taylor is justifying her originality, Bernard Adams is making good, T. C. Dugdale in making Fanny smile, certainly makes the beholder smile too, it is so compelling, and Bernard Minns introduces a new scheme of feeling into his two portraits with neo-primitive backgrounds. The stablemen, the men that can be always relied on for sound work, form the strength of the exhibition: James Quinn, with his conscientious treatment and his acute vision, and George Coates with his fine rich quality of paint and felicity of placing, prove themselves very worthy members of the splendid Australian group of artists in London. Ishibashi does more than credit to Japan; he is a portrait-painter of the first order; he has the secret, and knows how to use the knowledge. W. E. Webster gets better and better, and Alfred Priest holds well to his reputation, as do also Chas. W. Ward and John Crealock.

## The Lefèvre Galleries

There is a fine feast for the print collector spread out for his edification at the Lefèvre Galleries: etchings, dry-points, aquatints, and mezzotints. The two latter forms of engraving are too rarely practised by the painter-etcher, and the examples by Percival Gaskell are all the more welcome on that account, especially as they happen to be very good examples. It is refreshing, too, to find that a "Punch" artist is so much of an artist that he finds himself, like J. H. Dowd, compelled to express himself otherwhere than in the pages of our only humorous journal. Dowd's dry-points of children are delicious, the Boy Scout, indeed, has become famous. Robert Spence's Fox series is a *tour de force*. There are twenty plates of splendid quality, and a rare rigour of subject and vigour of accomplishment. The legends in old-fashioned print beneath each picture add greatly to their effect. John Barclay is a young etcher, and his prints here are of considerable promise.

## Sir Ernest George, R.A.

There is a display of the faculty of direct observation in the water-colour and other drawings of Sir Ernest George at the Fine Art Society which is very unusual. It reminds one of the same faculty in Ruskin. Both George and Ruskin saw things in a flash and recorded them with enthusiasm. In the drawings of both there is much more love of beauty than of picture-making. Neither were "artists" in the first place: Ruskin was a professional writer as George was an architect by profession, but both were very talented master-amateurs in their drawings, and so these have a character denied even to the drawings of a painter or sculptor. They have no technique, their character lies in their joyous discovery and recording of things that seemed very beautiful to their authors. The display of these 150 drawings is in itself a wonderful thing, for there is not a bad one amongst them: you have to imagine Ernest George sitting down promptly on his sketching-stool and doing the subject the moment he discovered it, in a calm passion of sustained enthusiasm I think. This he did, time after time, for year after year, until he was over eighty years of age, and this exhibition is a monument to the sense of beauty as it was developed during the Victorian period, a sense which seemed to distil the essence from the objects upon which it was exercised. It missed many things, but those it found it thoroughly exploited.

In the case of Sir Ernest George it was exercised upon many subjects, mainly architectural—bridges, houses, palaces—in many lands.

## Other Exhibitions

There are nearly a hundred oil-pa ings by Henri Harpignies at the Fre Gallery, large and small, and the bes them is a small painting of rocks.

A delightful set of water-colour dr ings by Turner, Cotman, Girtin, Pr Cozens, de Wint, William Hunt, Bi Foster, and other masters of the Eng school form the first of a series of proje exhibitions at the Cotswold Gallery.

Messrs. Connell's annual show etchings by contemporary artists incl Affleck, Whydale, Turkingham, R bury, Eyre Walker, and others.

At the Greatorex Gallery there is exhibition of early etchings of E. Lumsden, R.E., and some woodcuts Lepère of great interest.

A pleasant set of works by P. Jowett in water-colour is on exhibi at the St. George's Gallery.

Receiving days for the Royal Acad Exhibition are March 29 (drawings prints), March 31 and April 3 (oil-p ings), and April 4 (sculpture).

Sotheby's are selling a representa selection of works by Nelson Dawso Friday, March 16, and on the 22 small but very choice collection of d ings of the French eighteenth-cen school. Illustrated copies of both t events are on sale, as well as the o modern etchings and water-colour the 14th.

## Professional Publicity

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—I join with you in congratulating the enterprising firm of contractors who at so reasonable a cost and in so artistic a manner are attaining much deserved publicity by their display outside a building in course of erection in one of London's busiest thoroughfares. This is, as you say, one way of making a new building of interest to the public. I was passing this building in company with a member of the public the other day, and her first remark was: "Why do not the architects display their names? It would be still more interesting to know who they are." I had to explain that architects, being artists, are too modest to seek this form of publicity, and in any case in the best architectural circles this sort of thing is not done. I was rather taken aback a little farther on when my friend drew my attention to another building in an equally busy thoroughfare on which was displayed a notice to the effect: "This building to let. For plans, etc., apply to ——— Architect." Again I had to explain that if this were known in the circles in which this architect moved he would be called to account.

My friend expressed the view that architects were "a funny lot." She may or she may not be alone in that opinion.

This morning on opening my newspaper I find a full-page announcement by another enterprising firm of contractors, who have also erected several buildings in prominent positions in London, some of which are illustrated in the advertisement. In this case I am glad to observe that the architects of these buildings share, if only in a lesser degree, in the publicity thus obtained inasmuch as their names are attached to the illustrations of the buildings which they designed, so that my friend will have no cause for complaint that the names of these architects are unknown to the public who read this newspaper.

C. MCARTHUR BUTLER.

Secretary of the Society of Architects.

## Landed Property Practitioners (Registration) Bill

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—It would appear from a statement in your columns that it is anticipated that this measure will be introduced into the House of Commons next month, and that it will receive the support of a large number of members of Parliament. The attention of the Society has been directed to certain clauses of the Bill which would seem to affect the interests of architects engaged in work within their calling as set out in the Bill. The Society of Architects is one of the bodies mentioned in the second schedule of the Bill as being one of those whose members would be exempted from the operations of the Act, but there remains the possibility that architects who are not members of these organizations might suffer if the Bill becomes an Act, and as the Society of Architects does not exist for itself and its members only, the Council is watching the developments of the measure with a view to taking ever action (if any) may be found n sary at a later stage.

C. MCARTHUR BUTL

Secretary of the Society of Archit

## Registration

*To the Editors of* THE ARCHITEC JOURNAL.

SIRS,—I have made no suggestio implied by Mr. Sadgrove in the s paragraph of his letter, publishe you on the 28th ult. The Regist Committee approached him last Ju a representative of the Society of tects: I can think of no other r for asking for an interview. The ment in my letter, published by y the 21st ult., is quite correct, and also quite true that at the intervi the Registration Committee with Sadgrove everything was informal, was agreed that nothing should b to bind either party. That w approach the Society of Archite amply confirmed by Mr. Sadgrove letter, particularly in his seventh graph. Mr. Sadgrove states "the S knew absolutely nothing of the co of the Bill," and when the draf approved by the Council it was forw to the Society of Architects. It wa on January 23rd.

SIDNEY PE

P.S.—I am sure your readers are ested to hear from Mr. Sadgrov he "did not stay to tea on A 10th"; but we hope for bette next time!—S. P.

## he Architecture Club Exhibition

rchitects and laymen rallied in force
the opening of the first exhibition
the Architecture Club, and the
ms of Grosvenor House were crowded.
rd Crawford, in his opening address,
l that an exhibition representing
rent average architectural work would
rm and in some cases shock. He
aded that the Architecture Club should
e its full share in shaking up our com-
cency. Referring to Sir Christopher
en, Lord Crawford expressed the hope
t Wren's influence, great as it was
lay, would continue to grow here-
r. Wren did not attain achievement
denly, without effort and training, he
led. Although his early training was
ociated from architecture as such,
vas all of such a character as contri-
ed to the full manifestation of his
ius. Others would do well to-day if
y could emulate the catholicity of
n's training.

## The R.I.B.A. Ball

n the night of Friday, March 9th, the
itectural students of London held a
in the Galleries of the R.I.B.A. to
brate the bi-centenary of the death
ir Christopher Wren.

his was one of the most successful
ces the architectural students of
don have ever organized. Everybody
eared to enjoy it enormously, and
y startling creations in fancy dress
e there to bewilder the eyes of those
wished to recognize their friends
enemies. Harlequins, columbines,
tes, duellists, dancers, Chinamen, and
inds of queer birds and animals and
igners were the order of the day. The
ards, who were dressed appositely in black as Fascisti, kept a hawk-like watch on all those who endeavoured to misbehave, and several hapless Bolsheviks who came in perfectly harmlessly with bombs under the arms were expelled with extraordinary rapidity.

Tut-ankhamen was here in many forms. There were several Egyptians to give a spice of atmosphere to the proceedings, and one enterprising lady, dressed as a Royal Queen—Cleopatra possibly—carried a genuine mummified head several thousand years old under her arm, the teeth still hanging to the mouth: a somewhat gruesome reminder of the brevity and uncertainty of life.

To quote now from the programme: "On XII ſtrokes of the gong at midnight enter the CITY FATHERS for ſpecial fitting to receive a deputation requeſting the uſe of the Guildhall for a Ball, and to expreſs horror thereat, followed by the moſt timely appearance of SIR CHRISTOPHER," who proclaims that the Guildhall is eminently satisfactory for a Ball and puts the city fathers incontinently to flight.

The rest of the evening was used for dancing by some and for refreshment by others, and proceedings did not hesitate or falter until the early light of dawn came creeping into the ballroom.

A word is due to those who produced the decorations, which were exceedingly beautiful, especially the fine decorative painting of St. Paul's, which was worth careful study as a work of art.

## Bigger Selfridge's

The tender of Messrs. F. D. Huntingdon, Ltd., has been accepted at £115,610 for another extension to Selfridge's. It will involve sweeping away nearly all the old buildings between the main Selfridge block and Orchard Street, and putting up in their place a section exactly similar in design to the present one. This will still leave a gap of 80 ft. in the middle of the 170 yd. Oxford Street frontage. That gap will be tackled, if all goes well, in sixteen months' time, and in about four years from now the whole of the island site will have been dealt with. A feature of the completed Selfridge's will be the courtyards in the very centre of the site. Mr. Frank Brangwyn, R.A., has been engaged for some time upon designs for decorating these courtyards, and he is also doing the internal decorations of the new section. Sir John Burnet, A.R.A., is the architect of Selfridge's, working in association with a Chicago firm, Messrs. Graham, Anderson, Probst, and White.

## Competition News

### *The Cairo Hospital Competition.*

The result of the final stage of this competition—perhaps the greatest architectural competition of an international character that has ever been organized—repeats the triumph of British architects which was so marked a feature of the first stage.

It will be remembered that in the first stage, open to the architects of the world, five places out of six were won by British architects.

In the final stage there were twelve competitors, and the first and second places have been won by London architects—Messrs. Nicholas and Dixon-Spain, of Hanover Square, and Messrs. Lanchester, Rickards, Lucas, and Lodge, of Bedford Square. All are Fellows of the R.I.B.A.

### *Manchester Exhibition Competition.*

The following awards have been made in the competition promoted by the Manchester Building Trades Exhibition

MR. CHARLES NICHOLAS, F.R.I.B.A

MR. J. E. DIXON-SPAIN, O.B.E., F.R.I.B.A.

THE WINNERS OF THE CAIRO HOSPITAL COMPETITION.

in conjunction with the Manchester Society of Architects, for architectural students:—

Class 1: Measured Drawings.—First prize: Mr. R. A. Cordingley; second, Mr. R. Briggs.

Class 2: Sketches.—First prize: Mr. R. A. Cordingley; second, Mr. G. G. Quarmby.

All the competitors are students at Manchester University.

*Bournemouth Pavilion Competition.*

The Corporation have resolved to grant to competitors an extension of time, beyond May 12, of one month. A number of questions have been received and the answers will be circulated to the competitors in due course.

[*For List of Competitions Open see last week's issue.*]

## Coming Events

*Thursday, March 15.*

Edinburgh A.A.—"Town Planning in Edinburgh." By T. B. Whitson, C.A. 7.30 p.m.

Birmingham Town Planning Lecture: "The Scheme in Operation." By F. C. Minshull, LL.M. 5.30 p.m.

R.I.B.A.—"Architecture: A Necessity or a Luxury." By H. S. Goodhart-Rendel. 5 p.m.

Grosvenor House.—"Architecture and the Theatre." By Nigel Playfair. 5 p.m.

British Museum.—"Excavations at Babylon." By Claire Gaudet. 3.15 p.m.

Inc. Inst. of British Decorators.—"Decoration: Past Examples and Present Trend." By John Scott. 7.30 p.m.

*Friday, March 16.*

Art Workers' Guild.—"Churchyard Monuments."

Birmingham Municipal Technical School.—"How White Lead is Manufactured." By James B. Duncan, M.Sc., F.I.C. 7.15 p.m.

*Saturday, March 17.*

A.A. Visit New Church at Acton, by Robert Atkinson, and New Pensions Office, Acton.

*Monday, March 19.*

R.I.B.A.—"The Hammersmith Housing Scheme." By B. E. S. Streatfield, O.B.E., D.S.O. 8 p.m.

*Tuesday, March 20.*

Liverpool Architectural Society.—"The Architecture of Freedom." By Major H. C. Corlette, O.B.E., F.R.I.B.A.

Grosvenor House.—"Fashion and Style in Domestic Architecture." By Sir Lawrence Weaver, K.B.E.

## South Wales Architects

At the general meeting of the South Wales Institute of Architects (Western Branch), held at Swansea, the following officers were elected for the ensuing year: Chairman, Mr. Charles S. Thomas, F.S.Arc.; hon. treasurer and librarian, Mr. H. C. Portsmouth, F.S.Arc.; hon. secretary, Mr. J. Herbert Jones, F.S.Arc.; Committee, Messrs. Glendinning Moxham, F.R.I.B.A., C. Russell Peacock, F.S.Arc., J. Cook Rees, F.S.Arc., Thomas Gibb, F.S.A., G. R. U. Rogers, G. L. Crocker, W. T. Lloyd. Mr. Ernest E. Morgan, A.R.I.B.A., was elected hon. auditor. The following were elected to the Council of the South Wales Institute of Architects: Messrs. Charles S. Thomas, H. C. Portsmouth, J. Herbert Jones, Glendinning Moxham, J. Cook Rees. Associates' representative, Mr. G. L. Crocker.

## The Lighting of Picture Galleries and Museums

A discussion upon a paper, "The Lighting of Picture Galleries and Museums," read before the R.I.B.A. by Mr. S. Hurst Seager, F.R.I.B.A., some time previously, took place at the Institute on Monday evening last week. The president, Mr. Paul Waterhouse, was in the chair, and among those present were Lord Crawford, H.M. First Commissioner of Works, and Sir Charles Holmes, curator of the National Art Gallery.

Mr. Seager re-introduced the subject with the remark that he proposed to illustrate only a line of that which would include the contrast seen in the types of double and single glazed galleries. By means of lantern-slides he then proceeded to give illustrations showing types of top-lighted galleries—as at Birmingham, Dulwich, Hertford House, Christie's, etc.—galleries where attempts had been made to overcome defects in lighting, and examples designed on the principle of shielding the spectator—at Munich, Berne, the Ryke Museum, Amsterdam, and elsewhere—top side-lighted methods where it was designed to carry out the principle that the picture wall must be the best-lighted part of the room; examples showing how present side-lighted rooms might be converted into top side-lighted ones (with an interesting and successful experiment at the Louvre); and the various expedients which might be adopted for overcoming defects in irregular galleries, or for the proper illumination of individual pictures.

He pointed out that, in spite of all that has been written and said on this subject, especially in the United States, it is a curious fact that very few modern galleries are lighted in an entirely satisfactory way. The necessity for covering pictures with glass has created the problem of reflections, and the pleasure of looking at pictures is frequently marred by the image of the spectator in the glass of the picture, particularly—as the lecturer pointed out—in the case of bald-headed men, as he had found from personal experience.

The remedy, according to Mr. Seager, is to adopt a system of top side-light, and he showed by a very fine series of slides and photographs the defects in many of the leading European galleries, and in some cases the improvement already effected by adopting his suggestions. Speaking generally his idea is that the spectator should stand in the shadow, while the bright light should fall on the picture.

Mr. Seager advised that in winter, when we needed all the light possible, and the sun had not enough power to do harm, the skylights should be exposed each in turn on the sunny side; in summer they should be closed on the sunny side.

All blinds should be opaque, and if reduction of light were required it should be gained by the reduction of the size of the skylight by partially covering it, when a pure daylight would still be obtained.

"May I venture to express the hope," Mr. Seager concluded, "that you consider my papers and the experiments of the National Physical Laboratory, and those made by H.M. Office of Works, under Sir Frank Baines, have proved beyond ques tion that the remedy for getting rid the irritating and harmful reflections see in pictures on the walls of the gallerie the world over, lies in the hands of the directors and proprietors."

Mr. Wm. Woodward, F.R.I.B.A., sai that all would agree with him that th present lighting of picture galleries was very unfortunate thing. What could more vexatious, not only to the archite of the gallery, but to the general publi to be able to see, not the picture itsel but the reflection of your own forn Consider two important galleries London—the Tate and the Nation Gallery. One had only to enter either these to arrive at the conclusion that th lighting was hopeless for seeing the pi tures in a proper manner. With all o wealth, science, and art, we had n got a gallery where you could see th pictures that were in it.

Sir Charles Holmes said that th National Gallery had quite rightly be used as a whipping post. But he wou like to remind them that the proble there was extraordinarily difficult. Wh you had pictures that were painted very dark oils, and they had to be e hibited, as in London, in very dangero climes, they had to be glazed. And wh you once put glass over a picture you h at once something approaching a mirr and nothing would eliminate reflectior

If the nation possessed only 100 p tures, it would be possible to show the in separate bays as isolated examp of art, but it would be impossible to house such a large collection as that in t National Gallery.

The lighting of the National Galle was frequently criticized. But when y got rooms 20 ft. to 30 ft. high—and some cases 30 ft. to 40 ft. high—short pulling the building down you could do away with the diffused light wh was responsible for the reflections.

Lord Crawford expressed himself not caring for any of the remedies forward by Mr. Seager. And with reg to reflections on pictures in the Natio Gallery, he went there constantly a did not see them. And that was beca he looked at them as a human bei while the camera with which Mr. Sea had taken many of his illustrations sho ing "glare" had looked at them a machine. Mr. Seager's pictures w entirely misleading.

In a public art gallery it was v necessary to have the pictures glaze not only because of the climate, but cause of mischievous people. They had as many as twenty injuries in day to the glass upon pictures in National Gallery.

Mr. Dunbar Smith, F.R.I.B.A., Arthur Bolton, F.R.I.B.A., and Arthur Keen, F.R.I.B.A., also spoke.

Mr. Seager, acknowledging a vote thanks for his paper, said that he despondent that the seed he had tried sow should have fallen upon such h soil.

## An Acknowledgment

The photograph of "Wrencote," Cr don, published on page 456 of our issue, is the property of Mr. Natha Lloyd, whose name was inadverten omitted from the reproduction.

# The Week's News

### *Shardlow Infirmary Extensions.*

t is proposed to build a new infirmary rd at a cost of £2,500.

### *posed Winter Palace for Colwyn Bay.*

proposal is afoot to construct a ter palace at Colwyn Bay.

### *House Shortage at Coventry.*

t is estimated that 2,500 houses are uired for Coventry.

### *More Houses for Nuneaton.*

scheme for the erection of 200 ses will shortly be placed before the poration.

### *Change of Address.*

Ir. Eric Hayman, M.A. (Camb.), has ved to 44 Bedford Row, W.C.1. Tele- ne: Chancery 7058.

### *Croydon Air Terminus.*

he Civil Aviation Advisory Board mmend the enlargement of the Croy- aerodrome at a cost of £250,000.

### *Lincoln Cathedral Restoration.*

he Dean of Lincoln has raised nearly oo in America and Canada towards restoration of Lincoln Cathedral.

### *Dudley's £320 House.*

number of municipal houses are to erected at Dudley at a cost of £320 .

### *tbourne Cricket Club War Memorial.*

war memorial dining-hall is to be ted by the Eastbourne Cricket and tball Club.

### *More Houses for Eastbourne.*

further scheme for 100 municipal ses, estimated to cost £59,396, has approved.

### *Municipal Offices for Nuneaton.*

he Nuneaton Corporation have under ideration a proposal to build new icipal offices.

### *New Cinema for Worthing.*

new cinema is to be erected on the of Worthing Lodge, Chapel Road. new building will provide accom- lation for 2,000.

### *Wakefield Improvement Scheme.*

akefield City Council propose to olish 100 houses in areas near Kirk- and to erect houses on Portobello te for the displaced tenants.

### *Slum Clearance at Blackburn.*

lackburn Corporation are to clear a ber of slum areas. The displaced nts will be accommodated in model .

### *Doll's House in Titania's Palace.*

the nursery of Titania's Palace is a ature doll's house which is four inches . It is a copy of the doll's house by Sir Neville Wilkinson.

### *Bank of England Rebuilding Scheme.*

view of the fact that the rebuilding e Bank of England is to be under- n shortly, the Corporation of the City ondon have put forward a scheme the widening of Princes Street. It timated that the scheme, including pulling down and rebuilding of the r wall of the Bank, will cost about o,000.

### *New Midland Road.*

The Dudley Town Council have agreed to contribute a sum not exceeding £20,000 towards the cost of the Birmingham to Wolverhampton road.

### *Oxford Women's Colleges.*

An appeal is being made for funds for the erection of more buildings and the installation of more equipment for the four women's colleges at Oxford.

### *Housing at Birmingham.*

The Estates Committee propose to sell 104 acres of land on the Billesley Common Estate for development for housing purposes. The purchase price is fixed at £18,500.

### *The Kitchener Memorial at Chatham.*

A block of four cottages for disabled sailors and soldiers is to be erected at Chatham as a memorial to Lord Kitchener. Mr. R. L. Honey, F.S.I., M.S.A., is the architect.

### *Southport War Memorial.*

The Southport Corporation are applying to the Ministry of Health for sanction to a loan of £2,000 for the lay-out of the gardens in Lord Street and for the new war memorial.

### *Pendower Development.*

The Newcastle Corporation Housing Committee have decided to apply to the Ministry of Health for permission to construct a further batch of houses on the Pendower Estate.

### *Gosforth Garden Village.*

The London and North Eastern Railway are to co-operate with the London and North Eastern (Gosforth) Garden Village, Ltd., in the laying-out of a garden village at South Gosforth. The site will hold about 200 houses.

### *House in which Leech was Born.*

A house at the corner of Bennett Street and Stamford Street, Blackfriars Road, in which John Leech, the celebrated "Punch" artist, was born, and where John Rennie, the builder of London Bridge, lived, is to be demolished.

### *Manchester Improvements.*

The Manchester City Council are considering proposals to spend £198,308 on main drainage, £64,000 on assisting private builders of house property, and £5,187 on forming tennis courts and bowling greens.

### *Malvern Hill to be Tunnelled.*

The Great Western Railway Company are about to construct a new tunnel through Malvern Hill at a probable cost of £1,000,000, to accelerate their service from Birmingham and Worcester to Hereford and South Wales.

### *R.W.A. School of Architecture.*

The Royal West of England Academy School of Architecture are holding an exhibition of the designs for a "stadium for international Olympic games," submitted for the Society of Architects' Victory Scholarship.

### *Art Gallery for Birkenhead.*

Viscount Leverhulme has given a site at Birkenhead to the Corporation for an art gallery. The building will be erected from the proceeds of legacies amounting to £30,000 left to the Corporation by Mr. John Williamson and Mr. P. A. Williamson.

### *The Wren Bicentenary Celebration.*

The secretary of the R.I.B.A. has received the following cablegram from the Royal Victorian Institute of Architects:

> "Melbourne.
>
> "Victorian Institute Architects tender hearty support Wren commemoration."

### *Dunwich Lost Churches.*

All that now remains of Dunwich Church, Suffolk, is an angled column of stone and flintwork. The remainder of the church has been gradually washed away by the sea. It is suggested that the remains should be re-erected inland as a memorial.

### *Stained Glass at the V. and A. Museum.*

The Victoria and Albert Museum has acquired, out of the funds of the Murray Bequest, four panels of stained glass from the recent sale of the Engel-Gros collection in Paris. Three of these are Swiss, and belong to the period of highest accomplishment; the fourth is South German. The panels are temporarily exhibited in Room 139.

### *Scottish Building Strike Settled.*

The building strike in Glasgow and the West of Scotland has been settled. The parties agreed upon 2d. per hour reduction on the wages of masons and bricklayers, and 1½d. an hour on the wages of labourers attending skilled workers, the terms to be submitted to a ballot vote of the workers, the votes to be returnable on March 15. Meantime the men have resumed work at the old rate.

### *West End Garage Scheme.*

The work of transforming the Poland Street workhouse, off Oxford Street, into a garage for West End motorists will probably be begun within a month. £35,000 is to be spent on alterations and restoration of the existing building. The London County Council have given provisional approval to the erection of a three-story building. The aim of the syndicate is to provide a garage which will accommodate several hundred motor-cars, and will meet the "parking" requirements of theatre-goers and West End diners-out.

### *The Lord Kitchener Chapel.*

The memorial chapel to Lord Kitchener in St. Paul's Cathedral, for which a chamber on the ground floor of the north-west tower has been given to the committee by the Dean and Chapter, will not be completed before May of next year. It will be known and used as "Lord Kitchener's Chapel," and is to contain a recumbent marble statue of the great soldier, a marble altar, surmounted by a carved "Pieta," and two life-sized statues of St. Michael and St. George. In a niche enclosed in a wrought-iron grille is to be placed the roll of honour containing the names of Lord Kitchener and some 20,000 of his comrades in the Royal Engineers.

## The House Shortage

The following resolution has been passed at a meeting of the Executive Committee of the National Building and Engineering Brick Federation held at London: "That in the opinion of this meeting the whole problem of the re-establishment of the house building industry, apart from that of unemployment, centres on the renewal of confidence in the investment of capital. It is submitted that the re-establishment of the house building industry to provide a sufficiency of houses of a present cost value not exceeding £400 is and will continue to be impracticable until the Government in co-operation with the local authorities put into operation a system of subsidies to operate until economic conditions of building costs and cost of living are brought down to a standard of reasonable permanency, and this Federation would welcome the opportunity of submitting to the Government a subsidy scheme. It is submitted that such re-establishment would tend to a return of confidence in the investment of capital, would encourage house provision in adequate quantity, be a considerable relief to unemployment, and reduction in national and local relief costs, would assist in removing the existing danger to national health and morality through overcrowded living conditions, would alleviate some of the despondency and anxiety consequent on unemployment, and would promote citizenship responsibility and interest by tenant ownership. This Federation is strongly of opinion that the facilities for tenant ownership available by the Small Dwelling Act of 1899, and the extended facilities provided by Section 49 of the Town Planning Act of 1919, are very little known to the people who might desire to become tenant owners, and that an extensive advertising of these facilities by the Government would be a worthy national Service." The Federation Secretary is Mr. G. Wink Wight, C.A., 22 Surrey Street, Strand, London, W.C.2.

The following suggestions for the amendment of the Small Dwellings Acquisition Act are submitted for the consideration of Members of Parliament in the monthly record issued by the Housing and Town Planning Council:—

(*a*) An annual subsidy should be given by the State to occupying owners purchasing houses under the Act. This State subsidy should be supplemented to an equal amount by the local authority. In both cases the subsidy should take the form of annual grants paid by the State and the local authority respectively over a term of thirty years.

(*b*) The subsidies described above should be given only in the cases of new houses actually built as a result of the operation of the Act.

(*c*) Advances in accordance with a scale to be determined should be made during the erection of the houses.

(*d*) The limit of 85 per cent. of the market value of the houses should be retained. But the local authority should be empowered to advance a sum in excess of the 85 per cent. of the market value.

(*e*) The security for this additional sum shall be found in the grants pledged to be given by the State and the local authorities together.

(*f*) The local authority should take special care to secure that the house and the estate on which it is built should conform fully to good modern standards of design and town planning.

## Clerks of Works at Dinner

Under the chairmanship of Mr. E. C. P. Monson, PP.S.A., F.R.I.B.A., F.S.I., the fortieth annual dinner of the Incorporated Clerk of Works Association was recently held at the Holborn Restaurant.

The King's Hall, in which the dinner took place, was filled to its utmost capacity, and among the guests present were Mr. Stanley Hamp, F.R.I.B.A. (President of the Architectural Association), Sir Henry Tanner, Lieut.-Col. A. C. Preston, V.D. (Past-Master of the Carpenters' Company), Mr. William Woodward, F.R.I.B.A., Lieut.-Col. R. J. Tasker, L.C.C., and Mr. H. C. H. Shenton (President of the Institution of Sanitary Engineers).

Including the toast of "The King," there were eight toasts in all, to say nothing of a very comprehensive musical entertainment (under the direction of Mr. Harry Briden).

Mr. F. J. Pitts (Vice-President of the Association), in proposing the toast of "The Architects," expressed the appreciation which the members of the Association felt for the interest taken in their organization by architects, surveyors, and builders alike.

In reply, Mr. Stanley Hamp, F.R.I.B.A. (President of the Architectural Association), said he fully realized the value of the clerk of works in the erection of a building, and held the view most strongly that at the present time, with building construction as complex as it had become, it was essential that architects should have the services of the clerk of works on all buildings, however small, to coordinate the work of the contractor and sub-contractors, and so avoid confusion and delay.

Lieut.-Col. R. J. Tasker, L.C.C., who responded to the toast of "The Surveyors" (which was proposed by Mr. W. Lake, PP.I.C.W.A.), urged that members of the architectural and surveying professions should gain first-hand experience of building work by spending part of the time allotted to their training on buildings in course of erection.

Mention was made by Mr. P. J. Luxton (Editor of the I.C.W.A. Journal) of the important work which is now being carried on by the Carpenters' Company at the Trades' Training College and elsewhere.

Mr. E. Schofield, PP.I.C.W.A., proposed "The Builders," and was followed by Mr. F. Shingleton, M.V.O., who, in referring to the present unsatisfactory position of the building industry, stated that builders were tendering at cost price, or under, in order to keep their staffs together. Improvements in the condition of the industry could only come about through lower wages, cheaper materials and a better output.

Mr. E. C. P. Monson, PP.S.A., F.R.I.B.A., in proposing the toast of the "Incorporated Clerk of Works Association," recalled that it was founded in 1882, and remarked that the rules were framed to ensure that the members were all men of the calibre required by the architects to superintend buil works. In referring to salaries, Monson said he was certain that possessing the necessary knowledge integrity for the proper discharge their duties could not be found who willing to accept such remuneration was sometimes offered by local auth ties.

The President of the Association H. W. Page), who responded, followed by several other speakers.

## Heating and Ventilatio of Buildings

In the course of a lecture at Uni sity College, on the subject of hea and ventilation, Professor A. H. Ba said that it was somewhat deli to address architects as to the relati which should exist between them heating and ventilating engineers, he would venture to do so as he thou the situation called for some comm In his view, unless the architect posse a special and unusual amount of kn ledge on the subject of heating ventilation he was taking on his shoulders a serious responsibility in b sole professional adviser to his client u the matter. Of course, if the installa was a simple one it would be ha necessary for him to call in a consult "Experience has shown that architects inclined to deal with complicated hea and ventilating installations with s assistance as they can obtain from fi of contractors who specialize in this c of work, with the result that nine ou ten, and probably nineteen out of twe of the installations which have rece been installed in important buildings such that if they were brought to him building owner he would decline to acc Frequently he is called in where procedure has been adopted and finds existing plant very bad and giving poor results." As to the training a should have to deal professionally this work he alluded to the three ye course provided at University Coll the curriculum of which embraces trical engineering, including elect design and a general knowledge mechanical engineering, as well a knowledge of building construction s cient to fulfil the requirements of a h ing and ventilating engineer. fessor Barker condemned the co adopted by so many architects of ca in half-a-dozen or more different firm contractors who specialize in heating ventilation work. "Much time is s by these firms in preparing schemes, it is really impossible for an archite say which of these is best. If six schemes were handed to him, as freque happens, he is generally unable to which is best, and usually it ends in scheme being abandoned and a scheme redrawn." The design of a hea and ventilating installation by an a tect was analogous to a private o who contemplated building a house ing in a builder and telling him rou his requirements and the builder c ing out these as best he could. It ne little imagination to know that the would be disappointing. He advoc close collaboration between the arch and the heating and ventilating engi

# Hoardings

UNCH" once told a story of a Salvation Army
band which, when requested by a gentleman with
a headache to move on, "moved on" a few doors
and there prayed for his soul. "Punch's" readers
ubt saw the humour of the situation, but the gentle-
with the headache must have felt that the matter was
d a joke. He would have found redress at law. As
tter of fact, the L.C.C. are at the present moment pro-
g the abolition of *all* unnecessary street noises and
and especially the epidemic of street whistling, which
nfortunate London pedestrian has to encounter in
ion to the unavoidable roar of the traffic.

rd Newton the other day introduced his Bill for the
er regulation of advertisements (a Bill supplementing
Advertisements Regulation Act which became law
7) by insisting that the eye should be given the pro-
n which the law has already given to the ear. The
sity for some such Bill no architect will deny. What
n can be more heartrending than to erect a fine build-
nd have it ruined by the erection of great boards
g immense letters or pictures, breaking up the pro-
ns and obliterating the design? Of course, there is a
y to try to prevent these things (one has a suspicion
there is a society pro- or anti- everything if we only
), but what is wanted in a case like this is not so much
ety as an Act of Parliament. Of course, we have to
the former before we can get the latter.

Advertisements Regulation Act of 1907 "authorized
authorities to make by-laws for regulating, restricting
eventing the exhibition of advertisements in such
or by such means as to affect injuriously the ameni-
f public parks or pleasure grounds, or to disfigure the
al beauty of a landscape," which last would be diffi-
o define for legal purposes, and, brought to court in
tempt, would have given point to the fact that great
rarely think alike. And as Mr. John Bailey, the
treasurer of the Society for the Control of Abuses of
Advertisement (the Scapa Society), has elsewhere
d out, it left the general amenities of the towns and
s quite unprotected. The Bill now carried through
rds by Lord Newton proposes to enable local authori-
make by-laws not only with respect to particular
apes, "but generally to the rural scenery of their
t; also for the preservation of the amenities of towns
illages and places frequented by the public on account
ir beauty or historic interest." But, it will be noticed,
rchitect remains unprotected against the disfigure-
of his buildings, and must still rely upon all his clients
the good sense and tact of Mr. Gordon Selfridge.

even from the layman's point of view it is high time
ster nuisance was stopped. One day, of course, we
e left regretting their disappearance as much as we
the old London cries, but that we are willing to risk.
e a street in London which has not been made hideous
nouncements of patent pills? Is there a village in
d where the glaring red and yellow of somebody or
soap advertisement has not plastered all the walls?
en by night is the nuisance hidden. The sky-signs of
lilly Circus have made it the most foolish place in
Surely no one with mind grown beyond the fire-
age can care for this sort of thing?

Row after row of drab, depressing houses have more excuse (though a Ministry of Fine Arts will assuredly be asked to deal with them, too, one day). And they are less irritating because they are not in the first place put there to catch the sight. But the advertisement hoarding is intended to address itself directly to you, "Busy salesmen for twenty hours a day." Not even by keeping your eyes steadily cast down upon the pavement is there any escape. Reflections of mutton chops and pencils are cast before you upon the very footway. The clouds, too, reveal the delicate tracery, wrought in smoke, of somebody's patent washer or syrup.

We can rail against the abuse of the system without saying a word against the system itself. Primarily, the advertisement poster is intended as an announcement. If the announcement interests and concerns us, it is something we should be pleased to read. Nobody can object to the quiet, black-lettered announcements, for instance, which tell of the sale of Farmer Hayseed's stock. Rather are these part and parcel of the countryside. And in many of the advertisements placed on the railway—and especially the London Underground Railway—stations, the eye takes a delight. Here they are in keeping with the bookstalls and refreshment-rooms, and without them waiting for trains would be worse than it often is.

Only two towns in England have taken a stand against the abuse. They are Edinburgh and Dover. But a clean sweep could be made of most of the things that offend in the open country if county and district councils would exercise the powers conferred upon them under the 1907 Act. Field-boards and roadside display, as well probably as the more blatant signs on business and other premises (outside urban limits), can be forbidden by by-laws framed under the Act, and it is said that the Home Office has shown itself ready to confirm such rules when there is clear evidence of local desire for relief.

Under a law passed by the French Parliament in 1912, hoardings are taxed at £2 per square yard if not over 6 yds. in area, a graduated scale of taxation up to £16 per square yard applying to advertisements larger than 20 sq. yds. The object of the measure is avowedly that of taxing such advertisements out of existence.

At Potsdam no advertisement hoardings are allowed within 400 yds. from a railway. Further legislation might be cited—legislation passed even in the United States of America themselves.

The poster nuisance has spread widely during the last twenty-five years. One big billposting firm in London advertises proudly as having "over a million sites." Well, it is safe to assume that three-quarters of a million of those sites are in their wrong places, and ought not to exist. That is, three-quarters of a million places have been rendered residentially the worse. The rich can protect themselves against the eyesore; the poor have it thrust before them at every street turn. They should be made aware that the remedy is in their, and their council's, own hands. At Hampstead, Ealing, Letchworth, Welwyn, and elsewhere, where garden cities have been laid out, no advertisements of any kind are allowed except on a proper notice-board put up for the purpose. This means that in these new towns or estates, at any rate, architecture will at last be given a fair chance.

# Notes and Comments

## The Housing Subsidy

It is by no means certain that the new Government subsidy of £6 per house per annum for twenty years will produce the 500,000 houses which are still required. Critics of the new policy maintain that the sum is inadequate to ensure a reasonable return on capital outlay. If it were larger, or the period of the subsidy longer, the outlook might be more reassuring. The alternative proposal that new houses should be tax-free for fifteen or twenty years (which, we note, is being advocated in "The Daily Mail"), seems to have distinct possibilities. The experiment has proved a success in New York, and is now being tried in Italy. The method has, of course, obvious disadvantages, chief of which is the creation of a privileged class of property. But preferential treatment would be required for a limited period only. It is important to remember that no matter what form the subsidy may take, it must ultimately be debited to the national exchequer; whether it takes the form of a money payment or of abatement of taxation is, from a broad point of view, immaterial. If the "tax-free" method will more readily produce the houses (and it certainly offers a stimulus to private enterprise) it should be boldly adopted.

## Our Itinerant Monuments

Monuments, especially statues, are notoriously peripatetic. They have a way of changing their sites that, while it adds much to the gaiety of our conventional scenery, must surely be rather disconcerting to the tracker. A stranger, who is also an admirer of our military history, goes to Waterloo Place to do homage to the great Napier, only to find that he has been ousted by King Edward VII. Or a denizen of our Indian Empire comes to honour the memory of Clive, who was wont to stand in Whitehall. Some well-informed Londoner may possibly be at hand to direct the pilgrim to Charles Street. The Crimean Guards, it is to be noted, have never deserted the post of duty; they merely took six paces to the rear on the approach of Florence Nightingale and Sidney Herbert. And then there is James II who delights in dodging about among the Westminster palaces during his intervals of disinterment. In Manchester they propose to erect a war memorial in Albert Square, but unfortunately the site is already occupied by a monument. What shall they do? Obviously, remove the offending monument. This it is decided to do. A correspondent of "The Manchester City News" suggests (ironically, we fear) that public monuments should be set up on wheels to facilitate removal from time to time. An excellent idea. Let London follow the example of Manchester. It is rather unexciting to see the Nelson Column so regularly in Trafalgar Square. Why not trundle it down to Parliament Square for a change? And there would be no harm in a cross-over between the Griffin at Temple Bar and Eros in Piccadilly Circus. But there is danger in the suggestion. The Anti-Public Monument Society might one dark night wheel the whole lot into the Thames.

## The Charing Cross Bridge Exhibition

The London Society has done an excellent work in getting together the Exhibition of Designs for a New Bridge at Charing Cross, which is now being held at the old County Hall, Spring Gardens. Most of these designs have been seen separately before, but, assembled, they have a special interest, showing in how many different ways the problem may be handled. Over and beyond this, the exhibition renders invaluable service by keeping the Charing Cross Bridge project in the public mind. We do not believe that the public is indifferent to the civic interest; it is merely unorganized and has no adequate means of giving expression to its wishes. It is by interpreting the public mind and
giving it forcible expression that the Press may hel
enormously to get such essential improvements as th
Charing Cross Bridge carried into effect. That the imp
ment is one of vital urgency is admitted by every
(with the possible exception of the directors of what
until recently the South-Eastern and Chatham Rai
Company). So long as Charing Cross Station and rai
bridge exist, so long will the development of Londo
held up. On the south side of the river (and let it b
membered that Waterloo Station is roughly at the
graphical centre of London) there are many square mi
ground, of enormous potential value, at present occupie
small and sometimes semi-derelict property. Here
that London must develop in the future; the north
of the river is already developed to capacity. But no
can be done until cross-river communications are gr
improved. The distance between London and South
Bridges is 480 yards; between Waterloo and Westmi
1,200 yards. This enormous gap must be filled in. W
ing either Waterloo or Westminster Bridge will be of
use, and to the widening of the former, in any case,
are definite æsthetic objections. That "ugly red
Behemoth," as Mr. John Burns called it, must go; it st
in the way of progress and spoils the view. The pro
is one that must be dealt with in a big way. There mu
no parochialism or small-mindedness—no petty pric
prejudice on the part of the different authorities concer
The scheme must be regarded as a London improven
not merely as one that relates to Westminster or Lam
and we hope that the City Fathers will view it in this
Of the exhibition itself we have no space to say any
this week. We propose, however, to deal adequately
it in our next issue. In the meantime we offer our h
congratulations to the London Society on this very
and stimulating exhibition.

## The Late Earl of Plymouth

The death of the Earl of Plymouth will be widel
gretted. For many years he had been closely assoc
with works of public benefit, and always unobtrusivel
without personal ambition. Essentially was he a man
believed in deeds, not words, and all his deeds were
well and with as little publicity as possible. He wa
tensely interested in the welfare of London, and one
most notable works in this regard was the saving o
Crystal Palace from the hands of the speculative bu
at great financial cost to himself. He helped to esta
the London Society, of which he was president, and i
early years of the century held, with distinction, the
of First Commissioner of Works. His humanizing infl
in public affairs will be greatly missed.

## Charging for Admission to the Museu

The proposal, which is now before Parliament, to c
for admission to the British Museum and the Natural
tory Museum must be vigorously opposed. As a mea
raising revenue it is negligible, since the yield expec
only £9,500 a year. Even if it were a hundred tim
much, the charge would still be unjustified. Already
difficult enough to get people into museums—pos
because of the fact that they are called museums. If
were known as "Fashion Fairs of Other Days" or "
at the Past," the public would probably flock to th
thousands. As it is, they only go into them on very
occasions—when country cousins come up to see the
of town, or when excavations in the East stimulate a
sient interest in mummies. To charge for admissio
stop their going in altogether. Thus, the only effect
proposal would be to penalize students and those
use the museums to get a living. Parliament must se
that this Bill is rejected.

# As We See Ourselves

## An Architect on Architecture

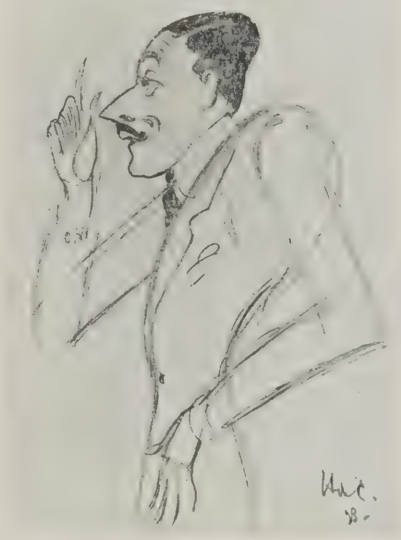
A FORTNIGHT ago the architectural profession heard the unvarnished criticism of a layman; last week (at the R.I.B.A.), a section of the laity listened to the other side of the question.

In discussing the question of "Architecture, a Necessity a Luxury," Mr. Goodhart-Rendel flatly, if uncon- ously, opposed the doctrines expounded by Mr. Frankau the Architectural Association, and, were the two speakers meet in debate, one could imagine a very pretty quarrel king place.

By "Is Architecture a Necessity?" said Mr. Goodhart- ndel, he meant "Is Architecture a thing which cannot done without?" and to that he added a subsidiary estion, "Is Architecture a thing we are going to get ether we can do without it or not?"

By luxury he meant a thing which was desirable but not dispensable; by "Is Architecture a xury?" he therefore meant "Is chitecture a thing which can be done thout, but which it is natural to nt to have?" Architecture was not easy thing to define. It could not described as a mere mitigation of brutalities of building, nor was its ction that of clothing and adorning at which would be ugly unadorned.

Bernard Shaw had said that some ople regarded art as "a costly ring the nose of Nature," and this was extremely accurate simile of a mmon mental attitude. Many peo- thought of Nature as the sort of imal that one would expect to wear ring in its nose, and the nose-ring art would frustrate its most dis- eeable propensities, and might even made a handsome thing in itself. e addition of ornament would often vert comely building into architec- e, but with uncomely building no ament would fuse and no amalgam ult. Perhaps the only absolute rule h which all works of art must comply was that of sistency; no work of art could be at war with itself.



MR. H. S. GOODHART-RENDEL.

Mr. Goodhart-Rendel took exception to the assumption t architecture was described by Wootton's familiar otation: "Well-building hath three conditions, fitness, nness, and delight." He instanced the Radcliffe Library Oxford, which was notably lacking in commodity, and arcades of the Alhambra at Granada, which were tainly not conspicuous for their firmness. Neither of m were examples of well-building, but nobody could y their claims to be architectural objects, since they re richly endowed with the third quality, that of "de- ht."

When all was said and done the fine art of architecture was t of appearances. He did not mean by that that it was art of deceit; true appearances were usually more irable than false ones, but the relation of appearances reality was governed by considerations not strictly hitectural. He wished to express his disagreement with theory held by some people that if a thing was perfectly pted to its use it was entitled to be called beautiful. ose who talked of the "beauty" of machinery ought to e about the beauty of the best-designed machinery in world, the liver and the stomach. He had no doubt t mechanical enthusiasts got more pleasure from looking the inside of a motor than from looking at the façade of Automobile Club, but that was not because they found the steam crane the more beautiful, but because their emotions were more readily touched by efficiency than by beauty.

Without this attribute of "delight," he contended, architecture could not be. It was of the essence of the art. Not only that, but the essence itself, for nothing else was necessary. The stage palaces of Bebrena, Inigo Jones, or Leon Bakst would often be inconvenient for even stage courts to inhabit, and in matters of construction their design was frequently optimistic; but surely they were works of architecture of a very delightful kind. He did not mean to say that anywhere save on the stage or in the field of pure decoration, architecture, thus distinguished from well-building, was self-sufficient; but he did mean that to build soundly and reasonably was not to make architecture, though it might be to lay a reasonable foundation for it. Physical needs demanded that the shelters we built for ourselves should be strong and convenient, but our emotions hungered for something more than security and comfort. We wished by art or artifice to intensify the secure appearance of that which we would should be secure, the comfortable appearance of that which we would have comfortable. Having done this, we generally wished also to exercise our fancy in adornment. And it was not until we did these things that we began to practise the art of architecture.

Architecture, as he saw it, was not the art of building strongly, or cleverly, or economically, but the art of building beautifully. It would generally be the better for a foundation of strength, or cleverness, or economy in building, but it could do without these things and exist on canvas and paint.

Architecture might run counter to the facts of building, or might simply ignore them. It would, however, do best if it looked among those facts for the raw material of its expression. Most architectural forms were constructive forms glorified, though they had seldom attained to their full beauty before their constructional significance had become obsolete.

The elimination of some appearances and intensification of others which could lift mere building into the estate of architecture was a process very much like that which the actor must practise. Just as the natural symptoms of various emotions, if they be unemphasized by art, might fail to convey their meaning to the onlooker, so without the aid of architecture a strong building would often give but little idea of strength, a big one but little idea of bigness; a gorgeous one but little idea of magnificence. The Grand Hotel at Charing Cross was covered with ornament, but looked incurably poor in contrast to the Kodak building in Kingsway, where every ounce of power in the building was emphasized architecturally, or the Royal Hospital at Chelsea, where every inch of plain brickwork contributed toward a noble effect of largeness. The expressiveness of these buildings and of all good architecture was due to the embodiment of forms which symbolized ideas which belonged not only to art but to life. Sir Joshua Reynolds said that one of the first principles of poetry, painting, and architecture was that of "affecting the imagination by means of association of ideas." Wren went beyond this and said that the ideas evoked by association might be ideas remote from art, ideas "pleasing to us from other causes."

This theory accounted for those general preferences for one form over another, which ruled the course and the development of art. Universal associations which were probably more inaccessibly buried in our subconsciousness than any others formed the mainspring of man's æsthetic impulse, and the whole human conception of beauty was probably nothing more than the idea of that which by means of these universal associations could afford us pleasure. Conversely, the human conception of ugliness was probably the idea of that which by these associations could give us pain.

Contrasting architecture and civil engineering, M Goodhart-Rendel said that "intensification" and ador ment were the natural processes of architectural creatic while the latter was that form of building which compli with the commodity and firmness, but was not concern with delight. Civil engineering was obviously a necessit but architecture was not. It was, however, an inevitabilit the impulse to make it and to demand it would out. M had desired, and would presumably continue to desire throughout the ages, and he, therefore, contended that might fairly be regarded as a luxury and not as an expensi nuisance.

# The British School at Rome Scholarships

## A Criticism of the Designs

COMPARED with former years the exhibition of works submitted for the 1923 scholarships, now on view at Burlington House, is a little disappointing. With but two or three exceptions what is shown is—considering the high standard expected of tried students—a mere simmering of promise. It looks as though, for all the indubitable benefits it confers, the school system does, at times, traverse and break up the streaks of strong individual self-expression to be found in promising students.

On a whole, the engravers this year maintain a solider front than any other. The selection for the final test seems judicious, Miss E. Fyle and Messrs. F. Medworth and Ch. Murray being especially good.

The ink and wash drawing of a mountain shown by Miss Fyle carries a rhythm of value, and Mr. Murray's wash drawing of an underground station, like his etched architectural fantasy and, above all, his "Christ on the Cross," herald an artist of sensitive perception. The sculpture is very disappointing, Mr. D. Evans being the less leanly equipped of all seven competitors. It is in the section of painting that an arguable slip of judgment on the part of the selective jury has been made. For all its wilfulness, the work of Mr. Edward Wolfe strikes a most potent note, and shows that here is a personality conversant with the less obvious laws of composition and balance of line and colour. If his portrait of Arnold Bennett is somewhat diffuse, on the other hand that of a Spanish dancer is a ripe accomplishment. His "Nude" may also appear overwhelming, but great skill is evinced in its elaborate building-up. How is it that the innate pungency and technical ability of this Mr. E. Wolfe did not fetch the asterisk of selection? All the cartoons for last year's final competition show interesting, if somewhat recondite interpretations of "Winter."

In the section devoted to architecture, twenty hapless youths elected to tread the arduous path leading to Rome. The route to be followed was so mapped out that instead of passing along beautiful buildings in the grand manner, it led them to a "Bridge" where difficulties were cunningly devised to test their fortitude and skill. The happenings in this section being probably of more interest to the readers of this JOURNAL, we will dilate at more length on them. Briefly put, this "Bridge" had to span a deep ravine, 130 ft. wide, and had to carry, at two different levels, a railway and a road, the railway following a straight tract, with the road 40 ft. below, making a troublesome S, and the total height being roughly 160 ft.

All manner of bridge-forms were tackled, but oddly enough, only three students felt themselves secure enough to design it in ferro-concrete, the others, excepting one with a *vif penchant* for steel, falling back on masonry. As in former years, the bulk of the competitors fought this battle royal under the banners of Liverpool University and of the A.A., the former sending forth ten "hopes," of which five got through, and the A.A. five, four of which succeeded. A careful survey of all the designs shows that while the selection was, on a whole, a just and considered one, y in one instance, a serious lapse of judgment occurred. Th criticism is not made in a carping or airy way; the jury, its composition, was as good as any jury could be, but jury is infallible, and here one does feel that a downrig mistake was made in rejecting the design numbered sixt three, by far the very best submitted.

Structurally, it meets all requirements; from the poi of view of planning ("agencement" of road and railwa position of abutments, etc.), it is every whit as good as a other, unless one objects to the principle of suspending t roadway in the middle which, in this case, one can harc do with such a powerful and well-contrived central arc Or is it because ferro-concrete is used? These days fer concrete is an ideal material, durable, safe, economical, a lending itself more than willingly to bold and simple shap Again, if this design was rejected because some elusi æsthetic canon of balance of parts (such as the relati height and forms of its component arches) was deemed have been violated, then other designs shown, embodyi an almost identical use of such elements, should also ha been rejected, which they were not. Whatever reason it a poor one, and to allow the robust weaknesses of desi No. 60 (observe the clumsiness of the central arch in re tion to that stretch of roadway which it encompasse while ploughing design No. 63, with its many subtleties a excellences of design, construction, and even of present tion, is simply to undermine the confidence of futu students, in our eyes a most uncommendable policy to follo

Next to No. 63 (rejected), designs Nos. 55, 56, and 62 a the best. No. 62 is truly monumental; it has strength plenty, and would pile up indeed effectively. No. 56 h about the finest elevation; here, contrast of arch-forn comes off with an undeniable and welcome snap. No. is also a sound design and is the best rendered of the without fuss or hesitation. The lower central arch seem little flat, however, and the thickness between the parap and the intrados somewhat inadequate. The authors designs Nos. 64, 65, 66, 68, 69, 71, and 72 lack the necessa training, and suffer a turgid mind and a clumsy hand control their not ignoble ideas and enthusiasm, but th will no doubt do better next year.

The work submitted by the Rome scholars for 1921 a 1920 is full of interest. Mr. F. O. Lawrence (Rome scho 1920) sends photos of restoration of dwelling-houses Ostia. They bring home the curious analogy of ancie and modern treatment of dwelling-houses or tenemen under one roof. It is a pity the photos are so small. Rowland Pierce's restoration of the Temple of Zeus Girgenti is a serious contribution to this kind of resear work. Mr. E. W. Armstrong (Henry Jarvis student 19 sends a most winsome set of measured drawings of t Piazza del Popolo, Rome, well-drawn and well-colour though we venture to say that all the sun originally trapp in the rendering went out when the sky was sprayed darkly.

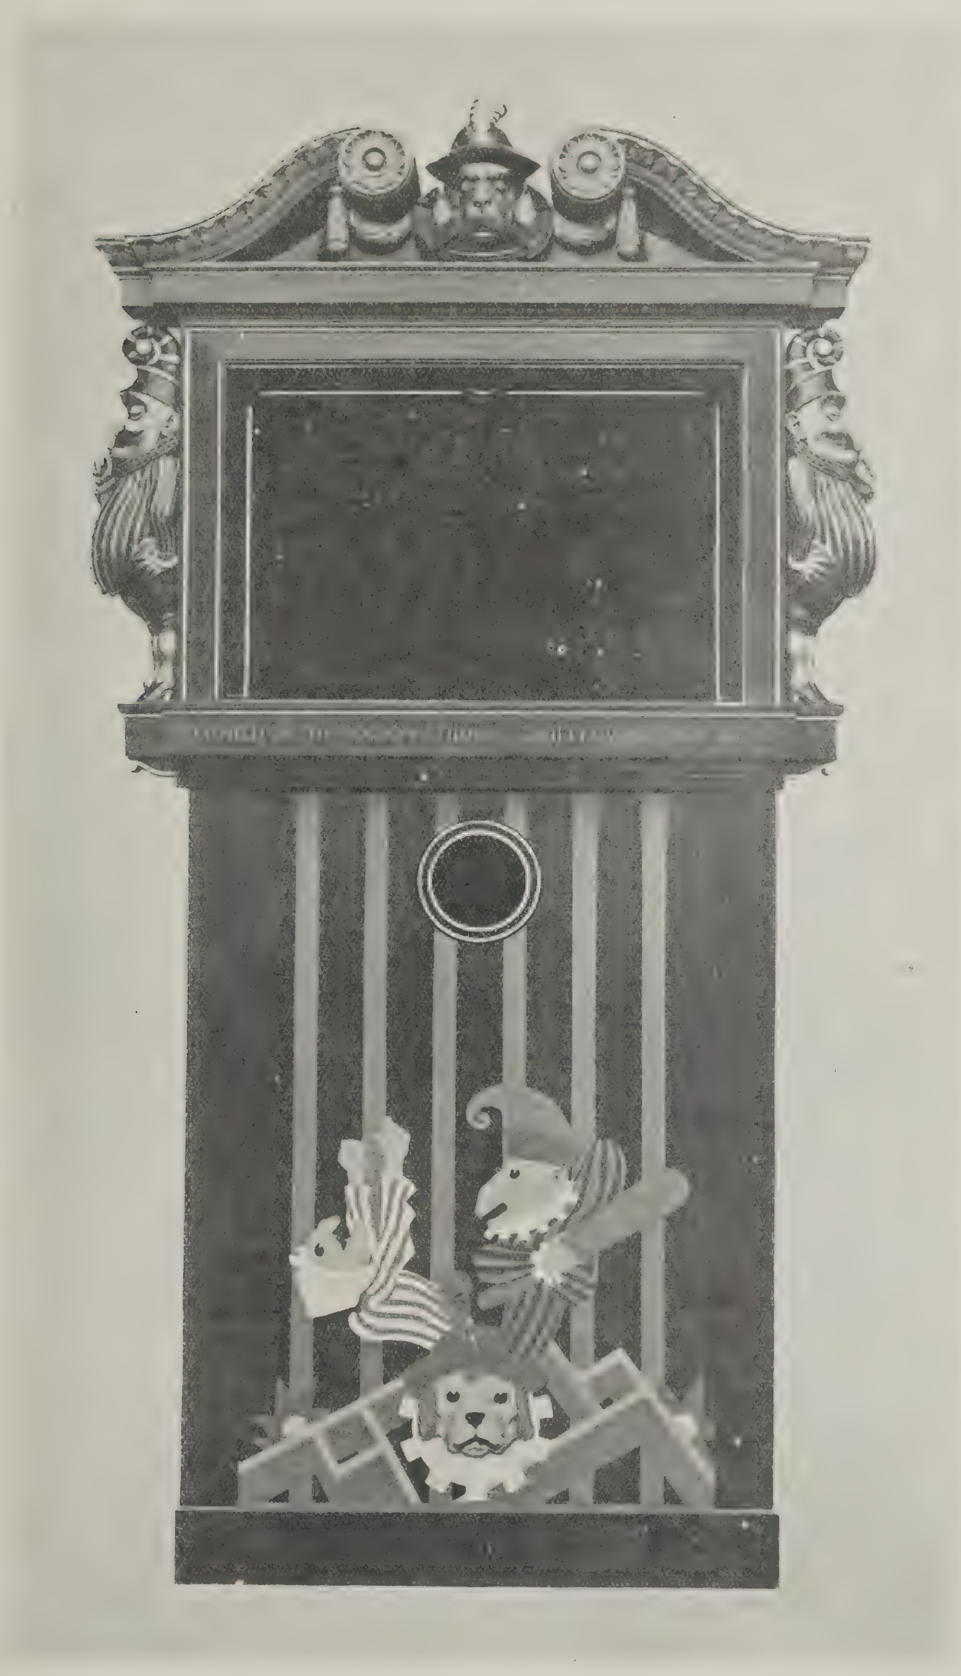
# Architectural Designs. 20.—A Booth for a "Punch and Judy" Show



One of Liverpool's cherished possessions, the "Punch and Judy" Show beneath the podium of St. George's Hall, has been saved through the generosity of the Sandon Studios Society and the public. The booth, which is illustrated above, was designed by Mr. G. W. Harris. The wood-carving is by Mr. G. H. Tyson Smith, and the construction is by Mr. W. Burden. All are members of the Society. The decorated fabrics were supplied by Mr. Arthur Lee, of Bidston. The show has occupied its present position for at least seventy years.

# Architectural Travel

### Edited by F. R. YERBURY, Secretary of the Architectural Association

## 1.—Paris: By HOWARD ROBERTSON, S.A.D.G.

*his series of articles has been compiled for the guidance of those travelling for the purpose of seeing and studying archi-cture. They do not set out to be exhaustive guides to any place or country, but it is hoped that they will be of service in nveying a general idea of the architecture to be seen and routes to be followed. They will contain various notes on conditions of travel and other points on which the would-be traveller generally requires guidance.*

TO great artistic achievement is attached a severe penalty. The artist has small beginnings—his work follows more or less the laws of growth; then suddenly he seems to have reached attain-nt—the public accepts and applauds his work. But while artist feels himself to have arrived at a maturity which nerely a stage in the eternal search, the public's craving satisfied. All that it desires in future is that the artist ould continue to produce repetitions of this manner of rk to which it has become accustomed.

rench art to-day is in the position of the artist who uses to rest on his laurels. The vitality which manifests lf in a search for a new expression naturally arouses ret in many of those who love the beautiful attainments the past. The architecture of the France of to-day, like painting and its sculpture, lies under the cloud which nost inevitably hangs over any period of transition.

The architect who wishes to understand contemporary nch architecture must above all things cultivate an open nd. He must bear in mind that French architecture has ssed through phases and periods in each of which something n to perfection has been attained; and he must ask him- whether French design is not now on the point of enter- on another such phase, which, like all beginnings, is ended with a mead of tentative and sometimes abortive eriment.

The knowledge of principles which resulted in the finest nch architecture of the past is handed down by continu- teaching in the great French school of architecture. less knowledge of these principles is submerged by fashions the increasing complexities of modern design, there is reason to believe that French architecture will not ain its vital force, triumphantly refuting those who so quently say that French art to-day is completely dead.

Paris, as a city, holds for the artist a unique position ongst the capitals of the world. France is the most roughly centralized nation on the globe, and no other y is such a perfect mirror of any one nation as Paris is of nce. And besides this, Paris reflects France only; she not cosmopolitan in anything but her visitors. For this son her architecture has an intense interest resulting as does from the expression in building of her national tory.

The very plan of Paris reveals in its structure the gradual wth from its origin, for it has, passing through its very rt the natural feature which has really made Paris— River Seine. The Seine flows round the two islands of a Cité" and "St. Louis," which the Romans converted m being a village of fisherfolk and watermen into a man city. The Emperor Julian liked the soft water of Seine, the figs and the local wines, and so he built, on ill overlooking the two islands, a palace and thermæ, the nains of which are still to be seen in the Latin quarter, the gardens of the Musée Cluny.

The old Roman Lutetia was traversed by two parallel in streets, one of which still retains its importance in general plan of Paris as its main cross axis. This is Boulevard St. Michel, the main artery of the Latin rter, which crosses the centre of the Ile de la Cité in front of the Palais de Justice, and continues northwards as the Boulevard Sébastopol, laid out as part of Haussmann's scheme. The Boulevard St. Michel, like the other old Roman street parallel to it, the rue St. Jacques, takes the name of a patron saint of France; St. James the Apostle is said to have reached Lutetia by what is now this rue St. Jacques, a continuation northwards of the road from Rome.

At right angles to this transverse axis, and crossing it in what is nearly the centre of gravity of the plan as a whole, is the main longitudinal axis of the city, the rue St. Antoine, continued west by the rue de Rivoli, the Champs Elysées, and so out into the Bois de Boulogne. A magnificent succession of avenues, laid out in axial planning, and yet so arranged as to provide buildings as climaxes to each section, without in any way interrupting the flow and direct circulation of traffic. The second main feature of the Paris lay-out from the town-planning aspect is the chain of concentric boulevards which form more or less regular figures round the two main axial arteries. "Boulevard" really means bulwark or rampart, and these streets occupy the sites of the ancient fortifications which they have replaced. These boulevards are fine features of the plan, being rarely less than 100 ft. in width, but it cannot be denied that the great beauty of Paris fundamentally lies in the Seine around which the town is grouped.

The architects of Paris have revealed real love and respect for this river. It receives nearly everywhere the splendid architectural setting which its natural beauty of flow and curve demand. To stand on the Seine bridges in the daytime is to be able to feast the eyes on architectural dreams come true. To see the river at night with the winking lights of its bridges reflected in the water helps one to understand the lyrical side of French expression in art.

Paris is still a city of convenient dimensions; it is only now beginning to collect around it suburbs and "dormitories." It differs from London in this respect, that there is far less travel from distant residential quarters to a main central congested area like the "City." It is the possibility of easy distance from home to shop or office as opposed to our long journeys which accounts for the continual animation in the streets and the fact that Paris is never "dead." The recent growth of the suburbs is, however, beginning to bring with it the same difficulties of circulation which are so apparent in London.

As a work of artistic beauty it is France which is responsible for Paris. The French people have made Paris the expression of their national pride, and in turn Paris makes beauty for the rest of France, through the artists trained in that Parisian atmosphere which is still unique.

The teaching of Paris is expressed in her architecture, in the fine planning, the knowledge and delight in geometry as an art. In the appreciation of a scale which is not huge but nearly always fine and true; in architectural moderation and discipline, the subordination of the imaginative individual to the requirements of a general harmony.

These are the qualities uppermost in the architecture of Paris, qualities which are often decried and yet imitated by other countries, and which, one must admit, run the risk of gradually disappearing in Paris itself in the inevitable war between the commercial and the artistic.

Although the general character of Paris architecture is maintained throughout the city as a whole, there is a distinct cleavage between the atmosphere of the streets and buildings on the two sides of the Seine, the right and left banks. The left bank, with the Boulevard St. Michel and the Boulevard St. Germain as its main arteries, contains the greater part of what is either picturesque, graceful, or stately in simple dignity and restraint. It contains the hotels of the old French families, the aristocracy of blood. On the right bank the vestiges of the old régime are less apparent, and Paris has flowered out into display and glitter, magnificent avenues lined with the homes of another class, the aristocracy of wealth. Each phase is interesting, but the left bank should be explored first by the architect in the order of the evolution and growth of the city.

The chief charms of Paris to the architect naturally enough do not lie in the direction of archæology. The Musée de Cluny holds much of delight to the mediævalist and the Church of St. Germain dés Près will interest those who wish to see one of the most ancient buildings in Paris. The great attraction, however, of the left bank of the river undoubtedly lies in the Quartier Latin and the area extending as far west as the Chamber of Deputies.

On the highest ground in the Quartier Latin, over the site where Ste. Geneviève, one of the three patron saints of Paris, lies buried, stands a big building whose dome is insistently dominating, the Panthéon of France's great men.

Louis XV, in his fear of an approaching demise, vowed to erect this shrine to the patron saint, incidentally paying for it out of his lotteries. History describes the death from a broken heart of Soufflot, the unfortunate architect, who saw public applause change to imprecation when the great mass of the building caused its foundations to settle and its walls to crack. The danger was averted, but Soufflot never lived to see his work finished, nor the church secularized in 1791, and devoted to the memory of "les Grands Hommes." The interior of the Panthéon has oil-paintings in canvas fastened to the walls as its main embellishment; especially interesting are those of Puvis de Chavannes. It is well worth while to climb up to the dome lantern and see how ingenious the structure of a triple dome may be, with a wonderful view of old Paris as a reward of inquisitiveness.

The Church of St. Etienne du Mont in the Place du Panthéon is charming in its mixture of Gothic and Renaissance. It has within it a rood loft in carved stone of exquisite design. It is said that Biard, the designer, did all the work himself; at any rate, he has shown with grace how to entwine a spiral staircase round a pillar.

The name of Labrouste, who built the Bibliothèque Ste. Geneviève hard by, is fairly familiar in England. The façade is the perfect library-type, a model of direct expression. McKim, Mead, and White and many other Americans have found its inspiration of value. The reading-room inside has the bold motive of a row of slender steel columns down the centre, supporting the airiest of metal cupolas. The effect is frank and successful.

Perhaps still better known to us as an architect is Nénot, who is responsible for the able and learned design of the Sorbonne in the neighbouring rue des Ecoles. This building has a splendid staircase and a great amphitheatre, and is laid out with masterly planning. Its façade appears as the rather heavy expression of a French scholar. The way in which varying street levels have been handled is well worth noting.

As a relief from the task of digesting large buildings, it is pleasant to turn into the Luxembourg gardens and occupy a prim iron chair on the tree-shaded gravel. The typically formal lay-out of the gardens is relieved by terraces and steps, and most of all by the swarms of children, to whom the gardens are a paradise as well as to their nursemaids. At one's back is that marvel of Stalactite Rococo, the "Fontaine Medicis," and in front the sturdy rusticated pile of the Palais du Luxembourg, French in spite of its strong flavour of the Medicis and the Pitti. There sits the French Senate, somnolently calm in contrast to the Chamber o Deputies, in a Salle de Séances which is well worth seein with its top-lit hemicycle and sober colonnade. The centr pavilion of the Palais, on the street façade opposite th rue de Tournon, is an effective and solid piece of massin which used to be a continual inspiration for "esquisses" t the "aspirants" of the Ecole des Beaux-Arts.

Like so many parks and open spaces, the Luxembour gardens have suffered the encroachment of building development. Extending some fifty years ago as far south a the Observatoire, of that portion there only remains to-da the grand central Allée de l'Observatoire, an extremel useful example of what can be done in the formal architectural treatment of a promenade. Leading through quarter devoted chiefly to important schools and lycées it reaches its climax with Carpeaux' fountain of the glob supported by four allegorical figures. The sea horses i the basin below are supplied with liquid nourishment b waterspouting dolphins and tortoises in abundance.

From the fountain of Carpeaux can be seen Mansart' satisfying dome which crowns his church of the Val d Grâce, now merely the appanage of a military hospital. Fo the great Benedictine nunnery of the Val de Grâce suffere in the Revolution like so many of the conventual establishments, which at the time occupied the best sites and nearl one-third of the area of Paris. With the disappearance o the convents has almost faded also the memory of th Duchesse de La Vallière, dear to Louis XIV. Close by th Val de Grâce, at No. 284 of the rue St. Jacques, stands i insignificance the entrance of the former Convent of th Carmelites, where La Vallière gave up the splendours o Fontainebleau and St. Germain for repentance and the veil

A direct contrast to these souvenirs is provided close a hand by the Bal Bullier, familiar to every artist and ever model who has ever danced in the Quartier Latin. Th Bullier is open once more, but with much of its old flavou departed.

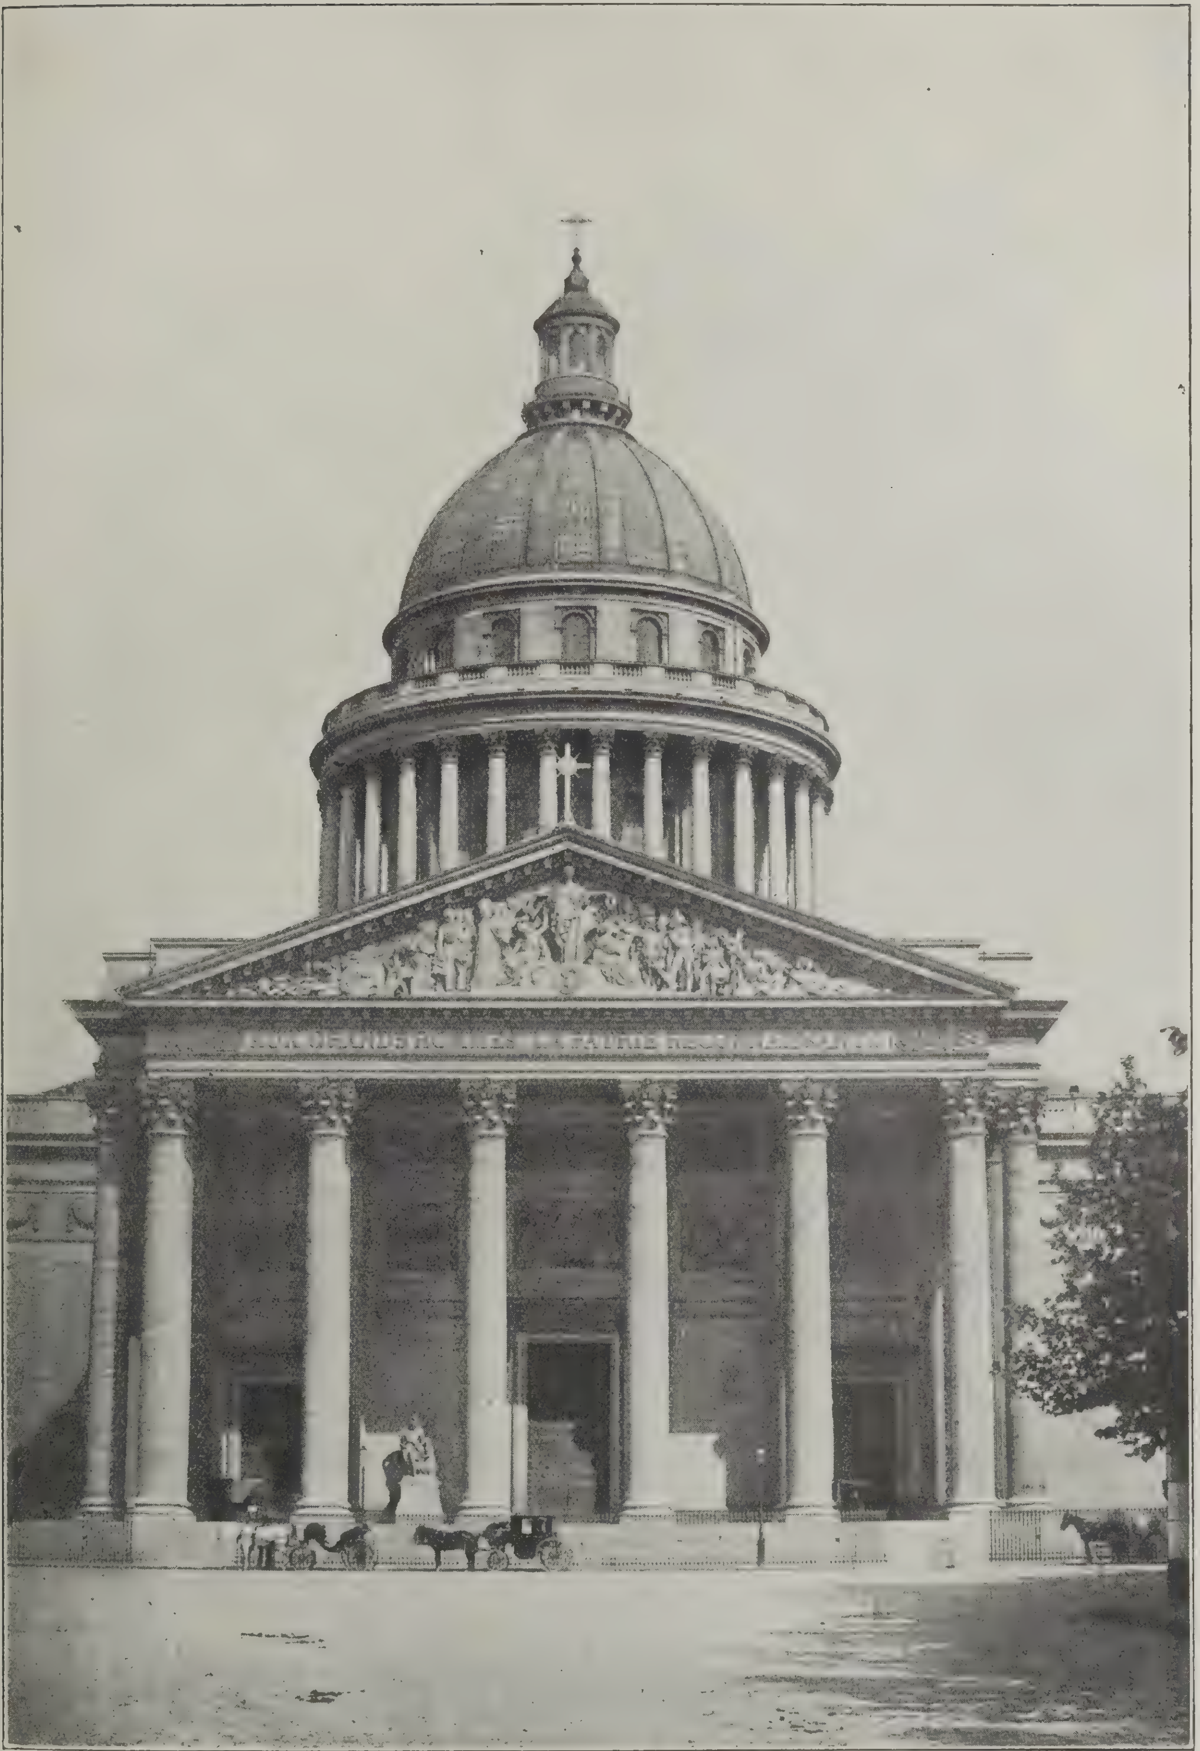
The Boulevard du Montparnasse which runs west fron the Place de l'Observatoire leads through the centre of quarter dear to the fraternity of artists. Painters an sculptors galore live and work in this neighbourhood. A the corner of the Boulevards Raspail and Montparnass is the Café de la Rotonde, frequented by artists, especiall Russians, Bolshevist and otherwise. And on the othe side leads off the rue de la Grande Chaumière, where ar two or three favourite painting academies, where architects may compete with painters in doing *croquis* i twenty minutes from the life.

Looking south from this corner one can just see the Plac Denfert Rocherean, with Bartholdi's huge bronze Lion d Belfort, and two little classic customs pavilions which hav really charming Roman friezes. And in the opposite direction the Boulevard Raspail stretches, broad and bourgeois bordered with up-to-date apartment houses which flou the traditions of the Louis, but are well worth studying They reach their climax in the Hotel Lutetia, a really well studied example of the "carved cheese" type. The interio of this hotel, in which colour and form are cleverly blended would create considerable interest if carried out in London

The quarter between the Boulevard Raspail and th Luxembourg gardens does not contain very much of architectural interest. But the Luxembourg Galleries, full o modern painting and sculpture, are worth seeing, and clos by is the Théâtre de l'Odéon, a grave and steady desig with covered arcades sheltering stalls where can be purchased books and music and "articles de bazar." Fron the Odéon one may go west to St. Sulpice, a church b Servandoni with a colonnade of enormous scale which ye fails to link together towers of unequal design. St. Sulpic has been for years a mecca of music lovers, attracted theret by the magic of Widor, composer and organist.

The Fontaine St. Sulpice, in the Place, is charming i scale and detail. It is the work of Visconti, and the fou great men who adorn it are famous French preachers of th eighteenth century.

Every architect will wish to see Napoleon's tomb in th



THE PANTHÉON, PARIS. SOUFFLOT ARCHITECT.

Invalides, and should push on a little further to look at Gabriel's quarter-mile-long façade of the Ecole Militaire; but before doing so there is to be visited a charming quarter full of retiring aristocratic hotels, most of which, alas, hide behind a fine street wall and sculptured gateway, "entre cour et jardin."

The most interesting streets are the rue de Varennes, the rues Barbet de Jouy, Vaneau, de Grenelle, St. Dominique, de l'Université, and rue de Lille. On the last named fronts the beautiful courtyard of the Hôtel de Salm, now the Chancellerie de la Légion d'Honneur. At one end of the rue de Lille stands the Chamber of Deputies, the rear façade of which is far less strained than the river front, and at the other end lies the Ecole des Beaux-Arts, the courts of which reveal much pleasant and restrained architecture. At the beginning of each month there is usually held at the Ecole some exhibition of students' work, and the *gardiens* in uniform are always accessible for information—and a coin.

The façade of La Monnaie (The Mint) has a really excellent cornice and very good doors and windows, and adjacent is the Institut de France, housing the five academies, the members of which rejoice in the soubriquet of "The Immortals." The guide book may refer to the Institut as a "clumsy edifice," but its curved façade and end pavilions are naïve and graceful. The absence of keystones to the arches, the vase finials, and roofs which really belong to the building, are refinements which appeal to a taste for restraint and nicety in design.

One should really cross the river to see these buildings, which, like the Gare d'Orsay Station, need perspective. The latter, by the way, provides good but expensive meals, and includes a view of a steel interior which is still one of the architectural wonders beside which even the American stations appear bombastic. The big nave is so airy, so simple, and so expressive. But, of course, it is only the use of electric locomotives which makes such a concourse feasible.

For those who wish to buy second-hand architectural books the Quai des Grands Augustins beyond La Monnaie still appeals. Many of the booksellers have better wares in their attics than on their stalls; and one should have a fairly definite idea of what one wants if bargains are to be picked up. At No. 51 on this Quai is the Restaurant Lapérouse, where can be got the best cooking in Paris; but Lapérouse is only for *prosperous* architects.

In the Place St. Michel at the end of the Quai one turns one's back on a successful but somehow uninspiring fountain and crosses the bridge to the Ile de la Cité, which is so full of architecture that no descriptions are required. The Palais de Justice and the Sainte Chapelle whet the appetite for Notre Dame. One should go boldly into the former in spite of natural qualms.

As to Notre Dame, each visitor will enjoy his own intimate sensations. The visit to the roof is splendid.

The Ile St. Louis, back of the cathedral, is almost deserted save as the rendezvous of anxious lovers. Its old houses are redolent of genteel decay, with here and there a balcony of charming ironwork.

Across the river on the right bank lies a huge quarter which requires courage and ambition to explore. The Place de la Bastille to the east is worth seeing from a town-planning viewpoint, and the Gare de Lyon really is a notable achievement in railway stations. But one should on no account miss the Place des Vosges off the rue St. Antoine, a spot which few foreigners visit. This deserted old square, with its brick and stone fronts and high-pitched roofs was built by Henri IV, and it is hard to believe that under Louis XIII it was the very mecca of fashion. So many familiar names are associated with this square, from Richelieu, Madame de Sevigné, and Victor Hugo to Ninon de Lenclos and Marion Delorme.

The Musée Carnavalet is interesting inside and out if one has the time, and one should pause to look into the colonnaded courtyard of the Hôtel des Archives, a charming eighteenth-century building which used to be the old Hôtel de Soubise.

Before proceeding to the almost unfailing disappointment of St. Eustache, so large and yet so dull a mixture o Gothic and Renaissance, there is refreshment for the ey in that little gem of architecture by Lescot, the Fontain des Innocents, just back of Les Halles (Central Market) One remembers this little fountain when others ar forgotten, for it is of pure quality.

The Bourse and the Bibliothèque Nationale are interesting as fine examples of fairly modern work. The former which is based on the temple of Vespasian in Rome, wa completed about a hundred years ago, and the Bibliothèqu has frequently been added to and enlarged up to ver recent years. Labrouste and Pascal are principally responsible for the design.

Most architects who are fond of music will find their wa to the Opéra Comique, rebuilt by Bernier after its destruction by fire in 1887. Those who wish to feel something c the lyrical appeal of student Paris before the war shoul try and hear Charpentier's "Louise," a love poem of Montmartre with music which can hardly be appreciated in th Covent Garden atmosphere. The theatre itself is interesting, with its vestibule under the auditorium and a pla conceived more spaciously than circumstance permitte in its actual execution.

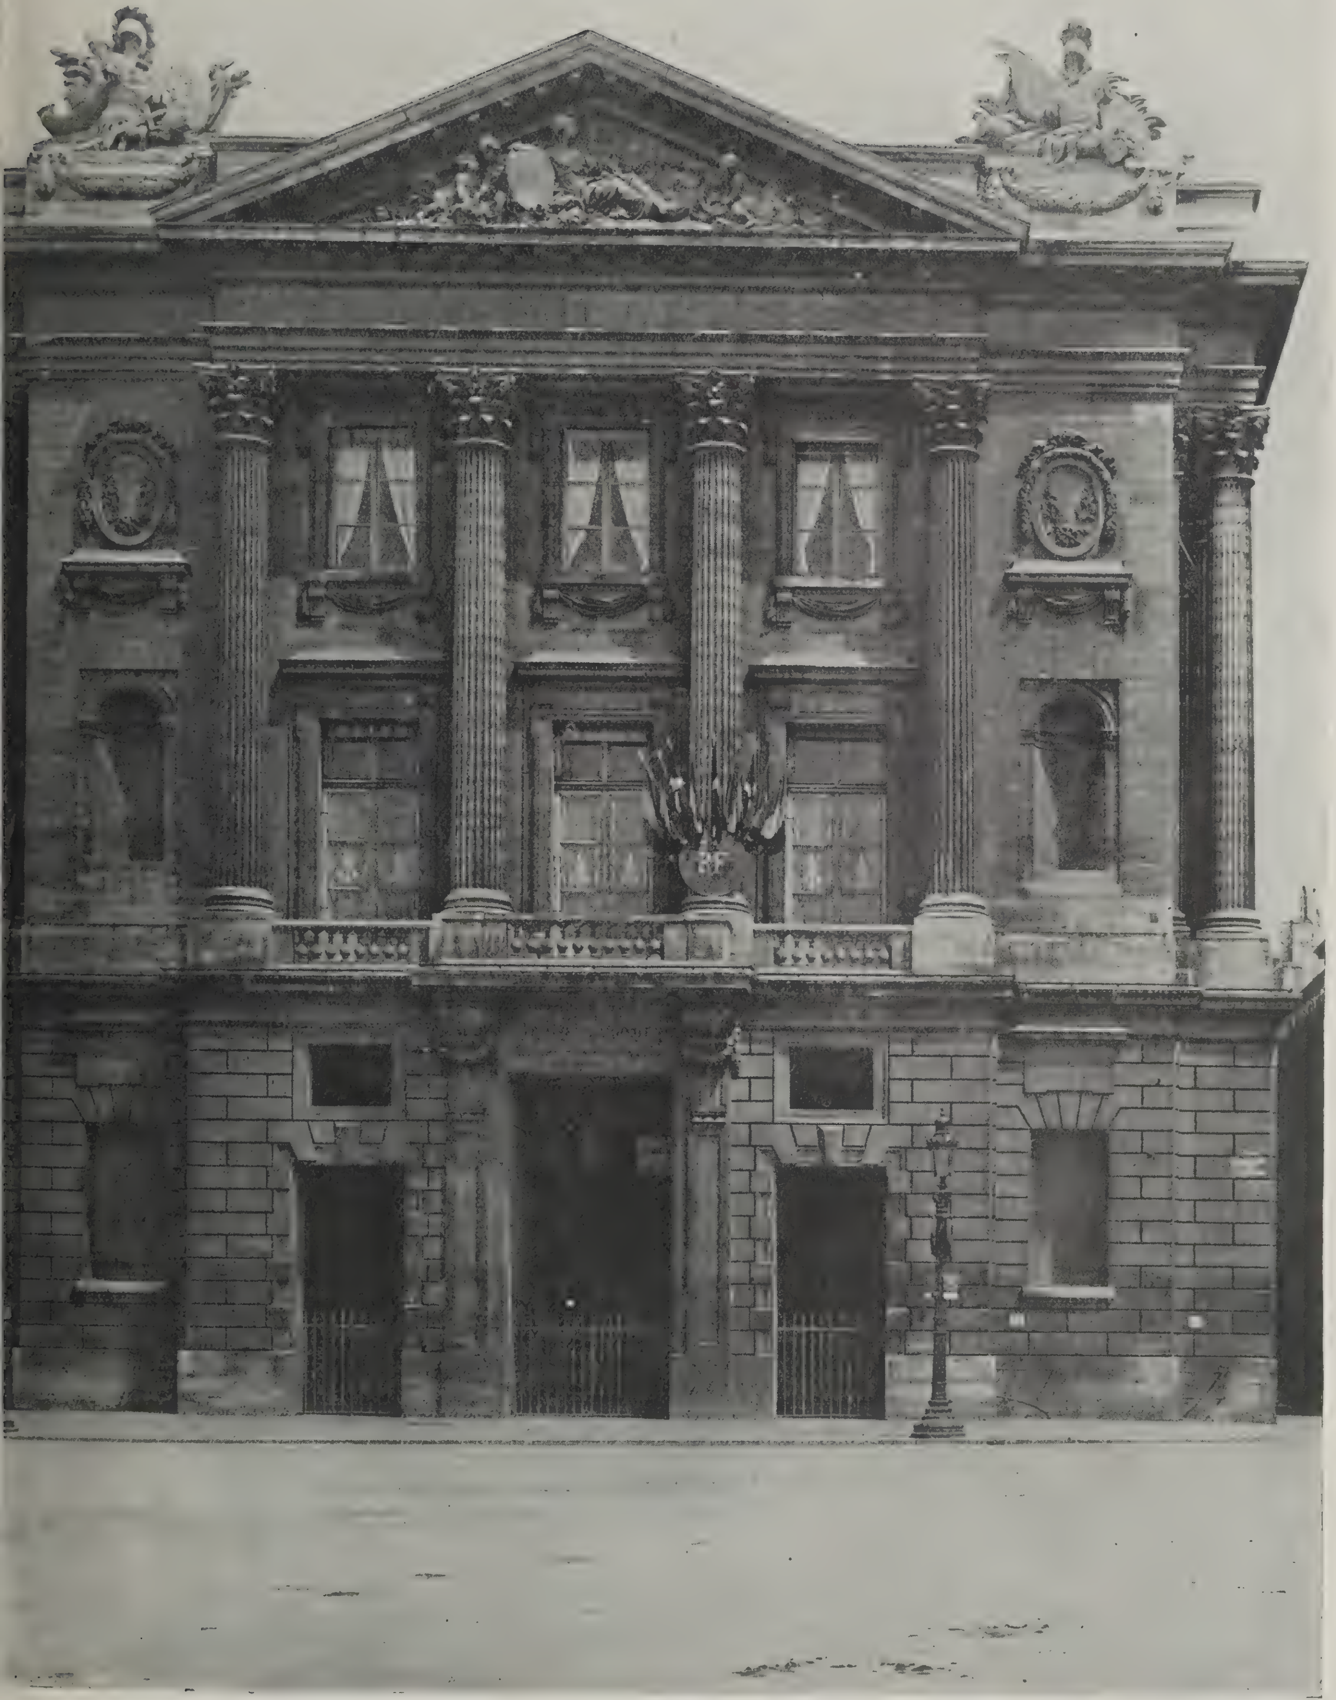
Montmartre itself does not disappoint. The lower slope of the Butte are in the grip of the tawdry attractio invented to give the foreigner what he is expected to wan but above it all rises the glimmering white mass of th Sacré Cœur, a monument to the faithful whose generou subscriptions erected it. The Sacré Cœur is designed to seen from afar, and its interior and detail are hard an disappointing; but there is no concession to triviality fashion in this building, which stands solid and dominan above Paris on its enormous caissons of concrete. As on approaches it by the steps which climb the Butte there a views of Paris less superb but more homely than from an vantage point of the Eiffel Tower. To sit towards evenin and dine on the terrace of the little restaurant in the Plac des Reservoirs is to be at peace with the world.

As one descends from the Butte the whole quarter of th Grands Boulevards spreads before one, with the great att of the Opéra dominating the lower roof of the office buil ings surrounding it. This quarter of Paris is full of interes and surprisingly compact. There is scarcely a street in which does not contain some buildings, old or new, interest to the architect. There are some excellent mode shop-fronts here, in the avenue de l'Opéra, the rue de Paix, and the rue Royale, but the few very recent offi buildings are rather disappointing, and do not rank wi some of the apartment house buildings on the left bank, Passy, and the quarters near the Bois and Champs Elysée

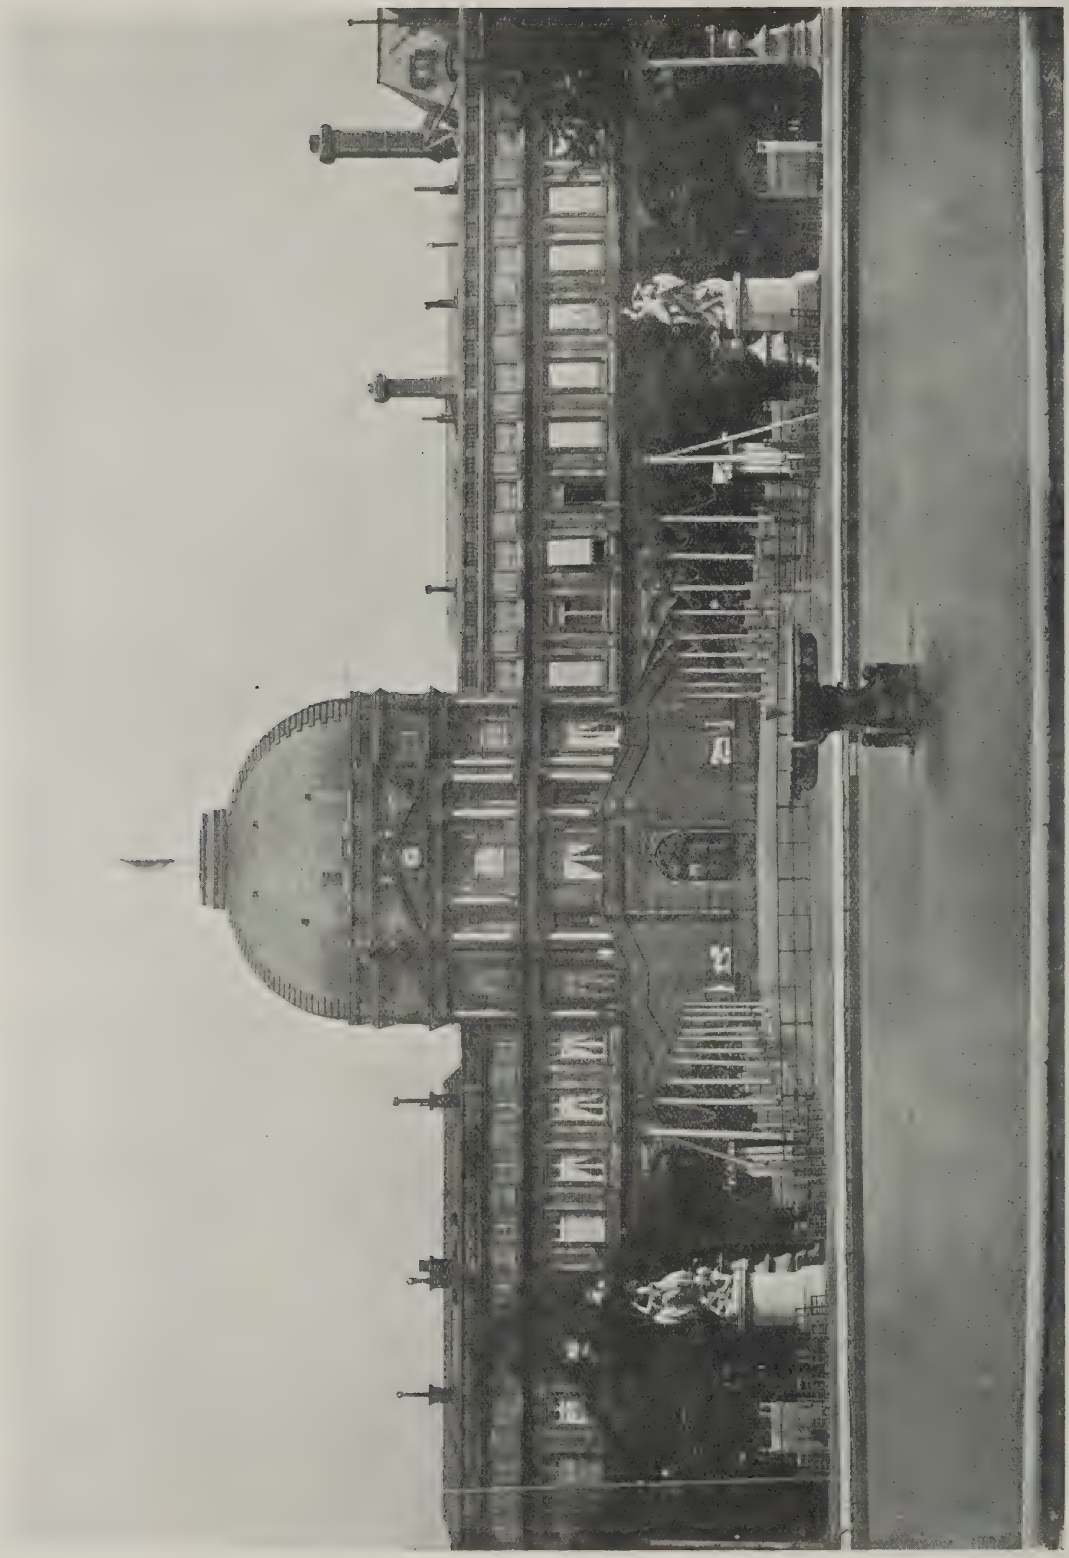
The Place Vendôme is a splendid continuous treatmen with its historic column which has served as a pedestal f two emperors and which in 1871 was cut to the ground an angry Commune. Its bronze has a total weight well over two hundred tons, and the inhabitants of th neighbourhood were compelled to line their windows wi paper bands in real air-raid fashion in anticipation of t shock of its fall.

The Church of the Madeleine has a fine interior, and the favourite bogey of those who above all insist on façade expressing the internal structure. But its Cori thian columns are in friendly touch with those of t Chamber of Deputies facing it on the other side of the riv while more columns of the same order form a connecti link in Gabriel's finely proportioned façades facing t Place de la Concorde, behind which lurk the Ministry Marine, the Automobile Club, and one of the most expe sive hotels in Paris.

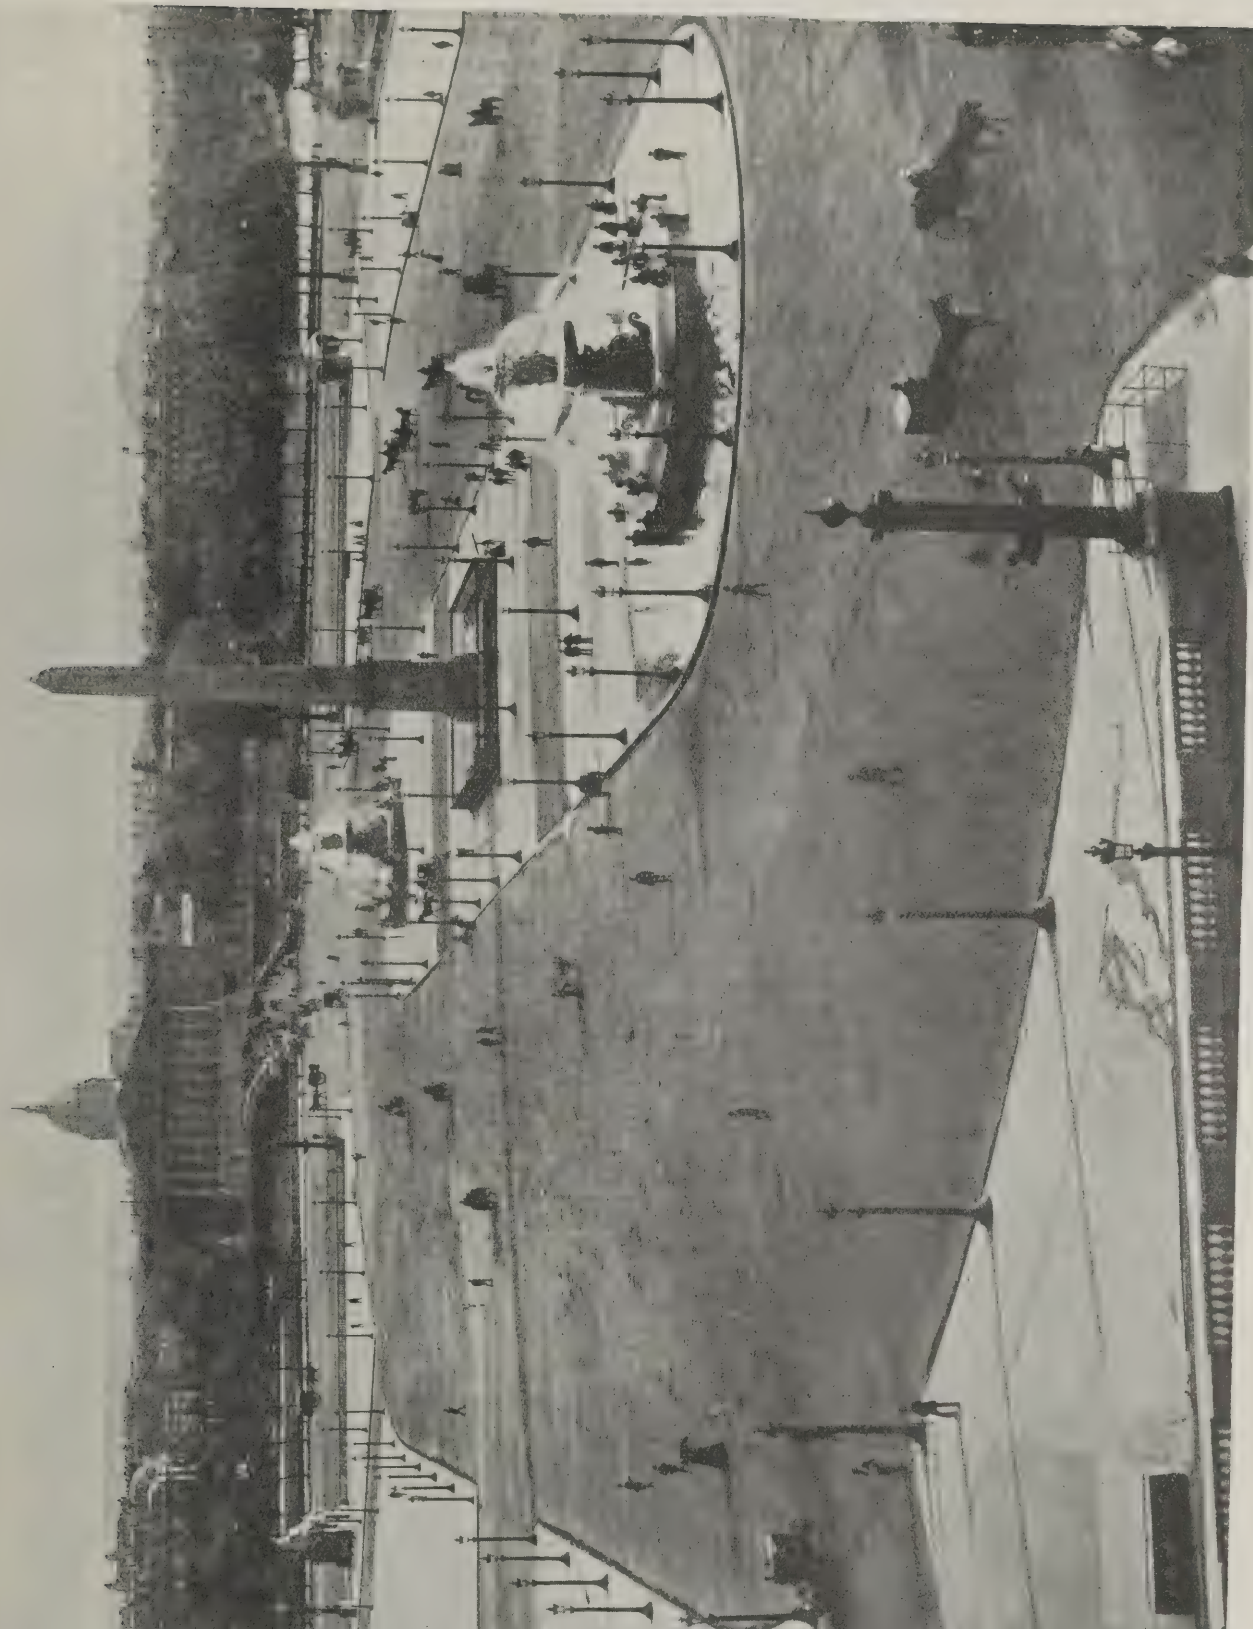
The Place de la Concorde has seen two big tragedi One in 1770, when a terrible panic during public festi ties caused the death of over 400 people, and the seco twenty years later, when the guillotine was first erect for Louis XVI, curiously destined to serve later for Dant and Robespierre. The obelisk is sister to our own on t Thames Embankment.



END PAVILION OF THE MINISTRY OF MARINE, PLACE DE LA CONCORDE.
JACQUES ANGE GABRIEL, ARCHITECT.



THE WEST FRONT OF THE PALACE OF THE TUILERIES. (DESTROYED DURING THE COMMUNE).



THE PLACE DE LA CONCORDE; VIEW LOOKING SOUTH.

Towards the setting sun rises Chalgrin's Arc de Triomphe de l'Etoile, linked to the Concorde by the broad ribbon of the Champs Elysées. The side walks of the Champs Elysées are broad, and the trees are planted far out from the houses so that their façades can be seen from the pavement below. Most of these big buildings are modern, but there is a charming little Louis XVI hotel on the right at the corner of the rue la Boëtie; there are also some fine hotels in the Avenue Gabriel and the adjacent Faubourg St. Honoré, including the British Embassy, which is close to the Elysée, official home of the Président de la République.

The Avenue du Bois de Boulogne, the Avenues Henri Martin, Marceau, Président Wilson, and many of the other big streets offer good examples of fairly recent work. In addition, this quarter houses the charming little Musée Galliéra, not far from the Trocadéro, and the "Style Louis XVI" Chapel in the rue Jean Goujon, erected to commemorate the terrible fire of the Bazar de la Charité.

The Cours la Reine, laid out in gardens which contain some quite good suggestions in treatment, lead back towards the Pont Alexandre III, with its single steel span and flamboyant pylons whose winged horses gleam so astonishingly in the Paris sun. It is said that Charles Garnier was not without having an influence in this design of Besnard's.

The Grand and Petit Palais are much discussed and much criticized. The former is the work of at least three architects who were responsible for its different façades; at any rate, its plan and lay-out are very fine. The Petit Palais by Girault (who recently received the Institute Gold Medal) cannot be passed by with a shrug. It contains an internal court in the form of a hemicycle which juggles amusingly with the orders and is distinctly refreshing.

So far one has only touched the fringe of the beautiful buildings of Paris, and even this tour has not yet included the Louvre and the Palais Royal, and the Hôtel de Ville.

The Louvre is so vast that it is a city of art in itself. Its architecture is a dictionary of design and its contents a dictionary of architecture including all its subsidiary arts. Its history is familiar to most of us, and its plans are published in many a volume. The Tuileries are perhaps less familiar, and it is perhaps not generally understood that until the Communards destroyed the Palace of the Tuileries in 1871, Delorme's façade linked together the two present end-pavilions facing the gardens. These t pavilions (de Marsan and Flore) are actually the c Tuileries pavilions restored.

The Arc de Triomphe du Carrousel is by Percier a Fontaine, to the glory of Napoleon I. It has weather pleasantly, but is curiously tiny in relation to its bro surroundings.

The Palais Royal, which lies hidden back of the Coméc Française, is pleasantly intimate after the Louvre. narrow arches and tall pilasters have an archaic charact in spite of their elegance which must have been so pe fectly in tune with the spirit of Richelieu, the builder this one-time Palais Cardinal.

The Palais and its garden has fallen on the same ha times as the Place des Vosges. The gardens where the b Louis XIV used to practise *la chasse*, where Cami Desmoulins preached revolt, and where *les élégants* the Directoire indulged in every pleasure, have becor to-day the home of the lesser shopkeeper and the hau of the dubious. There have been projects to open out t Palais Royal and bring back its former glory, but t architect's ambitious schemes remain on paper.

We wend our way back from this little tour of Pa past the proud roof of the Hôtel de Ville, a building er blematic in every sense of the civic pride of a great nation capital. Paris, like many another noble city, offers almo too much to the eye and senses. One's joy in all that seen is tempered by the feeling that many corners rema unexplored, hiding beauty the more rare for its mode reticence.

*Note.*—There are comparatively few shops on the rig bank of the Seine which deal in architectural books drawing materials. Second-hand architectural books c be picked up on the stalls on Quai des Grands Augustir and in the quarter near the Ecole des Beaux-Arts are sor good bookshops—M. Vincent, 4 rue des Beaux-Ar between rue Bonaparte and the rue de Seine, publish architectural books of all kinds and specializes in t published work of the Ecole des Beaux-Arts. There a plenty of dealers in artists' materials, photographs, po cards, etc., in the rue Bonaparte, and the rue de Sei and the Maison Chapron, No. 34 rue de Seine, specializ in architects' drawing materials. A small shop, Mais Renard, No. 101 in the rue de Rennes, has an excelle collection of architectural postcards.

MANUFACTURING PREMISES, BIRMINGHAM.
MESSRS. HARVEY AND WICKS, F. AND A.R.I.B.A., ARCHITECTS.

Business premises, though the prose of design, can be very good prose, and at times attain to almost lyrical beauty. The above, a photograph of which appears at the Architecture Club Exhibition, is an example.

# The Chapel, Trinity College, Dublin

By WM. N. SPENCE, A.R.I.B.A.

AMONGST available historical records of Dublin architecture it is difficult to trace any detailed information of the chapel.

In 1759 Sir William Chambers was first called in to extend and modernize the old college (originally an Elizabethan brick building), but apparently the first portion to be rebuilt was the west front of the quadrangle facing College Green. The chapel is situated on the north side of the quadrangle and is balanced on the other side by the examination hall. According to records the cost was about £12,000.

It is interesting to note that Sir William Chambers never visited Ireland to supervise his work, but sent a sketch model of his design (which can still be seen in the college), working drawings, and specification; his remuneration for this being the customary 2½ per cent.

The interior of the chapel is beautifully panelled in oak up to the sill level of the semicircular-headed windows the upper portion is treated in plaster with coupled Ioni pilasters supporting a richly ornamented cornice. Abov this is an elliptical ceiling of groined vaulting which i pierced over each window by a semicircular lunette.

The apse at the east end, which is semicircular on plan is an excellent piece of composition, and presents a pleasin termination to the vista between the oak-panelled pew which, being arranged so as to leave a central aisle, give th appearance of additional length to the chapel.

At the west end is the organ gallery, which is supported o six Ionic columns and is all in oak. The ceiling above th gallery is richly coffered, the centre of each coffer bein enriched by a large patera. The decoration in this pane of the ceiling is not successful, and is, in fact, rather over done and out of keeping with the dignified effect of th remainder of the work.

# ıe Qasr-el-Aini Hospital Competition

ondon Architects have achieved re-
kable success in the Cairo Hospital
ıpetition—one of the greatest archi-
ural competitions ever organized.
awards of the assessor, Mr. John W.
pson, PP.R.I.B.A., as announced last
k, are first Messrs. Nicholas and
ɔn-Spain, and second Messrs. Lan-
ter, Rickards, Lucas, and Lodge, of
ford Square. All are Fellows of the
B.A. In the first stage of the com-
tion open to the architects of the
d, five out of six places were won by
following British architects : Mr. John
inald Truelove, A.R.I.B.A. ; Messrs.
ɛett and Burns-Dick, FF.R.I.B.A. ;
srs. W. and T. R. Milburn, FF.R.I.B.A.;
srs. Lanchester, Rickards, Lucas, and
ge, FF.R.I.B.A. ; and Messrs. Nicholas
Dixon-Spain, FF.R.I.B.A., the sixth
e being secured by Messieurs. Pierre
Louis Guidetti, of Paris. In the
stage there were twelve competi-
among those accepting invitation of
Egyptian Government to take part
g Mr. E. Vincent Harris, O.B.E.,
I.B.A. ; Mons. M. A. Marcel ; Mr.
. Lisch ; Messrs. W. A. Pite, Son, and
weather ; Messrs. H. V. Ashley and
ton Newman, FF.R.I.B.A. ; and
rs. H. Percy Adams and Holden.

ıis week we publish illustrations of
designs placed first and second,
ther with portraits of the architects
secured second place. Portraits of
winners appeared last week. The
ital is situated at the northern ex-
ity of the island, its main approach
g from the bridge at the south side
e site. The hospital generally was
ɔvide beds for 810 males and 435
les.

### *The Winning Design.*

e winning design is admirably
ıed and is notable for its directness
simplicity. The hospital has wide
imposing frontages to the city, and
ıain entrance immediately faces the
of the Mahomed Ali bridge, over
ı the hospital traffic will travel.
the exception of the director's
ence and the students' hostel, all
ɔuildings are planned on the north
portion of the site. Access to the wards is obtained from a long corridor running parallel with the Nile. The main architectural motif of the design is a wide avenue terminating in the administration block and flanked by the medical school and the outpatients' block. It is interesting to note that the outpatients' block has been planned to the north of the main entrance to keep the large number of patients it will accommodate free from the Avenue de Rodah. This is a fine thoroughfare, but is not much frequented. It leads to Gizeh and the desert beyond, but the more usual route from Cairo to Gizeh is by way of the southern bridges.

### *The Second Design.*

In the second premiated design the female section of the hospital is placed at the north of the island, and the male section on the southern portion. The existing main road cuts the site into two pieces. The extreme southern end of the island is occupied by the home for sisters and nurses. Next to this is the harem division, separated from the male division by the isolation block on the west side, and by the extern work and the infant welfare block on the east side. The male division takes up the next section of the site with the two blocks for operating and the kitchens in a central position with access from both divisions. Facing the Avenue de Roda are the reception block and the laundry on the west side, and on the east side the medical school with mortuary attached and the power-house, the students' hostel and directors' house being placed on the southern portion of the site. The only difficulty that this disposition presented was that of providing access for women patients and visitors through the male division. This was met by the provision of a mezzanine corridor about 13 ft. above ground level, which could be screened from observation as far as necessary, this corridor serving also to give access from the female wards to the radiology department. The out-patients' department was placed in the garden area forming the south-west portion of the site, and a large central open space was thus secured for a recreation ground for the students. The buildings generally were to have been built in stone, with cornices and friezes in cement.

During the competition many of the most distinguished architects in the United States, Canada, Italy, and elsewhere, submitted designs and the result is an emphatic triumph for British architects.

# The Institute of Builders' Annual Dinner

The annual dinner of the Institute of Builders took place with its accustomed good cheer and good company at the Hotel Victoria, London. Mr. James Storrs, J.P., president of the Institute, was in the chair, and the company present numbered about 300.

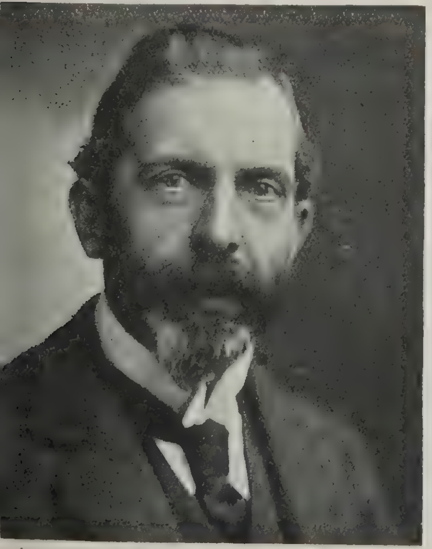
Excellent fare, brief and witty speeches, and a delightful musical entertainment combined to make the evening a conspicuous success.

Proposing the toast of the Institute of Builders, Mr. W. H. Nicholls said that from its buildings one could gather the history of a nation, and referred to famous buildings of every age and land. He paid a warm tribute to the work of the president, who, in reply, said that it was the function of the Institute to watch the interests of the trade as between architects and builders and surveyors and builders. They were particularly concerned with the better education of the employed, and hoped to establish a Chair of Building at one of the universities.

Mr. W. E. Collier proposed the Architects and Surveyors, and said that the I.O.B. had tried to establish good relationships with the professional bodies. They had had many conferences regarding the agreed form of contract, and there was every prospect that this would be brought to a successful issue. In connection with the Surveyors' Institution they had already achieved the issue of the standard method of measurement. There was a general desire that quantities should be invariably supplied as builders were not qualified in that direction.

Mr. Partridge, president of the Society of Architects, replied, and complained that they had on this occasion caught a partridge out of season.

Mr. Forsdike, Mr. Searles-Wood, and Mr. Denny also spoke.



Mr. H. V. LANCHESTER, F.R.I.B.A.

Mr. GEOFFREY LUCAS, F.R.I.B.A.

Capt. T. A. LODGE, O.B.E., F.R.I.B.A.

THE AUTHORS OF THE SECOND PREMIATED DESIGN, QASR-EL-AINI HOSPITAL COMPETITION.

# The First Atelier of Architecture

An exhibition of work executed by members of the First Atelier has been held in the Atelier and in the rooms of the Society of Architects, where a paper on "Colour" was read by Mr. R. G. Lovell, A.R.I.B.A., M.S.A., in the evening.

The Beaux Arts Committee arranged this exhibition and meeting in response to a request from a number of those who are interested in the aim of the Atelier and who have generously assisted the scheme as donors and subscribers.

It will be remembered that the First Atelier was founded in 1913 by a group of architects who had personal experience of the training of the Ecole des Beaux Arts in Paris, and who were impressed by the lack of system then prevailing in architectural education in this country. The First Atelier, after undergoing a somewhat difficult period at the start, proved a successful experiment, and many of the professors now teaching at home and in the Dominions were among its early members; and its methods have since been generally adopted as affording the best means to the architectural student for continuing his studies after completing the preliminary training of the architectural schools. It may therefore be of interest to re-state the principles for which the First Atelier stands.

It is considered that architectural design must be based on the purpose of the building, and the form of expression depends on this, qualified by the national and social factors. Only such traditions should be accepted as are appropriate to the expression of national character and local conditions.

The necessity of first analysing the components of a building and making the relative importance of these the basis of the composition is of great importance, and the disposition of the parts of the design (taking into consideration site, harmony, orientation, hygiene, durability, proportion and economy in the use of materials) can only be studied on a topical basis, after this preliminary analysis has been completed.

These studies evoke the imaginative faculty and at the same time subject all solutions to the control of a reasoned synthesis.

To put these principles into practice was and is the object of the Beaux Arts Committee.

It was felt that architecture would be most effectively influenced by inviting young architects and advanced students to join the Atelier and take part in the work, as it is essential to have sufficient members of tried ability to allow each one to profit by the knowledge of the rest, the Atelier being a common centre for free discussion on principles, methods, conditions and ways of seeing and acting.

The utmost freedom is allowed as regards modes and times of work, with the sole exception that the preliminary studies for each design must be prepared *en loge* on a given day. Such designs are carried to completion in the Atelier during the following month.

The Atelier is under the direction of M. Hector Corfiato, Médaille et Diplômé de l'Ecole des Beaux Arts, who succeeded the late patron, M. Chaurés, last year.

The designs, *esquisses* and *projets*, etc., are adjudicated on by a jury composed of Messrs. Arthur J. Davis, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., L. S. Sullivan, A.R.I.B.A., F.S.Arch., H. Corfiato, and Lieut.-Col. H. P. Cart de Lafontaine, O.B.E., A.R.I.B.A., who award marks and mentions in accordance with the merit of the designs. Medals and the Certificate of the First Atelier are awarded by the Beaux Arts Committee on the recommendation of the jury and Chef d'Atelier.

The work shown at the exhibition comprised selections from the work of students in pre-war days, during the period from the war until the appointment of the present Chef d'Atelier, and recent work. The latter was hung in the Atelier itself, and formed an excellent survey of the recent work of students; much of this reached a high level, and we particularly noticed some excellent designs for a "cinema" by Mr. Butler (awarded a "1st Mention"), and Mr. Murray (a "2nd Mention"), which were well planned and delightfully rendered. A decorative composition for a "Bank of England Note" also produced some able and interesting designs by Mr. Smith ("1st Mention"), Mr. H. L. Curtis ("2nd Mention"), and others.

A somewhat unusual subject for the Englishman was that of a "Police-Post on a Mountain Frontier," and no student has been entirely successful in their solution of the problem; but two interesting and well-drawn sets were shown by Messrs. B. George and J. Norburn, who also contributed some excellent holiday sketches.

Mr. H. L. Curtis showed a well-considered scheme for a "Civic Centre in a Workers' City," which was awarded a "2nd Mention."

The Chef d'Atelier (M. Corfiato) showed one of his own Beaux Arts *projets*—a design for a "Monastery on Mount Athos"—which was interesting in its planning detail. The designer has also kept in mind the climatic and local conditions, and his scheme was illustrated by a set of excellent drawings.

Mr. Lanchester prefaced his detailed criticism of the designs exhibited by a reference to an interesting composition for a Monastery on Mount Athos, executed at the Ecole des Beaux Arts in Paris by the Chef d'Atelier (M. Corfiato). He subsequently made a digression, during which he remarked that in the modern architecture of their cities it was probably unreasonable to expect that the design of every building would be a brilliant example of architectural composition; but they hoped the standard would improve, and as long as designs were honest and straightforward, they would provide a fair setting in which the more brilliant examples would be as jewels.

It was not to be expected that they could all be brilliant all the time, but he thought that the work hung on the walls showed great promise and justified their hope that the First Atelier would do much to raise the level of architectural design in this country.

Continuing his criticism of the various designs exhibited, Mr. Lanchester explained the reasons which had influenced the jury in making their awards, and concluded his remarks by expressing the
hope that progress would be maintain
and that in a short time they woul
bring new members to benefit by th
facilities for the study of architectur
composition which it was the aim
the First Atelier of Architecture
provide.

---

# R.I.B.A. Council Meetin

Appended are notes from the minut
of the last Council meeting of th
R.I.B.A. :—

Annual Exhibition.—It was decid
to hold an exhibition of French archite
ture in the R.I.B.A. Galleries in th
autumn.

Architects' and Surveyors' Approv
Society.—A grant of £75 was made to th
approved society to assist in liquidatin
the deficit on the administration accoun

Housing Policy.—The report of th
R.I.B.A. Housing Committee on t
National Housing Policy was adopted a
ordered to be submitted to His Majesty
Government.

Building By-laws.—The report of th
Building Code Joint Committee w
adopted and ordered to be submitted
His Majesty's Government. This rep
recommended the periodical revision
by-laws, the establishment of an app
tribunal, and contained suggestions
a greater uniformity in local by-laws.

Empire Forestry Association.—Mr.
D. Searles-Wood, vice-president, w
nominated to serve upon the governi
council of the Empire Forestry Associ
tion as the representative of the R.I.B.

Reinstatement.—The following we
reinstated as Licentiates: J. Ross Wil
Ernest Sprankling, E. H. Wigley, A.
Barnes, C. Procter Sherwin.

Registration Bill.—In pursuance of t
decision of the special general meeti
on January 29, it was decided to inv
all the bodies which were represented
the Unification and Registration Co
mittee, and any others which may
affected, to consider the draft Regist
tion Bill, to indicate any points in whi
they think it might be improved
amended, and in due course to appoi
representatives to attend a meeting
the discussion of the Bill.

Academic Dress for Members of t
R.I.B.A.—It was decided to refer to
general meeting the question of t
adoption of an academic dress for me
bers of the R.I.B.A.

London Squares.—A communication
to be sent to the London County Coun
urging that steps should be taken
ensure the preservation of the Lond
squares.

South Africa.—Mr. E. M. Powe
F.R.I.B.A., was appointed hon. secreta
for the R.I.B.A. in South Africa in s
cession to the late Mr. Arthur H. Re
It was decided that the Association
Transvaal Architects be admitted as
allied society of the R.I.B.A. in place
the Transvaal Institute of Architects

Daywork Charges.—Mr. Max Clar
F.R.I.B.A., was appointed to repres
the R.I.B.A. on a Joint Committee
architects, surveyors, and builders to
formed for the purpose of reporting u
the question of daywork charges for d
work with a view to establishing
agreed schedule.

The Incorporation of Architects
Scotland.—The draft by-laws of
Incorporation of Architects in Scotl

vere approved under the provisions of y-law 78.

The Institute of Cost and Works ccountants.—It was decided to present petition to the Privy Council in opposiion to the petition of the Institute of ost and Works Accountants for the rant of a Royal Charter.

## Contemporary Art

*The Grosvenor Galleries.*

Harold Knight makes a brave show vith his portraits, but there is an element f restraint about his landscapes and seacapes, and their colour is sombre and heir drawing weighty. But the porraits are sane, naturalistic, both in drawng and colour; they have no affectations, ut only a self-respecting technique vhich is of great value in the portrait art f to-day.

The London drawings of Horace Mann ivens are on the sombre side, too, but hey have a warmth that is grateful and grace that is comforting.

Fairlie Harmar enjoys landscape, and, deed, all her painting. You get the npression that she does not stop to hink, but just revels in the feeling of leasure in reproducing the brightness of ature; there is no sombre aspect at all her work, but it lacks the sense of esign which is definitely present in the ork of Livens and Knight.

In the Italian and French landscapes f Charles E. Cundall a new acquaintance f a most pleasing character is made. undall is a young man, and his pictures ave the buoyancy of early years. He, o, seems to find joy in the bounty of ature and in that of man's handiwork, r to landscapes he adds architectural eatures of an unassuming character and roduces very satisfactory results.

*The Goupil Gallery.*

Few artists maintain so consistent a tandard as Wilson Steer: his two oilaintings at the spring exhibition of the oupil Gallery, "The Valley of the evern" and "In a Park," are just as good s anything he has painted. Lack of motion and insistence on the truth of elling atmospheric effects are as usual e distinguishing features of this artist's ork. There are at least three very fine ieces of painting in the gallery, painting s painting: William Nicholson's "Porait of Miss Iris Tree," Mark Gertler's The Mother," and Orlando Greenwood's Visitor." The latter is a piece of viruosity; "The Mother" is an absolute uth; the portrait a complete piece of presentation. There is another distinuished thing, Augustus John's "Old edanois," a remarkable study in realism, ss remarkable as painting. There is fine ainting quality in Walter Sickert's usic-hall scene, "Katie Lawrence at atti's," of course, and I should like to e in the work of Henry Lamb a greater ve for this quality. I'm sure his original ay of observation would benefit by an nprovement in his technique. The Bather" of Charles Sims is a charming ttle boudoir picture, and James Pryde's Monument" is a nice small work, too, ut, curiously enough, much less monuental than the same artist's bedsteads d things that have been seen preiously here and elsewhere. Pryde's work presses the little in great better than e great in little. There is a brilliant rgent drawing in the small gallery lled "Near Versailles," a beautiful water-colour with the most melting greens imaginable. The Continental painters represented are Ribot, Jacque, J. and M. Maris, Boudin, Sisley, and Cossaar.

*The Leicester Galleries.*

The late Douglas Fox-Pitt's water-colour drawings of Brighton are very charming; they are small, compact, well-constructed, and admirable bits of light and colour to match a bright room or enliven a dark one.

To pass from them to the next gallery where Edward Wadsworth's tempera paintings are shown is to pass into a new world of art. There is colour in profusion: bright and dark, crude and sophisticated; there is drawing reduced to its most simplified forms. Any room in which it was proposed to hang these examples of modernist art would have to be specially designed for their reception. Wadsworth's work would definitely extrude any example of conventional picture-making. His art is disturbing and yet it is placid: there is nothing more aggravating than placidity causing a disturbance. Wadsworth is absolutely sure of himself, and his work is a sure thing.

*The Women's Exhibition.*

The sixty-eighth exhibition of the Society of Women Artists at the Royal Institute Galleries was one of the bright things in London during a very dull February. It must be said of the women artists that they believe in the joy of art, which is quite the proper thing to do. The walls of all the galleries were glowing with oil-paints, water-colours, textiles, and enamels, and in cases were book-bindings and pottery adding their lines successfully to the general effect. The sculpture, too, was full of interest, although even here it was never placed to the greatest advantage: it never is. But it was good of its kind, the most ambitious piece being a symbolical war subject of a Mother and Child, by J. Lawson-Peacey. Among the portraits the steady growth of strength in those by Mrs. Blakeney-Ward was noticeable.

*Cézanne and Matisse.*

The Independent Gallery is doing a great service to the study of modernist painting in its frequent shows of the chief exponents. It is to be hoped that before long painting will be followed by sculpture, for there is just as pronounced a modernist school in plastic as in graphic art on the Continent waiting for the appreciation of London. The present exhibition contains more important works by several of the artists represented than I remember to have seen for some considerable time. There are five by Matisse, of which Etretat is the best, and double that number of drawings by Cézanne, while Segonzac and Marchand make an advance on most of the works that have been seen here previously, and the heavy, sombre colour-scheme of Luc Albert Moreau claims attention and interest. There are half-a-dozen other exhibitors. KINETON PARKES.

*An Architecture Exhibition in New York.*

The 38th annual exhibition of the Architectural League of New York is strengthened and embellished by a comprehensive exhibit of the work of notable contemporaneous English architects. These are shown for the first time through the courtesy of Mr. Paul Waterhouse, P.R.I.B.A., and Mr. Alfred C. Bossom. This exhibition takes on further significance by the fact that simultaneously with England they offered to Sir Christopher Wren the honours of bi-centenary remembrance.

## A New Adjunct to the Theatre

"The play's the thing," wrote the Immortal Bard. Within recent years, however, there has risen up a school of thought that maintains, in effect, that the scenery is the thing, and a distinctly lively quarrel has ensued. To the impartial observer it would appear that both are necessary. Possibly Shakespeare, if he were alive to-day, would amend his dictum to "The play accompanied by adequate but not obtrusive scenery, and such lighting effects as do not distract the attention, make for a performance that shall give the greatest pleasure to the greatest number." Thus would he eliminate the cranks on both sides.

The theatrical producer who rejected the aid of electric light in the production of his plays would not last long to-day. No one, of course, would be so foolish. Electricity has affected the presentation of the drama more than any other mechanical factor in the modern theatre. Is it to have a yet wider influence? We think so.

Scientific stage lighting has made much more rapid progress on the Continent than it has in this country; where, however, it is now being taken up by progressive producers. The St. Martin's Theatre, for example, has a remarkably complete equipment, including an installation—the first in England—known as the Schwabe-Hasait system, with which it is possible to produce effects that are entirely new to the British theatre. The elements are a series of lanterns and an artificial horizon, upon which are projected natural sky effects in colours—dawn, sunrise, the blue sky of broad day, sunset, twilight, clouds, stars, and so forth. The slow motion of clouds across the sky is perfectly simulated, one particularly interesting effect being that of two separate banks of cloud travelling independently one across the other, a phenomenon that is frequently observed in nature. All these effects are produced from actual photographs and are therefore as near to nature as it is possible to get by mechanical means.

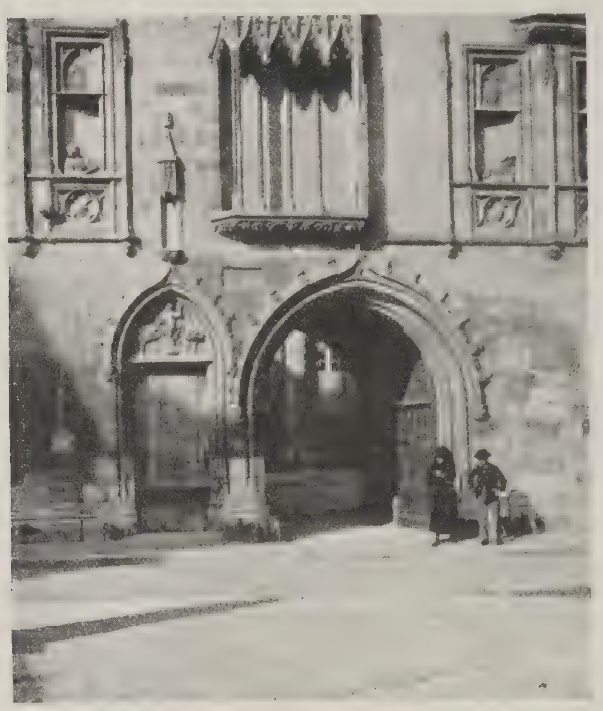
The advantages of this system are, briefly (1) that it is possible to do away with "drop" scenes, as the artificial horizon (which may be either a permanent structure of polished plaster of Paris or a movable canvas screen) forms the only background required for the presentation of sky effects; and (2) that it is under the control of a single operator, who, in addition, works all the subsidiary lighting, such as battens, floats, projectors, flood and spot lights. It is, therefore, very economical.

We are not sure that purely realistic effects are appropriate to the theatre, which itself is a pure convention; but we are assured that the system lends itself just as readily to the highly conventionalized effects of the scenic artist, who merely has to provide suitable slides for projection upon the artificial horizon. The General Electric Company, Ltd., have the sole rights of the system in this country.

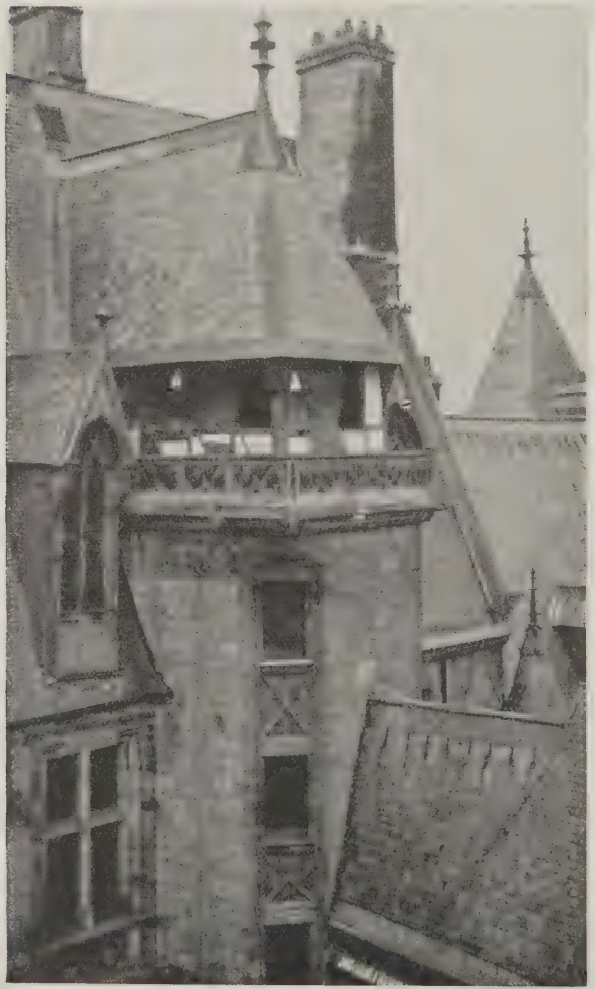
# A Pictorial Review

## Illustrations of Topical, Practical, or Curious Interest

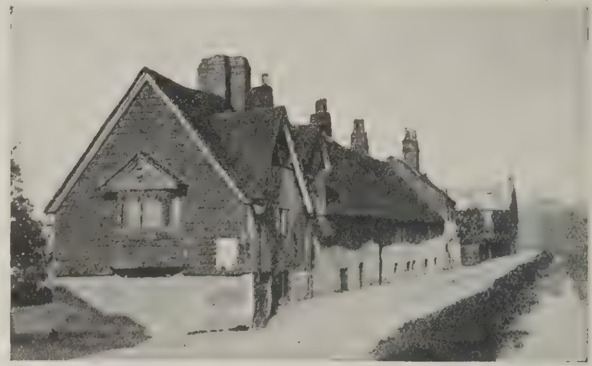
*Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.*



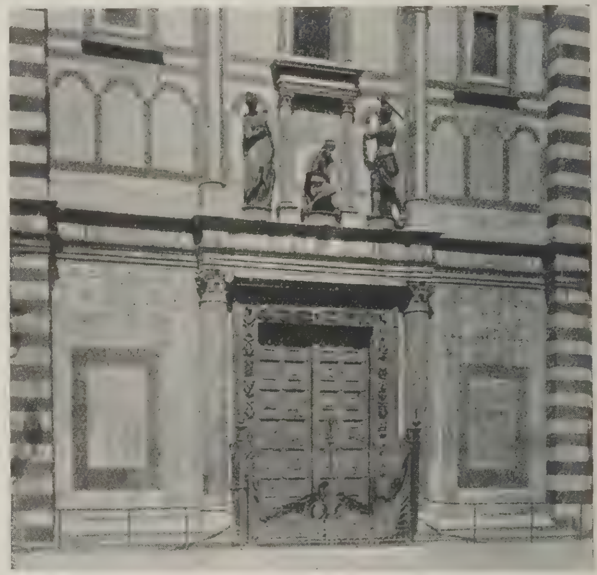
The main entrance to the house of Jacques Cœur at Bourges. From the false windows on the first floor are figures of servants looking for their master. (One of the stair turrets is illustrated below.)—A. B. H.



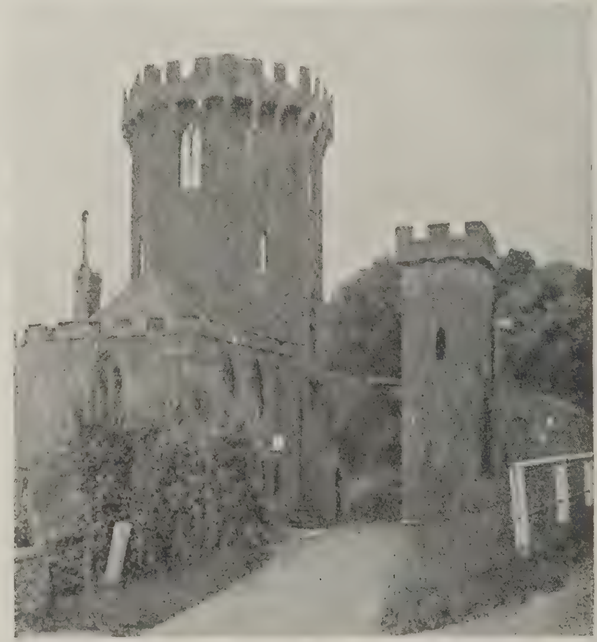
One of the stair turrets to the house of Jacques Cœur at Bourges. The house was built between 1443 and 1451, and is now partially used as the Palais de Justice. It is to be vacated by the Law, and cared for as an historical monument. It is in a state of good preservation (the main entrance is illustrated above).—A. B. H.



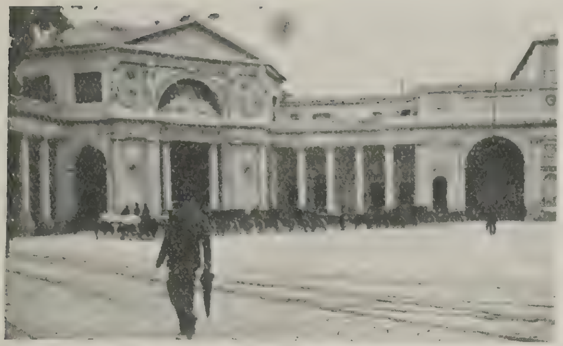
The "Weavers' Cottages" on the bank of the Kennet at Newbury, Berks. The town in the fifteenth century was a flourishing seat of the cloth trade. There is a marked contrast between windows in the front of the cottages and the oriel window at the east end of the structure.—J. B. T.



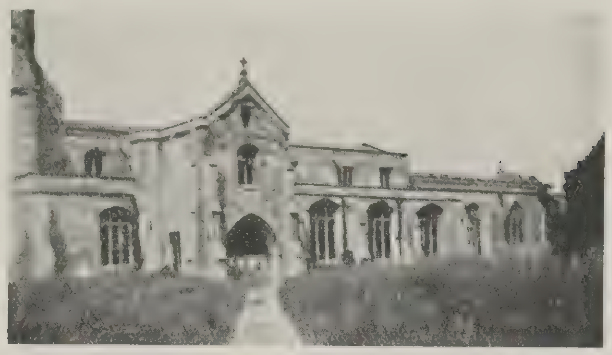
One of the three bronze doors to the baptistry at Florence and the first to be completed. It dates from 1336 and is the work of Pisano. The statuary group above is by Dante, and represents the beheading of John the Baptist.—J. V. D.



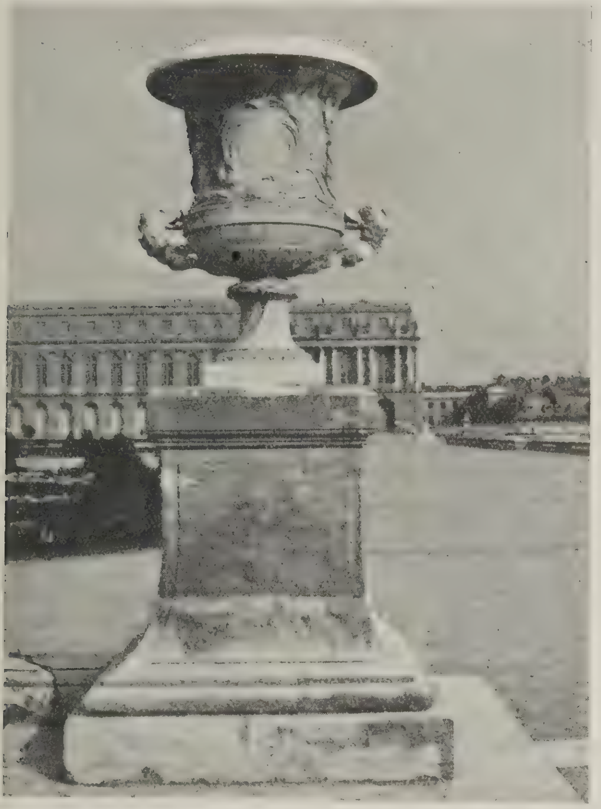
Edgehill Tower was erected to mark the position of the Royalist army before the battle. It was designed by Sanderson Miller—who evidently found inspiration in Guy's Tower at Warwick Castle—and completed in 1750.—A. H. G.



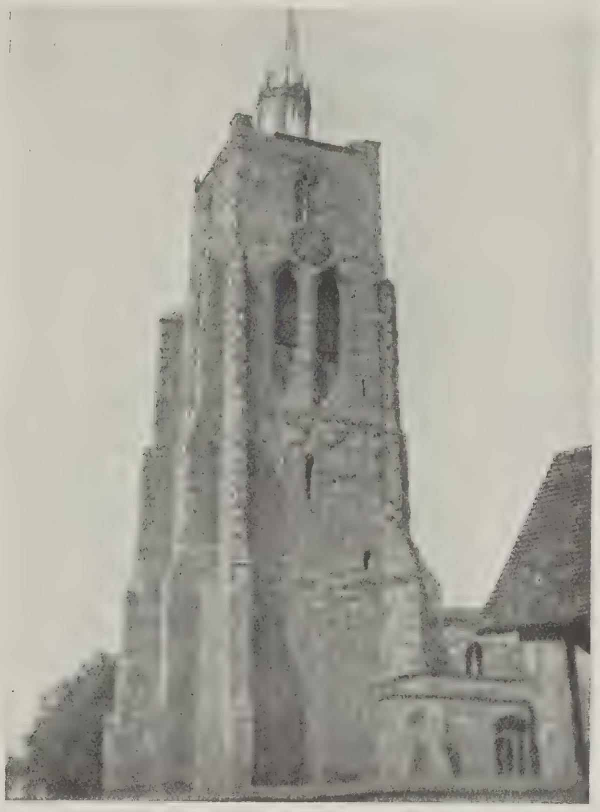
The railway station at Genoa is at the end of the via Balki. It consists of a central pavilion, and two colonnaded wings, one of which forms a screen across the thoroughfare.—A. MCG. H.



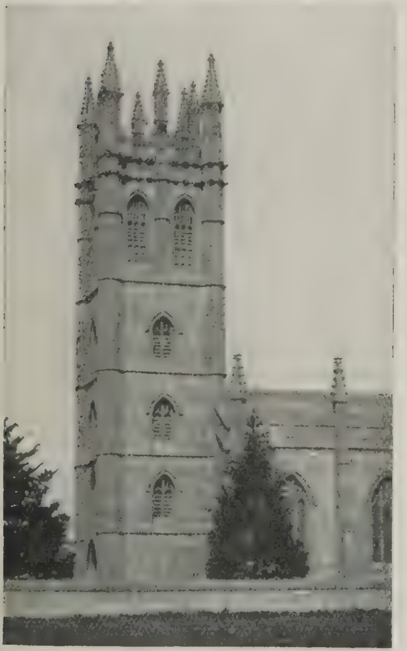
Ashwell Church, Herts, is on the extreme eastern end of the Chiltern Hills. The tower (illustrated below) has one of the best examples of the "Hertfordshire Spike."—W.



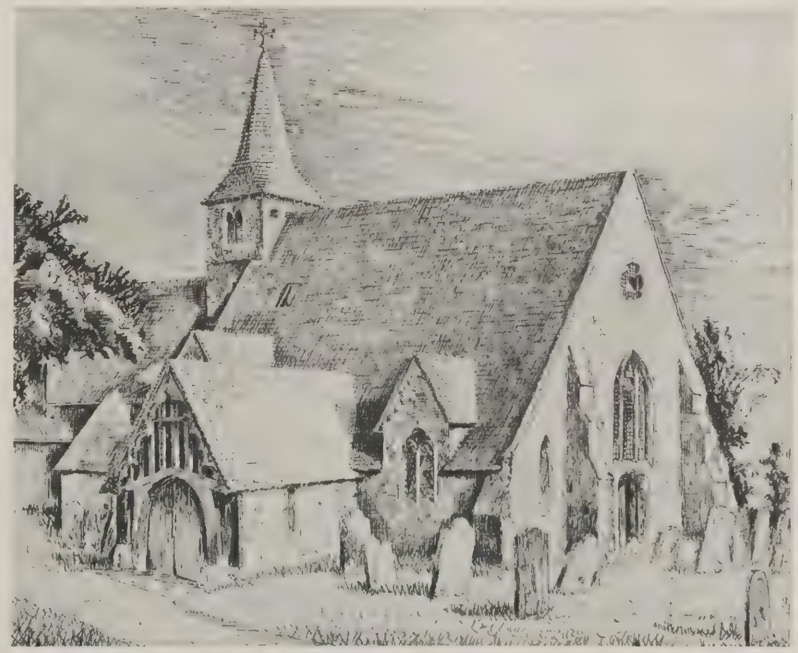
The "Bertin" Vase stands in the Palace Gardens at Versailles, near the Orangery. The height of the vase is 4 ft. 2 in., the pedestal being 4 ft. 6 in. high and 4 ft. 4 in. across the base.—B.



On the inside of the walls of the tower of Ashwell Church several fourteenth-century "Graffitti" are scratched. The gale of 1361 weakened the tower and the stone buttresses had to be enlarged.—W.



The tower of Churchill Church, Oxfordshire, is a reduced facsimile of the famous Magdalen Tower of Oxford. The original is copied down to the minutest detail.—J. B. T.



Warblington Church is a quaint example of early English architecture. The ancient wooden porch, according to local tradition, is fashioned from an old ship of the period of Edward the Third. Portions of a Saxon church which formerly occupied the site are incorporated in the building.—C. J. B.

# Acquiring and Replanning Congested Areas

## By L. C. EVANS, Town Clerk, Salford

IN reading a paper before the Town Planning Institute, Mr. L. C. Evans (Town Clerk of Salford) said that acquiring and replanning congested areas as a matter of practical politics resolved itself into a question of money. He said that sites could be cleared and newly planned on modern lines without difficulty so long as they were prepared to pay the price, as, e.g., the clearing and newly planning of Paris and payment of the cost by octroi duties on necessities of life entering Paris. But such heroic measures were too much for this country. Giving particulars of the actual administration prior to 1919 of the Housing Acts in Salford, a borough with nearly one-quarter of a million inhabitants, he said, when the Housing Act, 1890, was passed, Salford, like many other towns, declared that several areas in the town were unhealthy areas. These were in that part of the borough which was first built upon over a century ago.

As you are all probably aware, building by-laws and limitation of the number of houses per acre were unknown in the eighteenth century. The first Public Health Act was not passed until 1844. Up to 1792, Manchester and Salford were both under manorial government, but its inadequacy was such that in that year Police Commissioners were established by Act of Parliament, giving very limited powers to the Commissioners for watching and lighting the townships of Manchester and Salford; but at that date no one had visualized the rapid growth of towns which began to set in with the beginning of the industrial revolution, which may be said to have started about 1770, and he would have been a bold man who dared then to suggest wide streets and development of towns on modern garden city lines.

Consequently, the very centre of Manchester and Salford was covered to the last inch in providing dwellings for the industrial workers in the mills and manufactories then springing up. These dwellings are not all gone even now, and can still be seen on the verge of the river dividing Manchester from Salford. But many of them have been swept away, particularly in Manchester, to make room for new and commodious buildings.

Up to 1890, however, Salford had, in its oldest built-up district, several areas crowded with dwellings, one being on the verge of its main street. They were all crowded with working-class dwellings hemmed in together in courts and alleys, without sanitary conveniences of any kind, with a water supply on the village pump principle in the courts and alleys, where every occupier had to draw water from a standpipe, as it was called, and carry water to his dwelling, such as it was. Judged by the standard even of 1890, this condition of things was so deplorable that several areas were declared by the Corporation under the Act of 1890 as unhealthy areas, and the Council had to buy out the owners and build other houses for the dispossessed tenants. Then came the tug-of-war. The owners, very naturally wanted as much compensation as possible. And in those days the amount of compensation payable was so many years' purchase of the fair market value of the property. The net result of clearing these congested areas was that the Corporation paid, as the phrase goes, "through the nose," and they had never repeated the experiment. Some of the cleared sites have been sold as vacant land at about half the price per square yard which the Corporation paid for land and buildings. Some of the vacant land is still in hand. Compound interest on the price paid will mount up to a big figure. The purchase money and compensation was £40,669, including costs. On the cleared sites, except one, the Corporation erected working - class dwellings and erected dwellings on another large site instead of on the excepted area, to a total of 703 dwellings and 35 shops, at a cost of £298,162, of which £223,353 is still outstanding.

But although the dwellings erected by the Corporation were a very great improvement on the old cottages, the small sites were not laid out on garden city lines, but on the largest site a large hollow square was laid out to serve as a recreation ground available to the public and the tenants of the cottages built along the sides of the square. This type of lay-out seems to be most suitable in large towns, and although it does not approach the twelve-houses-to-the-acre standard, it is a great improvement on the inherited conditions still existing in large towns, where streets upon streets of brick boxes with slate lids extend over hundreds of acres. But these brick boxes cannot be said to be congested within the Housing Acts. They are merely monotonous and ugly. In the older parts of the towns there are long rows of cottages unbroken by intersecting streets, but in the newer parts the rows are broken up by intersecting streets in accordance with by-laws requiring such intersections.

We must, therefore, first of all decide what we mean by congested areas. Judged by the modern standard of twelve houses to the acre, Salford is hopelessly congested. In the older parts of the borough nearest to Manchester and only divided therefrom by the Irwell, and on the Manchester side of the river there are equally congested areas cheek by jowl with the celebrated John Rylands Library and warehouses, the warehouses being built on the site of cottages pulled down to make way for these modern buildings. But in the suburban parts of Salford built during the past thirty years there are wide streets and plenty of air space, and in some parts there are areas dignified by the name of parks where there are less than twelve houses to the acre. And this mixed condition of things doubtless prevails in most of the large towns of the country.

There is not now in Salford a really large congested area exceeding 6.26 acres. We must, however, decide what is meant by the words "congested areas." The Housing Acts do not use the words. What they do enact is that it is the duty of the medical officer of health in a district other than a rural district to make a written representation to the local authority in regard to any area which appears to him to be an area of the character described in Section 4 of the Act of 1890. Such an area is one within which either—

(*a*) any houses, courts, or alleys are unfit for human habitation; or

(*b*) the narrowness, closeness, and bad arrangement, or the bad condition of the streets and houses or groups of houses within such area, or the want of light, air, ventilation, or proper conveniences, or any other sanitary defects, or one or more of such causes, are dangerous or injurious to the health of the inhabitants either of the buildings in the said area or of the neighbouring buildings.

Here, therefore, we have the word "area" used, but not "congested area." The word is used under two headings, (*a*) and (*b*). Under the first heading an area includes any houses, courts, or alleys unfit for human habitation, and under (*b*) streets and houses or groups of houses where the narrowness, closeness, and bad arrangement or bad condition thereof, or the want of light, air, ventilation, or proper conveniences, or any other sanitary defects or one or more of such causes, are dangerous to the health of the inhabitants of the buildings in the area or of the neighbouring buildings, so that an existing built-up area which can be dealt with at all is an area where there are houses unfit for human habitation, or streets and houses or groups of houses dangerous to the health of the inhabitants thereof or of the neighbouring buildings.

I take it, therefore, that congested areas are areas falling within (*a*) and (*b*), otherwise we are each at large to form our own opinion as to what is a congested area. But the Acts call such areas unhealthy areas and not congested areas.

If we are agreed that congested areas means unhealthy areas as thus defined, we can now proceed to analyse the conditions which enable the Medical Officer of Health to prescribe the extent of an area. Section 4 of the Act of 1890 is a difficult section to interpret. Can the medical officer first prescribe an area of, say, 100 acres, and represent that within such area the conditions of (*a*) or (*b*) exist with respect to 10 acres thereof, and that the evils connected with such 10 acres cannot be effectually remedied otherwise than by an improvement scheme for the 100 acres? Do the words "such area" in the latter part mean the "certain area" in the first part of the clause? If so, the local authority might resolve that the 100 acres are an unhealthy area, and if the confirming authority agreed, the local authority could buy all the buildings on the 100 acres at site value.

But if, on the contrary, the medical officer of health can only include within the area houses, courts, or alleys falling within (*a*), or streets and houses, or groups of houses falling within (*b*), i.e.,

erous or injurious to the health of
nhabitants either of the buildings in
rea or of the neighbouring buildings,
only the area covering these which
be the subject of a representation
scheme.

the first proposition is sound, it is
ous that if there are in an urban
ct any houses, courts, or alleys
for human habitation, or the con-
ns referred to in (*b*) exist, the official
sentation made to the local authority
say that within a certain area, viz.,
urban district of A.B., there are
s, courts, or alleys unfit for human
ation, or that conditions referred to
exist, and that the evils connected
such houses, courts, or alleys
ot be effectually remedied otherwise
by an improvement scheme for the
angement and reconstruction of the
s and houses within the whole
ct, and if a local authority were
ied of the truth thereof, and of the
iency of their resources, they could
a resolution that the whole district
unhealthy area, and that an improve-
scheme ought to be made in
ct of the whole district. If the
ming authority agreed, the local
rity could buy up the land and
ings in their district at site value.

may be said neither the medical
r of health, the local authority, nor
nfirming authority would do so, but
is construction sound? Can it be
d to a lesser degree? Can an area
escribed including property falling
n (*a*) or (*b*), but also property neither
for human habitation nor dangerous
alth nor itself endangered? In my
n, for what it is worth, the medical
r of health cannot first prescribe
rea, and if he finds within it either
(*b*) conditions make a representation
he whole of the area first prescribed
m is an unhealthy area. He must
up the area by finding (*a*) and (*b*)
tions, and be able to prove the
tions, and if it be necessary to
le buildings not within (*a*) or (*b*), the
authority may by the scheme include
and pay full compensation for such
ngs. Other lawyers, however, hold
he medical officer of health can first
ibe an area, however large, and if
(*b*) conditions exist in a part only,
ver small, of such area, the whole
area may be described by him as an
lthy area.

s problem is definitely before us in
d, and it seemed to me to be so
ful that the opinion of eminent
el was obtained. He says :—

[COPY OPINION.]

. The answer to the question what
mises may be purchased at site
ue depends upon the true construc-
of the parenthesis in the First
agraph of Section 9 (1) of the
using, Town Planning, etc., Act,
9. In my opinion, according to the
e meaning of that parenthesis any
mises except "neighbouring lands"
luded by the Local Authority for
purpose of "making their Scheme
cient" under Section 6 of the Housing
he Working Classes Act, 1890, might
purchased at site value. In other
ds, any premises comprised in the
eme which are premises within the
a comprised in the Official Repre-
tation made by the Medical Officer
of Health might be purchased at site value. But important practical limitations exist. First of all there is the possibility that the Local Authority might not indicate as "lands proposed to be taken compulsorily" under Section 6 (2) of the Act of 1890, such buildings as factories or such dwellings as are in good sanitary condition. In the second place, the Ministry of Health have power to make conditions and modifications of the Scheme under Section 8 (5), or to alter the area under Section 8 (4) of the Act of 1890. The Ministry will certainly refuse to confirm a Scheme except upon condition that the market price is to be paid for buildings which are in no sense detrimental to the health of the area.

2. I do not think it is legally impossible that buildings other than dwelling-houses can be purchased at site value under Section 9 of the Housing and Town Planning, etc., Act, 1919. But I think the circumstances under which purchase at such a price would be permitted must be exceptional.

3. If licensed premises were purchased at site value, I do not think the existence of the licence would add anything to the site value. In my opinion, the value of the licence attaches to the buildings and not to the site. If it is contemplated that licensed premises should not continue within the area, the most satisfactory method would be, if possible, to get the licence referred for compensation. Those interested in the licensed premises would thus obtain a reasonable amount of compensation, and the premises would then be merely a dwelling-house.

If no licence is to be permitted in the area, and if the site value is to be paid, then the extinguishment of the licence will affect the "deduction factor" under the First Schedule to the Housing and Town Planning, etc., Act, 1919.

R. M. MONTGOMERY,
5, Crown Office Row, Temple, E.C.4.
30th January, 1923.

The opinion of the Ministry of Health was also sought, who say :—

[COPY.]

Reference: 1593/8.
Ministry of Health,
Whitehall, S.W.1.
1st March, 1923.

Sir,

I am directed by the Minister of Health to refer to your letter of the 13th ultimo, with regard to the proposed scheme for the clearance of an unhealthy area in Salford. The application of the provisions of Section 9 of the Housing, Town Planning, etc., Act, 1919, to individual cases is a matter for the consideration of the Minister after a local enquiry has been held and the persons concerned have had an opportunity of stating their contentions, and for this reason the Minister does not consider that it would be proper for him to anticipate his decision by expressing an opinion as to the various categories of houses mentioned in your letter. In general, however, he agrees that while premises other than dwelling-houses are not excluded from the operation of Section 9, business premises should not as a rule be included in a scheme except for the purpose of making the scheme efficient, unless there is positive proof that they are (*a*) themselves unhealthy or insanitary, or (*b*) a source of danger to neighbouring buildings which, but for their presence, would otherwise be both healthy and sanitary.

In the case of licensed premises the question whether the value of the licence can be wholly excluded appears to the Minister to be open to some doubt, but he agrees that until the price has been decided by the Official Arbitrator Local Authorities would be well advised to negotiate on the footing that the existence of the licence does not add anything to the value of the land as a site cleared of buildings.

I am, however, to inform you that arrangements have been made under which the services of the District Valuer will be available to the Corporation both in framing a preliminary estimate of the expense of acquiring the property in the area, and also in taking subsequent negotiations for its acquisition. If you will furnish the District Valuer with information as to the properties the Council propose to include on account of their insanitary condition and which it is proposed to include for the sake of making the scheme efficient, the District Valuer will be ready to furnish you with a preliminary estimate of the cost of the acquisition.

I am, Sir,
Your obedient Servant,
(Signed) T. C. WRIGLEY,
For Assistant Secretary.

The Town Clerk,
Town Hall, Salford.

It is obvious that the estimated cost of any clearance and replanning a congested area depends to a large extent upon the fact whether land and buildings are purchased at site value or partly at site value and partly at full value of lands and buildings. But until a scheme has actually been made and the confirming authority has definitely stated which land may be bought at site value and which at full value, it is impossible for a local authority to estimate the probable cost of purchase. But in any event the main cost will be due to the annual loss due to rehousing the dispossessed tenants. This depends upon the price of land elsewhere than on the cleared site, the type and cost of the new dwellings, the rent likely to be obtained, and other factors difficult to assess, so that it is almost impracticable to give any reliable figures of the probable cost of clearing any area. Having regard to the still existing high cost of materials and wages, it seems prudent for any district to make haste slowly in embarking upon any extensive schemes of clearing and re-planning congested areas except those which are a source of real danger to health.

Courts and alleys are familiar words, but in what sense are they used in this Act? A building and premises such as Hampton Court, even if it were unfit for human habitation, could scarcely be included within the term. Nor could we imagine that it includes courts of justice. The words must have a more restricted meaning. Courts or alleys are the words used, and they are in a collocation—houses, courts, and alleys. The latter must, therefore, be of the same character as houses, on the judge-made doctrine of *ejusdem generis*. The dictionary meanings of court and alley include many things other than houses, e.g., court includes a palace, a hall where justice is administered and the tribunal itself, and all the surroundings of a sovereign in his regal state, etc., so that we are forced to adopt a restricted meaning of the word to mean a short arm of a street enclosed on one or more sides by houses and buildings. And an alley means a narrow passage with houses therein.

Suppose that a medical officer of health does represent that courts or alleys are unfit for human habitation. They can be made the subject of a representation and be acquired and replanned by an improvement scheme, but in practical politics these courts and alleys in towns are little bits of places as a rule whereof replanning is a very minor operation. They can only be replanned on a very limited scale determined largely by the surroundings of the cleared area. But when we come to (*b*) we reach a bigger scale of operations.

Acquiring houses or groups of hou under either (*a*) or (*b*) follows the sa procedure, and since the Acquisition Land (Assessment of Compensation) A 1919, the process of purchase is mı simpler and much less expensive th under the Act of 1890.

Replanning an area depends largely its extent. It is possible to plan area of 100 acres much better th replanning an area of one acre sı rounded by streets and buildings which streets in the area would have be adapted.

---

# The Shortcomings of the L.C.C. By-laws

"THE Shortcomings of the London County Council By-laws and the Difficulties of Enforcing them in Restricted Areas" was the subject of a paper read recently before a meeting of the Associate Members of the Institution of Municipal and County Engineers by Mr. C. A. Austin, of the Holborn Borough Surveyor's Department.

Mr. Austin confined himself to those by-laws dealing with house drainage, and the special difficulties met with in enforcing them in the Central London boroughs, stating that his views were based upon many conversations and arguments between the administrators of the by-laws and those who were forced to conform to them. The by-laws were distinctly out of date, the most important being over twenty years old, since when not only had sanitary fittings vastly improved, but, what was more important, public opinion was better educated, and the time for a revision had arrived. To add to this, the by-laws had been tested in administration, which had brought to light defects in drafting and clauses which could be evaded. It is evident that the framers of the by-laws had a certain type of building only in their eye—that of the old-fashioned dwelling-house, with its front area, and that their knowledge was limited, as was shown, for example, by the many omissions of urinals.

The author's experience in Holborn had shown him that the by-laws had to be twisted to meet certain cases, and that, had full consideration been given to the need of Central London, stall-board and skylight ventilation to basement w.c.'s and the use of other than lead soil pipes inside a building would not always have been forbidden.

Taking the by-laws seriatim amongst other suggestions the author proposed no alteration to that which dealt with the notice to the sanitary authority, but would add a clause to the later by-laws, No. 1,451, 1911, on the same subject, making the person giving notice responsible for all the work contained in the notice and drawings, although part of the work may be executed by somebody else.

The author asked for a definition of a gully, when referring to No. 330, Drainage By-laws No. 3, and maintained that the gully mentioned in the by-laws means an open trap with a grating in the open air, not a sealed gully indoors, nor a sealed gully outside. The words "where practicable" should be inserted after "open air," as the only open-air position for a gully where the site is entirely covered by buildings is on the roof. There being some doubt as to what constitutes an air-tight cover, the words "to the satisfaction of the local authority" should be included in By-law No. 6. By-law No. 10 should be made applicable to baths in addition to lavatories and sinks, and also that here again the insertion "wherever practicable" should be made after "external wall" in this by-law. In connection with this by-law the author mentioned a case where a bath had been put in an outhouse, the waste water running into the garden to soak away. The local authority required the owner to run a waste pipe from the bath to a gully, although "bath" is not mentioned in the by-laws.

Dealing with By-law No. 11, it was suggested that drawn lead, with proper wiped joints, should only be used for a soil pipe where it passed through a room used for human habitation, or for the storage of food. By-law No. 17 should apply to urinals, and that ventilation of the trap in the case of a top w.c. of a stack was not necessary when the w.c. was not more than 12 in. from the soil vent-pipe. Alterations and additions were suggested to the by-laws made under the Public Health (London) Act, 1891, section 39, deleting water-closets from By-law No. 1 and of the words "in the case of a w.c., one of its sides at least shall be an external wall," thereby permitting of a skylight or lantern instead of a window.

Reference was made to unnecessary clauses dealing with water-closets below the surface of the ground, and the obscurity of their meaning. The subject of the ventilation of a range of water-closets or urinals received much attention from the author, certain stipulations being very well left out, while others could with benefit be added. No. 3, dealing with the capacity of flushing cisterns was, so the author said, vague, and suggested that the capacity should be stated, both for w.c.s and a set of urinals. He also suggested the addition of a clause prohibiting washout or trough closets, and the addition of a new by-law, forbidding anyone making alteration or additions upsetting the existing sanitary arrangements. In support of this addition he instanced the case of a w.c. in a vault opening into an area, or with stall-board ventilation, when it was very difficult to prevent anyone subsequently covering the area with pavement lights and fixing a shop-front with no stall-board.

In conclusion the author moved "Th this meeting of Associate Members of t Metropolitan District do request t Council of the Institution to approa the London County Council and to dra the attention of that body to the fa that the drainage by-laws made und the Metropolis Management Acts ar the Public Health (London) Act, urgent require to be amended on the lin laid down in the accompanying sch dule."

Mr. Frederick White, L.R.I.B.A., ma out a strong point against the exclusi use of lead soil-pipes for internal work habitable houses, and stated one ca where he had fixed a cast-iron soil-pi in a kitchen. The Marylebone Borou Council took the case to court, but t magistrate dismissed the case. Later t Borough Council applied for a convictio as a by-law had been contravened; the magistrate fined Mr. White ten sh lings and the cast-iron soil-pipe st remains in the kitchen. Dealing wi alterations to existing buildings, M White, as a member of a Public Heal Committee, always used his discretio when plans were submitted for alter tions, maintaining that in a close built-in district it was sometimes impo sible to alter existing buildings to mal them comply with by-laws intended f new buildings. If the alterations show an improvement on the existing state affairs, he was willing to propose the approval.

With regard to the resolution, M White considered that before the san was sent to the Council of the Institutio they should obtain the support of t twenty-eight Metropolitan Boroughs.

Mr. Harvey R. Sayer said, in supportir the Resolution, that at a meeting of t R.I.B.A., held on December 18, whe Mr. A. N. C. Shelley (of the Ministry Health) read a paper on "The Law Building Outside London," Mr. A. Alba H. Scott proposed, among other thing that "All by-laws must be revised ever ten years," and he gathered that M Austin held practically the same vie with regard to the L.C.C. draina by-laws. He did not agree with t writer's suggestion of the use of t words "wherever practicable" in ne by-laws. The use of these words woul tend to argument as to when the by-la was practicable or not, while it was t thought required in solving what appe at first sight to be unsolvable problem by which any advancement can be mad in the science of sanitation.

# Reinforced Concrete Calculations for Beginners. IX

## By Professor HENRY ADAMS, M.Inst.C.E.

*(Concluded from February 21, page 355.)*

HE next step is to determine the points for bending up and down the longitudinal reinforcement. 21 shows section through the slab cross-beams. The bars are bent up the cross-beams for one-quarter span ach side to meet the negative bend- moments. No shear members are ired in the slab, but contraction rein- ment will be required to localize any ible shrinking. This consists of ¼ in. 12 in. centre to centre at right angles ne longitudinal reinforcement. Fig. ows the longitudinal section through ross-beam and transverse section ugh main beam. In one direction the lle bar will be bent up to cross over beam, and in the other direction wo outer bars will be bent up, so as ake the full resistance of three bars nst the negative bending moment. bent up bars after passing over the beams have the ends hooked at quarter span beyond. Where the lle bar is bent up the other two will through, and where the two bars are up the middle one will run through, bars having the ends hooked at three-sixteenths of the span beyond the centre of main beam.

The main beams being doubly reinforced the bars will all run through both top and bottom, as shown in Fig. 23. Where joints are necessary in the length they should preferably be welded owing to the difficulty of finding any other convenient method where the rods are so numerous. A plain butt joint may under certain circumstances be used if an additional joint rod be put in not less than forty diameters long each way from the joint, and of the same section as the rod to be covered. This is what is known as "grip length," meaning that the grip of the concrete at that length is equal to the tensile strength of the steel of the given section. If the joint is outside the middle third of the span half the above length will be sufficient, as the stress is reduced. For the shear members of the cross-beams, the load is 22,336 lb., therefore, maximum shear equals 11,168 lb., and dividing by 10,000, the allowable shear stress on steel, $\frac{11,168}{10,000} = 1{\cdot}1168$ sq. in. total sectional area required each side of the centre. Assume eight points for stirrups, then $\frac{1{\cdot}1168}{8} = {\cdot}14$ sq. in.; assume two stirrups at each, i.e., four rods, then $\frac{{\cdot}14}{4} = {\cdot}035$ sq. in. sectional area. On reference to a table this is found to be given by a rod $\frac{7}{32}$ in. diameter, but either $\frac{3}{16}$ in. or ¼ in. may be used. Working from a parabola as previously described the shear stirrups will be placed as shown on Fig. 22, being attached to the outer rods.

For the shear members of the main beams the load is $\frac{2,932,320 \times 10}{25 \times 12} =$ 97,744 lb., therefore, the maximum shear $= \frac{97,744}{2} = 48,872$ lb., and dividing by 10,000 allowable stress, $\frac{48,872}{10,000} = 4{\cdot}8872$ sq. in. total sectional area required each side of the centre. Assume ten points for the stirrups, then $\frac{4{\cdot}8872}{10} = {\cdot}49$ sq. in.; assume four stirrups in each set, i.e., eight rods, then $\frac{{\cdot}49}{8} = {\cdot}06125$ sq. in. sectional area. On reference to a table this is found to be given by a rod $\frac{9}{32}$ in. diameter, but either ¼ in. or $\frac{5}{16}$ in. may be used.

For the pillars we have the load from the main beams 97,744 lb. plus the load from one pair of cross-beams 22,336 lb. = 120,080 lb., and we may assume a load equal to half this coming from the upper floor or roof, making a total of, say, 180,000 lb. Assuming the pillars 12 ft. high, allowing 600 lb. sq. in. on the concrete, and 1 per cent. reinforcement, we shall have a sectional area of $\frac{180,000}{600}$ = 300 sq. in., or, say, 17½ in. by 17½ in., and a reinforcement of 3 sq. in., or, say, four 1 in. diameter rods.

Checking this by another rule where

$$A_c = \frac{W}{570} = \frac{180,000}{570} = 315{\cdot}8,$$

say, 316, and $\sqrt{316} = 17\frac{3}{4}$ in. side of square pillar. The diameter of the laterals or horizontal binding of the reinforcement rods, must not be less than $\frac{3}{16}$ in., with a pitch not greater than $\frac{6}{10}$ of the effective diameter of the pillar, i.e., measured outside the vertical rods. Allowing for 18 in. pillar with 1½ in. cover the effective diameter will then be $18 - 2 \times 1\frac{1}{2} = 15$ in., and the pitch of laterals $15 \times \frac{6}{10} = 9$ in. At the ends for a length of one-and-a-half times the effective diameter, $15 \times 1\frac{1}{2} = 22\frac{1}{2}$ in., the pitch must be reduced to half the amount, or 4½ in. The details of this pillar are added to Fig. 23.

The pillar for the upper floor with a load of 60,040 lb. will have a sectional area of $\frac{60,040}{570} = 105$ sq. in., or $\sqrt{105} = 10\frac{1}{4}$ in., say, 10½ in. square, with a reinforcement of four ⅝ in. rods. The plan of the beams and pillars is shown in Fig. 24.

# Enquiries Answered

*The Editors cordially invite enquiries from readers who require information on architectural, constructional, or legal matter
Answers to enquiries are in all cases the work of experts ; and while every care is taken to make the replies thoroughly reliabl
the Editors cannot hold themselves responsible for any inaccuracies that may inadvertently occur. Correspondents whos
difficulties involve possible legal proceedings are strongly urged to consult their solicitors before taking action on any advic
that may be given. Examination questions cannot be answered. It must be understood that, as a rule, both question an
answer will be published in these columns. The name and address of the querist must always be given, not necessarily fo
publication. Correspondents are requested to be as brief as possible, and to write on one side of the paper only.*

### *Sewage Disposal from Hotel.*

"Architects" write : "The accompanying drawings show a small septic tank-disposal arrangement, which is not acting satisfactorily. The tank arrangement is almost exactly on the lines of a type drawing, sent us by the Ministry of Health in connection with the housing scheme, with the exception of the filter bed, which is covered in. This was inevitable as it had to be close to buildings. From an article of J. E. Tuke in your issue for May 18, 1921, it would appear that this is not likely to upset the working, ventilation being provided by out and inlet pipes. There are four closets, two sinks, and a small public urinal, and now after eight months the whole system is choked with scum or sludge. The anaerobic chamber has a solid scum perhaps 2 ft. deep, so solid that a spade cannot readily be pushed into it, and bearing on its surface a plentiful growth of lanky bleached fungus. The outlet is through an anti-flooding valve to the foreshore, where the effluent finds its way under the 10 ft. or 12 ft. of shingle. The foreshore is covered with a depth of anything over 10 ft. or 12 ft. of boulders and shingle always travelling eastward. It is almost impossible to arrange for any ordinary form of outfall. It is possible, however, that at the strongest spring tides, especially if accompanied by a gale, a little salt water may find its way into the filter chamber through the masonry walls. This would only happen perhaps once or twice a year, and would not affect the anaerobic chamber. No nuisance has
arisen from the effluent, but the w
arrangement appears to be clogged
We have never before come on a cas
so much or so solid a floating scum (
so deep that it is passing undigested
the dipper and filter chamber). Can
suggest a remedy or point out any de
in the arrangements ? The systen

*Specification for Thatch.*

nquirer" writes : "I am building a in the country for a client who a thatched roof, and I propose the ing : Good reed or wheaten straw 15 in. thick laid on 2 × 1 battens on afters, 2 ft. centres, by an experi- thatcher. Eaves minimum pro- 2 ft., and protected from birds re netting. Pitch of roof 50 deg. ave not had any previous experience tching I should be glad to know is in accordance with modern prac- What is the best method of treat- e verges to gables and round dor- and chimney stacks to keep out in, and what special underlining al is required? As unless some vious material, such as a good inous felt, is used, I see no pro- from wet getting through if a patch or other defect develops in hatch, or down the sides of the ey stacks, which, I take it, should d flashed in the ordinary way and the thatch. Is there any known expensive method of treating the surface of the thatch as a protec- gainst fire ?"

w thatch and reed thatch are of y differing value as a roof covering, re laid by different methods. The may be taken as having a "life" rhaps, twenty years, which may be led by a new top dressing and ng" or ridge after that interval. atter, which is driven home after so that only the butt ends are d forming the surface of the roof, en known to last eighty years with- ore attention than would be entailed ordinary slate or tile roof. If it is led to rely entirely on a descriptive cation, considerable expansion will irable. For straw thatch the follow- suggested :—

thatcher shall provide all materials, laddering, plant, etc. Cover the with good rye or wheaten straw thatch, 15 in. thick, well tied down to 2 × 1 in. battens or sound straight fir or larch poles. The straw to be hand-threshed and unbroken, free from mildew and mould, thoroughly damped and softened before use, and only the best in length and quality drawn and laid. Twine to be best hemp well tarred.

The thatching to have fair verges and hips as required; the valleys shall be formed rounded with extra thickness of straw; the eaves shall project 18 ins. (or 2 ft.) from face of wall and be neatly undercut at a slight angle; the finished thatch shall be raked down until all loose or broken straw is removed; work thatching up and around projecting brick courses of chimney stacks and ramps at ridge; the ridges shall be formed separately with as long a staple as possible and laid on over the ordinary surface of the thatch; put proper wood lacing of clean sound elastic hazel rods made up about 15 in. on face along eaves, verges, hips, and where else shown on drawings, circular over dormer windows, all well and securely pinned in with bent hazel loops driven upwards against slope of roof, ½ in. mesh galvanized rabbit wire to be pegged down round eaves, verges, and roving, as protection against birds; trim all loose ends and leave perfect on completion.

If reed thatch is desired, it is advisable to get quotations from one or two of the few firms who practice this very specialist craft and insert a p.c. sum. Messrs. Farman, of N. Walsham, and Mr. Oldfield, of Whittlesey, nr. Peterboro', are two reliable reed thatchers.

With regard to other queries, verges are treated quite differently in different districts. I prefer the treatment in which the straw is laid off diagonally and cut down, rather like the eaves treatment. Dormers and such-like projecting features should be covered by gentle-swelling forms—the characteristic beauty of thatch, which lends itself to easy transitions.

No underlinings are necessary or desirable, and it is not usual to provide lead flashings in any of the positions where these would ordinarily be used. A heavy oversailing of brick or tile should be formed projecting at least 3 in. above the finished thatch level. Flashings may, however, be used as suggested, in which case they should lie on the thatch and be covered by a super-coat, somewhat similar to the ridging.

The Timber Fireproofing Co., of Market Bosworth, will treat reed before laying in such a manner as to make it virtually fireproof for a time, but it apparently becomes rather brittle as a result.

For further information as to thatching refer to "Specification," No. 9, pp. 379 *et seq.*, which also describes the Midland method of thatching upon a layer of fibrous sods or "scraws." G.

## Noises in Steam Heat Pipes

"Eliminating noise in heating systems" is the subject of an article in "Power Plant Engineering" (Cleveland), which has reference specifically to the clicking noises generally associated with steam heating plants. The writer describes several cases in which the noises were eliminated by the judicious use of traps to get rid of accumulations of water and by changed piping. He says :—

"In the main office of a manufacturing plant it was necessary to instal more radiators. After steam had been turned into the system there was more or less noise in some of the return pipes. On investigation it was found that when more radiation was installed in some of the rooms the fitters had connected the half-inch outlet from one of the new radiators to the half-inch outlet of one of the old radiators. This made two half-inch return pipes discharge into one, and I was under the impression that this was the cause of the noise, as it was my idea that the main pipe was continuously filled with water, and when one of the radiator traps discharged and a little steam leaked by it would cause the clicking noise.

"As a remedy, the half-inch pipes between the outlets of the two radiators were replaced by one-inch pipe. After this change there was no more noise in any of the return pipes.

"As it would have taken much time and expense to straighten the feed line the trouble was overcome by replacing the elbow with a tee. Then a trap was placed which collected any condensate in the pipe. This condensate was returned to the boiler by a tilting trap.

"The writer has a pressure regulator in use reducing the pressure to a heating system. In many plants where there are pressure regulators in use for air or steam they have much trouble with them even if they are of the correct size and of a reliable make. In most instances this is due to carelessness in taking care of the regulator. A regulator should receive proper inspection frequently the same as any other equipment in the plant.

"Many users fail to instal a strainer or sediment trap ahead or in the initial pressure line next to the regulator. This will prevent much of the trouble experienced with regulators caused by dirt, scale, etc., finding its way into the regulator, causing some part to bind, thus preventing the regulator from working properly or causing it to leak."

# The Week's News

### *Music Pavilion for Tunbridge Wells.*

Tunbridge Wells Corporation is to build a £30,000 music pavilion.

### *More Houses for Banbury.*

At Banbury a model lodging-house and forty cottages are to be built.

### *Proposed Baths for Bloxwich.*

Walsall Town Council are considering a proposal to erect slipper baths at Bloxwich at a cost of £1,760.

### *Herne Bay Improvements.*

Herne Bay propose to construct a new bandstand, promenade, shelters, and bathing pool at a cost of £27,000.

### *A Builder's Estate.*

Councillor David Morgan, of Glandyfi, Tredegar, Mon., builder, who left £11,808, bequeathed over £5,000 to charity.

### *Slum Clearance at Durham.*

Durham City is to spend £20,000 in "abolishing slums" and improving housing.

### *New Garden Suburb for Yorkshire.*

The Richmond (Yorks) Garden Suburb, Ltd., are to purchase 12 acres of land upon which to form a suburb estate.

### *New Baths for Newcastle.*

New baths are to be erected at Heaton and Walker by the Newcastle-upon-Tyne Corporation.

### *Housing at Clacton-on-Sea.*

Clacton-on-Sea Urban District Council are to build sixteen houses, each containing six rooms, with bathroom, to be let at 10s. 6d. per week.

### *New Dwellings for London.*

The L.C.C.'s scheme for the clearance of the Ware Street area of Hoxton involves the provision of new dwellings to accommodate 2,648 working people.

### *New Institute for Newcastle.*

The Horden Brotherhood has acquired a site at Newcastle-on-Tyne for the erection of an institute and hall, which it is estimated will cost about £2,000.

### *Ballymena New Town Hall.*

At a meeting of the Ballymena Urban District Council it was stated that the proposed new town hall would cost something like £32,000.

### *Sunderland Building Trade Association.*

Mr. J. Duncan White has been chosen as president of the Sunderland and District Building Trade Association for the ensuing year.

### *Housing at Dorking.*

In view of the possible early passing of the Government's Housing Bill, the Urban Council have decided at once to prepare plans for the erection of working-class cottages.

### *Whitby Memorial Cottage Hospital.*

The architect for the Whitby Memorial Cottage Hospital is Mr. A. E. Young. An appeal has been made for £15,000. The present funds reach a total of £11,543.

### *St. George's Cathedral.*

The Roman Catholic Bishop of Southwark has made an appeal for £5,000 to renovate St. George's Cathedral in commemoration of the diamond jubilee of its opening. The anniversary is in July.

### *£2,000,000 for Slum Clearance.*

Glasgow Corporation are applying to the Scottish Board of Health for powers to borrow £2,000,000 for slum clearing schemes. Already £4,000,000 has been expended on housing proposals.

### *New Exhibition Hall for Manchester.*

A scheme has been prepared by a number of private business men in Manchester and Liverpool for building a permanent exhibition hall in Manchester. The site selected is that of the White City at Old Trafford.

### *Housing at Ashington.*

Plans of the Lynemouth housing scheme submitted by the Ashington Coal Company have been approved by the Morpeth Rural District Council. Sixty-nine three-roomed houses and twelve six-roomed houses are to be erected.

### *Temple Bar.*

Efforts are being made to restore Wren's Temple Bar to the nation. At present it stands on the Essex estate of Sir Hedworth Meux, and it is proposed that the new site shall be the Embankment.

### *New "Underground" Stations.*

The Underground Company have placed a contract for £21,000 with Messrs. James Carmichael for the construction of two station buildings on the new Edgware and Hampstead Extension Line at Brent and Hendon.

### *Exhibition of Mr. Raffles Davison's Drawings in New York.*

The largest one-man show of its kind is now being held in New York. It consists of over a thousand drawings and sketches by T. Raffles Davison, hon. A.R.I.B.A., which have been created during the last forty years of his professional experience.

### *A Longer Embankment.*

A £160,000 scheme to extend the Westminster Embankment along Millbank is being considered by the L.C.C. The extension will link up the present Embankment from Lambeth Bridge to that part of the Thames Wall which begins at Grosvenor Road.

### *Blyth Water Supply.*

In his annual report to the Blyth Town Council Mr. L. Leeper, the borough engineer, strongly criticizes the public water service. The necessity of a large service reservoir within the borough, he says, is becoming more and more urgent. A recommendation to build a storage tank at a cost of £15,000 has since been adopted by the Council.

### *2,757 Municipal Houses in Leeds.*

Since the Corporation housing schemes were commenced on the different estates in 1919, no fewer than 2,757 dwellings have been erected and are occupied, and it is confidently expected that a further 3,130 houses, a number of which are now being built, will be completed by the end of the year.

### *London Site for Sale.*

A portion of the Duchy of Cornwall estates, about one acre in extent, is to be let by auction on a building lease. The property is situated on the Prince's Meadow estate, between Waterloo Bridge and Waterloo Station, at the corne Waterloo Road and Stamford Str next to St. John's Church.

### *An Ancient London Church.*

The 800th anniversary of the found of the Church of St. Bartholomew Great, London, was marked by larg attended celebrations. It stands c under the Hospital in Smithfield, honour its founder, Rahere. The Bis of London has dedicated a lectern commemorate the safe-standing of church through the air-raids.

### *Durham's Insanitary Areas.*

The Ministry of Health have agr to contribute towards an approved sche for the reconstruction of insanitary ar in the city. The Council will receive haps £15,000 to £20,000 on loan for si years from the Government, and scheme could be carried out at the of a 1½d. rate. A crescent of houses gardens will be built from Court Lan Hallgarth Street in the Elvet district.

### *Sheffield War Memorial.*

The Lord Mayor of Sheffield has iss a public appeal for funds to erect obelisk as a war memorial for the It was originally intended to buil memorial hall, but owing to the finan stringency this proposal has been ab doned temporarily in favour of obelisk, which is to cost about £5,00 £6,000, and to be 80 ft. in height. ready £1,461 has been contributed.

### *New Pictures for the National Gall*

Four new pictures have just been h in the National Gallery. Two of th a portrait of Lady Emilia Kerr by R ney and a portrait of a Gentleman by Anglo-Dutch painter of the school Mierevelt, have been bequeathed by late Mr. John G. Griffiths, C.V.O. other pictures are an "Italian Gentlem by Richard Wilson, which the trus have purchased, and a flower-piece Fantin-Latour bequeathed by the Mrs. M. J. Yates.

### *L.C.C.'s Claim against the Governm*

It is reported that the claim of London County Council against Government in respect of interfere with the building of the County Hall its subsequent occupation during war amounts in all to £1,473,546, incl ing £1,230,374 in respect of the additi cost of the County Hall by reason of stoppage of the building work. An timation has been received by the Cou from his Majesty's Office of Works application is being made to the Compensation Court with a view having the compensation payable to Council determined by that Court.

### *The late Mr. R. D. Oliver.*

Mr. Robert Dudley Oliver, the archi who has just died, was best known the restoration of Hoghton Tower, Preston, for Sir James de Hoghton, Another piece of judicious restora was some work for Colonel Harding Madingley Hall, near Cambridge, w King Edward VII lived for a time an undergraduate at the univers Throughout life Mr. Oliver devoted m of his time to painting, and in his ea years work of his was shown at the R Academy exhibitions in several seaso

## tutory Registration of Architects

*o the Editors of* THE ARCHITECTS' JOURNAL.

RS,—I am directed by the Council of Royal Institute of British Architects form you of the steps that have been 1 by them since the beginning of the in pursuance of the policy of Statu- Registration for the architectural ssion.

Bill was drafted and submitted to a ral meeting of the Royal Institute at end of January. The meeting was fully attended, and it was decided first step, to consult the other pro- nal societies and interests affected to endeavour to obtain a general con- is of professional opinion in favour e Bill.

pies of the Bill have, accordingly, sent to all the architectural societies erned and to the representatives of tached architects, and they have been ed to consider the Bill in principle in detail and to inform me of all ts in which they think it might be oved or amended.

1 the receipt of this information the stration Committee of the Royal tute will endeavour to embody the estions in the draft as far as may be ticable, and a meeting of all interested es will be arranged at which the Bill, mended, will be examined and dis- d.

is hoped that by this means the imity which is desired will be ob- d in support of the Bill.

IAN MACALISTER.
Secretary of the R.I.B.A.

## As Others See Us

*o the Editors of* THE ARCHITECTS' JOURNAL.

RS,—To see ourselves as others see a view which is always interesting, ever its æsthetic qualities are. The majority of the "others," however, t see us at all, so on the rare occasions 1 we happen to catch the eye of the in the street we blush nervously and greatly flattered.

ith these feelings I read the report r. Gilbert Frankau's lecture at the , and having partly recovered from awe caused by the novelty of the I venture to scribble a little humble nent.

. Frankau has the layman's objec- to technical parlance; but inquiry convince him of its necessity, though ould be interesting to know where Frankau got the information that bellishment" was the technical for ament"; the latter is the term in- bly used by architects. Mr. kau's suggestion that architectural seology should be translated into Anglo-Saxon is practically impos- because of the limitations of that st, but inexpressive, language.

resent-day architecture does not," Frankau said, "reflect the character e public." But I am afraid present- architecture and the daily news- rs reflect it only too well; and the reflection is too black and sordid to be desirable. The only beautiful present-day architecture reflects character and ideals quite at variance with those of the public.

Mr. Frankau tells us that the man in the street "is not uneducated . . . he both knows and appreciates what is good." Let Mr. Frankau have half an hour's conversation with a typical man in the street and find out the things which the man thinks are good and appreciates. He will then agree, that compared with our man in the street, the average African savage is a marvel of culture and refinement.

It is certainly true that modern houses are "full of conveniences, but empty of comforts," and that the present tendency is to save the servant and "strafe" the mistress, this, however, is a result of the public labour-saving mania.

Mr. Frankau sounds a timely word of warning when he tells us to "let the profession cling to individualism and fight for freedom from control." What little art we get out of modern architecture will soon be stifled if we regulate it on the lines of a Government department.

Mr. Frankau tells us we are "far too obsessed with lofty ideas of art." Little does he know us—lofty ideas of art are rare amongst architects. He also informs us that architecture is not an art but a craft; but if he reflects on what he means by craft I think he will find the definition more applicable to "art." "Architects," he further tells us, "should come off their art pedestal." Very flattering, but I am afraid very few architects have mounted such a pedestal. Mr. Frankau then asks us to think and feel as the people think and feel, and to give them what they want. Unfortunately, this is just what most architects are doing; and to give the people what they ask for means ugliness, not art.

Mr. Frankau has some strange delusions as to architects and their work, but touching on the "silence" of the profession he spoke words of distilled wisdom. "Why don't they do something about it; write, speak, agitate, anything rather than suffer in silence?" For these suggestions Mr. Frankau deserves paradise.

EDGAR LUCAS.

## Acoustics of Large Concert Rooms: Hints to Architects

*To the Editors of* THE ARCHITECTS' JOURNAL.

SIRS,—In reply to questions on the above subject may I outline briefly the main facts which have emerged as a result of acoustic research upon this class of auditory during recent years. The problem of reverberation where music is concerned is different to that for the speaking voice. In the case of the speaking voice as short a reverberation as is consistent with loudness is desirable; where music is concerned a reverberation of at least two seconds is necessary in order to secure adequate tone for strings and voices. Now the absorption necessary to ensure two seconds, reverberation is generally provided for by the relatively large audiences common to concert rooms and opera houses. Consider a concert room seating 2,000. A rough preliminary calculation will show that such an audience will provide $2{,}000 \times 4{\cdot}7 = 9{,}400$ units of absorption. In order to secure a reverberation of two seconds this involves a minimum air volume of 376,000 cu. ft. But other factors such as stage scenery, carpets, drapery, will also contribute slightly to the total absorption. This means that for music the figure, 376,000 cu. ft., is on the small side. If, on calculating and adding in all the factors, using Sabine's formula (as recently explained by Mr. G. A. Sutherland in his lectures at University College, published in the architectural Press), it is found that the reverberation is considerably less than two seconds, dissatisfaction in regard both to the tone and loudness of instruments and of voices is sure to result unless a considerable amount of wood panelling is used near the source of sound. The effect of wood panelling is to brighten the tone of instruments by absorbing sound in the lower rather than in the upper register and thereby relatively increasing the power of over-tones. Also, wood surfaces, owing to resonance, increase loudness where they are in contact with or placed very near to a musical instrument. Thus the floor of a platform or orchestra pit having a 6 in. air space below it will reinforce notes of average pitch for instruments in contact with the floor, such as piano, double bass, cello, solo voice. In the case of a platform, if the floor is tightly jointed to the panelling of the platform recess, so as to make one continuous wood area, the reinforcing effect is likely to be greater. The 6 in. air space under the floor can be either continuous or divided into compartments by floor joists; the conditions are fulfilled by 6 in. floor joists laid upon a concrete floor. The reinforcing of double basses and cellos by some such means as this is important. Halls suitable to the speaking voice, owing to their short reverberation, are frequently dull and lifeless for orchestral and choral music and inaudible for cellos, double basses, and the larger organ pipes.

In regard to shape a good acoustic plan for this class of auditory has certainly emerged. This is the fan shape with a portion of the splay to right and left of platform turned over to form a deep proscenium arch. This plan has been developed in America for combined concert and cinema auditories. The splays, both of vertical and horizontal section, form useful reflecting surfaces and should be hard and smooth. They are diminished in their usefulness if they are broken for the insertion of boxes. Up to a level of 8 ft. or 10 ft. above the stage floor they should be unbroken, but doors can be shown in them. The fan shape has developed naturally, as far as acoustics is concerned, from the principle of directing sound with as few reflections as possible from the neighbourhood of the source to the neighbourhood of the audience. For this reason the splays require to be hard reflectors and not soft absorbers. Sound paths vary in efficiency. From a crowded platform, horizontal sound paths are interrupted, and lessened in efficiency, by neighbouring human beings. On the other hand the vertical sound path rising from each instrument rapidly disengages and preserves its intensity. Hence the great importance of the overhead portion of the proscenium splay. Sound reflected from the overhead portion of the splay will penetrate under the galleries at a more efficient angle than will sound reflected from the horizontal plane of the ceiling. The depth of penetration of these proscenium reflections under the gallery should mark the limit of the rear seats on the floor below.

The rear wall of an organ chamber can with advantage be tilted forwards, thereby deflecting sound downwards; the rear wall of an orchestra pit can with advantage be tilted backwards, thereby deflecting sound upwards.

The galleries should be at as great a rake as possible, so that direct sound from the speaker's mouth shall reach each listener at as wide an angle of incidence as possible. Sound traversing human heads at a narrow angle dies away at a considerably greater rate than in proportion to the square of the distance from the source. Hence deep galleries, the rear seats of which are screened from useful reflecting sources and having nothing to rely upon but the direct sound, naturally suffer from insufficient loudness and lack of tone. Conversely, a chief feature in the Greek theatre and Bayreuth theatre types is the efficient rake of the seats and the full advantage taken thereby of the direct sound.

Having directed the bulk of the sound upon the audience, it remains to prevent reflections back from rear walls behind the audience. This can be done by a frieze of acoustic felt, acoustic tiles or plaster. In a modern acoustically designed hall there need be no more than a very small area on the back wall that will prove dangerous and will require to be eliminated.

Where curves are used either on plan or section the length of the radius of the curve must be carefully considered. The arc of a curved ceiling must have a radius *considerably greater* than the height of the hall. The curves of coves must have a radius considerably smaller than the length of any possible sound path in the room. This is in order to prevent concentration of sounds from curved surfaces to focal points which might result in echoes. Echoes are caused not merely by long reflected paths, but also by bringing sound to a focus at the level of seats.

It is important in large concert rooms, as in cinema halls, not to include the expensive seats in the front rows next the platform. Nothing is more annoying than to pay a high price for a seat at the end of a front row and to hear the whole performance astigmatically. A distance of at least 20 ft. or 30 ft. back is required for an equal assembling of sounds from all instruments upon the ear.

Good examples of concert rooms showing acoustic design are as follows: New Orchestra Hall, Boston, Sabine's "Collected Papers," page 60; Hill Memorial Auditorium, University of Michigan, "Brickbuilder," August 1913; Smith Memorial School of Music, Illinois University, "Archit. Forum," November 1921; Eastman Theatre and School of Music, "American Architect," February 28, 1923.

Yours, etc.,

H. BAGENAL.

Architectural Association.

## Coming Events

*Wednesday, March 21.*

R.I.B.A.—"The Public and the Architect." By Lord Sumner. 5 p.m.

Institute of Builders.—"Ancient English Woodwork." By Professor Beresford Pole. R.I.B.A. Galleries. 8 p.m.

Institute of Civil Engineers.—"Electric Train Lighting." By Mr. J. R. W. Grainge. 7 p.m.

*Thursday, March 22.*

Edinburgh A.A.—Annual General Meeting of the Assoc. Section. 8 p.m.

Institute of Structural Engineers.—Presidential Address by E. Feander Etchells, A.M.Inst.C.E. 7.30 p.m.

Grosvenor House.—"Is Architecture the Mother of the Arts?" By Professor W. Rothenstein. 5 p.m.

Architecture Club.—Quarterly Dinner, Grosvenor House. 7.15 p.m.

*Friday, March 23.*

R.T.C.A.C.S., Glasgow. — Business Meeting.

Art Workers' Guild.—Ladies' Night. "Design and Treatment of Street Furniture." By Professor Adshead. 8 p.m.

Birmingham Municipal Technical School. "Paints and Varnishes in the World's Work." By Dr. Morrell. 7.15 p.m.

*Saturday, March 24.*

Architecture Club.—Visit to P.L.A. Building.

Institute of Civil Engineers.—Visit to King George V Dock, Port of London Authority.

*Monday, March 26.*

A.A.—"As Others See Us." By Maurice E. Webb. Exhibition of Executed Work by Seven Past Students.

*Tuesday, March 27.*

Illuminating Engineering Society.—"Window Design and the Measurement and Predetermination of Daylight Illumination." By P. J. Waldram and J. M. Waldram, B.Sc. 8 p.m.

## Improvement of London

At the annual meeting of the London Society, held at the Royal Academy, Sir Aston Webb, P.R.A., in moving the adoption of the report, referred to the work of the society, which, he said, received many applications for help from various quarters. For example, there was a little place at Chiswick called Strand-on-the-Green, which was threatened with destruction. The society had done its best to assist in preventing this. The society considered that it should take a large view of London as a whole, and that was how it came to be concerned in the matter of Charing Cross bridge and St. Paul's bridge. Lately interest had been centred on St. Paul's bridge, which the society considered was not really a great necessity. Another matter which concerned the Metropolis very much was the possibility of founding a commission of fine arts for London, a consultative commission, composed mainly of experts who would act in an advisory capacity, and to whom any proposal for public improvement could be sent for opinion. The society was very anxious to prepare a plan for the future enlargement of London—an imaginative plan showing not only roads but also where commerce and residences were likely to expand and where open spaces were likely to be required.

## Competition News

*Bridge in Bergen, Norway.*

The replies of the Judging Commi to certain questions raised by the c petitors may be seen at the Departn of Overseas Trade (Room 40), 35 Queen Street, S.W.1.

*Ossett War Memorial Competition*
*Haifa Business Centre Competition*

The R.I.B.A. have issued the foll ing notice: "Members and Licentiate the Royal Institute of British Archit must not take part in the above con titions because the conditions are no accordance with the published regulat of the Royal Institute for Architect Competitions."

## List of Competitions Op

| Date of Delivery | COMPETITION. |
|---|---|
| March 28 | Cenotaph for Ossett. Cost not to e £2,000. Premiums 20 guineas and 10 gui Apply Borough Surveyor, Town Hall, C |
| March 31 | War Memorial in Crow Nest Park, Dews Assessor, Professor C. H. Reilly, O. M.A., F.R.I.B.A. A copy of the cond together with plans of the site ma obtained on application to Mr. H. Dea A.R.I.B.A., Borough Surveyor, Town Dewsbury, on payment of one shilling. |
| April 15 | Buildings for the Polytechnic Inst Reval. Premiums 200,000 marks, 1 marks, 100,000 marks. Apply Office tional du Commerce Exterieur, 22 Av Victor Emmanuel III, Paris. (8e) competition is an International one. |
| June 1 | New Municipal Buildings and Town Cork. Total cost not to exceed £12 Assessor Mr. Lucius O'Calla F.R.I.A.I., A.R.H.A. The successful petitor will be appointed to carry the work. Second and third pren £200 and £100 respectively. Apply William Hegarty, Town Clerk, Cork. competition is limited to architects and practising in Ireland. |
| June 12 | Concert Pavilion, Bournemouth, to seat Estimated cost £100,000. Assessor Edwin Cooper, F.R.I.B.A. Premiums: £200, and £100. Apply Town Clerk, cipal Offices, Bournemouth. Deposit (cheque). |
| June 30 | Bridge over Nygaardsstrommen in Be Apply Department of Overseas (Room 50), 35 Old Queen Street, minster, S.W. 1. |
| No date | The Crown Agents for the Colonies, a on behalf of the Government of the S Settlements, invite competitive design the reinforced concrete work requir connection with the construction of a general post office at Singapore. Tent designs, for which no fees will be paic required in the first instance, from w it is proposed to select a design and sp its adoption in the contract for the struction of the building. The firm w design is so adopted will be subsequ engaged to prepare full detail plans, sp cation, quantities, &c., for an approve Drawings can be seen and further d of the competition obtained from the C Agents for the Colonies, 4 Millbank, minster, S.W.1, quoting Z/Straits S ments 5664. |
| No date | Five shops for the Prestwich Co-oper and Industrial Society. Premiun guineas. Apply General Manager o Society, Warwick Street, Bury New Prestwich, Lancs. |
| No date | Pavilion in Calverley Gardens, Tunb Wells. Assessor Mr. E. Guy Dawber, F. F.R.I.B.A. Premiums £150, £100, and Apply Town Clerk. |

Photo: Architects' Journal.

The centre block of the Bush Building, which stands on the for long derelict Aldwych site, is now nearing completion. Ultimately it will have balancing wings on either flank, and we understand that a start will shortly be made with that on the west side. Our photograph, which gives a good idea of the immense scale of the building, was taken last week from a position in Kingsway.
